406,779.

blocks from said plane being inversely proportional to the length of said bushings or bearings, so as to secure equal wear on both sides of said plane and consequently to maintain the lower revolving grinder always horizontal, substantially as described.

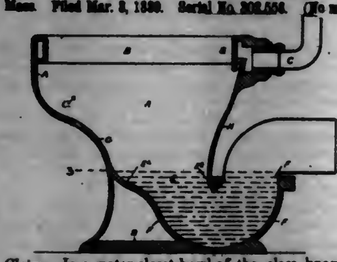
3. The lower revolving grinder and the upright arbor therefor provided with a driving-pulley, in combination with a bearing for said arbor, with bearing-surfaces of equal length on opposite sides of the horizontal plane through the middle of said pulley and at equal distances from said plane, substantially as described.

4. The combination, with a supporting-frame and a stationary grinder, of a revolving grinder, an upright arbor, an adjustable tubular step-bearing supported in said frame, and composed of a tubular portion extending over nearly the whole length of said arbor, and a step attached to and adjustable with said tubular portion, and a pulley in the same horizontal plane with a portion of said tubular step-bearing, mounted with said revolving grinder on the said upright arbor, substantially as described.

5. The combination, with a supporting-frame and a stationary grinder, of a revolving grinder, an upright arbor, an adjustable tubular step-bearing supported in said frame and constituting the sole journal-bearing for said arbor, and a pulley mounted with said revolving grinder on said upright arbor and arranged in the same horizontal plane with a portion of said tubular step-bearing, the latter being composed of a tubular portion and a step attached thereto and adjustable therewith, and its tubular portion being provided with bearing-surfaces on opposite sides of the horizontal plane through the middle of said pulley and at distances from said plane which are inversely proportional to the respective lengths of said bearing-surfaces, substantially as described.

6. The series of superposed mills for gradual reduction, each provided with a hopper for the grist and a collecting-chamber with a side delivery for the chop or meal, and each composed of its individual frame with legs, its individual vertical arbor adjustable in its own frame independently of the other arbors, and a pair of grinders, the mills of the series being each supported by the legs of its own frame resting on the frame of the mill below outside the hopper thereof, in combination with sieves and purifiers arranged at the side of the series of mills, receiving the chop or meal from the collecting-chamber of a higher mill and delivering the sifted or purified material as grist into the hopper of the next lower mill, substantially as described.

7. The series of superposed mills for gradual reduction, composed each of a pair of legs, a double bracket connecting said legs, a vertically-adjustable arbor supported in bearings by said bracket, a revolving disk-grinder mounted on said arbor, a stationary disk-grinder, and a stationary crown supporting said stationary grinder, the crown



in each mill having extensions which rest upon the tops of the legs in its own mill and form rests or supports for the legs of the mill above, substantially as described, in combination with sieves and purifiers set at one side of the series of mills in the vertical space between each pair of disk-grinders and the pair below, as set forth.

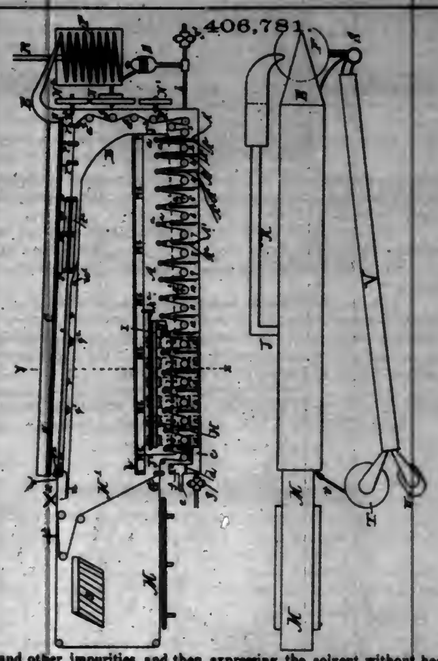
8. A mill composed of a frame having legs connected by a double bracket, a vertically-adjustable tubular step-bearing supported in said bracket, and composed of a long tubular portion and a step attached thereto and adjustable therewith, an upright arbor in said tubular portion, with its lower end resting on said step, a plate-pulley and grinder mounted on said arbor, with the pulley in the same horizontal plane with a portion of said step-bearing, which it surrounds, the crown supported by said legs, the stationary grinder fastened under said crown, the hopper for the grist, and the annular chamber and spout for the chop, substantially as described.

9. The combination, with a supporting-frame and a stationary grinder, of a revolving grinder, an upright arbor, an adjustable tubular step-bearing supported in said frame, and composed of a tubular portion extending over nearly the whole length of said arbor, and a step attached to and adjustable with said tubular portion, and a pulley in the same horizontal plane with a portion of said tubular step-bearing and supported from said revolving grinder on the said upright arbor, substantially as described.

10. The combination, with a supporting-frame and a stationary grinder, of a revolving grinder, an upright arbor, an adjustable tubular step-bearing supported in said frame and constituting the sole journal-bearing for said arbor, and a pulley secured to and depending from said revolving grinder and arranged in the same horizontal plane with a portion of said tubular step-bearing, the latter being composed of a tubular portion and a step attached thereto and adjustable therewith, and its tubular portion being provided with bearing-surfaces on opposite sides of the horizontal plane through the middle of said pulley and at distances which are inversely proportional to the respective lengths of said bearing-surfaces, substantially as described.

406,780. WATER-CLOSET BOWL. William Scott, Medford, Mass. Filed Mar. 8, 1889. Serial No. 302,556. (No model.)

Claim.—In a water-closet bowl of the class known as a "short hopper" and having means to flush it, an elongated discharge-opening E in the bottom of the bowl, a discharge way or passage F, leading from said opening and coincident, or substantially so, with the longer axis E^3 E^3 of and rising to a height above said discharge-opening, and a slope G of the inner surface of the bowl, in the vertical plane of the longer axis of said discharge-opening and directly at each side of said plane, which has generally a downward direction from below or near the flushing means to a horizontal plane below the horizontal plane of the discharge-opening and above the level of the standing water of the bowl has a portion G^3 of a more or less horizontal direction, substantially as described, for the purposes specified.



406,781. PROCESS OF CLEANING WOOL. Ignatius Singer and Moritz W. Jüdell, Adelaide, South Australia. Filed May 18, 1888. Serial No. 274,267. (No model.) Patented in South Australia Jan. 16, 1888, No. 945; in Victoria Jan. 17, 1888, No. 5,566; in New South Wales Jan. 18, 1888, No. 463; in Queensland Jan. 20, 1888, No. 337; in New Zealand Jan. 30, 1888, No. 2,773; in Tasmania Jan. 31, 1888; in England Feb. 20, 1888, No. 2,533; in Belgium Mar. 3, 1888, No. 80,961; in Luxemburg Mar. 6, 1888, No. 964; in France Mar. 9, 1888, No. 189,294; in Germany Mar. 23, 1888, No. 44,015; in Cape of Good Hope May 25, 1888, No. 6/307; in Spain June 30, 1888, No. 7,966; in Italy July 12, 1888, XLVI. 301, and in Austria-Hungary Oct. 3, 1888, No. 18,590 and No. 31,944.

Claim.—1. The process of cleansing wool and like material, consisting in passing the same continuously through a constantly-flowing counter-current of bisulphide of carbon for the purpose of removing grease and other impurities, and subsequently passing the wool through a chamber in which it is subjected to the action of heated air, substantially as set forth.

2. The process of cleansing wool and like material, consisting in passing the same continuously through a constantly-flowing counter-current of bisulphide of carbon for the purpose of removing grease and other impurities, and then expressing the solvent without heat, and afterward passing the wool through a heated chamber provided with heated rollers and a counter-blast of heated air for the purpose of removing the remaining traces of the solvent, substantially as set forth.

3. The process of cleansing wool and like material, consisting in passing the same continuously through a vessel containing bisulphide of carbon for the purpose of removing grease and other impurities, then removing the solvent by the action of heated air, then condensing the volatilized bisulphide of carbon, and then returning the said product of condensation to the said vessel, substantially as set forth.

4. The herein-described process of cleansing wool and like material, consisting in passing the same into and out of the successive cells of a trough or vessel adapted to contain a liquid, and simultaneously passing a liquid current of bisulphide of carbon from one cell to the next in a direction opposite to the movement of the wool, whereby the material is alternately immersed in and withdrawn from a liquid of progressively-increasing purity, substantially as set forth.

406,782. FASTENING FOR MINING-DRILL STOCKS. Edward Smith, Plymouth, Pa. Filed Apr. 25, 1889. Serial No. 308,803. (No model.)

Claim.—1. The combination, with the stock of a mining-drill having a stationary jaw formed on its forward end and provided with a lug or projection on its inner side, of a movable jaw recessed or slotted on its inner side to receive the lug of the stationary jaw and pivoted to said lug, and provided with a lever-extension, and means for operating said lever to separate the outer ends of the jaws, all constructed, arranged, and operating substantially as shown and described.

2. The combination, with the stock of a mining-drill having a stationary jaw formed on its forward end and provided with a projecting lug on its inner side, of a movable jaw recessed on its inner side to receive the lug of the stationary jaw and pivoted to said lug, and provided with a lever-extension, a spring interposed between said lever and the stock to hold the lever normally away from the stock and the jaws closed, and means for operating said lever against the tension of its spring to separate the forward ends of the jaws, all constructed, arranged, and operating substantially as shown and described.

3. The combination, with the stock of a mining-drill having a stationary jaw formed on its forward end and provided with a projecting lug on its inner side, of a movable jaw recessed on its inner side to receive the leg of the stationary jaw and pivoted to said lug, and provided with a lever-extension having a slot in its rear end, a screw-threaded arm or bolt pivoted at one end to the stock and projecting through the slot in the lever and being provided with a nut adapted to engage with the outer side of said lever, and when screwed upon said pivoted arm to draw the lever toward the stock and separate the forward ends of the jaws, substantially as shown and described.

4. The combination, with the stock of a mining-drill having a stationary jaw B formed on its forward end provided with a projecting lug C on its inner side, of a movable jaw D, having a recess E on its inner side to receive the lug C, and pivoted to said lug, and provided with a lever-extension D', having a slot g in its rear end, and a screw-threaded arm or bolt G, pivoted at one end to the stock and extending through the slot g, and provided with a nut g^4, engaging with the outer side of said lever, all constructed, arranged, and operating substantially as shown and described, as and for the purpose set forth.

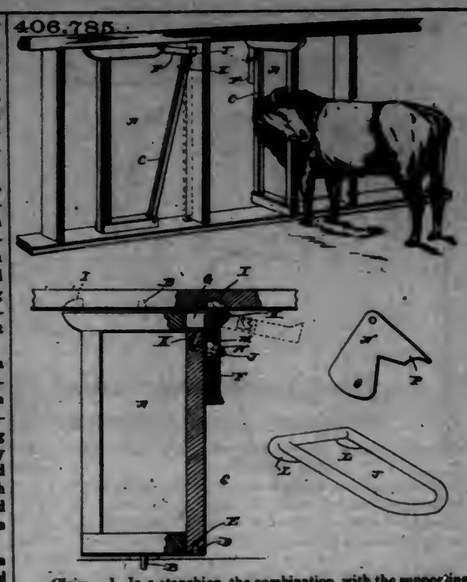
5. The combination, with the stock of a mining-drill having a stationary jaw B formed on its forward end provided with a projecting lug C on its inner side, of a movable jaw D, having a recess E on its inner side to receive the lug C, and pivoted to said lug, and provided with a lever-extension D', having a slot g in its rear end, a spring F, interposed between the stock and lever to hold said lever normally away from the stock and keep the jaws closed, and a screw-threaded arm or bolt G, pivoted at one end to the stock and extending through the slot g, and provided with a nut g^4, engaging with outer side of said lever, all constructed, arranged, and operating substantially as shown and described.

6. The combination, with the stock of a mining-drill having a stationary jaw formed on its forward end, of a movable jaw pivoted to said stock and having a lever-extension, a spring interposed between the lever and the stock to hold said lever normally away from the stock and the jaws closed, and means for operating the lever against the tension of the spring to separate the forward ends of the jaws, substantially as shown and described.

406,783. SIRUP FOR SODA-WATER. Frank L. Smith, Sioux City, Iowa. Filed Apr. 3, 1889. Serial No. 306,020. (No specimens.)

Claim.—A sirup composed of celery, alcohol, phosphoric acid, water, and sugar, in or about the proportions described.

406,784. APPARATUS FOR DYEING. Jos Smith, Philadelphia, Pa., assignor to George C. Hetzel & Co., same place. Filed Apr. 20, 1889. Serial No. 308,050. (No model.)



Claim.—1. In a machine for dyeing or scouring yarn, the combination of a vat or tank, an endless chain traversing said tank, and a series of yarn-holding frames mounted upon said endless chain, said frames consisting of bars projecting outward from the chain and having lateral yarn-carrying arms, substantially as specified.

2. In a machine for dyeing or scouring yarn, the combination of the vat or tank and endless chains traversing said tank with a series of yarn-holding frames mounted upon said endless chains, each frame consisting of a cross-bar extending from chain to chain, upright bars extending from said cross-bar, and transverse yarn-carrying rods supported upon said upright bars, substantially as specified.

3. In a machine for dyeing or scouring yarn, the combination of a vat or tank and an endless chain traversing said tank with a series of frames secured to said chain, each of said frames having a series of orifices for the reception of the yarn-carrying bars, substantially as specified.

4. In a machine for dyeing or scouring yarn, the combination of a vat or tank and an endless chain traversing said tank with a series of yarn-supporting frames carried by said chain, each frame having guards to retain the hanks of yarn in proper lateral position, as set forth.

406,785. STANCHION. Ralmon W. Smith, Addison, N. Y., assignor to Frank G. Parsons and Jacob V. Graham, same place. Filed Mar. 6, 1889. Serial No. 302,694. (No model.)

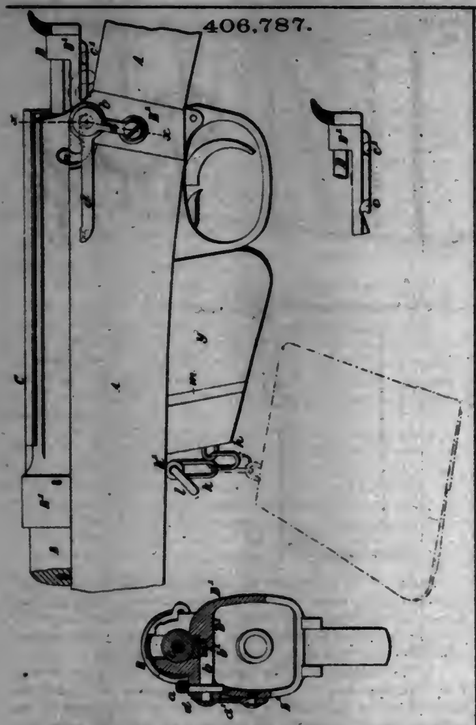
Claim.—1. In a stanchion, the combination, with the supporting-frame having the recesses I in its top, of the stanchion-frame mounted therein and provided with a swinging side bar, and a latch pivoted to the upper end of the stanchion-frame, adapted to engage the recesses I, and connected with the swinging side bar, as set forth.

2. The combination of the supporting-frame having the recesses I, the swinging stanchion having the swinging side bar C, and the latch pivoted to the stanchion and adapted to be operated by the swinging side bar to engage the recesses I, the said latch being provided with a point or tooth to enter one of the said recesses, and having a rounded extremity, as set forth.

3. The combination of the stanchion having the swinging side bar C, provided at its upper end with the slot K, the latch F, pivoted to the stanchion, the link engaging the slot K and passing around the latch, and having the lugs L engaging against the side of the bar C, and the locking-lever pivotally mounted on the latch and having a concave recess in its edge engaging the link, as set forth.

4. The combination of the stanchion having the swinging side bar C, the latch F, pivoted to the stanchion and having a recess M, the link mounted on the side bar and passing around the latch, and the locking-lever pivoted in the recess M and having a weighted arm O, and a concave recess P, adapted to engage the link, as set forth.

406,786. METAL FABRIC. Robert F. Snow, Detroit, Mich., assignor of one-half to Charles E. Snow, Rochester, N. Y. Filed Mar. 19, 1888. Serial No. 267,648. (No model.)



Claim.—1. A metal fabric consisting of a series of slotted bars having in combination therewith a series of twisted bars, the width of the slots respectively being less than the diameter of the periphery of the twisted bar, substantially as described.

2. A metal fabric consisting of the combination, with a series of bars slotted at suitable intervals, of a series of twisted bars, the width of the slots being less than the peripheral diameter of the twisted bars, and a border located about one or more edges of the fabric, substantially as set forth.

3. A metal fabric consisting of the combination, with a series of corrugated bars slotted at suitable intervals, of a series of twisted bars, the width of the slots being less than the peripheral diameter of the twisted bars, substantially as set forth.

406,787. MAGAZINE FIRE-ARM. James J. Speed, Waltham Cross, England. Filed Dec. 19, 1888. Serial No. 294,103. (No model.) Patented in England Nov. 1, 1888, No. 15,793.

406,787.

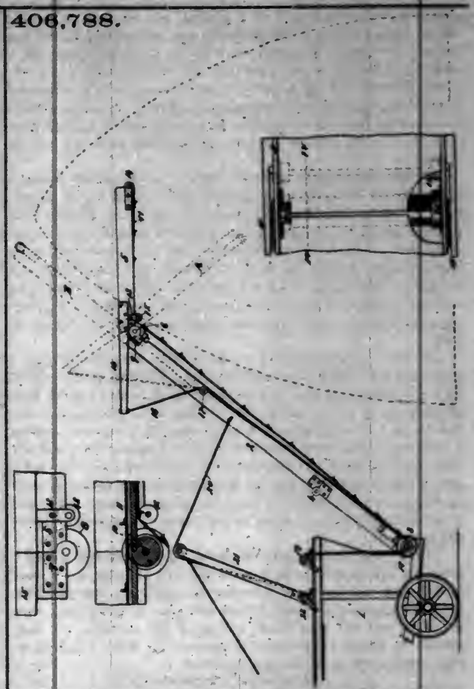
Claim.—1. The combination, with the receiver and the breech bolt of a breech-loading fire-arm, of a firing-pin and a movable locking-pin adapted to move into engagement with and lock the firing-pin in both its cocked and uncocked positions, substantially as described.

2. The combination, with the breech-bolt, of the firing-pin having the front and rear notches *c c'*, and a movable locking-pin for engaging either of said notches to lock the firing-pin in both its cocked and uncocked positions, substantially as described.

3. The combination, with the firing-pin D, having a cocking-piece D' and provided on its under side with the front and rear semicircular notches *c c'*, of the rotary pin *b*, having the semicircular end *b'*, to engage either of said notches and thereby lock the firing-pin in its cocked or uncocked positions, substantially as described.

4. The combination, in a fire-arm, of the firing-pin D, the transverse locking-pin *b*, adapted to engage the firing-pin in both its cocked and uncocked positions, the swinging rear sight-arm *d* carried by the locking-pin and having a peep-hole, and the spring *d'*, acting on the sight-arm to hold it in either a vertical or horizontal position, substantially as described.

5. The combination, with a fire-arm, of a cartridge-magazine and the link-hinge connecting the magazine with the receiver or shoe of the fire-arm, substantially as described.



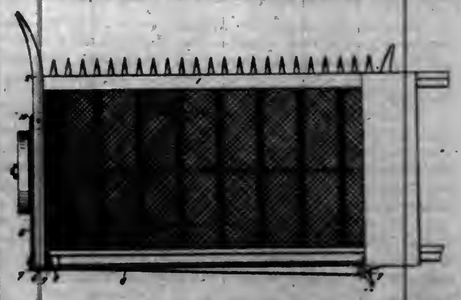
6. A cartridge-magazine for fire-arms, consisting of the casing having a laterally-widened base and contracted at the top to substantially the width of a single cartridge, said casing being thus adapted to contain a zigzag column of cartridges and provided near the front end alone of its opposite side walls with vertically-extending depressions, and the cartridge-platform *n*, having the laterally-widened or extended parts *n'* in front of the said depressions for preventing the said extended parts of the platform from passing the depressions when its rear end is depressed, substantially as described.

406,788. STRAW-STACKER. PEARLEY J. SPRAGUE, Adrian, Mo. Filed Aug. 20, 1888. Serial No. 283,249. (No model.)

Claim.—1. In a straw-stacker, the combination of a main section and an outer section having floors, the outer section being connected with the main section by journal-brackets 9, and a cylindrical part 8, rigidly secured to the inner end of the outer section, the floor of the latter being tangential thereto, whereby said cylindrical part 8 is caused to follow the motion of the outer section, thus preserving the symmetry of the floor between the two sections, substantially as set forth.

2. A straw-stacker having a main section and an outer section,

406,788.

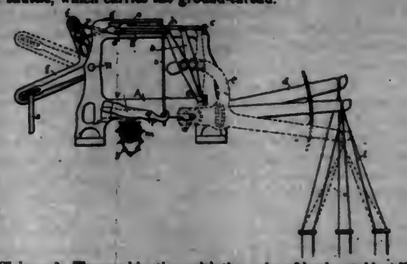


the latter being jointed to the former by means of a notched cylindrical rigid part 8, in which the inner end of the outer section fits, and journal-brackets for said roller on the main section, a raddle, and idlers 25, over which the raddle passes, substantially as set forth.

3. In a straw-stacker having a main section and an outer section united with the latter by a hinged joint, both of said sections having carrying-belts, rigid arms secured to and projecting from the outer sections, a windlass, ropes connecting said arms with the windlass for controlling the outer section, idlers 25 in line with the hinge-joint, idlers 12, and a raddle passing over the sections and over and under idlers 25 and over idlers 12, substantially as set forth.

4. In a straw-stacker, the combination of the main section, an outer section hinged to the main section, arms 15, secured to the outer section, ropes 16, secured to the arms, windlass 19, to which the ropes are secured, raddle 11, and rollers 12, substantially as and for the purpose set forth.

406,789. GRAIN RETARDER AND REGULATOR FOR HARVESTERS. PEARLEY J. SPRAGUE and JAMES M. MCCRAW, Adrian, Mo. Filed Aug. 20, 1888. Serial No. 283,247. (No model.)

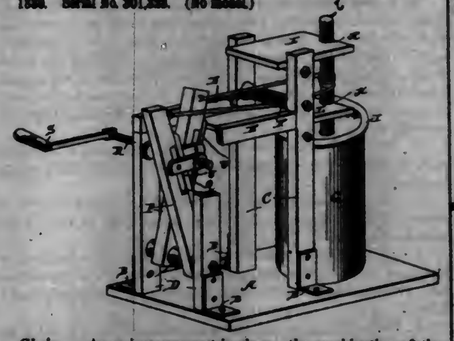


Claim.—1. In combination with a cutter-bar and apron of a harvester, a crank-shaft, a belt operated by said crank-shaft and arranged to move parallel with the divider-bar, and a cord resting upon the apron and made fast to said movable belt, whereby said cord may be moved toward and from the cutter-bar without stopping the machine, substantially as set forth.

2. In combination with the cutter-bar and apron of a harvester, a retarder consisting of a cord and means for adjusting said cord, consisting of a movable belt parallel with the divider-bar, to which

belt the cord is made fast, pulleys journaled in the divider-bar, over which the belt passes, and a drum and crank-shaft for turning the belt.

406,790. SHEDDING MECHANISM FOR LOOMS. GEORGE W. STAFFORD, Providence, R. I., assignor to the Geo. W. Stafford Manufacturing Company, same place. Filed Dec. 18, 1886. Serial No. 204,008. (No model.)

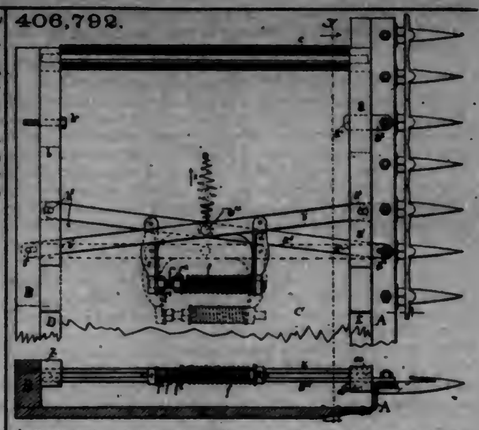


Brief.—By means of the double-hooked latches and the lifter-bars, which are actuated to move over paths of unequal extent, it is possible to raise any one of the harness-frames, so as to shed either for the upper shuttle, which carries the figure-thread, or else for the lower shuttle, which carries the ground-thread.

Claim.—1. The combination, with the series of horizontal heddle-levers *d*, having curved arms extending up with jack-levers pivoted to them, of double-hooked latches pivoted to the upper ends of said jack-levers, two lifter-bars placed one above and the other below the said hooked latches, and means for moving said lifter-bars simultaneously in toward the loom side at one beat of the lathe and outward at the succeeding beat, the outward movement imparted to one of the lifter-bars being greater than that imparted to the other, substantially as described.

2. The combination of the heddle-levers having arms with jack-levers pivoted thereto, with double-hooked latches pivoted to the upper ends of said jack-levers, two lifter-bars placed one above and the other below said hooked latches, links *p p'*, connected to the lifter-bars, and the lever *f*, to one arm of which the said bars are pivoted at different distances from its center of motion, substantially as described.

406,791. CHURN. DAVID STEPHENS, Rushville, Ill. Filed Feb. 27, 1889. Serial No. 301,322. (No model.)



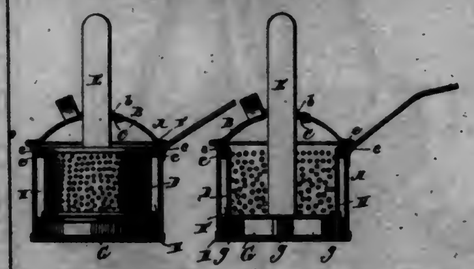
Claim.—As an improvement in churns, the combination of the dasher-shaft, the standards D D, the oscillating levers P, pivoted at their lower ends between the standards D D, and provided near their upper ends with the longitudinal slots Q, the belt V, having its central portion wrapped around the dasher-shaft and its ends secured to the upper ends of the levers P, and the shaft journaled on the standards D D, and having its crank-arms engaging the slots Q of the levers, the lateral portions of the crank-arms being flattened and engaging the sides of the levers, substantially as specified.

406,792. CANVAS-STRETCHER FOR HARVESTING-MACHINES. JOHN F. STEWARD, Chicago, Ill. Filed Nov. 24, 1888. Serial No. 291,888. (No model.)

Claim.—1. In combination with the platform-frame, the apron-sustaining roll, the two slides supporting said roll, and the crossed levers united by the pivot and connected each at one end to the frame and at the other end to one of the slides, whereby the two slides are compelled to move simultaneously and equally.

2. In a harvester, the combination of a suitable supporting-frame, an apron-carrying roll, two slides sustaining the ends of said roll, two crossed levers pivoted together and connecting at their opposite ends the respective slides with the frame, and a spring, substantially as described, acting to carry the roller outward and thereby stretch the apron.

406,792.

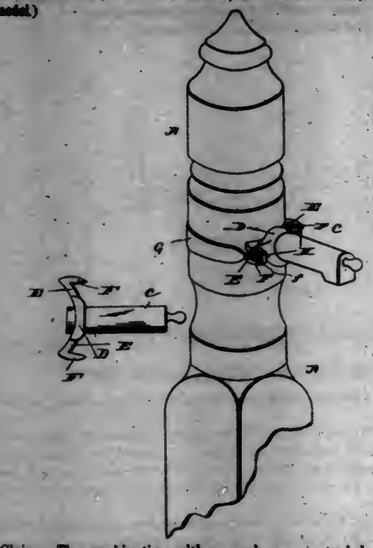


3. In combination with the supporting-frame, the apron-carrying roll, and the roll-supporting slides, the crossed levers connecting at their opposite ends the respective slides with the frame and pivoted together, the rigid arms on said levers, and a spring acting between said arms.

4. The roll, the roll-carrying slides *a b*, the crossed levers connected to the frame and to the respective slides at opposite ends and pivoted together, the arms *d e*, secured rigidly to the respective levers, the bolt *f'*, the spring *f* thereon, and the adjustable nut *f''*, said elements combined substantially as described and shown.

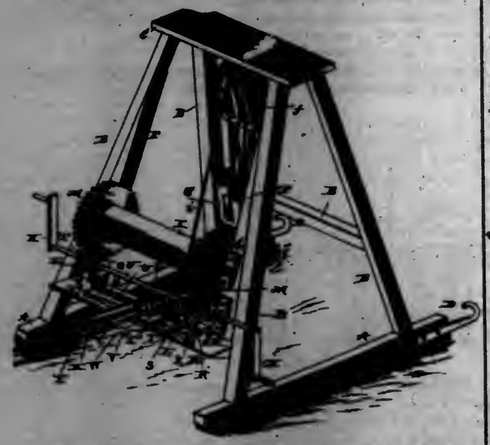
5. In combination with the supporting-frame and the two roll-supporting slides provided with slots, the crossed levers extending through the slots in the slides and connected at their opposite ends to the frame and the slides, substantially as described, whereby the levers are adapted to serve the twofold purpose of adjusting and supporting the slides.

6. In combination with the roll-supporting slide, the finger-bar and the guard-finger bolted thereto, as usual, and the slide-sustaining plate *a'*, secured to the bar by the vertical finger-bolt.



406,793. STEAMER AND BOILER. AMELIA H. STORMS, Farmingdale, N. J. Filed July 3, 1888. Serial No. 278,913. (No model.)

Claim.—1. The combination, with the cylindrical boiler and a suitable cover therefor, of the removable steamer arranged within said boiler and smaller in diameter than the diameter of the depending flange of the cover, whereby an annular space is formed between them, and the partition F within said steamer, said partition having ears *e e*, engaging the upper edge of the steamer and passing thereover into said annular space, which ears simultaneously support the partition vertically and hold the steamer concentric with said cover, as and for the purpose set forth.

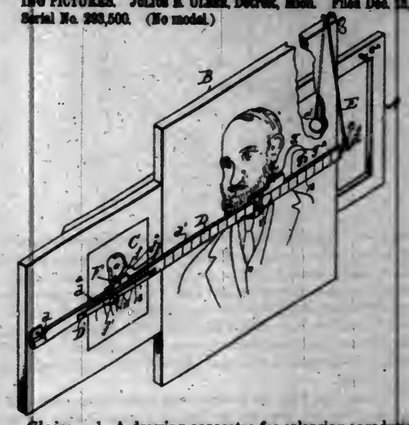


2. The combination, with the cylindrical boiler, the cover B therefor, said cover having a slot in its body, and the plate C, pivoted to the cover and adapted to close said slot, of the cylindrical steamer D, removably inserted within said boiler, the body of the boiler being larger in diameter than that of the steamer, and the vertical sides of the latter extending upwardly nearly to the cover, for the purpose set forth, and the flat handle E, rigidly secured to the interior of the steamer and projecting upwardly through said slot in the cover, and with the removable partition F within said strainer, said partition having ears *e e*, engaging its upper edge, passing thereover, and fitting between the outside of the strainer and the inside of the depending flange *c* of the cover, as and for the purpose set forth.

406,794. MEANS FOR SECURING PUMP-SPOUTS. JAMES G. TAYLOR, Brasher Falls, N. Y. Filed Aug. 13, 1888. Serial No. 282,602. (No model.)

Claim.—The combination, with a wooden pump-stock having an opening to receive a spout, of a metallic spout having at a short distance from its inner end an annular collar adapted to bear against the face of the pump-stock and provided with laterally-extending flanges having upturned slotted outer ends, the flat clip or band having screw-threaded ends, and the fastening-nuts, substantially as and for the purpose set forth.

406,795. STUMP-EXTRACTOR. JACOB H. TERRY, Phillipsburg, Mo. Filed Mar. 8, 1888. Serial No. 302,482. (No model.)



Claim.—1. The combination of the supporting-frame, the driving-shaft mounted thereon, the half-clutches secured rigidly on the driving-shaft, the windlass mounted on the supporting-frame above the driving-shaft and provided with gear-wheels at its ends, the pinions loosely mounted on the driving-shaft meshing with the gear-wheels and adapted to engage the half-clutches, the horizontally-moving slides mounted on the supporting-frame and having vertical forks engaging said pinions, and means for operating said slides, as set forth.

2. The combination of the supporting-frame, the windlass mounted thereon and provided with gear-wheels at its ends, the driving-shaft mounted on the supporting-frame below the windlass, the half-clutches secured rigidly on the driving-shaft, the pinions mounted loosely on the said shaft engaging the gear-wheels on the windlass and adapted to engage the half-clutches, the guides mounted on the supporting-frame below the driving-shaft, the slides moving in said guides and carrying forks engaging the loose pinions, the springs arranged around the slides and adapted to project them outward, and a lever connected to the slides and adapted to throw them inward, as set forth.

3. The combination of the supporting-frame, the windlass mounted thereon and provided with gear-wheels at its ends, the half-clutches secured rigidly on the driving-shaft, the pinions mounted loosely on the said shaft meshing with the gear-wheels and adapted to engage the half-clutches, the slides mounted on the supporting-frame and carrying forks engaging the loose pinions, the plate *b*, having the notch *a*, the lever connected with the slide, the latch pivoted on the lever and adapted to engage the notch *a*, and the springs for forcing the slides apart, as set forth.

406,796. DRAFTING APPARATUS FOR ENLARGING OR REDUCING PICTURES. JULIUS R. ULMER, Detroit, Mich. Filed Dec. 13, 1888. Serial No. 293,500. (No model.)

Claim.—1. A drawing apparatus for enlarging or reducing pictures, consisting of the combination, with a suitable frame for the drawing-sheet and the copy, of a pivoted bar provided with a large scale, a small scale, and movable supports F G, bearing pointers, said bar being adapted to be traversed across the sheet, and the pointer-supports adapted to be adjusted to corresponding points along their respective scales, substantially as described.

2. A drawing apparatus for enlarging or reducing pictures, consisting of the combination, with a supporting-frame for the drawing-sheet and the copy, of a pivoted bar D, a fixed scale d', a reduced scale d^2, and pointers fixed to movable supports adapted to be adjusted along their respective scales, said reduced scale being made interchangeable with other reduced scales to correspond with the dimensions which the reduced picture bears to the larger picture, substantially as described.

3. The combination, with the movable support G, of a pointer made of paper or card-board, substantially as and for the purposes described.

4. The combination, with the movable supports F and G, of pointers made of paper or card-board, substantially as and for the purposes described.

5. The combination, with the bar D, having a permanent inch or other scale d', of an interchangeable scale d^2 and means for temporarily securing said scale d^2 in place on the bar, substantially as described.

6. The combination, with the movable supports F and G, of the pointers supported therefrom and having overhanging hooked points, thereby leaving a working-space between them and the supports, substantially as described.

7. The combination, with the bar D and movable pointer-supports F G, of means at the free end of said bar for adjusting and supporting the same in any position, substantially as described.

406,797. CLOSED SLOTTED CONDUIT FOR ELECTRIC RAILWAYS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Apr. 13, 1889. Serial No. 307,130. (No model.)

Claim.—1. The combination, in a closed slotted conduit, of means for supplying compressed air thereto and for localizing the air-pressure therein, substantially as described.

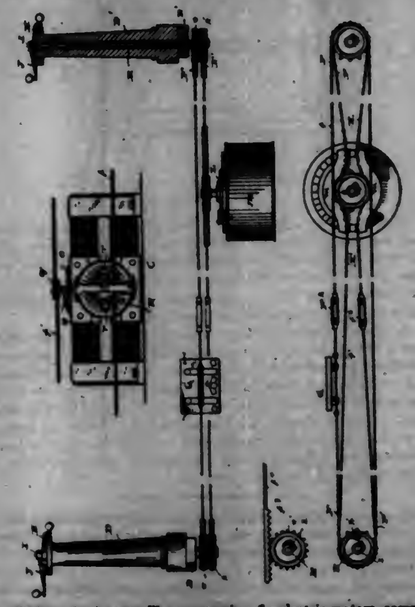
2. The combination, with a conduit for electric conductors having a surface slot closed by flexible packing, of means for supplying compressed air to desired portions of said conduit and for confining said air therein.

3. A closed slotted conduit having a conductor-containing chamber therein, flexible conductors at desired points along said conduit, and means for supplying compressed air to the conductor-containing

406,797.

chamber and for contracting the flexible conductor to close the chamber and confine and localize the air-pressure.

4. A flexibly-closed slotted conduit having a conductor-containing chamber therein, flexible conductors at desired points along said conduit, and means for holding said flexible conductors in close contact to close and shut off any desired portion of the conduit.



5. The combination, in a conduit having a conductor-containing chamber, of sections of stationary conductors electrically united by flexible connections, an elastic casing inclosing the flexible connections and joined to the extremities of the main conductor-containing chamber, and suitable springs applied to contract the casing inclosing the flexible conductors and thereby render the conductor-containing chamber discontinuous.

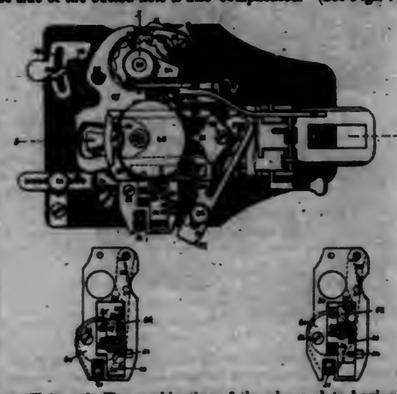
6. The combination, with a flexibly-closed slotted conduit and a conductor containing chamber therein, of means for contracting and closing the conductor-containing chamber and a contact device adapted to forcibly open and pass through the said closed portion or portions of the conduit.

7. The combination of discontinuous portions of a conductor-containing conduit, permanent electrical connection between said discontinuous portions, a movable section of conduit adapted to connect the discontinuous stationary parts, and permanent electrical connections between the stationary and moving sections of the conduit.

8. The combination, with a draw-bridge carrying a section of electric-railway conduit, of stationary termini of the main conduit at each extremity of the normal position of the bridge, permanent electrical connections between the conductors of the stationary portions of the conduit, and a permanent electrical connection between the said stationary portions of the conduit and the section upon the bridge.

406,798. MECHANISM FOR CONTROLLING ELECTRIC-RAILWAY MOTORS. CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed Oct. 20, 1888, Serial No. 288,693. Divided and this application filed Apr. 13, 1889. Serial No. 307,133. (No model.)

Claim.—1. A controlling mechanism for electric motors, comprising a pair of movable hand-levers supported at either end of the vehicle to be propelled and at a distance from the motor or motors, two sets of movable mechanical connections, one attached to and operated by each hand-lever, current-controlling devices mechanically connected to one of the movable connections for regulating the speed and power of the motor, and circuit-reversing mechanism connected to and operated by the other of said hand-levers and connections, substantially as described.



2. The combination of an electrically-propelled vehicle, an electric motor or motors connected to the running-gear thereof, a support or standard upon the forward part of said vehicle, a tubular shaft within said standard, a shaft within the tubular shaft, operating-levers attached, respectively, to said shafts for imparting rotary movement thereto independently, sprocket wheels and chains upon each shaft, and connections extending from said independent set of sprocket-chains to devices for controlling, respectively, the direction of movement and the rate thereof of the motor or motors, substantially as described.

3. The combination of an electrically-propelled vehicle, a post or support upon the forward part thereof, a tubular shaft sustained in said support and provided with an operating-handle at its upper end and with a sprocket-wheel or equivalent at its lower extremity, said shafts, operating-handles, and sprocket-wheels operating independently, means for controlling the direction of rotation of the armature of the motor propelling the vehicle and for varying the speed thereof, and separate sets of connections between the sprocket-wheels and the said speed and direction controlling devices, substantially as described.

4. The combination of an electrically-propelled vehicle, posts D D', located one on each platform thereof, a reversing-switch included in the circuits of the motor, a rheostat also included in the external circuit of the motor, a tubular shaft E in each post and an operating-handle adapted to engage the upper extremities thereof, sprocket-wheels on the lower extremities of each of said tubular shafts, an endless flexible connection extending between said sprocket-wheels and the reversing-switch, separate shafts extending through the tubular shafts and provided with an operating handle or handles at their outer extremities and with sprocket-wheels on their lower extremities, and flexible connections extending from said sprocket-wheels to the circuit-controlling devices for regulating the speed and power of the motor, substantially as described.

406,799. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. WASHINGTON WALLIS, Philadelphia, Pa. Filed Jan. 26, 1888. Serial No. 262,196. (No model.)

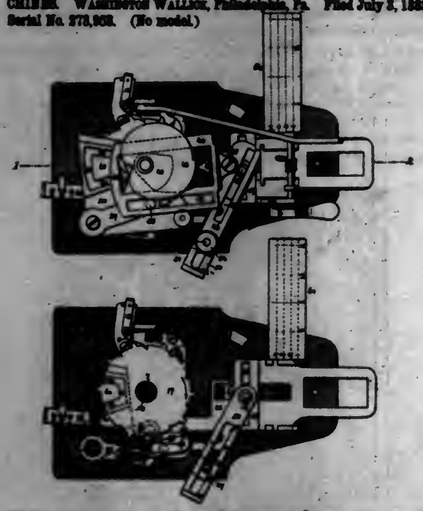
Brief.—The groove 66 in the vibrating plate 27 engages with a pin upon the plate 50 to vibrate the same and the clamp while stitching the ends of the button-hole. The mechanism for shifting from one side of the button-hole is also complicated. (See Figs. 7 and 8.)

Claim.—1. The combination of the clamp-plate having a transverse slot, the traversing cam for said plate, transmitting mechanism comprising a slotted and pivoted traverse-arm and a traverse-regulating bar slotted to receive the pivot-pin and having pins entering the slots of the clamp-plate and traverse-arm, ratchet mechanism for operating the traverse-cam, a stop-plate and regulating-lever, whereby the extent of movement of the ratchet is controlled, and graduated scales, whereby corresponding adjustments of said regulating-lever and traverse-governing bar are facilitated, all substantially as specified.

2. The combination of the clamp-plate, the shifter-frame, and the traverse-cam for operating the latter with connecting devices comprising a slotted and pivoted traverse-arm connected to the frame and a traverse-regulating bar adjustable longitudinally in respect to its fulcrum, said bar being connected to the clamp-plate and having a pin engaging the slot in the pivoted traverse-arm, all substantially as specified.

3. The combination of the clamp-plate, the vibrator-lever having a portion swinging longitudinally or in the same direction as the

traverse motion of the clamp-plate, the shifter-cam, the shifter-frame connected to the clamp-plate, a pin carried by said frame, and a slot formed in the longitudinally-moving portion of the vibrator-lever for the reception of said pin, said slot comprising opposite longitudinal side portions and transverse end portions, whereby the shifter-frame is brought under control of the vibrator-lever while said frame is being shifted laterally, all substantially as specified.



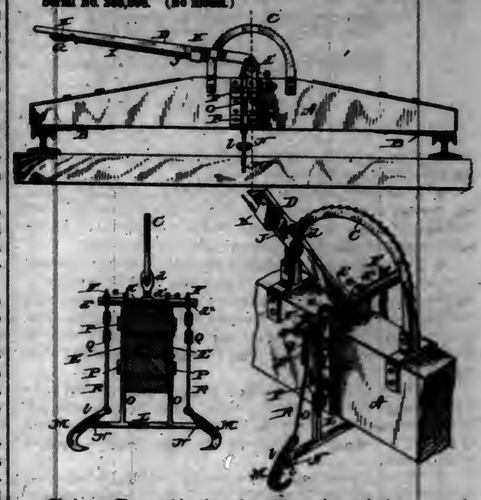
4. The combination of the clamp-plate, the vibrator-lever, the vibrator-plate, the vibrator-slide guided in the plate, the lever and bolt for locking said slide to the vibrator-plate, the trip-plate having a lug for acting on the locking-bolt lever, the shifter-frame engaging with projections on said trip-plate and vibrator-slide, and means for connecting the vibrator-slide to the clamp-plate, all substantially as specified.

5. The combination of the pivoted clamp-plate, the vibrator-plate and means for operating the latter, a transmitter-link 39, connected to the vibrator-plate, a longitudinally-adjustable regulating-bar, and slot-and-pin connections between said regulating-bar and the clamp-plate and transmitter-link, all substantially as specified.

6. The combination of the clamp-plate, the vibrator-lever, the vibrator-plate, the vibrator-slide, the lever hung to the vibrator-plate and having a locking-bolt for the slide, the trip-plate for the lever, the shifter-frame engaging with projections on said trip-plate and vibrator-slide, the eccentric hung to the vibrator-plate, a connection between the vibrator-slide and eccentric adjustable from and toward the fulcrum of the latter, and means for connecting the eccentric to the clamp-plate, all substantially as specified.

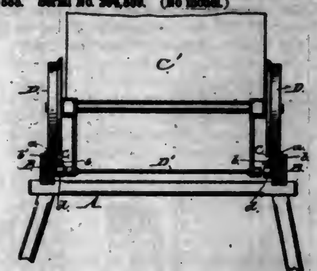
7. The combination of the traversing mechanism for the clamp-plate with a pivoted stud and a clamp-plate having a longitudinal slot for the reception of said pivot-stud, and a transverse slot for engagement with the traversing mechanism, said transverse slot being formed in a portion of the plate located above and crossing the longitudinal pivot-slot, all substantially as specified.

406,800. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. WASHINGTON WALLIN, Philadelphia, Pa. Filed July 3, 1888. Serial No. 278,968. (No model.)



Claim.—1. The combination of the clamp-plate, operating mechanism therefor having as one of its elements a ratchet-wheel, the operating-lever, the pawl-lever, a swinging arm engaging with the operating-lever, and stops for the free end of said arm, one of said stops consisting of a short arm of an adjustable lever hung to the pawl-lever, substantially as specified.

2. The combination of the clamp-plate, the pawl-lever and its pawl, a vibrator-lever the arms of which have projecting lugs, mechanism for operating the pawl-lever and for transmitting the movement of the vibrator-lever to the clamp, and a ratchet-wheel having teeth the faces of which are engaged by the pawl, the backs of some of the teeth acting upon the lugs of the vibrator-lever to impart a vibrating movement thereto, substantially as specified.



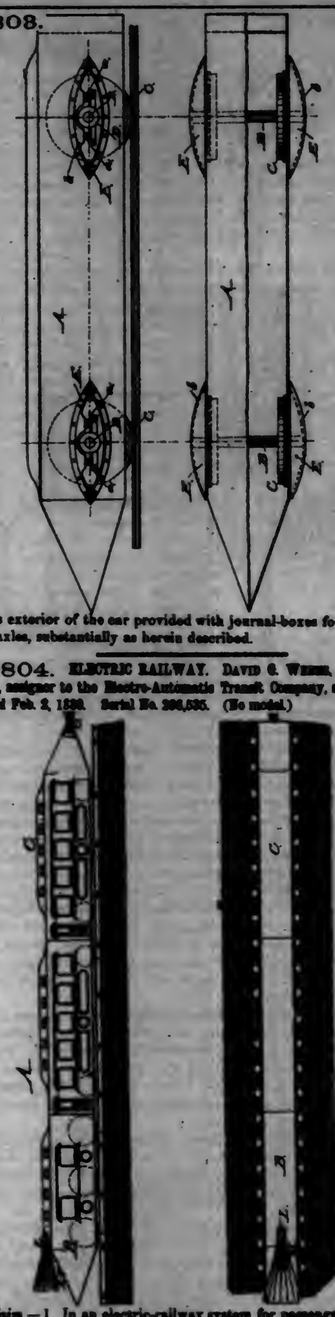
3. The combination of the clamp-plate, the vibrator-lever, the swinging shifter-frame, operating mechanism for said lever and frame, the pivoted shifter-lever having two arms, one of which engages with the shifter-frame, and a transmitter-lever connected to the clamp-plate and pivoted at one end to the vibrator-lever and at the opposite end to the other arm of the shifter-lever, whereby said pivots may both serve as fulcrums for the transmitter-lever, substantially as specified.

406,801. RAILWAY-GAGE AND TIE-GRIP. ALFRED P. WARNER and HENRY R. KRIMMEL, Independence, Oreg. Filed Sept. 20, 1888. Serial No. 285,602. (No model.)

Claim.—The combination of the beam, the arched or curved rack-bar, the lever having longitudinal slot and provided with a cross-head having enlarged ends, said enlarged ends being provided with hooks, means for securing the lever in its adjusted position, the side bars, each provided with an eye or perforation in its upper end, the bracket having the lower cross-piece thereof provided with bifurcated ends, the hooks pivoted in said bifurcated ends, and the connecting links and rods, substantially as set forth.

406,802. RAILWAY. DAVID G. WEEMS, Baltimore, Md., assignor to the Electro-Automatic Transit Company, same place. Filed Dec. 29, 1888. Serial No. 294,899. (No model.)

Claim.—1. The combination, with a car having bearing-wheels, a shaft below the main axles, and supplemental wheels thereon, of an angular rail having an upper tread or bearing-surface for the main wheels, and a laterally-projecting arm or flange, the under surface of which forms a track for the supplemental wheels when brought into contact therewith, substantially as described.



2. The combination, with a carrier or vehicle having the wheels D and *d*, of angular rails between said wheels, and each consisting of a horizontal arm having a bearing-surface or track for the wheels D, and a vertical arm *c*, having a laterally-projecting flange *b*, the lower under surface of which serves as a track or surface for the other wheels *d*, the said wheels *d* being normally slightly below the vertical arm of the rail and being brought into contact with its lower bearing-surface when the main wheels D attempt to leave their track or surface, substantially as herein described.

406,803. CARRIER FOR ELECTRIC-RAILWAY SYSTEMS. DAVID G. WEEMS, Baltimore, Md., assignor to the Electro-Automatic Transit Company, same place. Filed Jan. 30, 1889. Serial No. 298,110. (No model.)

Claim.—1. A car or carrier having closed semi-elliptical housings bolted to its external sides and adapted to contain the journal-boxes for the shafts of the main bearing-wheels.

2. The car or carrier having bearing-wheels within and near the inner walls thereof and the axles for said wheels projecting through the sides of the car or carrier, in combination with closed semi-elliptical

406,808.

housings exterior of the car provided with journal-boxes for the ends of said axles, substantially as herein described.

406,804. ELECTRIC RAILWAY. DAVID G. WEEMS, Baltimore, Md., assignor to the Electro-Automatic Transit Company, same place. Filed Feb. 2, 1889. Serial No. 298,535. (No model.)

Claim.—1. In an electric-railway system for passenger traffic, in which a train of cars is propelled, lighted, and heated by a current from an electric rail, a locomotive or carrier having a pointed end and head-light, and a rear car having a pointed end, the apex of which is provided with a signal-light, both the head-light and signal being in the main circuit and lighted thereby, substantially as herein described.

2. In an electric-railway system for passenger traffic, in which a train of cars is propelled, lighted, and heated by a current from an electric rail, a head-light and rear signal-light in said circuit and lighted thereby, and an independent conductor conveying a second current to telegraphic or other instruments on the train, substantially as herein described.

3. In an electric-railway system operated by a current from an electric rail, a locomotive or carrier having a point or front capable of movement in vertical planes, substantially as described.

4. In an electric-railway system operated by a current from an electric rail, a locomotive or carrier having a pointed end or front hinged or jointed to the body thereof and movable about its joint, whereby said point may be adjusted, substantially as herein described.

5. In an electric-railway system operated by a current from an electric rail, a locomotive or carrier having its pointed front or end hinged to the body portion, and a system of levers connected with said movable point or front, whereby the latter is adjusted, substantially as described.

6. In an electric-railway system operated by a current from an electric rail, a locomotive having a pointed front end, a rear car having a pointed rear end, and a signal-light in the apex of the pointed rear end, substantially as herein described.

7. In an electric-railway system operated by a current from an electric rail, a locomotive having an adjustable front or point provided with a "lookout," substantially as and for the purpose described.

8. In an electric-railway system, a car or carrier having its rear end pointed and having in the apex thereof a signal-light, substantially as described.

9. An electric system for passenger traffic comprising the following instrumentalities, to wit: a train of cars, the locomotive and rear car having a pointed end, as described, said locomotive carrying a motor, a main conductor conveying an electric current to the motor and propelling, heating, and lighting the cars, signals in the main circuit, and telegraphic instruments in a second circuit, substantially as herein described.

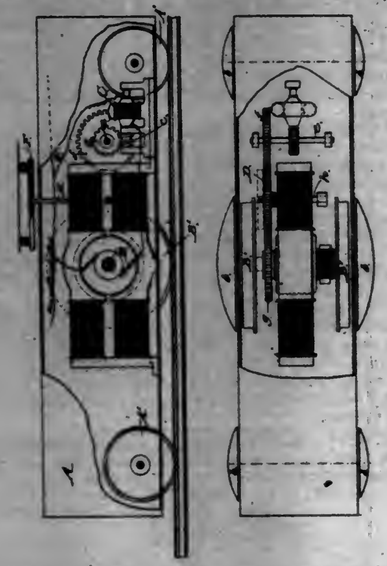
406,805. ELECTRIC RAILWAY. DAVID G. WEEMS, Baltimore, Md., assignor to the Electro-Automatic Transit Company, same place. Filed Mar. 7, 1889. Serial No. 302,317. (No model.)

Claim.—1. In electric railways, a main rail having a laterally-extending flange, in combination with a conductor secured to the bottom of said flange, but insulated therefrom, and bolts passing through the flange and securing the conductor in position, substantially as described.

2. In electric railways, a main rail having a flange provided with a downwardly-extending projection, in combination with a conductor bolted to the under surface of the flange, and insulating material between the conductor and flange and between the securing-bolts and flange, substantially as described.

3. In electric railways, the combination of a rail having a conductor bolted to the under surface of its flange, but insulated therefrom, and a non-conducting cap fitted on the bolts, substantially as described.

4. In electric railways, a conductor bolted to the rail and insulated therefrom, and a cap or covering of non-conducting material fitted over the exposed portions of the bolts and their securing-nuts, substantially as described.



5. In electric railways, the combination of a main rail having an outwardly-extending flange, a copper or other plate or conductor bolted to the under surface of the flange, the bolts and nuts for securing the conductor to the flange, insulating material between the flange and conductor, an insulating-bushing between the bolts and their nuts and the flange, and caps inclosing the upper portions of the bolts and seated on the flange, said caps being formed of non-conducting material, substantially as and for the purpose specified.

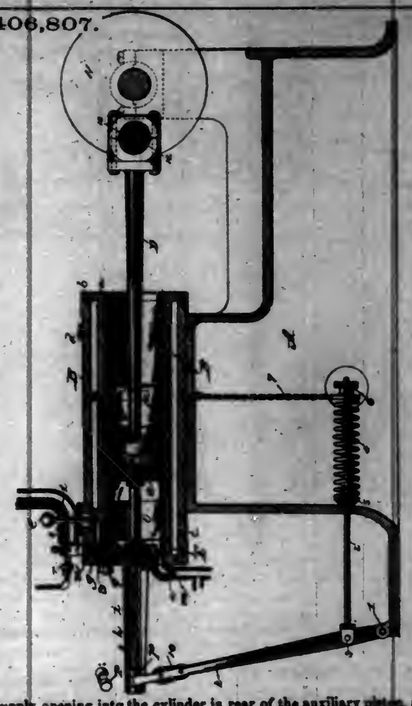
6. In electric railways, a conductor bolted to the under surface of the flange of the rail, and a cap of non-conducting material screwed upon the outer exposed ends of the securing-bolts, said conductor and bolts being insulated from the rail, substantially as herein described.

7. In electric railways, the main rails having outwardly-extending flanges with downturned projections, the copper strip or conductor, the bolts securing said conductor to the under surface of the flange, insulating material between the conductor and flange and between said flange and the bolts, in combination with caps of non-conducting

material having annular flanges and threaded sockets, which engage the threaded ends of the bolts, whereby the caps are secured, substantially as described.

406,806. ELECTRIC RAILWAY. DAVID G. WEBER, Baltimore, Md., assignor to the Electro-Automatic Transit Company, same place. Filed Mar. 15, 1889. Serial No. 303,430. (No model.)

Claim.—1. In electric railways, a locomotive having a motor operated by the main current and a supplemental motor in the main-motor circuit for effecting a preliminary movement of the driving-wheels of the locomotive.



2. In electric railways, a locomotive having a main motor operated by the main current, a supplemental motor in the main circuit, and gearing between the supplemental motor and driving-wheels, whereby a preliminary movement of said wheels is effected.

3. In electric railways, a locomotive having a main motor operated by the main current, a supplemental motor carried by said locomotive and operated by said current, gearing between said supplemental motor and the driving-wheels, and a shifting-lever for disconnecting the gearing and cutting off the current from the supplemental motor, substantially as described.

4. In electric-railways, a locomotive having a main motor operated by the main current, a supplemental motor carried by the locomotive and operated by said current, gearing connecting the supplemental motor with the drive-wheels of the locomotive, and a trip-lever and clutch mechanism for connecting and disconnecting the gearing, substantially as described.

5. In electric-railways, the combination of a locomotive having a main motor for driving it, a supplemental motor on the locomotive for effecting a preliminary movement of its drive-wheels, gearing between the supplemental motor and drive-wheels, a shifting-lever for connecting and disconnecting the gearing, and fixed obstructions for tripping the lever and disconnecting the gearing, whereby the power of the supplemental motor is removed from the drive-wheels, substantially as described.

406,807. GAS-ENGINE. CHARLES WHITE and ARTHUR R. MIDDLETON, Baltimore, Md. Filed Jan. 18, 1889. Serial No. 296,726. (No model.)

Claim.—1. A gas-engine consisting of a cylinder, a reciprocating piston within said cylinder, an independent auxiliary piston separated from the main piston, the space between the two forming the explosion-chamber, a fuel-supply entering the cylinder in rear of the auxiliary piston, and a device for moving the auxiliary piston in one direction independent of the main piston, substantially as described.

2. A gas-engine consisting of a cylinder having main and auxiliary pistons, the said pistons being separated from each other by a projection on one extending beyond the line of the face of said piston the space between the two pistons constituting the explosion-chamber, means for igniting the charge, means for giving movement to the auxiliary piston in one direction independent of the main piston, a fuel-supply opening into the cylinder in rear of the auxiliary piston, and a passage therefrom to the front of said piston to the combustion-chamber, substantially as described.

3. In a gas-engine, a cylinder, a piston therein, an auxiliary piston separated from the main piston by a projection from one of said pistons, the explosion-chamber being formed between the two pistons, a fuel-supply opening into the cylinder in rear of the auxiliary piston, means for igniting the charge, and means for operating the auxiliary piston in one direction, consisting of a spring and an operating connection between said spring and said piston, substantially as described.

4. In a gas-engine, a cylinder, a main piston within the same, an auxiliary piston, means for moving said auxiliary piston in one direction, consisting of a spring and connections therefrom to the said piston, a fuel-supply in rear of said piston, passages for said supply to the explosion-chamber, means for igniting the charge, and an adjustable extension projecting from one of the cylinders and separating the same, the space between the two constituting the explosion-chamber, substantially as described.

5. In a gas-engine, a cylinder, a main piston in the same, an auxiliary piston separated from the main piston, the space between the two forming the explosion-chamber, means for moving said auxiliary piston in one direction, consisting of a spring and connections therewith to the piston, a fuel-supply in rear of said piston, passages for said supply to the explosion-chamber, and means for igniting the charge, substantially as described.

6. In a gas-engine, a cylinder, a piston therein, an auxiliary piston, said pistons being separated to form an explosion-chamber, means for automatically operating the auxiliary piston, a fuel-supply, and igniting means controlled by the said auxiliary piston, substantially as described.

7. In a gas-engine, a cylinder, a main piston within the same, an auxiliary piston, said pistons being separated to form the explosion-chamber by a projection extending from one of said pistons, means for igniting the charge, a fuel-supply, means for advancing the auxiliary piston, and valved openings in said piston, substantially as described.

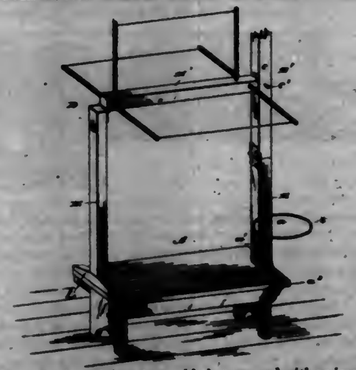
8. In a gas-engine, a cylinder, a piston within the same, an auxiliary piston operated independently in one direction, said pistons being separated to form the explosion-chamber by a projection extending from one of said pistons, valved openings in said auxiliary piston, a fuel-supply in rear of said piston, and a check-valve in the fuel-supply pipe, substantially as described.

9. In a gas-engine, a cylinder, a piston within the same, an auxiliary piston, said pistons being separated by a projection from one of the pistons, means for advancing the auxiliary piston, a fuel-supply, igniting means, and an opening leading therefrom to the explosion-chamber, and a valve for said opening controlled by the auxiliary piston, substantially as described.

10. In the described gas-engine, a main piston, means for igniting the charge, consisting of a burner, a chimney therefor, a tube passing through the chimney and extending into the shell of the cylinder, a passage leading therefrom to the interior of the cylinder, a valve for controlling said opening, and an auxiliary piston for operating said valve, substantially as described.

11. In combination, a cylinder, a main piston, an auxiliary piston, a separating-stem between the two, an igniting-tube, a fuel-supply, a spindle bearing against the rear face of the auxiliary piston, a spring, and a pivoted lever under the tension of said spring and in connection with the spindle for advancing the said auxiliary piston, substantially as described.

12. In combination with the cylinder, the pistons C and E, igniting means, a valve controlling the ignition of the charge, said valve being operated by the rearward movement of the piston E, a lever *k*, and a positive connection between said lever and the piston E, whereby the said piston may be retracted by hand operation of the lever *k* and the engine thereby started by the ignition of the charge, substantially as described.

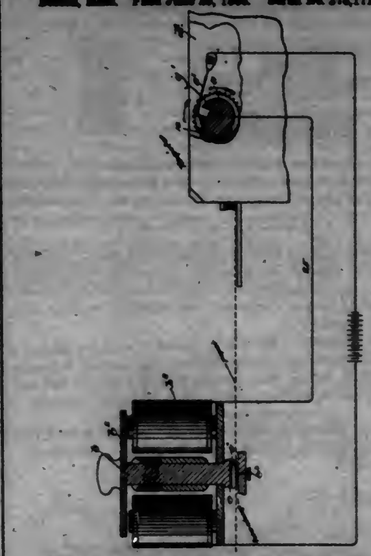


13. In a gas-engine, a cylinder, a piston within the same, an auxiliary piston, an explosion-chamber between the two pistons, a fuel-supply, igniting means with an opening therefrom leading to the cylinder, and a valve for said opening normally closed and opened positively by the backward movement of the auxiliary piston, substantially as described.

14. A gas-engine consisting of a cylinder, a main piston within the same, an auxiliary piston in rear of the main piston, an explosion-chamber between the two, a fuel-opening in rear of the auxiliary piston, an igniting-opening, an exhaust-opening arranged relatively to the main piston, whereby it is uncovered in the outward movement of said piston, and means for advancing the auxiliary piston as soon as the exhaust is uncovered, substantially as described.

15. A gas-engine consisting of a cylinder, a main piston, an auxiliary piston, a fuel-opening, an igniting-opening, an exhaust-port arranged relatively to the outward limit of the main piston, so as to be uncovered in said movement, and means for giving said auxiliary piston a quick forward movement as the port is uncovered, consisting of the spring, the lever *k*, the rod pivoted to the lever *k* at its lower end to form a long arm, and a connection between the lever *k* and the piston, substantially as described.

16. A gas-engine consisting of a cylinder, a main piston within the same, an auxiliary piston in rear of main piston, a fuel-supply pipe, an igniting-tube, means for moving the auxiliary piston, consisting of the spring and lever *k* and connections therefrom to the said piston, an extension from the cylinder-head, and a scale thereon, the lever *k* being adapted to act as an indicator, substantially as described.



406,808. WASH-BENCH. ELIZA J. WHITLOW, Mountain, Mo. Filed Jan. 24, 1889. Serial No. 297,302. (No model.)

Claim.—1. A wash-bench provided at one end with an immovable standard B, a section B', hinged to the top thereof and provided with a mortise c, a hook and staple to retain the section vertically on the standard, and a removable drying-frame consisting of a vertical member E, provided with a foot and a horizontal section fitted with radial arms and terminating at its free end in a tenon to engage the mortise c, substantially as described.

2. In a wash-bench having rigid vertical standard B, a section B', hinged thereto, and provided with a recess c, a drying-frame made up of the sections E and E', the section E' having arms and a tenon adapted to fit within the recess or mortise c, substantially as shown.

406,809. MESSAGE AND TIME RECORDER. JOHN C. WILSON, Boston, Mass. Filed June 25, 1888. Serial No. 278,171. (No model.)

Claim.—1. The combination, with a self-starting register, of a time-stamp comprising continuously-moving time-printing devices and a presser, the paper fed by the register and upon which the signal is recorded moving between the said time-printing devices and the presser, an electro-magnet controlling the presser for effecting the printing of the time on the paper, and a circuit-changing device controlled by the register for changing the condition of the circuit of the said electro-magnet, substantially as described.

2. The combination, with a self-starting register and a time-stamp comprising continuously-moving time-printing devices, a presser, and an operating electro-magnet, of a circuit-changer controlled directly by the said register for changing the condition of the circuit of said operating electro-magnet, substantially as described.

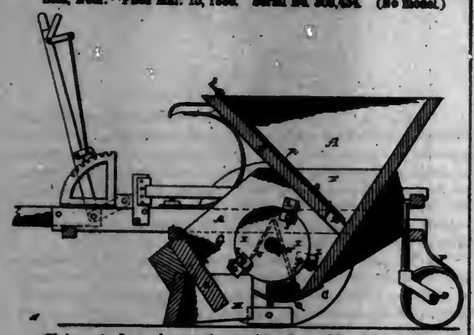
3. The combination, with a self-starting register, of a time-stamp comprising continuously-moving time-printing devices and an electro-magnetically-movable presser, the circuit of the presser-magnet being controlled by the motor mechanism of the register, the paper upon which the signal is recorded moving between the said time-printing devices and the said presser, substantially as described.

4. The combination, with a register comprising as a co-operative part of it a starting-lever and stop-wheel and motor mechanism and a circuit-changing device the circuit-wheel of which is moved by the said motor mechanism, and is formed to co-operate with its pen and change the condition of the circuit just before the stop-wheel is engaged by the starting-lever to stop the register, of a time-stamp and an electro-magnet for said time-stamp included in the circuit controlled by said circuit-changing device, substantially as described.

5. The combination, with a register comprising as a co-operative part of it the starting-lever *n*, stop-wheel *j*³, and motor mechanism, the circuit-wheel *o*, rotated by the said motor mechanism, making one complete rotation while the stop-wheel completes one-third of a rotation, the projection 12, formed on said circuit-wheel, and the pen *s'*, of the local circuit 25, the electro-magnet included in said circuit, and the time-stamp controlled by said electro-magnet, substantially as described.

406,810. SEAL-LOCK. ORANGE S. WHEAM, Chicago, Ill. Filed Feb. 28, 1888. Serial No. 265,674. (Model.)

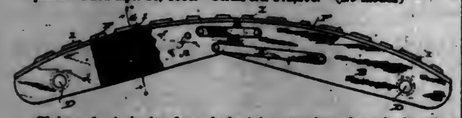
406,810.



Claim.—1. The combination of the recessed case A, having the slot *b* and opening *k*, the bolt D, having a notch *g*, the latch H, adapted to engage said notch and having a pin *e* to engage the slot *b*, and the bar I, having a pin *j* to engage the opening *k*, substantially as described.

2. The combination of the recessed and slotted case A, a notched bolt D, a latch H, adapted to engage said bolt and provided with a pin to engage a slot in the case, a locking-bar operated by the bolt, the plate C, having groove or channel *l* and shoulders *m*, and a seal, substantially as described.

3. The combination of the case A, having slots or openings *b k* and a perforated projection *p*, the plate C, the notched bolt D, having hole *o*, the latch H, having pin *e*, the bar I, having pin *j*, a seal held by the plate C, and an auxiliary seal G, substantially as described.

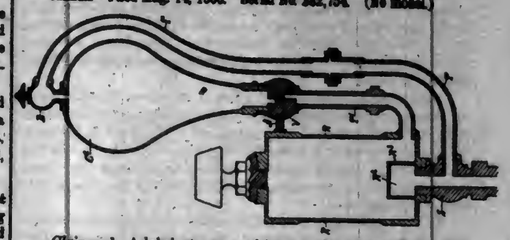


406,811. POTATO OR SEED PLANTER. CHESTER WRIGHT, Fairfield, Nebr. Filed Mar. 15, 1888. Serial No. 303,434. (No model.)

Claim.—1. In a planter, the combination, with a V-shaped frame having an inclined partition forming a hopper at its upper end and a wheel planting-chamber at its front lower end, of furrow-openers placed in its lower front end, a driving-shaft passing through the lower chamber, having driving and supporting-wheels upon its ends, a planting-wheel secured to said shaft within the lower chamber and provided with seed-cups, and stationary brushes within the chamber for brushing away the seed, whereby the planting-wheel is adjacent to the furrow-opener, substantially as shown and described.

2. In a planter, the combination, with a V-shaped frame having an inclined partition forming a hopper at its upper end and a wheel planting-chamber at its front lower end, of the furrow-openers, the driving-shaft passing through the chamber, driving-wheels on its ends, a planting-wheel placed on the shaft within the chamber and having seed-cups, stationary brushes within the chamber below the periphery of the planting-wheel, and division-plates secured to the sides of the chamber extending inward near the face of the planting-wheel, for the purpose specified.

406,812. DEVICE FOR PRINTING SIGNS. EDWARD A. BISHOP, Racine, Wis., assignor of one-half to H. Prochl and W. G. Gittings, same place. Filed Apr. 30, 1888. Serial No. 272,290. (No model.)



Claim.—1. A device for printing signs on fence-boards, &c., that comprises two or more segmental frame-sections hinged one to the other, and suitable letters or characters arranged on the sections, substantially as set forth.

2. A device for printing signs on fence-boards, &c., that comprises two or more segmental frame-sections hinged one to the other and provided with opposing cross-braces, a button pivoted to the cross-brace of one section to be brought over upon the opposing cross-brace of the adjacent section, and suitable letters or characters arranged on said sections, substantially as set forth.

3. A device for printing signs on fence-boards, &c., that comprises two or more segmental frame-sections, the pivotal links J K, uniting each two of the sections, and suitable letters or characters arranged on said sections, substantially as set forth.

4. A device for printing signs on fence-boards, &c., that comprises two or more segmental frame-sections, the pivotal links J K, uniting each two of the sections, the stops *g* for the links K, and suitable letters or characters arranged on said sections, substantially as set forth.

406,813. LUBRICATOR. BENJAMIN A. BURDSALL, London, Ontario, Canada. Filed Aug. 14, 1888. Serial No. 282,754. (No model.)

Claim.—1. A lubricator comprising an oil-reservoir R, a steam-heated chamber R^3 within said reservoir and separated from the lubricant contained in said reservoir by a solid partition R^3 and a hollow stem S, substantially as shown and described, and for the purpose specified.

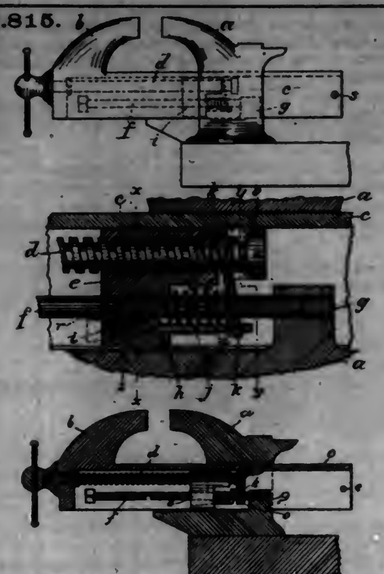
2. A lubricator comprising an oil-reservoir R, hollow stem S, the tube T, ante-chamber B, condensing-chamber C^3, valve V, and tube T, substantially as shown and described, and for the purpose specified.

3. A lubricator comprising an oil-reservoir R, a steam-heated chamber R^3, within said reservoir and separated from the lubricant contained in said reservoir by a solid partition R^3, a hollow stem S, the tube T, ante-chamber B, condensing-chamber C^3, valve V, and tube T, substantially as shown and described, and for the purpose specified.

4. A lubricator comprising an oil-reservoir R, hollow stem S, the tube T, ante-chamber B, condensing-chamber C^3, valve V, and tube T, in combination with the brackets B' B^3, having passages P P' therein, respectively, valve V^3, and glass tube G, substantially as shown and described, and for the purpose specified.

5. A lubricator comprising an oil-reservoir R, a steam-heated chamber R^3 within said reservoir and separated from the lubricant contained in said reservoir by a solid partition R^3, a hollow stem S, the tube T, ante-chamber B, condensing-chamber C^3, valve V, and tube T, in combination with the brackets B' B^3, having passages P and P' therein, respectively, valve V^3, and glass tube G, substantially as shown and described, and for the purpose specified.

406,814. FOLDING BED. SANFORD S. BURR, Winnetka, and CHAS. TREVEL, Chicago, assignors to the A. H. Andrews & Company, Chicago, Ill. Filed Apr. 9, 1888. Serial No. 269,566. (No model.)



Claim.—1. In a folding bed, the combination, with the main casing, of a bed-frame pivoted thereto, said bed-frame being provided at its lower portion with an extension E, and being provided, also, with a front B', hinged at its top in a manner permitting it to swing outwardly, said hinged front being provided at its bottom with a ledge D, hinged thereto, and having a suitable block or blocks K affixed thereto and adapted to engage with the front of the extension E, to retain said hinged front in normally-closed position, substantially as described.

2. In a folding bed, the combination, with the main casing, of a bed-frame pivoted thereto, a front for said frame hinged thereto near its upper end, and a fastener to hold said front and frame normally together, said front, on release of said fastener, being free to swing away from the bed-frame at its lower portion to permit access to the under side of the bed-frame, substantially as described.

406,815. VISE. CLARENCE A. CHANDLER, East Bridgewater, Mass. Filed Oct. 12, 1888. Serial No. 287,946. (No model.)

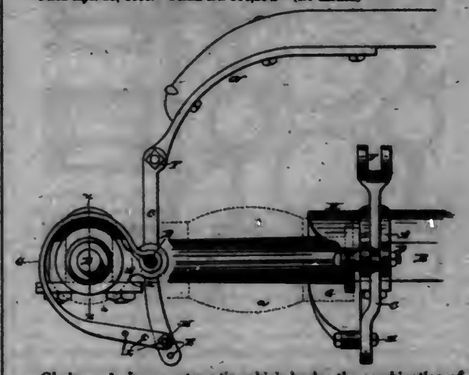
Claim.—1. The combination of the fixed jaw, the sliding jaw having a shank fitted to slide in the fixed jaw, a screw journaled in the shank of the sliding jaw, a nut within said shank engaged with said screw, a fixed rod arranged substantially parallel with the screw, a gib interposed between said rod and a part of the nut and provided with a spring-supporting arm, a spring interposed between the nut and said arm, whereby the gib is normally engaged with the rod and nut, and a stop which moves with the sliding jaw, whereby the gib may be displaced to release the nut from the fixed rod, as set forth.

406,815.

2. The combination of the fixed jaw, the sliding jaw and its shank, the screw journaled in said shank, the loose nut engaged with the screw and provided with a cavity at one side thereof, the rod affixed to the fixed jaw and passing through said cavity, the gib located in said cavity at one side of the rod and provided with an arm *k*, the spring *j*, interposed between the nut and said arm *k*, whereby the gib is normally held in engagement with the fixed rod, the stop *o*, moving with the sliding jaw, and a spring or springs *r*, whereby the gib is separated from the fixed rod when displaced from its normal position, as set forth.

406,816. WATCH-CASE. EDWARD C. CHAFFEE, Philadelphia, Pa. Filed Mar. 2, 1888. Serial No. 301,720. (No model.)

Claim.—1. The combination of a center having a flange or rim projecting inwardly from the bezel and forming an annular groove back of the bezel, with a movement-ring formed with an annular rim extending beyond the dial-plate and within said groove and centering upon the flange.



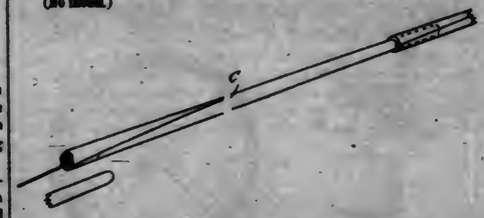
2. The combination of a combined watch center and bezel provided with a curved annular groove about the bezel portion and on the interior of the center, a movement-holding ring secured in said combined center and bezel and provided with a curved annular rim adapted to fit into said groove, and a removable back secured upon said combined center and bezel.

3. The combination of a combined watch center and bezel provided with a curved annular groove about the bezel portion and on the interior of the center, a movement-holding ring provided with a curved annular rim adapted to fit into said groove, a removable back secured upon said combined center and bezel, and means, substantially as described, to removably secure said movement-ring in said combined center and bezel and force said curved rim into said annular groove to form a dust-proof connection.

4. The combination of a combined watch center and bezel provided with a curved annular groove about the bezel portion and on the interior of the center, a movement-holding ring provided with a curved annular rim adapted to fit into said groove, a removable back secured upon said combined center and bezel, and means, substantially as described, to removably secure said movement-ring in said combined center and bezel and force said curved rim into said annular groove to form a dust-proof connection, consisting of a projecting ledge or flange about the surface of said combined bezel or ring and half-heads driven upon said movement-ring.

5. The combination of the combined bezel and center A, having the bezel reflector-rim B, forming the annular internal groove *b*, the movement-ring E, having annular rim or flange H, fitting into said annular groove *b*, means, substantially as described, to removably secure said movement-ring in said combined center and bezel and force the flange or rim H into the annular groove to form a dust-proof connection, and a removable back secured upon the combined bezel and center.

406,817. AUTOMATIC BUGGY-BRAKE. JOHN J. CHESNUT, Henderson, Tenn., assignor of one-half to Chas. H. Williams, same place. Filed Apr. 28, 1889. Serial No. 308,264. (No model.)



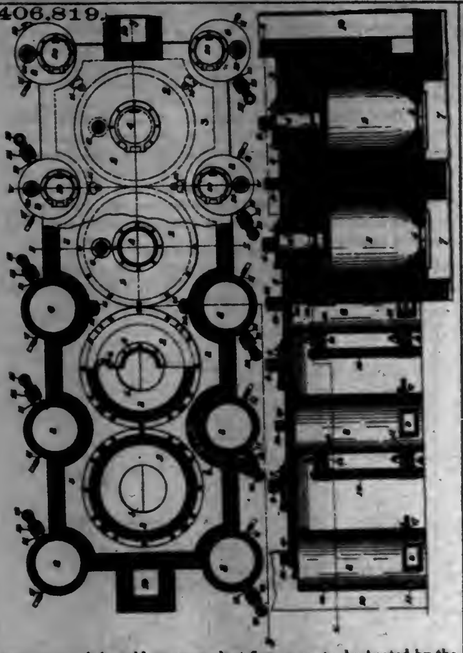
Claim.—1. In an automatic vehicle-brake, the combination of the levers, the thills attached thereto, and the brake-bands passed around the wheel-hubs, having their front upper ends attached to fixed points and their lower ends attached to the levers, substantially as described.

2. The combination of the levers pivotally attached to the front axle, the thills pivotally connected to the upper ends of the levers, and the brake-bands passed around the front-wheel hubs, having their upper ends attached to fixed points and their lower ends attached to the levers, substantially as described.

3. In an automatic vehicle-brake, the brake-bands adapted to bear on the annular surfaces of the inner portions of the wheels, and provided with the flanges I to bear against the inner ends of the hubs, substantially as described.

406,818. UNDERGROUND CONDUIT FOR ELECTRICAL CONDUCTORS. GEORGE W. COES, Detroit, Mich., assignor of one-third to Charles C. Geary, same place. Filed Dec. 6, 1888. Serial No. 292,973. (No model.)

Claim.—1. In a conduit for electrical conductors, in combination with an outer conduit, an inner conduit consisting of a series of like paper tubes fitted one within the other, substantially as described.



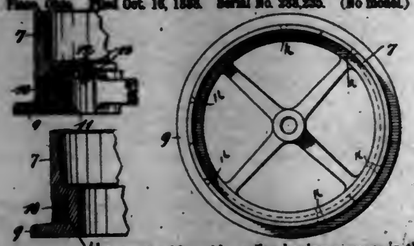
2. A conduit for electrical conductors, consisting of a series of like paper tubes saturated with paraffine and taper-jointed together.

3. A conduit for electrical conductors, consisting of a series of like tapering asbestus-paper tubes, substantially as described.

406,819. APPARATUS FOR THE MANUFACTURE OF GAS. JOHN M. CHEVELOW, Beaver Falls, Pa., assignor of one-half to Reuben T. Roberts, Thurville, Pa., and Hugh McKay, London, Canada. Filed June 8, 1887. Serial No. 240,703. (No model.)

Claim.—1. The combination, with two or more water-gas generators having a common waste-product flue, of a coal-distilling re-

406,819.

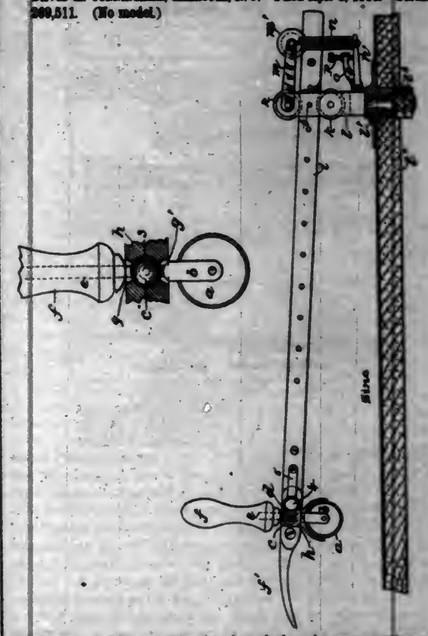


tort arranged in said waste-product flue, so as to be heated by the waste products from the water-gas generators, said coal-retort having a steam-adit for the admission of steam at or near the close of distillation of the coal, substantially as and for the purposes described.

2. The combination, with two or more water-gas generators having a common waste-product flue, of two or more coal-distilling retorts arranged in said waste-product flue, so as to be heated by the waste products from the water-gas generators, said coal-retorts having each a steam-adit for the admission of steam at or near the close of distillation of the coal, substantially as and for the purposes described.

3. In an apparatus for the manufacture of water-gas, the combination, with a gas-producer, a waste-product chamber, a gas-retort located in said chamber, steam-adits in the producer and retort, an air-adit at the top part of said producer, the waste-pipe of said producer being connected with the waste-product chamber, and a damper in said waste-pipe for regulating the supply of waste products to the waste-product chamber, substantially as and for the purposes specified.

406,820. CABLE-GUIDE PULLEY. JOHN CROWTHER, Elmwood Place, Ohio. Filed Oct. 16, 1888. Serial No. 288,235. (No model.)

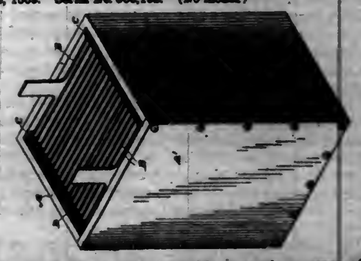


Claim.—1. A flanged cable-guide pulley having a recess in that portion of its rim adjacent the flange, which is ordinary pulleys of the kind is mostly worn, and a supplementary rim filling said recess and flush with the main portion of the rim at its junction therewith, substantially as shown and described.

2. A horizontal cable-guide pulley having an upright rim, a flange extending outwardly from the lower edge thereof, and a recess provided in the main rim near the junction of rim and flange, and a removable supplementary rim secured in said recess flush with the balance of the rim and completing the same, as shown and specified.

3. A flanged cable-guide pulley having a recess in that portion of its rim adjacent to the flange, which is ordinary pulleys of the kind is mostly worn, and a supplementary rim filling said recess and flush with the main portion of the rim at its junction therewith, said pulley being divided horizontally into two separable sections and having means for securing said sections together, substantially as shown and described.

406,821. MACHINE FOR CUTTING CLOTH AND PATTERNS. DAVID H. CUNNINGHAM, Elizabeth, N. J. Filed Apr. 3, 1888. Serial No. 269,511. (No model.)

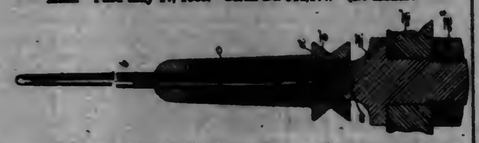


Claim.—1. The combination, in a cloth and pattern cutter, of the yoke, the rotary cutter having its axis in the sides of the yoke, the ball forming a part of the stem of said yoke, the socket containing said ball, the handle projecting from the latter, and the sliding bar and a suitable support therefor, substantially as shown and described.

2. In a cloth-cutting machine, the combination, with a bar and a pivotal support for the same, of a rotary cutter supported by a yoke, a ball on the stem thereof, and a socket in the said bar in which the ball is mounted, the ball having a depression and the bar carrying a spring-controlled pin engaging said depression, substantially as described.

3. In a cloth-cutting machine, the combination of the sliding bar with the vertical rotary slotted standard journaled in the table, the friction-rollers having axes in said standard, the vibrating arms pivoted to the upper part of the standard, the guide-rollers mounted on said arms, the retracting-springs each having one of their ends connected with one of said arms, the vibrating arm fulcrumed near the bottom of the said standard and with which the lower ends of the retracting-springs are connected, the bracket, and the adjusting-screw at the end thereof, as set forth.

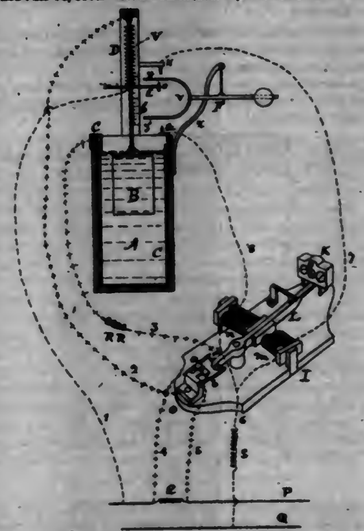
406,822. SECONDARY BATTERY. HARRY R. DEY, New York, N. Y., assignor to Phoebus H. Alexander, Hyde Park, Mass. Filed Feb. 16, 1889. Serial No. 300,162. (No model.)



Claim.—1. The combination, with an open box or case, of a series of smaller vertically-arranged battery-plates of a width less than the interior of the case, insulating-strips between the sides and lower ends of said plates, thereby forming cells between the plates, and an insulating and water-proof cement filling between the sides of the case and the edges of the plates.

2. The combination of a box or case, a series of similar battery-plates of width less than the interior of the case, insulating-strips between the sides and lower ends of said plates, thereby forming cells between the plates, and an insulating and water-proof cement filling between the sides of the case and the edges of the plates.

3. The combination of a series of battery-plates arranged with insulating-divisions between them, said divisions being made moisture-tight, whereby the spaces between the plates form cells for the electrolyte, and insulating-plates interspersed, whereby the battery is divided into two or more separate series.



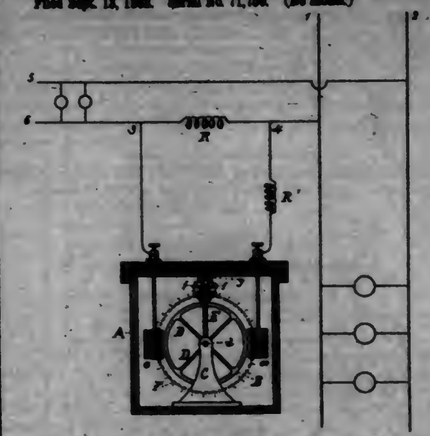
406,823. SUPPORT FOR SPINNING-SPINDLES. WILLIAM P. DRAPER, Hopedale, assignor to the Sawyer Spindle Company, Boston, Mass. Filed May 17, 1888. Serial No. 311,177. (No model.)

Claim.—1. The combination, with a spindle, supporting-case or holder, and step-support, of a bolster and step bearing swiveled at its lower end to rock or tip on the said step-support, substantially as described.

2. The combination, with a supporting-case or holder, a step-support, and a sleeve-whirl spindle, of a loose bolster and a step portion, the latter being free to rock or tip at or near the line of the band-pull, substantially as described.

406,824. ELECTRIC METER. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Jan. 31, 1881. Serial No. 26,093. (No model.)

Claim.—1. The webermeter, consisting of a coil, a spring-suspended electrode, and an index and scale, substantially as set forth.



2. The combination, in a webermeter, of a coil, a spring-suspended electrode therein, and means controlled thereby for reversing the circuit through the coil to cause each electrode to become alternately anode and cathode, substantially as set forth.

3. The combination, in a webermeter, of a coil, a spring-suspended electrode therein, and means controlled thereby for registering the rise and fall of each electrode in the coil, substantially as set forth.

4. The combination, with a suspended plate in a plating-coil, of means for registering the accurateness of maximum and minimum deposition thereon, and means for indicating the fractional depositions between the maximum and minimum, substantially as set forth.

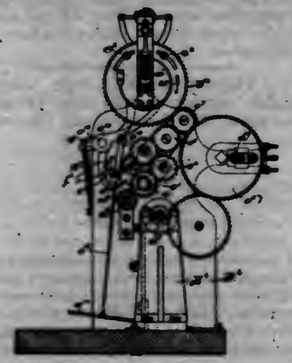
5. The combination of the spring-suspended plate, an arm projecting therefrom, a counterbalanced yoke or Y, and two contacts, the arm of the plate controlling the movement of the yoke, substantially as set forth.

406,825. ELECTRIC METER. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Sept. 13, 1888. Serial No. 71,780. (No model.)

Claim.—1. The combination, with the electrodes of an electrolytic cell, of a rotating body forming part of the circuit between them and caused to revolve by the differences in weight between its two sides, due to the deposition and removal of metal, substantially as set forth.

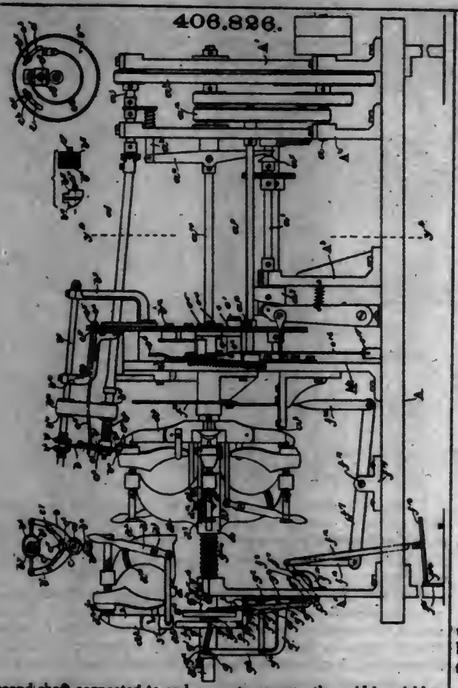
2. In an electrolytic-cell meter, the combination of an electrolytic cell, the electrodes thereof, the cylinder placed in the cell, forming part of the circuit through the cell, and caused to revolve by variations in weight, as described, with means for registering the number of revolutions of said cylinder, substantially as set forth.

3. In an electrolytic-cell meter, the combination, with the electrodes of the cell and the revolving cylinder, of the paddle-blades carried by said cylinder and immersed in the liquid of the cell, substantially as set forth.



4. In an electrolytic-cell meter, the rotating cylinder having an exterior surface of amalgamated zinc, in combination with the anode and cathode plates, also of amalgamated zinc, said cylinder being located in circuit between the said electrodes, substantially as set forth.

406,826. MACHINE FOR TREATING BOOTS OR SHOES. WARREN G. EVANS, Exeter, N. H., assignor to the Automatic Heel Trimming and Burnishing Machine Company, same place. Filed Oct. 29, 1888. Serial No. 289,618. (No model.)



Claim.—1. In a machine for treating the heels of boots or shoes, a tool-shaft and a burnishing-tool consisting of two blocks or pieces, combined with levers secured to said blocks and with means to move said levers to produce a reciprocation of the said blocks, substantially as described.

2. In a machine for treating the heels of boots or shoes, a tool-shaft and a burnishing-tool consisting of two blocks or pieces, combined with eccentrics connected to the said blocks to reciprocate the same one with relation to the other, substantially as described.

3. In a machine for treating the heels of boots or shoes, a rotating shaft, a burnishing-tool consisting of two wedge-shaped blocks or pieces vertically movable one with relation to the other, levers secured to said blocks, and a second shaft, combined with eccentrics on said

406,826.

second shaft connected to and so as to operate the said burnishing-tool, substantially as described.

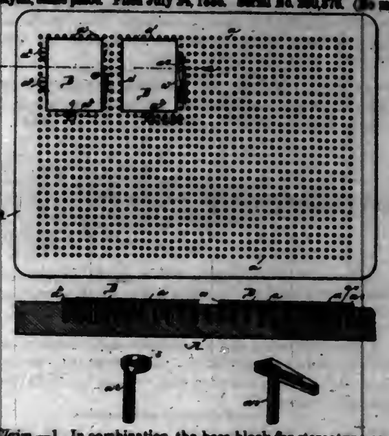
4. In a machine for treating the heels of boots or shoes, a rotating tool-shaft and gears to produce travel of the said shaft about the heel of a boot or shoe, and a reversing mechanism consisting of gears to produce travel of the tool-shaft in opposite directions, combined with the adjustable stop carried by the said gears to operate the reversing mechanism and reverse the travel of the tool-shaft, substantially as and for the purpose specified.

5. In a machine for treating the heels of boots or shoes, a jack consisting of arms, as d^2 d^3, the arm d^2 having its heel-seat portion hinged or pivoted, combined with a lever pivoted on the arm d^2 and operatively connected to said hinged portion of the arm d^2, and with a pawl on the said lever and ratchet on the arm d^2 to lock said hinged portion in adjusted position, substantially as described.

6. In a machine for treating the heels of boots or shoes, a shaft and a plurality of jacks mounted thereon, a disk, as f, provided with holes or sockets, a pin to engage said sockets, a disk g^{12}, having teeth, a rack-bar to engage the teeth on the said disk, and means, substantially as described, to produce longitudinal movement of the shaft, combined with a treadle and with intermediate levers connected to the said treadle, whereby the shaft is rotated and moved longitudinally at one operation, substantially as described.

7. In a machine for treating the heels of boots or shoes, a shaft and a plurality of jacks mounted thereon, a disk, as f, provided with holes or sockets, a pin to engage said sockets, a disk g^{12}, having teeth, a rack-bar to engage the teeth on the said disk, and a slotted lever g^5, combined with a treadle and with intermediate levers, to operate substantially as described.

406,827. FASTENER FOR STAIR-RODS. ALBERT D. FIELD, Waterbury, Conn., assignor to the Globe Curtain Pole Company, same place. Filed Aug. 31, 1888. Serial No. 284,223. (No model.)

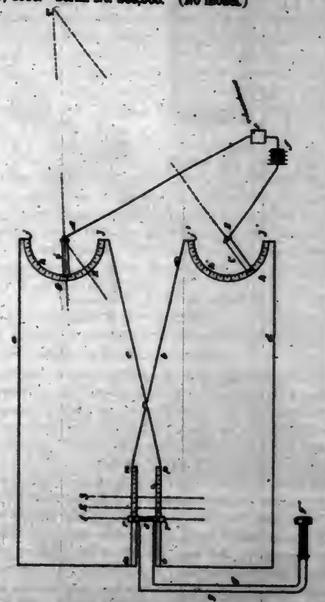


Claim.—1. In a stair-rod fastener, the combination, with a shell provided with a single hole and a slotted washer, of a screw the head of which is adapted to pass through the hole in the shell and be engaged by the washer, substantially as set forth.

2. In a stair-rod fastener, the combination, with a shell having a screw-hole therein and a rib, of a clamping-screw and a slotted washer adapted to rest under the head of the screw and engage the rib, substantially as set forth.

3. As a new article of manufacture, a shell having a screw-hole therein for the passage of the head of a screw and a slotted washer, the latter adapted to rest on the shell and engage the under side of the head of the screw, substantially as set forth.

406,828. BLOCK FOR STEREOTYPE OR ELECTROTYPE PLATES. HERMAN FISCHER, Jr., Chicago, Ill., assignor of one-half to Daniel W. Ryan, same place. Filed July 24, 1888. Serial No. 280,876. (No model.)



Claim.—1. In combination, the base-block for stereotype or electrotype plates, having holes in its surface, stop-pins adapted to said holes, and wedges for forcing the plates against the stop-pins, substantially as described.

2. In combination, the base-block for stereotype-plates, having holes, stop-pins adapted thereto, and wedge-pins a^2, having eccentric heads, substantially as described.

3. In combination, the base-block having the holes with smooth sides, the smooth stop-pins adapted thereto, and the wedging means, substantially as described.

406,829. RANGE-FINDER. BRADLEY A. FISKE, U. S. Navy. Filed Oct. 17, 1888. Serial No. 288,505. (No model.)

Claim.—1. In a range or position finder, in combination with a source of electricity and an indicating device such as described, two similar bodies of conducting material similarly disposed with reference to a predetermined base-line, alidade-arms establishing and maintaining electrical contact with said bodies, and circuit-connections, as set forth, and including a Wheatstone bridge having adjacent members d and c connected to said arms and adjacent members a and b connected to corresponding extremities of said bodies.

2. In a range or position finder, in combination with a source of electricity and an indicating device, such as described, two similar bodies of conducting material similarly disposed with reference to a predetermined base-line, alidade-arms establishing and maintaining electrical contact with said bodies, and circuit-connections, as set forth, and including a Wheatstone bridge having adjacent members, as d and c and a and b, connected to corresponding ends of said bodies.

3. The combination of the four members a b c d of a Wheatstone bridge, two arcs h k', respectively interposed between members a c and b d, two pivoted radial arms i i', respectively having their free ends moving over and maintaining electrical contact with said arcs, a source of electricity having one pole connected to one of said arms and the other pole connected to the other of said arms, two bars of conducting material respectively interposed between members a b and c d, contact-pieces adjustable upon each of said bars, a loop-conductor connected at its ends, respectively, to said contact-pieces, and an indicating device, such as described, in said loop.

406,830. METHOD OF FINDING RANGE AND POSITION OF DISTANT OBJECTS. BRADLEY A. FISKE, U. S. Navy. Original application filed Oct. 17, 1888, Serial No. 288,505. Divided and this application filed Feb. 27, 1889. Serial No. 301,311. (No model.)

Claim.—1. The improvement in the art of finding the range of a distant object, which consists in first determining a fractional portion of a conducting-body bearing in length a ratio to the angle included between two lines of sight directed upon a distant object, and, second, measuring the electrical resistance of said length, substantially as described.

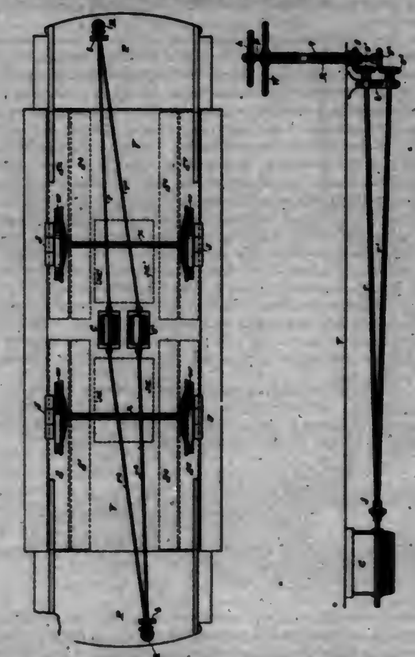
2. The method of determining the angle included between two lines of sight directed upon a distant object, which consists, first, in directing two alidade-arms located at opposite ends of a base-line longitudinally in line with said object, the said arms establishing and maintaining contact with similar bodies of conducting material similarly disposed with reference to said base-line; second, measuring the difference between the electrical resistances of the lengths of said conducting-bodies included between corresponding extremities of the aforesaid bodies and the adjusted positions of the contact-points governed by said arms, substantially as described.

3. The method of determining the angle included between two lines of sight directed upon a distant object, which consists in, first, directing two pivoted alidade-arms located at opposite ends of a base-line longitudinally in line with said object, the said arms being pivoted at one extremity and having their other extremities moving over arcs of conducting material; second, placing one arm parallel to the other arm, and thereby establishing an electrical balance; third, measuring the length of the arc included between the initial and final positions of said last-mentioned arm, substantially as described.

406,831. FIRE-ESCAPE. OLIVER P. FISHER, Hornellsville, N. Y., assignor of one-half to Luther T. Mason, same place. Filed Mar. 16, 1889. Serial No. 303,513. (No model.)

Claim.—1. In a fire-escape, the combination, with the central suspending-pulley and the lateral carve-pulleys, of the central steady-pulley and the lateral steady-pulleys, respectively located below the central and lateral suspending-pulleys, the three wire ropes engaging said pulleys, as shown, the suspended car connected to said wire ropes, and the branched steady-rope connected to said car, substantially as specified.

2. The fire-escape consisting of the central arch or brace and its suspending-pulley, the lateral suspending-pulleys and the central and lateral steady-pulleys vertically below said suspending-pulleys, the cross-balled car, its branched steady-rope and central bearing-post, and the central and lateral wire ropes attached to said car at the intersection of its balls, passing over the suspending-pulleys downward, engaging the steady-pulleys, and having the free operating ends k extending from said steady-pulleys, substantially as shown, and for the purpose set forth.



406,832. BOTTLE-STOPPER. GEORGE P. GOULDEN, Rochester, N. Y., assignor of one-half to Yeoman & Erbe, same place. Filed Jan. 12, 1889. Serial No. 296,128. (Model.)

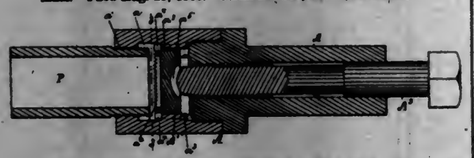
Claim.—1. The herein-described cork-holder, made of elastic metal and having the top plate b^4, with depending arms b', bent at their lower ends to form the fingers c, to engage the shoulder 2 of the bottle-neck, the arms and fingers being corrugated longitudinally, substantially as described.

2. The herein-described cork-holder, made of elastic metal and consisting of a top plate b^4, provided with the projection 5 to enter the cork, and having the depending arms b' bent at their lower ends to form fingers c, to engage the shoulder 2 of the bottle-neck, the arms and fingers being corrugated longitudinally, substantially as described.

406,833. MEANS FOR PROPELLING VEHICLES BY SECONDARY BATTERIES. WILLIAM W. GIBBINS, Haverford College, Pa. Filed Mar. 30, 1889. Serial No. 305,966. (No model.)

Claim.—1. The combination of a vehicle having four or more wheels mechanically united in pairs, two or more electric motors, one for each pair of wheels, mechanically connected thereto, a number of cells of secondary battery divided into eight substantially equal series, two series being located in parallel planes in the plane of and adjacent to each wheel, a permanent electrical connection between the more distant ends of each such parallel series, a switch or circuit-changer located at a central point, having a series of fixed contacts, one for each free terminal of each series of cells, two or more series of movable contacts registering with said fixed terminals to produce two or more

variations in the connection of such cells with respect to each other, and a second switch or circuit-changer located in proximity to the first switch, consisting of a series of fixed terminals having an electrical connection with the terminals of both motor-armatures, with the terminals of both field-magnets, and with the terminals of the battery, respectively, and a series of movable contacts for varying the connection of said fixed terminals with respect to each other, whereby said motors may be connected in series or in parallel with respect to the battery, the cells of which may be similarly varied in connection with respect to each other and to said motors, substantially as described.



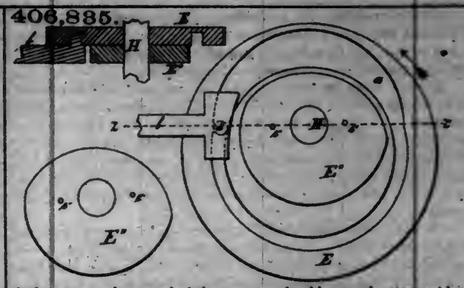
2. The combination of a wheeled vehicle, an electric motor carried thereby and connected with said wheels to produce rotation thereof, a series of cells of secondary battery carried by said vehicle and connected in circuit with said motors, two switches or circuit-changers located at or near the center of the car, each consisting of a series of fixed terminals and a series of movable contact-points, a shaft for each switch extending from said switch to the platform of the car, containing a universal joint, and a compound shaft at said platform for operating both shafts, substantially as described, whereby the connections of the cells may be varied with respect to each other and the connection of said motors may be varied with respect to the battery and to each other.

3. The combination of a wheeled vehicle, one or more electric motors for propelling said vehicle, a series of cells of battery in circuit with the motor and carried by said vehicle, and two or more switches for varying the connection of the battery with respect to the motors, and vice versa, two rods connecting with the switches, one rod for each switch, and a compound shaft, substantially as described, for operating each rod independently.

4. The combination of a wheeled vehicle, one or more electric motors for propelling said vehicle, a series of cells of battery in circuit with the motor and carried by said vehicle, two or more switches located at or near the center of the car for varying the connection of the battery with respect to the motors, two rod extending from each platform to one end of each switch, and a compound shaft at each platform, substantially as described, for controlling each switch independently.

5. The combination of a wheeled vehicle, two or more electric motors mechanically connected to two or more wheels, respectively, a number of cells of secondary battery divided into eight substantially equal series, two series being located in parallel planes in the plane of and adjacent to each wheel, a permanent electrical connection between the more distant ends of each such parallel series, a switch or circuit-changer located at a central point having a series of fixed contacts, one for each free terminal of each series of cells, two or more series of movable contacts registering with said fixed terminals to produce two or more variations in the connection of such cells with respect to each other, and a second switch or circuit-changer located in proximity to the first switch, consisting of a series of fixed terminals having an electrical connection with the terminals of both motor-armatures, with the terminals of both field-magnets, and with the terminals of the battery, respectively, and a series of movable contacts for varying the connection of said fixed terminals with respect to each other, whereby said motors may be connected in series or in parallel with respect to the battery, the cells of which may be similarly varied in connection with respect to each other and to said motors, substantially as described.

406,834. NIPPLE-HOLDER. JAMES F. GUERRIE, Jr., Somerville, assignor to Thomas C. Ashley, Boston, and George H. Graves, Malden, Mass. Filed Aug. 23, 1888. Serial No. 283,587. (No model.)



Claim.—Holder A, having a chamber *a*, provided with interior threads *a'*, in combination with a non-rotary auxiliary holder A', which is mounted in chamber *a*, is movable therein toward and away from the mouth thereof, and is provided with teeth a^2, which project from the holder A' toward the mouth of the chamber *a*, and means, substantially such as described—for example, a set-screw A^2—to force the toothed holder A' into engagement with the article to be operated on, substantially as and for the purpose set forth.

406,835. VALVE-GEAR. MARSH R. HALL, U. S. Navy, assignor of one-half to Mary C. Hall, Lowell, Mass. Filed Mar. 7, 1888. Serial No. 266,695. (No model.)

Claim.—The combination of a single valve and valve-rod, a crank-shaft, a grooved eccentric (whose groove is widest on the steam side) rigidly secured thereto and directly actuating said valve and valve-rod, whereby the admission, release, and compression are normally and invariably controlled, and a cut-off cam suspended loosely upon said crank-shaft and adapted to a rotary movement upon said shaft and connected with and operated by an automatic centrifugal governor, whereby steam is cut off at varying points of the stroke by the said valve without change in its other movements, substantially as described.

406,835.

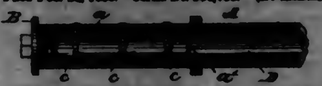
406,836. SEMAPHORE-SIGNAL. JOSEPH W. HANCOCK, Knighton, County of Leicester, England. Filed Feb. 13, 1888. Serial No. 263,734. (No model.) Patented in England Feb. 1, 1884, No. 2,556.

Claim.—1. In a semaphore-signal, the combination, with the lantern, of a signal-arm of a hollow wedge shape, having open end and one face or both the front and back faces covered with glass, substantially as described.

2. The combination, with the cylindrical lantern provided in its circumference with the openings *a'* and *b'*, of the pivoted signal-arm in the form of a hollow wedge, and provided with the plates *c* and *d*, substantially as and for the purpose specified.

406,837. VENTILATED PAD. MICHAEL HARRIS and FREDERIC ROSPERT, Litchfield, Minn.; said Rospert assignor to said Harris. Filed Nov. 9, 1888. Serial No. 290,572. (No model.)

Claim.—The combination, with the saddle 1, having the open center 3, of the cap 5, secured to said saddle and raised above said open center, substantially as described.

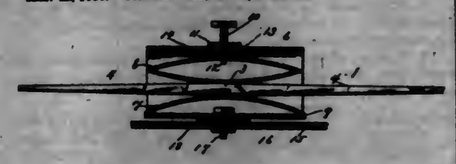


406,838. SHAFT-COUPLING. JOHN H. HEMBLETHWAITE, Rock Falls, Ill., assignor of one-half to Joseph Wright, same place. Filed Jan. 7, 1888. Serial No. 260,102. (No model.)

Claim.—1. The within-described coupling device, consisting of a clamp made of two similar pieces, each centrally and longitudinally grooved, and secured together by bolt and nut devices near the upper edges and having lateral openings at the lower edge of the longitudinal groove, and locking means inserted therein, substantially as and for the purposes set forth.

2. The twin clamping-pieces C, each centrally and longitudinally grooved at D and having transverse openings E in the lower edge of the said groove for the admission of keys, combined with and compressed together by the bolts and nuts near the upper edges of the clamps, substantially as and for the purposes described.

406,839. AXLE-LUBRICATOR. JOSEPH L. HOUSE, Minneapolis, Minn. Filed Feb. 26, 1889. Serial No. 300,791. (No model.)



Claim.—1. In the axles of wheeled vehicles, the combination of a drilled and plugged oil-reservoir in the end of said axle, one or more transverse countersunk holes communicating between said reservoir and the bearing-surface of said axle, and screw-threads in said transverse holes, whereby the wicks for conveying the oil through said holes may be adjusted and securely held in any desired position, substantially as and for the purpose set forth.

2. In combination, the axle of a wheeled vehicle, the drilled and plugged hole D in the end of said axle, the smaller hole *d*, extending beyond the end of D, the oil-hole *d'*, drilled in the body of the axle back of the bearing and communicating with *d*, the countersunk holes *d'*, the wicks *c*, passing through said holes *d'*, and screw-threads in said holes *d'*, substantially as and for the purpose set forth.

3. In wheeled vehicles, the combination of a tubular axle A, having tapped and countersunk holes *d'*, an internal can or oil-reservoir *d''*, having holes to correspond to holes *d'*, and wicks screwed into said holes *d'* for the double purpose of holding said oil-can in place and conveying the oil from said can to the interior of the hub of the wheel by the capillary action of said wicks, all substantially as and for the purpose specified.

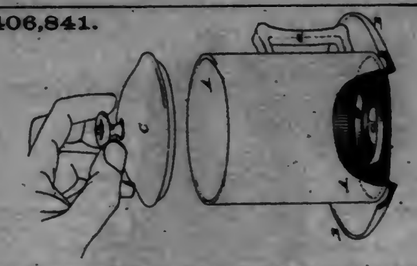
4. In wheeled vehicles, the combination of a tubular axle A, having countersunk and tapped holes *d'* in the bearing of said axle and an oil-hole *d'* back of said bearing, an internal oil-can *d''*, having holes to correspond to holes *d'* and *d''* in said axle, and wicks screwed into said holes *d'* and extending down into said oil-can, substantially as and for the purpose specified.

406,840. DOOR-CHECK. GEORGE R. G. JOHNS, Louisville, Ky. Filed Mar. 12, 1889. Serial No. 303,005. (No model.)

Claim.—1. A door-check consisting of a check-rod having its greatest diameter or thickness at a point near or at one side of its middle and is gradually tapered toward both ends, a sleeve fitted on said rod, and springs which are arranged with and connected to the sleeve and bear constantly on the lateral faces of the rod, substantially as and for the purpose described.

2. In a door-check, the combination, with a check-rod, substantially such as described, and a sleeve arranged to slide over said rod, of a spring connected to and fitted within the sleeve to bear on the rod, said spring being composed of two curved parts or members which are connected to each other at their ends, substantially as and for the purpose described.

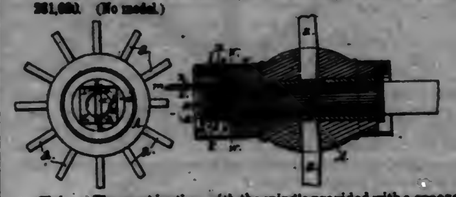
3. A door-check consisting of a longitudinally-tapered check-rod, a sleeve having a threaded boss in its upper side, a lower curved spring within the sleeve and connected at its ends thereto, an upper spring also arranged within the sleeve and having the two reversely-curved connected parts or members, and a regulating-screw fitted in the threaded boss of the sleeve and connected to the upper spring, substantially as described.



4. A door-check consisting of a pivoted check-rod having its greatest diameter at its middle and gradually tapered toward both ends, a sleeve fitted on said rod, the curved leaf-springs arranged within and secured to the sleeve and bearing on opposite lateral faces of the check-rod, a bracket adapted to be fixed on the door, a washer interposed between the sleeve and bracket, and a vertical pivot-bolt intermediate of the bracket and the sleeve to permit the latter to move in a horizontal plane, substantially as and for the purpose described.

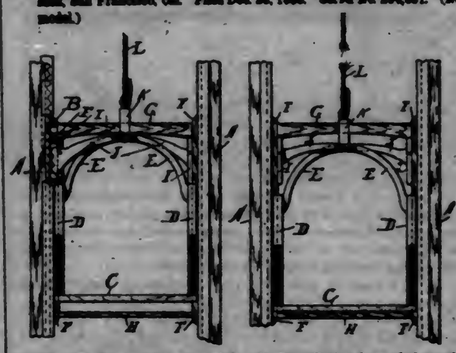
406,841. CUP FOR RECEIVING CONDENSED MILK OR MARMALADE PACKAGES. LAZARUS KOHNS, New York, N. Y. Filed Sept. 20, 1888. Serial No. 286,209. (No model.)

Claim.—1. As a new article of manufacture, a cup for receiving condensed-milk or marmalade packages, having an opening in its bottom and an integral flange projecting outwardly therefrom near its bottom, substantially as described.



2. A cup or receptacle having an opening in its bottom, an upwardly-projecting rim surrounding said opening, and an integral flange

406,841.



projecting outwardly from said cup near its bottom, substantially as described.

406,842. NUT-LOCK. HARRY H. KNEE, Salisbury, Pa., assignor of one-half to Joseph H. Batt, same place. Filed Aug. 1, 1888. Serial No. 281,630. (No model.)

Claim.—The combination, with the spindle provided with a groove across the end thereof, of a nut having a groove cut across its front face and adapted to register with the groove in the end of the spindle, a locking-arm pivoted in one end of the groove in the nut and constructed to engage with it and the groove in the spindle when they register with each other, and a face-plate rigidly secured to the front of the locking-arm, so as to cover the front of the spindle and nut, substantially as and for the purpose specified.

406,843. SAFETY DEVICE FOR ELEVATORS. RICHARD LAIDLEY, San Francisco, Cal. Filed Dec. 26, 1888. Serial No. 294,661. (No model.)

Claim.—The combination of the platform C, the channeled standards D, the hangers E, the grooved uprights F, the upper cross-beam G, the lower cross-bar H, the side supports I, the safety-levers J, the toothed racks K, the draw-head K, and the hoisting-rope L, all substantially as described.

406,844. BRAKE FOR LOCOMOTIVES. FRANK LAMBERT, St. Louis, Mo., assignor to the Lamberg Brake Company, East St. Louis, Ill. Filed Mar. 19, 1888. Serial No. 268,242. (No model.)

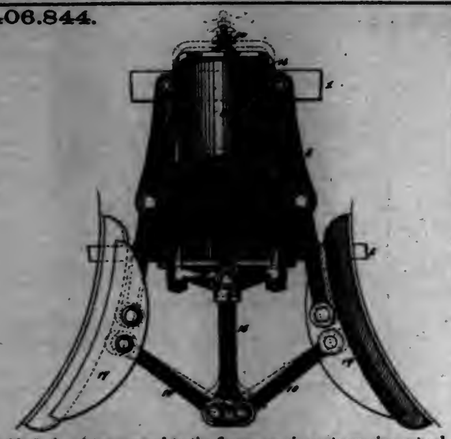
Claim.—1. In a brake for locomotives, &c., the combination of a fixed piston, a movable cylinder, and connection between the cylinder and brake-shoes, substantially as and for the purpose set forth.

2. In a brake for locomotives, &c., the combination of a fixed piston, a movable cylinder, brake-shoes, and connection between the brake-shoes and cylinder, consisting of a strap or yoke and links, substantially as and for the purpose set forth.

3. In a brake for locomotives, &c., the combination of a fixed piston, a movable cylinder, brake-shoes, a strap or yoke connected to the cylinder, the cross-head secured to the lower ends of the strap, a link secured to the cross-head, and links connecting the shoes to the link of the cross-head, substantially as and for the purpose set forth.

4. In a brake for locomotives, &c., the combination of a bracket 2, secured to the frame of the locomotive and having a flange or

406,844.



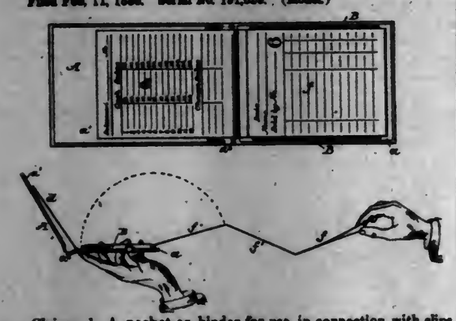


table 5, the piston secured to the flange, an air or steam pipe extending up through the piston, a movable cylinder fitting over the piston, a strap or yoke secured to the cylinder by means of a pin 19 and a cap 20, a cross-head secured to the lower end of the strap, brake-shoes, and links connecting the shoes to the cross-heads, substantially as and for the purpose set forth.

406,845. MANIFOLD SALES-BOOK. THOMAS W. LAWSON, Cambridge, assignor to the Lawson Manufacturing Company, Boston, Mass. Filed Feb. 11, 1886. Serial No. 191,639. (Model.)

Claim.—1. A pocket or binder for use in connection with slips for sales-memoranda and for duplicate copies thereof, composed, at least in part, of duplicating fabric which is relied upon for confining said slips in position convenient for service, and which also serves as a duplicating medium, substantially as described.

2. In a manifold sales-book, the combination, substantially as hereinbefore described, of a stack or pile of zigzag-folded slips for sales-memoranda and for duplicate copies thereof, and a fabric which constitutes the front of a pocket or binder for said pile or stack, and also serves as the duplicating medium, whereby said folded slips are maintained in compact form and the duplicating fabric maintained in position for convenient use in making duplicate copies.

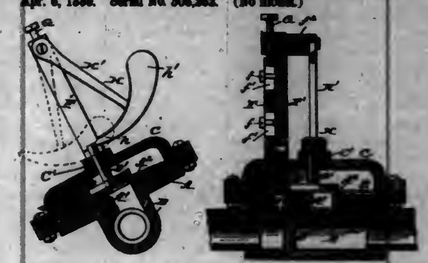
3. In a manifold sales-book, the combination, substantially as hereinbefore described, of a stack or pile of integrally-connected sales-slips and their appropriate copy-slips and duplicating fabric, which is adjustably arranged with relation to said stack to operate as a binding medium and enable fresh surfaces of said fabric to be presented for duty between any pair of said slips.

4. The combination, substantially as hereinbefore described, of a series of zigzag-folded sales-slips and a series of slips for fac-simile copies, interfolded, and each copy-slip arranged with relation to its proper sale-slip for receiving a duplicate of any memoranda made upon said sale-slip.

5. In a manifold sales-book, a series of zigzag-folded sale-slips consecutively and integrally connected with a series of alternating slips for receiving fac-simile copies of entries made upon said sale-slips, substantially as described.

406,846. DEVICE FOR CLEANING YARN, &c. JOHN H. HARMON, Utica, N. Y., assignor of one-half to James G. Smith, Jr., same place. Filed Jan. 12, 1889. Serial No. 296,141. (No model.)

Brief.—The invention consists in the improved device for removing bunches from yarn, &c.

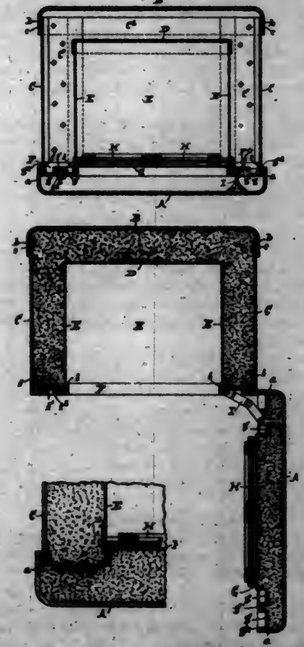


406,846.

Claim.—1. The combination of the adjustable comb, the adjusting-screw, the guide, the movable protector, and the supports of said guide-comb and protector, substantially as set forth.

2. The combination of the movable comb, the guide, and the movable protector and support of each, arranged substantially as set forth.

406,847. AUTOMATIC CUT-OFF. JOSEPH MILLER, Greenfield, Ind., assignor to Joseph Miller and Henry Snow, same place. Filed Apr. 6, 1888. Serial No. 305,262. (No model.)



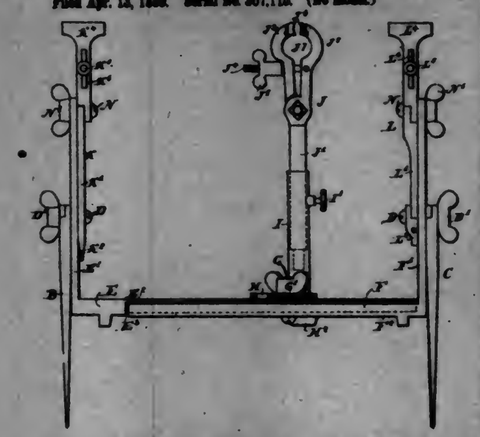
Claim.—1. In a cut-off, the combination, with a valve having the projecting stem, of a pivoted locking-wedge, substantially as set forth.

2. In a cut-off, the combination, with a valve having the projecting stem, of the locking-wedge pivoted to a post on the valve-casing, substantially as set forth.

3. In a cut-off, the combination, with a valve having the projecting stem, of the adjustable post, and the locking-wedge pivoted to the same, substantially as set forth.

406,848. FIRE-PROOF SAFE. MOSES MOSLER and MAX S. GOLDSMITH, Cincinnati, Ohio, assignors to the Mosler Safe and Lock Company, same place. Filed Mar. 11, 1889. Serial No. 302,807. (No model.)

Claim.—1. In a fire-proof safe, the combination of the pan-shaped back B, the sheet C, bent around and secured to the flange or rim of said back, the inner box, and the frame F, securing the two together and forming the body of the safe, substantially as described.



2. A door for fire-proof safes, consisting of the pan-shaped front A *a*, and back G, having its edges formed to match the front of the safe, both front and back plates of the door being stamped up from sheet metal and united together, substantially as described.

3. The combination, substantially as described, in a fire-proof safe, of the inner and outer shells, the frame F, uniting the same, the back B, having rim *b*, capped over the back of the outer shell and secured thereto, and the door composed of front A, having rim *a*, and the back G, having its edges formed to match the safe front and secured to the flanges *a*, said door being arranged to close over the front of the safe, substantially as specified.

4. The combination of the inner and outer boxes, each composed of a sheet-metal shell having one end closed by a flanged sheet-metal cap, the stamped sheet-metal frame uniting the two shells and forming the safe front and door-frame, the flanged sheet-metal cap forming the door front, and the inner wall G of the door having its edge stamped to match the safe front and close over the same, substantially as shown and described.

5. An outer shell for safe-bodies, composed of the sheet-metal pan-shaped back and sheet-metal box C, said shell having an opening to receive the filling, and a flanged cap, as J, to close said opening, the parts being combined and arranged substantially as specified.

406,849. PIPE-HOLDER. PATRICK MCCAHLEY, Braddock, Pa. Filed Apr. 13, 1889. Serial No. 307,118. (No model.)

Claim.—1. A pipe-holder comprising a frame, calipers detachably secured to the ends of the frame and forming legs, and a vise at each end of the frame, substantially as described.

2. A pipe-holder comprising a frame, calipers detachably secured to the ends of the frame and forming legs, and vises having shanks and detachably secured to the ends of the frame, the shank of one vise being formed with a screw-driver and the shank of the other with a wrench, substantially as described.

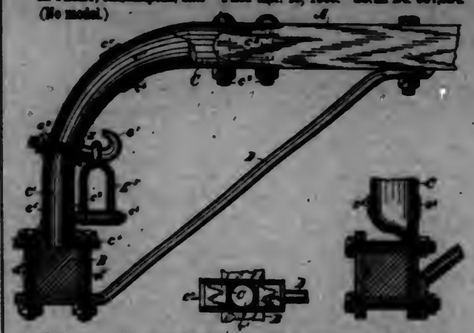
3. A pipe-holder comprising an adjustable frame, calipers detachably secured to the ends of the frame and forming legs, a vise secured to each end of the frame, each vise being provided with a shank, one of which is formed with a screw-driver and the other a wrench, an arm adjustably secured to the frame and formed with a cutter, and a third vise adjustably supported by said arm, substantially as herein shown and described.

4. In a pipe-holder, the combination, with two L-shaped arms held adjustably one on the other, of two pairs of calipers pivoted on the said arms and forming a frame with the same, and vises secured on the said L-shaped arms, substantially as shown and described.

5. In a pipe-holder, the combination, with two L-shaped arms held adjustably one on the other, of two pairs of calipers pivoted on the said arms and forming a frame with the same, vises secured on the said L-shaped arms, a slotted arm held adjustably on the said frame, a pipe secured on the said arm, and a third vise held vertically adjustable in the said pipe, substantially as shown and described.

406,850. ADJUSTABLE BROOM BAND OR CLAMP. ANDREW W. OTTERSON, Boston, Mass. Filed Mar. 15, 1889. Serial No. 303,493. (No model.)

Claim.—1. The combination, with a broom-encircling band or clamp, of the supporting-rod D, secured thereto and provided at its upper end with an adjustable spring-clamp G, composed of two loops or rings *c d*, formed in the same piece with said rod, and adapted to encircle the broom-handle at an angle to each other and exert a pressure thereon in opposite directions, whereby the rod is held securely in place when adjusted, substantially as set forth.



406,850.

2. The supporting-rod D, provided at its upper end with a fastening device for securing it to the broom-handle, and having at its lower end a hand-holder consisting of a loop H, formed in the same piece with the rod D, and having a swinging bar *g*, pivoted at one end to said loop, in combination with the broom-encircling band C, having one end secured to said loop and its opposite end adjustably confined between the opposite side of the loop and the swinging bar *g*, substantially as and for the purpose set forth.

3. The broom-band supporting rod D, provided at its upper end with an adjustable spring-clamp G, consisting of the loops or rings *c d*, arranged at an angle to each other, and the spring-coil *e*, formed in the same piece with the said rod and rings, substantially as described.

406,851. VEHICLE ATTACHMENT. DAVID M. PARRY and THOMAS H. PARRY, Indianapolis, Ind. Filed Apr. 15, 1886. Serial No. 307,204. (No model.)

Claim.—1. The combination of a horizontally-straight shaft, a curved one-piece metal clip constructed from malleable iron or drawn or swaged steel, having a tubular or partially tubular body flanged at its lower end, as axle, and a brace bolted to the flange at the sides of and beneath the axle and to the shaft in advance of the clip, substantially as described.

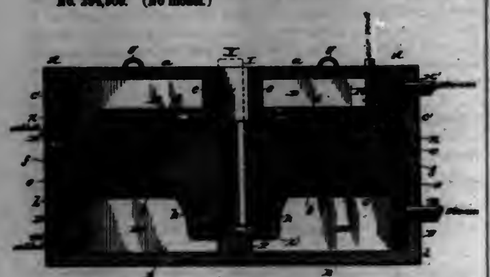
2. The combination, with the shaft-clip, of the bolt H, having the elongated head *d* and re-enforced portion at its forward end, and the reduced, screw-threaded, and square portions at its forward end, as shown, and the bifurcated spring-supporting link W, supported thereby, substantially as described.

406,852. FASTENING FOR THE TIPS OF BILLIARD-CUES. WILLIAM RAMSEY, St. Louis, Mo., assignor of one-half to Herman H. Lieuka, same place. Filed Oct. 5, 1888. Serial No. 287,204. (No model.)

Claim.—1. In a billiard-cue, the combination of trigger-lever *i*, inserted in recess *e* at the end of the billiard-cue and fulcrumed therein, said lever *i* having hook *j* and pin *k* projecting through hole *l*, spring *m*, and tip *b*, having shank *c* and hook *d*, the whole combined and operating substantially as described.

2. In a billiard-cue, the combination of a trigger-lever *i*, inserted in recess *e* at the end of the billiard-cue and fulcrumed therein, said lever *i* having hook *j* and pin *k* projecting through hole *l*, spring *m*, tube *f*, fixed in recess *e* and having cap *h*, and tip *b*, having shank *c* and hook *d*, the whole combined and operating substantially as described.

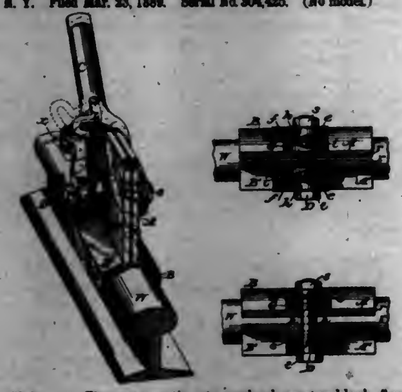
406,853. CAR-WHEEL. JAMES RIDDY, Minneapolis, assignor to the Rigby Car Wheel Company, St. Paul, Minn. Filed Oct. 9, 1886. Renewed Dec. 26, 1888. Serial No. 294,847. (No model.)



Claim.—In combination with the body of a car-wheel, the tire formed of steel or wrought-iron mixed with aluminum and having a groove and inwardly-projecting lip or flange at one edge or face, and a beveled spring locking ring or arc formed with a thick or broad

406,853.

outer periphery and a thin inner periphery, whereby said lip may be hammered down and forced to embrace the thick periphery of the beveled ring for the purpose of securing the body and tire together, as described.

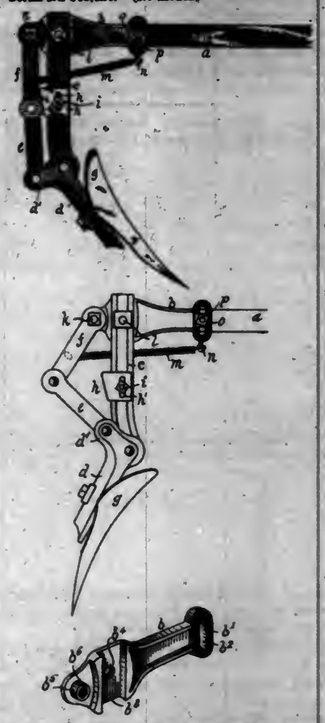


406,854. METALLIC MOLD FOR CASTING CAR-WHEEL BODIES. JAMES KENT, Minneapolis, assignor to the Rigby Car Wheel Company, St. Paul, Minn. Filed Nov. 6, 1886. Renewed Dec. 28, 1888. Serial No. 294,909. (No model.)

Claim.—1. In a metallic mold for casting car-wheel bodies, the upper removable hollow portion A, having neck *c*, connecting the outer and inner walls and forming central passage C for insertion of the axle-core and pouring in the molten metal, in combination with the lower hollow portion B, and provisions for fitting the upper and lower portions of the mold together, substantially as described.

2. In a double-walled metal mold for casting car-wheel bodies, the upper removable portion A, having the annular rim *e*, connecting the circumferential mold-wall with the outer wall, and neck *c*, forming central passage C, in combination with the lower portion B, having rim *f*, connecting the circumferential mold-wall with the outer wall, and also central recess *i*, formed in the inner surface of the mold-plate below passage C, for receiving the axle-core I, as described.

406,855. RAILWAY CHOCK OR STOP-BLOCK. THOMAS B. ROGERS, Brooklyn, assignor of one-half to William G. Robinson, New York, N. Y. Filed Mar. 23, 1889. Serial No. 304,425. (No model.)

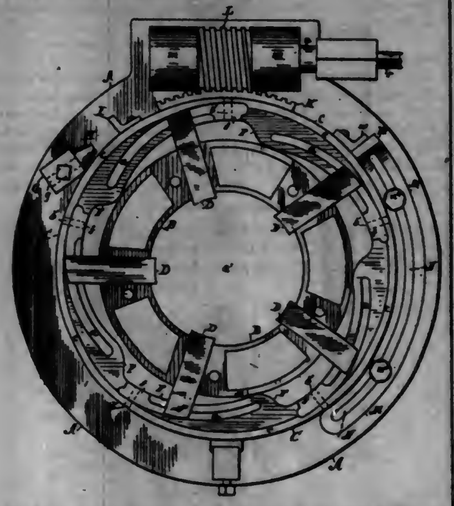


Claim.—1. The combination, in a chock or stop-block for railways with the clamping-plates to embrace the rail, of a forked lever, whose arms embrace the plates, a pivotal bolt passing transversely through the arms and plates, and whose head and nut afford bearings for the outer faces of said arms, an angular projection upon the inner face of one of said arms having its apex bisected by the bolt, and a counterpart angular recess in the outer face of a projection upon the proximate plate having its re-entrant angle in like manner bisected by the bolt, whereby the arms of the lever are in constant contact with the plates each at two diametrically-opposite points, one on each side of the transverse pivotal bolt, substantially in the manner and for the purpose herein set forth.

2. The combination, substantially as set forth, with the forked lever, the clamping-plates embraced by the lever and adapted to embrace a railway-rail, the transverse loose bolt upon which the lever is pivoted, the opposed cams formed upon the opposite faces of either lever-arm and the proximate plate, of a swinging latch pivoted to the lever to drop transversely upon the outer edges of the plates in engagement with notches therein, substantially in the manner and for the purpose herein set forth.

3. The combination, substantially as set forth, of the forked lever, the clamping-plates embraced by the lever and adapted to embrace a railway-rail, the transverse loose bolt upon which the lever is pivoted, the opposed cams formed upon the opposite faces of either lever-arm and the proximate plate, a swinging latch pivoted to the lever to drop transversely upon the outer edges of the plates in engagement with notches therein, and a padlock fitted to an aperture in the lever in position to prevent a movement of the latch out of the notch, substantially in the manner and for the purpose herein set forth.

406,856. CULTIVATOR. MARSHALL SATTLEY, Taylorville, Ill., assignor of one-half to Archibald Sattley, same place. Filed Mar. 13, 1889. Serial No. 303,129. (No model.)



Claim.—1. In cultivators, in combination, a beam, a bracket carrying a shank and secured to the beam, a sleeve pivoted on the shank and carrying a shovel, a toggle-joint connected with the bracket and with the sleeve, a spring to hold the toggle-joint extended, and an adjustable stop between the toggle-joint and the shank, as set forth.

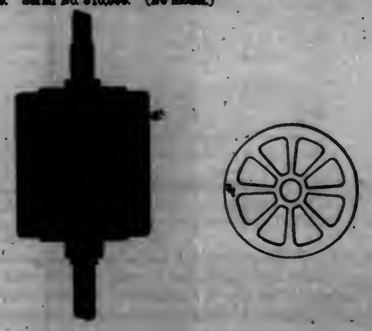
2. The combination, in cultivators, of the bracket having the transverse recess and the boss, the shank held in the recess of the bracket, the sleeve pivotally connected with the shank and carrying a shovel, the toggle-joint pivoted on the boss of the bracket and pivotally connected with the sleeve, a spring to hold the toggle-joint extended, and an adjustable stop interposed between the shank and the toggle-joint, as set forth.

3. The combination, in cultivators, of the bracket having the transverse recess, the boss and the slotted end, the beam, the shank held in the recess of the bracket by a bolt that penetrates the shank, the bracket and the beam, the bolt in the beam extending through the slot of the bracket, the sleeve pivotally connected with the shank and carrying a shovel, the toggle-joint pivoted on the boss of the bracket and pivotally connected with the sleeve, and the extension-spring to extend the toggle-joint, as set forth.

4. In cultivators, in combination, a beam, a shank on the beam, a sleeve pivotally connected with the shank and carrying a shovel, an approximately vertical toggle-joint connecting the sleeve with the beam, and an approximately horizontal extension-spring connected with the beam and with the toggle-joint, near the center thereof, whereby the action of the spring is exerted in the manner and for the purpose set forth.

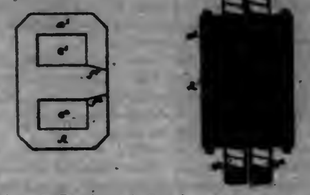
406,857. SCREW-CUTTING DIE. ALEXANDER SAEMANN, Yonkers, N. Y., assignor to D. Saemann' Sons, same place. Filed Apr. 11, 1888. Serial No. 306,780. (No model.)

Claim.—1. The combination of the removable stop H with the back plate A, having the hub B and carrying radial jaws D, and the stop I on the shell C, which has the grooves *a*, and the recesses *f* contiguous therewith, substantially as and for the purpose herein set forth.



2. The combination of the removable stop H with the back plate A, having the hub B and carrying radial jaws D, and the stop I on the shell C, which has the grooves *a*, the recesses *f* contiguous therewith, and the holes or openings *b'* behind said recesses *f*, substantially as and for the purpose herein set forth.

3. The combination of the worm L, provided upon the back plate A, which has the hub B and carries the jaws D, with a curved rack or toothed sector K on the circumference of the shell C, which has the eccentric grooves *a* arranged to actuate the said jaws, substantially as and for the purpose herein set forth.



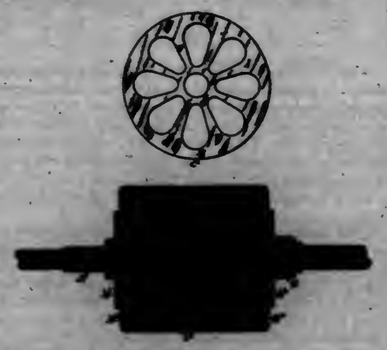
4. The combination of the slide M, placed upon the back plate A, which has the hub B and the jaws D, with the stop *w* on the circumference of the shell C, which has the grooves *a*, which actuate the said jaws, substantially as and for the purpose herein set forth.

5. The removable stop H, worm L, an adjustable slide M, placed upon the back plate A, which has the hub B and carries the jaws D, with the stop I, the curved rack or toothed sector K and stops *c* upon the periphery of the shell C, which has the eccentric grooves *a*, which actuate the aforesaid jaws, substantially as and for the purpose herein set forth.

406,858. METHOD OF FORMING LAMINATED CORES FOR ELECTRICAL APPARATUS. ALBERT SCHMID, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed May 13, 1889. Serial No. 310,866. (No model.)

406,858.

Claim.—1. The hereinbefore-described method of constructing the cores of electrical apparatus, which consists in first stamping out plates of magnetizable material—such as soft iron—afterward annealing and coating them with an insulating oxide, and building up the core from such annealed plates.



2. The hereinbefore-described method of constructing the laminated cores of electric converters and other electrical apparatus, which consists in first stamping out plates of magnetizable material having the required shape and size, heating such plates after they are so stamped and allowing them to cool gradually, thereby covering their surfaces and edges by coatings of oxide, and afterward building up the core from such plates by placing them face to face, substantially as described.

3. The hereinbefore-described method of constructing the laminated cores of electric converters and other electrical apparatus, which consists in first stamping thin plates of magnetizable material having the required shape and size, heating such plates after they are so stamped and allowing them to gradually cool, thereby covering their surfaces and edges by coatings of magnetic oxide, and afterward building up the core from such plates by placing them face to face, substantially as described.

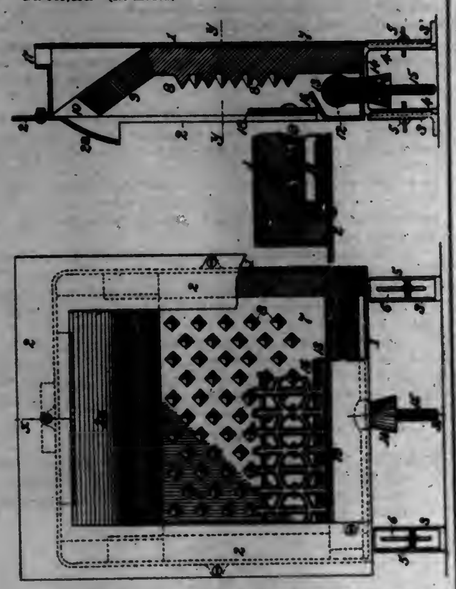
4. The hereinbefore-described method of constructing the cores of electrical apparatus, which consists in first stamping out plates of magnetizable material—such as soft iron—afterward coating them with an insulating oxide, and building up the core from such oxidized plates.

5. The hereinbefore-described method of constructing the cores for electrical apparatus, which consists in first stamping out the plates of magnetizable material—such as soft iron—afterward coating the edges of the same with an oxide, and building up the core from such oxidized plates.

406,859. METHOD OF FORMING CORES FOR ELECTRICAL APPARATUS. ALBERT SCHMID, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed May 13, 1889. Serial No. 310,869. (No model.)

Claim.—1. The hereinbefore-described method of constructing the laminated cores of electrical apparatus, which consists in building up the core of plates or sheets of magnetizable material, turning the core to the proper shape and form, afterward separating the plates, annealing the same, and finally reassembling them.

2. As a step in the manufacture of laminated cores of electrical apparatus, the turning down of the core to the proper size and shape, taking down the core, annealing the lamina, and reassembling the same.



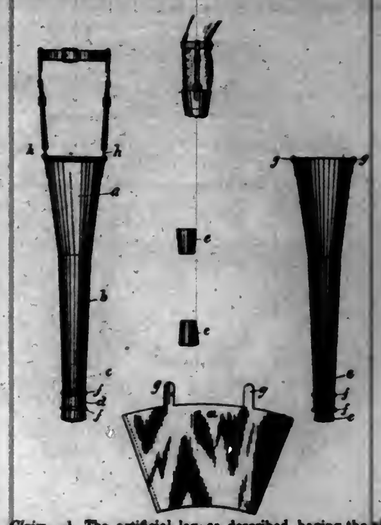
3. The herein-described method of constructing the armature-core of an electric machine, which consists in mounting upon the armature-shaft laminæ of magnetizable material, binding them firmly in position, with the faces of consecutive laminæ adjacent to each other in the peri-

tions which they are finally to occupy, turning down the core to the proper size and form, dissociating the laminæ, annealing them, and thereby coating their surfaces and edges with an oxide of metal, and finally reassembling the laminæ in approximately the positions formerly occupied thereby, substantially as described.

4. The hereinbefore-described method of constructing the laminated cores of electrical apparatus, which consists in building up the core of plates or sheets of magnetizable material, turning the core to the proper shape and form, afterward separating the plates, oxidizing the same, and finally reassembling the same.

5. The hereinbefore-described method of constructing the laminated cores of electrical apparatus, which consists in building up the core of plates or sheets of magnetizable material, turning the core to the proper shape and form, afterward separating the plates, coating the edges with insulating material, and finally reassembling them.

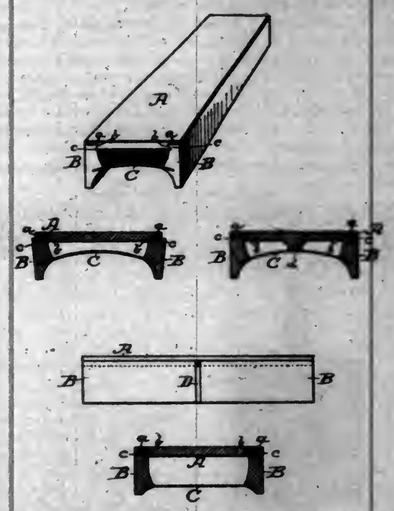
406,860. **GAS-BURNER FOR STOVES OR FIRE-PLACES.** JOHN SMITHLEY, Pittsburg, Pa., assignor to the Fuel Gas and Electric Engineering Company, (Limited,) same place. Filed Mar. 15, 1889. Serial No. 303,498. (No model.)



Claim.—1. The combination of a refractory radiating-plate having a series of projections on its front, an inclined deflecting-plate having an upper discharge-opening and placed above the radiating-plate, a burner-pipe having a series of burner-openings and located in front of the lower portion of the radiating-plate, a front deflecting-plate located above and adjacent to the burner-openings and inclined toward the radiating-plate, a mixer communicating with the burner-pipe, and a gas-supply pipe leading into the mixer, substantially as set forth.

2. The combination of a casing, a centrally-open front plate or frame secured thereto, a radiating-plate of refractory material fitted within the casing adjacent to its rear side and having a series of projections on its front, a deflecting-plate having an upper discharge-opening and inclined upwardly from the top of the radiating-plate to the front plate, a delivery-plate fixed to the front plate and outwardly and downwardly inclined in front of and below the discharge-opening of the deflecting-plate, a front deflecting-plate secured to the front plate and projecting inwardly and upwardly therefrom above and adjacent to the burner-openings, a chimney-passage communicating with the discharge-passage of the upper deflecting-plate and leading out of the casing, a mixer communicating with the burner-pipe, and a gas-supply pipe leading into the mixer, substantially as set forth.

3. The combination of an open front casing, a refractory radiating-plate fitted within the casing and having a series of projections on its front, a deflecting-plate having an upper discharge-opening and placed above the radiating-plate, a burner-pipe supported in the lower portion of the casing in front of the radiating-plate and having a series of burner-openings, a mixer communicating with the burner-pipe, a gas-supply pipe leading into the mixer, adjusting-arms projecting downwardly from the bottom of the casing, and longitudinally-slotted standards connected by clamping-screws to the adjusting-arms, substantially as set forth.

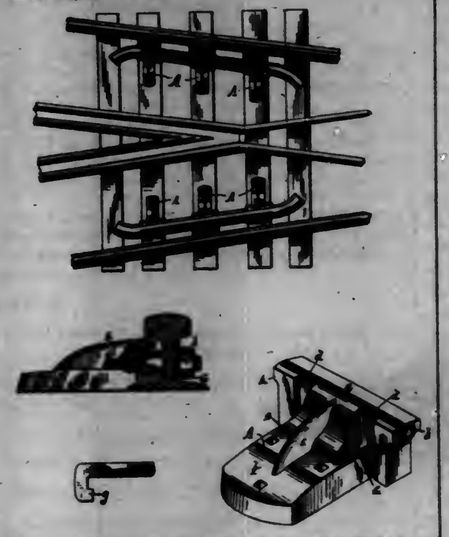


406,861. **ARTIFICIAL LEG.** JOHN T. STEER, Lamar, assignor to Willie Lawson Delony, Little Rock, Ark. Filed May 6, 1889. Serial No. 309,758. (No model.)

Claim.—1. The artificial leg, as described, having the air-tight cone-shaped socket *a*, provided with the integral ears *g* and proper extension to support said socket, substantially as shown and described.

2. In an artificial leg, as described, the air-tight cone-shaped socket *a*, having the integral ears *g*, hollow air-tight extension *b*, cork *c*, fitting in the lower end of said extension, flange *d*, secured to the lower end of said extension, rings or bands *f*, to strengthen said extension, flange *d*, and tapering rubber tip *e*, fitting into the end of said flange, all substantially as shown and described.

406,862. **STEREOTYPE-PLATE AND BASE.** FRANK D. THOMASSE, Englewood, assignor to the American Press Association, Chicago, Ill. Filed Nov. 12, 1888. Serial No. 290,730. (No model.)



Claim.—1. The combination, with a stereotype-plate A, having its under surface rabbeted parallel and next to its side edges, of the base consisting of the legs B, connected by a transverse elastic web, and having shoulders in their upper inner edges which oppose and lock said plate thereto and bear against the vertical walls of the rabbeted edges of the plate, as set forth.

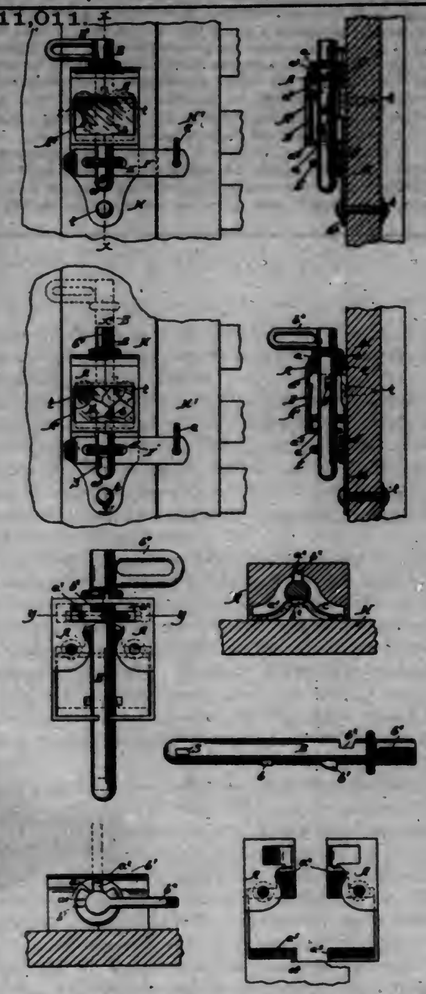
2. A stereotype-plate having its under surface next to and parallel with its side edges rabbeted so that the vertical shoulders of said rabbets are inversely beveled, and having a central longitudinal leg depending downward a suitable distance from its under surface, in combination with the legs B B, having longitudinal inversely-beveled shoulders in their upper inner edges which oppose the inversely-beveled walls of the rabbets of said plate, and a flexible transverse sheet-metal web connecting said legs.

3. A stereotype-plate having its under surface next to and parallel with its side edges rabbeted so that the vertical shoulders of said rabbets are inversely beveled, in combination with the legs B B, having longitudinal inversely-beveled shoulders in their upper inner edges which oppose the inversely-beveled plate, a flexible transverse sheet-metal web connecting said legs, and a transverse lead D, of a length equal to the width of said plate and of a height rising to the plane of the under surface thereof, as set forth.

406,863. **COMBINATION RAILROAD-BRACKET.** GEORGE WATERMAN, Villisca, Iowa, assignor to William W. Hite, Charles J. West, John Waterman, and W. S. Hite, all of same place. Filed Mar. 27, 1889. Serial No. 304,960. (No model.)

Claim.—1. The combination, with the bracket formed with vertical channels, of the bolts having hooked ends and designed to be passed through the rail with said hooked ends engaging in said channels, substantially as shown and described.

2. The combination, with the bracket formed with base portion, vertical channels, and shoulders *c*, of the rail and the bolts passed through the rail and provided with hooked ends reaching around the ends of said bracket and engaging in said channels, substantially as and for the purpose specified.



3. The combination, with the rail and the bracket formed with a head-piece provided with vertical channels extending below the shoulders *c* on the base portion of the bracket, of the bolts provided with hooked ends reaching around the ends of the bracket and engaging in said channels, and provided upon their opposite ends with adjusting-nuts, substantially as shown and described.

REISSUES.

11,011. **SEAL-LOCK.** CHARLES E. DAVIS, Chicago, Ill., assignor, by mesne assignments, to the Trans-Continental Car Lock and Seal Company, same place. Filed Apr. 24, 1889. Serial No. 308,477. Original No. 371,087, dated Oct. 4, 1887.

Claim.—1. In a seal-lock, in combination with the frame having a seal-holding space and the bolt journaled in such frame, and having both rotary and longitudinal movement in its bearings, and having a seal-breaking part which is moved into the seal-holding space by the

11,011.

rotary movement, a catch which locks the bolt to prevent its longitudinal movement out of locking position, the frame and the bolt having projections which co-operate to retain the seal in the seal-space, such projection on the bolt being so located thereon that it is moved into seal-retaining position by the longitudinal movement of the bolt, substantially as set forth.

2. In seal-locks, the combination of a lock-frame adapted to sustain in fixed position a frangible sealing-plate, substantially as shown, a perpendicularly and axially movable shackle-bolt, sustained by said frame and provided with a suitable projecting portion *b* and a lug *b'*, and means for securing said bolt in a certain position, from which it cannot be withdrawn or removed without breaking the said sealing-plate when the same is fixed in position, all arranged and adapted to be operated substantially as set forth.

3. In a seal-lock, in combination with a frame having a seal-receiving space, a bolt having bearings in said frame and capacity for rotary and longitudinal movement in said bearings and protruding longitudinally from its bearings to effect the locking by its longitudinal movement, and having a seal-breaking portion which is moved into the seal-space to break the same by the rotary movement, and a catch lodged in the frame which engages the bolt to obstruct its longitudinal movement when said bolt has been moved longitudinally to locking position and been rotated out of its seal-breaking position, substantially as set forth.

4. In a seal-lock, in combination with a frame having the seal-receiving space, a bolt having bearings in said frame and capacity for rotary and longitudinal movement in said bearings and protruding

longitudinally from said bearings to effect the locking, and having a seal-breaking part which is moved into the seal-space to break the seal by the rotary movement, and a catch in the frame which engages the bolt to obstruct its longitudinal movement when the bolt has been moved longitudinally into locking position and rotated out of seal-breaking position, the frame having a keeper E, through which the bolt protrudes when in locked position, and the bolt having a transverse aperture S beyond said keeper, substantially as set forth.

5. In combination, the frame A, the locking-bolt B, journaled therein and having capacity for longitudinal and rotary movement in its bearings, said frame having a seal-receiving space, and the bolt having a projection b, which moves into said space when the bolt is rotated, and having a transverse slot b^3, the leaf-spring C, extending transversely with respect to the bolt and adapted to rest in said slot, and the frame having a transverse cavity in which said spring is retained and prevented from moving longitudinally with respect to the bolt, substantially as set forth.

6. In combination with the frame A, having the seal-receiving space, and the spring-retaining cavity, and the spring C therein, the bolt B, having a seal-breaking projection, the spring-engaging notch b^3, and the projection b', the frame being provided at the upper part with notches a^5 and a^6, ninety degrees separated in the arc of movement of the projection b' about the axis of the bolt-bearings, substantially as and for the purpose set forth.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE MCMAHAN.

Decided June 10, 1889.

1. DIVISION—PROCESS AND APPARATUS.
   Division of an application should not be demanded unless there is in the given case such a total want of interdependence between the two matters claimed as would render them absolutely independent and distinct inventions.
2. When the apparatus cannot operate for any other purpose than to carry out the process, and the process can be carried out only by a machine operated substantially upon the principle of that shown by the applicant, division should not be required.
3. In such case there is no reason for requiring a division upon the ground that the examination of the Office would be facilitated, because the field of search is precisely the same whether the application is divided or not.

ON petition.

METHOD OF AND APPARATUS FOR SEPARATING MAGNETIC FROM NON-MAGNETIC SUBSTANCES.

Application of John M. McMahan filed February 20, 1889, No. 300,609.

Referred to the Assistant Commissioner, by order of the Commissioner, for hearing and decision.

Mr. Anthony Pollok for the applicant.

FISHER, *Assistant Commissioner:*

This petition is taken from the action of the Primary Examiner requiring applicant to divide his application upon the line of process and apparatus.

The application covers an improvement in the art of separating magnetic from non-magnetic particles in a finely-divided condition, which consists in feeding the particles through a magnetic field of force and at the same time subjecting them to the action of a suction current of air. Claims 1, 2, and 3 cover the method and the remaining claims the apparatus by which it is carried out. It is held that these two sets of claims cannot be treated in the same application. No good ground exists for this holding. There is no provision of the statute which prevents the joinder of a process and its apparatus in the same application. The courts have never declared a patent invalid for the reason that its claims embrace both, but, on the contrary, have sustained many such patents. And Rule 41 of the Patent Office expressly provides that inventions dependent upon each other and mutually contributing to produce a single result may be claimed in the same application. Both the law and the rule warrant the conclusion that division should not be demanded unless there is in the given case such a total want of interdependence between the two matters claimed as would render them absolutely independent and distinct inventions.

In this case the process and apparatus are dependent upon each other and do mutually co-operate to produce a single result. The apparatus cannot operate for any other purpose than to carry out the process, and the process can be carried out only by a machine operated substantially upon the principle of that shown by applicant.

The reason sometimes urged for requiring division in cases of this character, that examination would be facilitated, is of no force here, because it would be impossible to examine the claims for either the process or apparatus without at the same time examining the claims for the other. The field of search is precisely the same in each case, and patents embracing the apparatus and process, respectively, if granted, would be placed in the same class and sub-class of the same division.

All these are strong reasons why the division should not be required in this case; but it may be further said that the law provides that any person who has made an invention shall receive a patent granting to him the exclusive right to make, use, and vend the same throughout the United States and its Territories. By requiring two patents to be taken in such cases as this one would cover the right to make and vend the apparatus, while the other would cover only the right to use it. An invention would thus be split up into separate parts, one of which might fall into the hands of one assignee and the other into those of another, perhaps antagonistic. Such an interference with the rights of inventors was never contemplated by the statute, and the Patent Office should take no action which would accomplish it.

Division should not be required in this case, and the prayer of the petition is granted.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern District of Michigan.

THE CONSOLIDATED ROLLER MILL COMPANY *v.* COOMBS.

Decided May 20, 1889.

1. GRAY—GRINDING-MILLS.
   Letters Patent No. 222,895, granted December 23, 1879, to William D. Gray, for an improvement in grinding-mills, construed and sustained, and *Held* that Gray's invention is for such an improvement as to entitle him to a liberal construction of the claims of the patent and a liberal application of the doctrine of equivalents.

2. SAME—INFRINGEMENT.

The defendant's entire machine is simply a rearrangement of the Gray combination for the obvious purpose of an attempt to avoid his patent. The result attained by both combinations is the same. The means adopted to attain such result differ only in the location of the several elements and such dependent differences as are made necessary by such change of location.

3. COMBINATIONS—PATENTABILITY.

The rearrangement of an old combination, when each element operates practically as before, is not patentable unless a new or greatly-improved result is obtained.

4. DOWLING—FEED MECHANISM FOR ROLLER-MILLS.

Letters Patent No. 289,518, granted December 4, 1883, to Daniel E. Dowling, for an improvement in feed mechanism for roller-mills, *Held* to be an aggregation of old elements adapted to a new machine, but producing practically the same results. No invention involved in putting these devices together and placing them in the hopper of a flouring-mill.

5. MARMON—ROLLER-MILLS.

Letters Patent No. 274,506, granted March 27, 1883, to D. W. Marmon, for an improvement in roller-mills, construed, and so much of claim 1 as is not covered by the Gray patent—to wit: "means for adjusting simultaneously both ends of the counter-shaft"—*Held* to be so far anticipated as to involve only mechanical skill.

6. SAME—SUBSEQUENT PATENTS.

A former patent, No. 265,927, granted October 10, 1882, to Marmon jointly with one Warrington, construed, and *Held* that no one can take out a patent either jointly or severally for an invention, and, after the patent is issued, without reservation in his original application, obtain a second patent with broader claims for the device.

7. CONSTRUCTION OF CLAIMS.

Claims of patents should receive such interpretation as will enlarge or restrict them, so as to cover the actual invention when not absolutely inconsistent with the language used by the patentee. (*Winans* v. *Denmead*, 15 How., 330; *Van Martyr* v. *Miller*, 15 Blatchf., 562.) If, upon the one hand, the state of the art shows the invention to have been a narrow one, a strict interpretation will be given the claims. (*Manufacturing Co.* v. *Ladd*, 102 U. S., 408.) And it is of no practical consequence whether such restrictions are imposed by the Patent Office or not. (*Toepfer* v. *Goetz*, 41 O. G., 933.) If, upon the other hand, the patentee has taken a decided step in advance of the state of the art at the time his application was filed, the courts will, if possible, construe the language of his claim so as to give him the full benefit of his improvement. (*Turrill* v. *R. R. Co.*, 1 Wall., 491; *Rubber Co.* v. *Goodyear*, 9 Wall., 788.)

STATEMENT OF THE CASE.

This was a bill to recover damages for the infringement of Letters Patent No. 222,895, issued to William D. Gray December 23, 1879, for an improvement in roller grinding-mills; Patent No. 289,518, issued to Daniel E. Dowling December 4, 1883, for a feed mechanism for roller-mills, and Patent No. 274,508, issued to D. W. Marmon March 27, 1883, for a roller-mill.

The invention covered by the Gray patent was stated in the preamble to consist—

in a peculiar construction and arrangement of devices for adjusting the rolls vertically as well as horizontally, whereby any unevenness in the wear of the rolls, or in their journals or bearings, may be compensated for and the grinding or crushing surfaces kept exactly in line—

and also—

in the special devices for separating the rolls when not in action, and in other details.

The Dowling patent was essentially for an agitator centrally located within the hopper of the roller-mill above the grinding-rolls—

and provided with teeth or fingers arranged to reciprocate immediately above the surface of the feed-roll, and lengthwise thereof, to loosen and disintegrate the material and distribute it in a free condition upon the surface of the feed-roll in such manner that its delivery from the hopper is effected in a thin continuous sheet, which is delivered from the surface of the feed-roll directly to the surface of the grinding-rolls thereunder.

The Marmon patent related to a counter-shaft parallel with the roll-shaft and simultaneously adjustable at each end, so as to tighten or loosen the belts at both ends of the machine at one operation.

The defendant by his answer and proofs made the following defenses: (1) that the Gray patent is so circumscribed by reason of the limitation voluntarily made by the applicant, or imposed by the Commissioner of Patents and accepted as a condition precedent to the grant, that it does not cover defendant's machine or any part thereof; (2) that the features of defendant's machine are found in many prior patents recited in the answer and introduced in evidence; (3) that in view of the state of the art as shown by prior patents and publication the Gray patent is invalid for want of novelty; (4) that the plaintiff has never been engaged in the manufacture, sale, or use of the alleged inventions covered by its patents; denies that the same are of value or that plaintiff is entitled to damages.

The chief defense to the Dowling and Marmon patents are a want of invention, in view of the prior state of the art.

Mr. Rodney Mason for the complainant.

Mr. Joseph G. Parkinson and *Mr. Robert H. Parkinson* for the defendant.

BROWN, *J.*:

The ancient system of reducing wheat to flour by grinding between revolving stones, which obtained from the earliest historical period, has, within the last 20 years, largely given place to the system of crushing between rolls, which seems to have originated in Buda-Pesth, in the Kingdom of Hungary. These roller-mills, which soon after their invention were introduced into this country, and have practically superseded in all large flouring-mills the old-fashioned method of grinding, consist generally of two or more pairs of rollers mounted in a strong frame, and, as a rule, lying in the same horizontal plane. One of these rolls is fixed, and mounted in a stationary bearing, but susceptible, of course, of revolution. The other is mounted upon an adjustable bearing, which permits it to yield or give way in case any hard substance enters between them. While these rolls are not in actual contact when grinding, they are very nearly so, and their adjustment is a matter of extreme nicety. That the wheat may be ground and not merely crushed it is necessary that the rolls be corrugated upon their surfaces and driven at differential speeds, so as to give them a rubbing or tearing as well as a crushing action, and when driven by belts it is customary to drive one roll in each pair by a belt at one end of the machine and the other roll by a belt at the opposite end. A counter-shaft is run through the machine from end to end beneath the rolls, and driven by a line shaft or any suitable motor, and provided with pulleys over which the belts at each end of the machine are thrown, thereby driving the rolls with which these belts connect. It is desirable that the axes of the rolls shall always be parallel with each other, and to accomplish this the bearings of the movable roll are made independently adjustable, both vertically to bring the two rolls of a pair axially into the same plane, and horizontally, so that their surfaces may be exactly parallel, or else they will grind unequally. This adjustment should be so arranged that it can be made with one hand, while the other is feeling the product of the mill as it issues from the rolls. The adjustment must be absolutely rigid, so that the work may be uniform, and yet the faces must never come in contact, since that would ruin their surfaces. Above the grinding-rolls is arranged a hopper, at the bottom of which is a long narrow opening parallel with and above the line of the two rolls. This opening is nearly closed by a feed-roller, which by its revolution is intended to carry the material in an even regular stream to fall between the grinding-rolls.

The Gray patent relates to the adjustment of the rolls, both to preserve their parallelism, their grinding distance, and the pressure of the movable against the fixed roll. The Dowling patent relates to the feeding of the material in the hopper to the rolls, and the Marmon patent to the adjustment of the counter-shaft to tighten or loosen the belts at each end of the machine simultaneously.

THE GRAY PATENT.

We will proceed to consider the Gray patent, No. 222,895, the first and most important in the case. As before stated, this patent relates to the means for adjusting the rolls both vertically and horizontally, the requisites of such adjustment being that it must be fixed and permanent, and at the same time be capable of yielding to a breaking strain in case a hard substance enters between them, and at the same time of returning to their original position without a readjustment. They must also be capable of a vertical adjustment, or an adjustment for "tramming," as it is called, so that in case of irregular wearing of the surfaces or bearing the axis may be brought exactly in line. Seven claims are made in the patent, the second, third, fourth, and fifth of which are alleged to be infringed. That part of the preamble which refers to devices for adjusting the rolls vertically as well as horizontally relates to the subject-matter of the second and third claims, and that clause referring to the special devices for separating the rolls relates to the subject-matter of the fourth and fifth claims. An important question connected with this patent is the construction to be given to it in view of the limitations or restrictions imposed upon the original claims by the Commissioner of Patents. In his original specification, filed with his application, Gray stated his invention to consist—

in devices for adjusting the rolls vertically as well as horizontally, whereby any unevenness in the wear of the rolls or their journals or bearings may be compensated for and the grinding or crushing surface kept exactly in line—

and also—

in the devices for separating the rolls when not in action.

His claims correspond with his evident belief that he was the inventor, broadly, of devices for a roll adjustable both vertically and horizontally, and were as follows:

2. In combination with a stationary roll, an adjustable roll mounted substantially in the manner described, whereby it may be adjusted both vertically and horizontally.
3. In a roller grinding-mill, a roll mounted at its ends in arms or supports arranged to be independently adjusted both vertically and horizontally, substantially in the manner described.
4. In combination with the roll C, the independent arms or supports D, mounted upon eccentrics, substantially as shown, whereby either end of the roll may be adjusted vertically.
5. In combination with the stationary roll B and adjustable roll C, means, substantially such as described, for drawing the roll C to a fixed point.

His application in such form was refused by the Commissioner of Patents in a letter dated August 14, 1879, notifying Gray that "the invention alleged and claimed in his case is not generic, in view of the English patent No. 3,328 of 1877, this being known as the 'Lake English patent.'" Gray thereupon concluded to submit to this opinion of the Commissioner, and immediately amended his application by two insertions in the preamble, so that instead of reading "consists in devices for adjusting the rolls vertically as well as horizontally," it reads "consists in a peculiar construction and arrangement of devices for adjusting the rolls vertically as well as horizontally," and by inserting the word "special" before the words "devices for separating the rolls when not in action." Pursuant to the same intimation of the Patent Office, Gray also amended his claims to read as follows:

2. In a grinding-mill, the combination of a roll, an upright swinging arm at each end of said roll, an eccentric adjustable pivot located at the lower end of said arm, and devices, substantially such as shown, acting against the upper end of the arm.
3. The combination of a roll and upright swinging arms having their lower ends mounted on vertically-adjustable pivots, the latter thus serving both to sustain and adjust the rolls.
4. In combination with the movable roller-bearing, the rod G, adjustable stop devices to limit the inward movement of the bearing, an outside spring urging the bearing inward, and adjusting devices, substantially such as shown, to regulate the tension of the spring.
5. In combination with the roller-bearing, the adjusting-rod provided at one end with a stop to limit the inward movement, a spring, and means for adjusting the latter, and provided at the other end with a stop and holding devices, substantially as shown and described.

Now, if the plaintiff be limited to the literalism of these claims and is denied the benefit of the ordinary doctrine of equivalents, as contended by the defendant, then it is clear the defendant does not infringe, since he has neither an eccentric adjustable pivot nor a pivot located at the lower end of the swinging sustaining-arm, nor devices of any kind acting against the upper end of the arm. Authority for the proposition that plaintiff is limited to the exact language of his claims, where limitations and restrictions have been imposed upon the original claims by the Patent Office, is claimed to be found in numerous decisions of the Supreme Court to the effect that limitations introduced by the applicant are binding upon him, even if his actual invention be larger than his claim; that claims accepted by the patentee cannot be enlarged, and when a claim is restricted as to specific elements all are regarded as material. That this is particularly true of limitations introduced after rejection, and to ascertain what these limits are the court is not confined to the face of the patent, but may take into consideration the proceedings in the Patent Office in construing the meaning and scope of the claims, and for that purpose can go to the file-wrapper and contents of the original applicant. In the recent case of *Rodebaugh* v. *Jackson* (37 Fed. Rep., 882) we had occasion to consider the most prominent of these cases, notably that of *Sargeant* v. *The Hall Safe and Lock Co. et al.*, (31 O. G., 661; 114 U. S., 86,) in which it is broadly stated in the opinion of the court—

That in patents for combinations of mechanism, limitations, and provisos imposed by the inventor, especially such as were introduced into an application after it had been persistently rejected, must be strictly construed against the inventor and in favor of the public, and looked upon as in the nature of disclaimers.

Upon an examination of the other cases upon the same subject, however, we came to the conclusion that nothing more was intended than that where, under the state of the art and the action of the Patent Office, a patentee of a combination has modified and limited his claims he shall be held strictly to his combination as he has described it. What shall be considered as an infringement must depend largely upon the state of the art as it existed at the time the patent was issued. It has always been the law that a patentee is limited by his claims, even though his invention be broader, and that if he include a certain element in a

combination he is not at liberty to say that such element is immaterial. (*Vance* v. *Campbell*, 1 Black, 427.) At the same time it is equally true that a combination patent covers not only the elements named, but also such as may be substituted therefor and are known as mechanical equivalents. Practically all which the rejection of a claim by the Patent Office means is that after the patentee has limited his claim he shall not be permitted by construction to have the benefit of his claim as originally presented. (*Leggett* v. *Avery*, 101 U. S., 256.) But what shall be deemed a mechanical equivalent for his claim depends so largely upon the state of the art at the time his patent was issued that it is impossible to gather from the general language of the courts with respect to the construction of claims what should be the construction in any particular case. When we find a court using language which indicates that the patentee should be strictly limited to his claim and to the restrictions and the provisos he has inserted therein, we shall generally find that the invention is only a trifling deviation from or improvement upon what has gone before. When, upon the other hand, the case shows the doctrine of mechanical equivalents to be vigorously asserted and liberally applied, it will usually appear that the patent is a pioneer or a marked improvement upon any device which had previously existed. The prime object in construing a patent should be to preserve to the patentee his actual invention if this can be done consistently with the language he has himself chosen. Occasionally it will happen that the patentee will by inadvertence or mistake claim less than he is entitled to and the courts be powerless to help him; but their disposition is and should be to deal liberally with those who have made valuable contributions to the natural sciences. In this connection we fully coincide in the opinion of Judge Shipman in *Schillinger* v. *Gunther* (11 O. G., 831) that a strict construction should never be given to the claim where such construction would be a limitation upon the actual invention. Similar language is used by Judge Shepley in the case of *Esterbook* v. *Dunbar*, (2 B. & A., 427,) in which he says:

> The technical claims in a patent are to be construed with reference to the state of the art, so as to limit the patentee to and to give him the full benefit of the invention he has made. They are also to be construed in connection with the specification, so as to limit the patentee to and to give him the full benefit of the invention he has described. The general terms and sometimes special words in the claims may receive such a construction as may enlarge or contract the scope of the claim, so as to uphold that invention, and only that invention which the patentee has actually made and described, when such construction is not absolutely inconsistent with the language of the claim.

Indeed, the general principle is sustained by abundance of authority to the point that claims of patents should receive such interpretation as will enlarge or restrict them, so as to cover the actual invention when not absolutely inconsistent with the language used by the patentee. (*Winans* v. *Denmead*, 15 How., 330; *Van Martgr* v. *Miller*, 15 Blatchf., 562.) If, upon the one hand, the state of the art shows the invention to have been a narrow one, a strict interpretation will be given the claims. (*Manufacturing Co.* v. *Ladd*, 102 U. S., 408.) And it is of no practical consequence whether such restrictions are imposed by the Patent Office or not. (*Toepfer* v. *Goetz*, 41 O. G., 933.) If, upon the other hand, the patentee has taken a decided step in advance of the state of the art at the time his application was filed, the courts will, if possible, construe the language of his claim so as to give him the full benefit of his improvement. (*Turrill* v. *R. R. Co.*, 1 Wall., 491; *Rubber Co.* v. *Goodyear*, 9 Wall., 788.)

In the case under consideration Mr. Gray claimed broadly in his second original claim the combination of the stationary and movable rolls mounted in such a way that they could be adjusted both vertically and horizontally. In his third claim he limited himself only to "a roll mounted at its ends in arms or supports arranged" for vertical and horizontal adjustments. These claims were rejected in view of the Lake patent, and Gray thereupon re-formed and limited them. While, of course, we are bound to acquiesce in his action, we are not fully satisfied that he was not entitled to broader claims than he actually submitted to. Undoubtedly a horizontal adjustment was provided for in the Lake patent, and some of the drawings would indicate that a vertical adjustment was also possible; but there is some doubt as to whether it was such a vertical adjustment as is contemplated in the Gray patent. It is true that Lake in his preamble states that his invention—

> relates particularly to means for varying the relative heights of the axes of the rollers to each other, and also their relative horizontal distances;

but he also states that it was—

> for the purpose of producing a greater or less pressure of the one roller on the other,

and he further states that—

> the pressure of one roller upon the other depends upon the variations of the relative height of their axes to each other. This height may be altered according to the pressure required by displacing the block carrying the axle with the eccentric and by adjusting the set-screws arranged beneath the bearings of the adjustable roller.

In all the drawings of the Lake patent, where a vertical adjustment is provided for, it appears that the two rollers are not upon the same horizontal plane, but at an angle of 45 degrees, or less, to each other, and that the adjustment was intended to regulate the pressure of one upon the other, and not an adjustment for tramming, as provided in the Gray patent. It may be doubtful, however, whether this makes any difference in the principle, since it appears that there was provided an effective, though a somewhat primitive, means of vertical adjustment by a set-screw beneath the movable roller. But, conceding that in the matter of double adjustment Gray was anticipated by Lake, it is quite evident that his machine, at least so far as concerns the vertical adjustment, is decidedly in advance of the other, if such adjustment was not provided for a different purpose. The means used to accomplish these adjustments in the Gray patents are so unlike those employed by Lake that the questions of patentability, novelty, and superior utility can hardly be considered open ones. Indeed, their dissimilarity is such that it is quite immaterial to point out in detail the points of difference. About the only feature common to both is the use of a lever and an eccentric, though in Lake's patent they are used only for the purpose of horizontal adjustment, while in Gray's they are also used for vertical adjustment. Perhaps Gray was entitled to broader claims than he actually made; but at any rate we are satisfied that he is entitled to a liberal application of the doctrine of equivalents.

None of the devices claimed as anticipations, except that of Lake, show a combination of horizontal and vertical adjustment, although devices representing the different elements of plaintiff's combination are numerous. It is clear that his patent cannot be defeated by proof that part of his combination is found in one mechanism and part in another. (Walker on Patents, sec. 66; *Bates* v. *Coe*, 98 U. S., 48; *Parks* v. *Booth*, 102 U. S., 104.) Thus, the Dingler model for grinding paint shows three rolls, the middle one of which is fixed, and the outer ones movable horizontally by springs in the shape of a bow at each end of the rolls, connecting each movable bearing to a rod, which is also connected with an eccentric mounted upon a shaft. This device is not used for opening or adjusting the distance between the rolls, but merely for the purpose of keeping up a constant pressure of the two adjustable outer rolls against the fixed roll. There is no stop to prevent actual contact of the rolls and determine the grinding adjustment, the only object of the eccentric being to increase or diminish the pressure, as coarse or fine grinding is desired, but never to separate the rolls. In the Nagel and Kaemp patent there are means provided for simultaneous horizontal adjustment of the two ends of a movable roll by a yoke or bell-crank lever of the first order. Not only is there no vertical adjustment, but there are no means of adjusting the two ends of the movable roll separately, or adjusting for "tram," as it is called. The only adjustment possible is that of both ends of the roll simultaneously for grinding. Practically the same may be said of the Schacht machine, which also contains means for the simultaneous adjustment of the two ends of the movable roll, but no vertical adjustment, and of course no provision for tramming. In the Mechwart American Patent No. 251,124 there is a horizontal adjustment provided by means of a lever held in position by weights instead of springs, and in this arrangement it bears some resemblance to the Lake patent; but it appears to be but a clumsy contrivance as compared with the American machines. There is here also no arrangement for vertical adjustment. Indeed, while the practice of crushing wheat by roller action was adopted by American millers, the mechanism of the foreign mills for adjusting these rollers proved so clumsy and inadequate that the machines themselves speedily went out of use. In short, none of these prior patents, except Lake's, contain a suggestion of the underlying principle of plaintiff's patent, and are chiefly valuable as showing the extremely imperfect state of the art at the time Gray made his application. In the Lake patent there is, it is true, a provision for vertical as well as horizontal adjustment, sufficient probably to disentitle Gray to the broad claims of his original application; but it is very doubtful in our mind whether the Lake machine was ever intended or is susceptible of anything more than the regulation of the pressure, and his adjustments were accomplished by such rude devices, as compared with those of Gray, that we think his claims, unnecessarily restricted perhaps, are entitled to great liberality in construction.

Coming now to the question of infringement, we are compelled to analyze in some detail the elements of plaintiff's combination, and to compare them with corresponding features of defendant's machine. The second and third claims contain substantially four elements: (1) A roll; (2) upright or sustaining swinging arms at each end of the roll; (3) an eccentric vertically-adjustable pivot located at the lower end of the arm; (4) devices, substantially as shown, acting upon the upper end of the arm. The first two of these elements are undoubtedly contained in the Mawhood roller-mill, represented by defendant's machine, except that the swinging arm or lever of the Mawhood device is pivoted in its center instead of at its lower end; in other words, is a lever of the first instead of a lever of the second order. This is admitted by defendant's expert to be immaterial, as the different "orders of levers may be interchanged indiscriminately so far as the lever functions are concerned in modifying and converting motions." The third element is not exactly reproduced in defendant's machine. Instead of an eccentric adjustable pivot located at the lower end of the arm, there is a non-adjustable pivot located in the center of the arm midway between the ends, which means merely that his lever is of the first instead of the second order; while the adjustable pivot is contained at the outer end of the cross-arm, supporting the main arm which carries the roller. The operation of the two is practically identical. Indeed, the adjustable pivot might have been located in the main arm had the device regulating the grinding adjustment been located above instead of below the rollers. It is notable in this connection that Gray in the sixth and seventh figures of his drawings contemplated as an alternative of the devices shown in Figure 1 a lever pivoted in the middle, and operated at the outer end by a screw to elevate or depress the swinging arm D, located at the other end. It may be said in general that anything named by the patent as an equivalent will be so regarded by the court. (*Hayden* v. *Suffolk County*, 4 Fish., 86.) And while the defendant has not adopted the exact device suggested by Gray, we think the deviation too trifling to avoid the charge of infringement.

Before considering the parts of defendant's devices corresponding to the fourth element of Gray's second and third claims, it is desirable to analyze his fourth and fifth claims, which define more particularly the devices acting against the upper end of the arm. The fourth and fifth claims are for a combination of—(1) a movable roller-bearing; (2) the rod G; (3) an adjustable stop device to limit the inward movement of the bearing; (4) an outside spring urging the bearing inward; (5) means for adjusting the spring, and (6) a stop and holding device at the opposite end of the rod from the spring. There is no doubt the first two of these elements are also found in defendant's machine. It is true that in the Gray patent the rod G is located above, and in defendant's machine below, the rollers; but the location is not specified in the claim, and even if it were, it would be immaterial. The change of the location of an element in a combination, where there is no new function performed by such element in its new location, will not avoid the charge of infringement. (*Adams* v. *Gillette Manufacturing Co.*, 3 B. & A., I; *Ives* v. *Hamilton*, 92 U. S., 426; *Knox* v. *Great Western Co.*, 6 Saw., 430.) Nor is it of any great consequence that Gray's operated as a draw-rod to coerce the two devices together, while defendant's is a thrust-

rod operating in a different direction. (*Ives* v. *Hamilton*, 92 U. S., 296; *Rodebaugh* v. *Jackson*, 37 Fed. Rep., 882.) The third element—viz., the adjustable stop device to limit the inward movement of the bearing—is represented by the nut *l* of the Gray patent and by the nut *l* outside the spring in the Mawhood machine.

(4.) The outside spring urging the bearing inward is lettered H in both patents. What is meant by the term "outside spring" is somewhat uncertain. The expert See defines it as—

a spring located on the outer side of the thing it is intended to exert its operative pressure upon, as distinguished from a spring located on the inner side pressing outwardly against the thing which it is to exert its pressure upon.

Plaintiff's expert, Smith, considers the word "outside" as a word of description only, and not a word of limitation.

In the machine of the defendant the spring acts against the lower end of the bearing D. In order that the movable roll may be moved toward the fixed roll, or inward, the lower end of the bearing must be moved outward by the spring. In the machine of the patentee the spring acts against the upper end of the bearing, and in order that the roll may be urged inward, the upper end must be pressed inward by the spring.

However this may be, there is no doubt but that both springs operate alike to press the movable roll against the fixed roll, and that the different kinds of springs—as, for instance, those operated by contraction instead of expansion—are like the different orders of levers, mere matters of mechanical contrivance or of convenience or ease of construction. The object of the spring in both cases is to permit the movable roll to recede from the fixed roll whenever any foreign hard substance passes between them, so that the surfaces of the roll may not be damaged.

(5.) The means for adjusting the tension of the spring (the hand-nuts *j*) in both cases differ only in the fact that in plaintiff's machine this nut is located outside, and in the defendant's machine inside, the spring. Their operation is identical.

(6.) The stop and holding devices at the opposite ends of the rod G are an eccentric, shown in Fig. 8 in plaintiff's patent, operated in one case by a wheel and in the other by a lever.

In short, we regard defendant's entire machine as simply a rearrangement of the Gray combination for the obvious purpose of an attempt to avoid his patent. The result attained by both combinations is the same. The means adopted to attain such result differ only in the location of the several elements and such dependent differences as are made necessary by such change of location. As we had occasion to observe in *Rodebaugh* v. *Jackson*, the rearrangement of an old combination, where each element operates practically as before, is not patentable unless a new or greatly improved result is obtained. (Walker on Patents, sec. 41; *Woodward* v. *Dunsmore*, 4 Fish., 163, 169.)

THE DOWLING PATENT.

Plaintiff also claims for an infringement of the first, third, and fourth claims of the Dowling patent. The fourth claim contains the clearest statement of the combination, and is the only one which is necessary to be considered. It reads as follows:

4. In a grinding-mill, the combination of two grinding-rolls, the feed-roll above the same, a hopper above the feed roll, and a toothed agitator centrally located within the hopper and extending lengthwise above the feed-roll, and mechanism for reciprocating said agitator in a lengthwise direction.

The prominent feature of this combination is the centrally-located agitator, introduced for stirring up the material, and thereby keeping a continuous and uniform flow. The tendency of the material is to bank up or bridge over in the hopper when soft. This reciprocating comb prevents the bridging of the material by working out the center and permitting the loosened material to fall on the feed-roll. This impediment in the flow is most liable to occur in the reductions of the wheat after the first reduction, of which there are usually six or seven. It is also liable to occur in the soft material incident to finishing the middlings reductions. Agitators of this description for the purpose of breaking up lumps in such material as plaster, ashes, lime, or manure are not uncommon, and their mode of operation is practically the same. In Caine's patents, Nos. 78,423 and 137,051, for an improved machine for sewing fertilizers and seeds, there is shown a revolving stirrer E corresponding to the Dowling feed-roll D, and a reciprocating agitator F, having saw-like teeth on its lower edge, resting on or near the feed-roller. The rod of this agitator is reciprocated by a cam, substantially in the same manner as the plaintiff's. It is true this agitator is not centrally located within the hopper, but lies flat against one of its sides. But the patent to T. J. West, No. 100,573, has an adjuster which is centrally located in a machine for sowing fertilizers, and the patent to H. E. Keeler, No. 254,140, shows a similar device similarly located in a fanning-mill. Like devices are shown in other patents offered in evidence. In short, Dowling's combination of the two grinding-rolls, the feed-roll above the same, a hopper above the feed-roll, (used in all roller-mills,) and the toothed agitator of the Caine, West, Keeler, and Mahaffy patents centrally located as in the West and Keeler patents, and the mechanism for reciprocating such agitator in a lengthwise direction is but an aggregation of old elements adapted to a new machine, but producing practically the same results. We do not think that any invention is involved in putting these devices together and placing them in the hopper of a flouring-mill.

THE MARMON PATENT.

Plaintiff also claims an infringement of the first, second, and third claims of the Marmon patent, the first of which only it is necessary to notice. It reads as follows:

1. The combination, in a roller-mill, of the supporting framework, the roll-shafts, a counter-shaft extending from end to end of the machine substantially parallel with said roll-shafts, pulleys on several shafts, belts connecting the same, and means for adjusting both ends of said counter-shaft simultaneously, whereby the belts at both ends of the machine are tightened or loosened at one operation, substantially as set forth.

This claim consists of six elements, viz: (1.) The supporting-frame, which is a rigid casting in one piece, supporting all four grinding-rolls and a counter-shaft. (2.) The roll-shafts. (3.) A counter-shaft extending from end to end of the machine substantially parallel with the roll-shafts, receiving motion at one end from the main driving-belt, and communicating the motion to one roll of each pair at the other end. (4.) Pulleys on the roll-shafts and counter-shafts. (5.) Belts on the roll and counter shaft pulleys, arranged to give reversed and differential movement to the two rolls of each pair. (6.) Means substantially such as described for simultaneously adjusting both ends of the counter-shaft, by which means all the roll-belts may be tightened or loosened by one operation; and of which means

a great variety is shown in the drawings accompanying the patent.

As Gray's prior patent, No. 228,525, is admitted to contain the first five of these elements, the only question is whether the sixth element—viz., means for adjusting simultaneously both ends of the counter-shaft—is found in prior patents. It will be noticed that the patentee claims, broadly, any means of simultaneously adjusting both ends of the counter-shaft, and not specific devices for so doing, and the drawings accompanying his patent show twelve different devices for that purpose, which are thereby made equivalents of one another. It follows that if the defendant would be guilty of infringement by using any means of simultaneous adjustment, plaintiff's patent would also be anticipated by the prior use of any such means. Means for the independent adjustment of each end of such counter-shaft are admitted to be found in Gray's patent, No. 228,525. While defendant's testimony has failed to establish a case of the simultaneous adjustment of both ends of a counter-shaft, there is shown in the Lane and Bodley saw-mill a device for moving both ends of a shaft for carrying a circular saw, for the purpose of tightening and loosening the belts, a similar device in Clark's patent, No. 174,719, for a coal-breaker, and in the Odell patent, No. 250,954, there is shown a roller-mill containing a device for simultaneous adjustment of two short shafts carrying pulleys, each revolving in an opposite direction. The means adopted are not dissimilar, and, in our opinion, there is nothing beyond mere mechanical skill required in applying these means to the counter-shaft of a roller-mill. We agree with the defendant's expert that it does not call for the exercise of inventive faculty. (*Aron* v. *Manhattan Railway Co.*, 26 Fed. Rep., 314.) Beyond this, however, there is produced a prior patent to Marmon and one Warrington, dated October 10, 1882, or about six weeks before the filing of the application for the Marmon patent, in which the same adjusting devices shown in Fig. 20 of the Marmon patent are employed. This construction is made the subject-matter of the twelfth claim of the Marmon and Warrington patent in the following language:

12. The combination, with the counter-shaft M, of an adjusting mechanism consisting of the devices N, the rods O, and mechanism connecting said rods together, whereby they are operated simultaneously, all substantially as set forth.

The construction and operations of the corresponding parts in the two patents are substantially the same and the result produced by their action is the same. It is true that Marmon in the patent under consideration does not limit himself to any particular means for the simultaneous adjustment of the two ends of the counter-shaft, but he exhibits twelve different devices for such purpose, which are thereby made mechanical equivalents each of the other. If this be so, then it would follow that his patent will be anticipated by the use of any one of these equivalents in the prior patent to Marmon and Warrington, since a patentee making use of any mechanical equivalent of the Marmon and Warrington combination would be equally liable as an infringer as if he made use of the special device therein set forth. Upon the face of these two patents there appears to be an anticipation of the claim sued upon in this case. Plaintiff, however, seeks to avoid the force of this by showing that Marmon and Warrington, the original patentees, conceded priority of invention to Marmon of the device in question. It appears from the file wrapper and contents of the Marmon patent, that in his application Marmon stated that—

many of the devices and combinations shown and described herein are the invention of Jesse Warrington, or the joint invention of said Warrington and myself. They are therefore, of course, not claimed in this application, but are made the subject-matter of other applications for Letters Patent, either pending or in course of preparation. I regard myself, however, as the first inventor of a roller-mill having a counter-shaft extending from end to end of the mill parallel with the roll-shafts and simultaneously adjustable as a whole toward or from the roll-shafts. I therefore intend to claim the above invention broadly in this application, together with the specific means shown in the principal drawings, leaving the other constructions to be covered specifically by the other Letters Patent, the applications for which have been made or may be made either by himself or by others.

There seems to have been some effort made to have the Marmon patent advanced and passed upon before the Marmon and Warrington patent; but this does not seem to have been done, since the Marmon and Warrington patent seems to have been issued before the correspondence on this subject took place. On December 22, 1882, the examiner writes to Marmon's attorney, refusing claims 1, 2, and 3 of his patent, and stating that—

an applicant cannot receive protection in a separate application for matter which was described, claimed, sworn to jointly by himself and another, and jointly patented prior to the filing of the subsequent application. Whatever rights the present applicant may have had solely for broad claims on the driving mechanism should have received protection prior to the filing of the application; or the right to apply for broader claims subsequently might have been saved by an express reservation in said patent.

In reply to this the attorney wrote that there was no dispute between the parties as to the matter of invention; that "each is preparing further applications which will show just what each is entitled to separately and what jointly with the other, and the proper steps will be taken to put the record in shape so the objection urged by the examiner will be overcome," and at the same time he forwarded to the Patent Office a concession on the part of Marmon and Warrington of priority of invention to Marmon of the device for simultaneous adjustment. This was stated by the examiner not to be "sufficient to warrant the Office in issuing two patents for the same invention—a joint patent to two parties and a separate patent to one of them," and how the second patent came to be issued does not clearly appear by the record. There is nothing before us to show that the first patent was ever canceled or reissued, nor do we see how a mere concession of priority from one patentee to a later applicant, after the prior patent had been issued, could be binding as against infringers. Indeed, we are unable to see upon what theory this concession and correspondence is admissible at all. If the first patent is valid, then any infringer could be prosecuted under it at any time within seventeen years from the time the patent was issued; and if the second patent, which was issued nearly six months after the first, be also valid, infringements could also be prosecuted at any time within seventeen years from the time that was issued, so that the monopoly of the invention might thus be indefinitely extended. No one can have two patents for the same device, either as joint inventors or as sole inventor. No one can take out a patent, either jointly or severally, for an invention, and after the patent is issued, without reservation in his origi-

nal application, obtain a second patent with broader claims for the same device. The authorities upon this point are numerous and conclusive. (*Sickles* v. *Falls Company*, 4 Blatchf., 508; *O'Reilly* v. *Morse*, 15 How., 62; *Odiorne* v. *Amesbury Nail Factory*, 1 Robb., 300; *Smith* v. *Ely*, 5 McLean, 76; *James* v. *Campbell*, 104 U. S., 356.)

If there be anything in defendant's point that plaintiff's remedy is at law, the objection comes too late to be of any service. If such want of jurisdiction appears upon the face of the bill, it should be taken advantage of by demurrer. (*Clark* v. *Flint*, 22 Pick., 231; *Ludlow* v. *Simond*, 4 Caine's, 60, 40, 56; *Underhill* v. *Van Courtland*, 2 John's Ch., 369: *Pierpont* v. *Fowle*, 2 W. & M., 35; *Frandin* v. *LeRoy*, 2 Paige, 509.) If not, it should be set up by plea or answer and called to the attention of the court at the earliest opportunity. (*Roberdeau* v. *Rous*, 1 Atk., 543; *Bank* v. *R. R. Co.*, 28 Vt., 470; *Livingstone* v. *Livingstone*, 4 John's Ch., 287.) The objection cannot be taken at the hearing. (*Niles* v. *Williams*, 24 Conn., 279.)

It would be a great hardship in a case like this where the parties have spent many years of time and many thousands in money preparing for a hearing upon the merits to deny the plaintiff relief upon the ground that it should have resorted to a court of law.

It results from this that the plaintiff is entitled to a decree for an injunction, and the usual reference to a master to assess damages upon the Gray patent, and that the defendant is entitled also to have inserted therein a clause dismissing the bill as to the Dowling and Marmon patents.

U. S. Circuit Court—District of Massachusetts.

LOW *v.* BARSTOW STOVE COMPANY. LOW *v.* MAGEE FURNACE COMPANY.

Decided December 10, 1888.

LOW—TILE DECORATION.

Letters Patent No. 336,242 and 336,243, both granted to John G. Low February 16, 1886, for tile decoration, declared void for want of invention.

Mr. Thomas Wm. Clarke for the complainant.

Mr. David A. Burr for the defendants.

COLT, *J.*:

These suits are brought on two Letters Patent granted February 16, 1886, to the complainant, John G. Low, for improvements in the art of tile decoration. The claim in Patent No. 336,243 is as follows:

As an improvement in the art of decorating metallic or other surfaces, a medallion tile formed with a rabbet upon its edge, and glazed into the rabbet, in combination with a perforated plate suited to the contour of the projecting medallion, and with suitable backing to the tile attached to said perforated plate, substantially as and for the purposes described.

The claim in Patent No. 336,242 is as follows:

An improvement in the art of decorating surfaces to be ornamented, consisting in applying thereto by pins or screws passing through holes in the tile ornamental tiles of appropriate patterns and glazed to their bases, substantially as and for the purpose described.

The main defense to these patents is want of invention. I have carefully considered all that has been urged in support of the validity of these patents, and I am unable to find any invention in them in view of the prior state of the art. Both of the patents may describe tiles which present a very pleasing and artistic appearance to the eye; but it does not follow from this that it required in the sense of the patent law the exercise of the inventive faculty to produce them. The improvement described in Patent No. 336,243 consists in making the tile medallion in form with a rabbet upon its edge and glazed into the rabbet, in combination with a perforated plate and backing to attach the tile to the plate. Now, it is proved beyond question that a square tile formed with a rabbet and glazed into the rabbet, in combination with a perforated plate and suitable backing, was in use at the time Low made his alleged invention. It may also be said that a round medallion without the rabbeted edge was old at this time. Under these circumstances the changing of a square tile with a rabbeted edge to a round or medallion tile with a rabbeted edge involved no such exercise of the inventive faculty as entitles the party to a patent under the law.

As for Patent No. 336,242, the claim appears to be broad enough to cover any ornamental tiles glazed to their bases through which are applied pins or screws; but the complainant contends that this claim is limited by the specification and drawings to rosette tiles perforated through their geometrical center attached with round-headed screws or pins which harmonize with the rosette. But as thus limited the claim is manifestly void for want of invention. It was old in the art to attach porcelain or earthen knobs and shields of various forms, glazed to their base, to articles by means of screws or pins passing through holes in their center or upon their sides. In view of this there was no inventive skill required to decorate a surface by applying thereto a perforated rosette tile glazed to its base and secured by a pin or screw passing through a hole in its center or elsewhere. For these reasons and without entering upon the other defenses raised, the bills should be dismissed.

Bills dismissed.

U. S. Circuit Court—Northern District of Illinois.

COLEMAN HARDWARE COMPANY *et al. v.* KELLOGG, JOHNSON & BLISS *et al.*

Decided May 27, 1889.

SHUMARD—SASH-BALANCE.

The novel feature of Letters Patent No. 285,079, granted September 18, 1883, to Warren Shumard, for an improvement in sash-balances, is a brake so arranged as to be adjustable from the outside; and the second and third claims of this patent are infringed by a sash-balance having a band-brake bearing on the periphery of the drum.

Messrs. Banning & Banning & Payson for the complainants.

Mr. George P. Barton for the defendants.

BLODGETT, *J.*:

This is a motion for an injunction to restrain the infringement by defendant of a patent granted September 18, 1883, to Warren Shumard, for a sash-balance.

The device covered by this patent is what is known as a "spring-balance" for a window-sash, instead of the ordinary pulley-balance. The proof now before me shows that this class of devices is not new, one of the patents cited having been issued in 1856; but the feature in the complainants' patent which seems to me to be new and meritorious is the brake so arranged that it is adjustable from the outside. Defendants' patent also shows a brake adjustable from the outside, and differing only from the complainants' in the fact that it is what is known as a "band-brake" bearing upon the periphery of the drum, while complainants' brake is the ordinary brake-shoe bearing upon the periphery of the drum, and the pressure secured by a spring. There is no essential difference in the function of the two brakes; but the band-brake was a well-known equivalent for a spring-brake like the complainants' at the time complainants' patent was issued. I think, therefore, as at present advised from the proof before me, that the difference, so far as the brake is concerned, between complainants' and defendants' device is merely colorable, and that defendants infringe upon this feature of complainants' patent, and possibly upon other features.

An injunction will therefore be ordered according to the prayer of the bill,

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth	$10 00
INDEX TO ITALIAN PATENTS, 1868 to May 1, 1882, (subject-matter,) one volume, 120 pages—

DESIGNS.

19,206.—SURFACE ORNAMENTATION OF SHEET-GLASS.—*Anthony D. Brogan* and *Andrew M. Malloch*, Firhill, Glasgow, county of Lanark, Scotland. Application filed June 17, 1889. Serial No. 314,653. Term of patent 14 years.

19,207.—EXTERIOR OF A COUNTRY HOUSE.—*Antoine Lacroix, Jr.*, Brooklyn, N. Y. Application filed June 8, 1889. Serial No. 313,610. Term of patent 7 years.

19,208.—CARPET.—*John S. Lamond* and *Colin T. Robertson*, Paterson, N. J. Application filed November 23, 1888. Serial No. 291,722. Term of patent 3½ years.

19,209.—GLASSWARE.—*Thomas W. Mellor*, Philadelphia, Pa., assignor to *Gillinder & Sons*, same place. Application filed June 1, 1889. Serial No. 312,933. Term of patent 14 years.

19,210 and 19,211.—SPOON, FORK, OR OTHER TABLE UTENSIL.—*Edward C. Moore*, Yonkers, assignor to *Tiffany & Company*, New York, N. Y. Applications filed May 24, 1889. Serial Nos. 312,005 and 312,006. Term of patents 14 years.

19,212.—SPOON OR FORK HANDLE.—*William Rogers*, Hartford, Conn. Application filed April 23, 1889. Serial No. 308,337. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,808.—BRUSHES.—*Louis Alfred Emile Robert*, Méru, Oise, France. Application filed May 29, 1889. Used since March 15, 1888.

"The representation of a balloon."

16,809.—NATURAL MINERAL WATER, ITS SALTS, AND COMPOUNDS CONTAINING THE SAME.—*The Apollinaris Company, (Limited,)* London, England. Application filed June 11, 1889. Used since April 4, 1885.

"The words 'DOUBLE TRIANGLE MARK.'"

16,810.—NATURAL MINERAL WATER, ITS SALTS, AND COMPOUNDS CONTAINING THE SAME.—*The Apollinaris Company, (Limited,)* London, England. Application filed June 11, 1889. Used since May 15, 1885.

"The words 'DISC MARK.'"

16,811.—NATURAL MINERAL WATER, ITS SALTS, AND COMPOUNDS CONTAINING THE SAME.—*The Apollinaris Company, (Limited,)* London, England. Application filed June 11, 1889. Used since April 4, 1885.

"The words 'TRIANGLE MARK.'"

16,812.—NATURAL MINERAL WATER, ITS SALTS, AND COMPOUNDS CONTAINING THE SAME.—*The Apollinaris Company, (Limited,)* London, England. Application filed June 11, 1889. Used since April 4, 1885.

"The words 'DIAMOND MARK.'"

16,813.—MINERAL WATER.—*The Apollinaris Company, (Limited,)* London, England. Application filed April 11, 1889. Used since March, 1880.

"A narrow oblong neck-label of orange or yellow color."

16,814.—BEER.—*J. & P. Baltz Brewing Company*, Philadelphia, Pa. Application filed April 11, 1889. Used since 1881.

"The representation of a barrel lying on a rack, with 'J. & P. B.' across its head, and a barrel standing behind, the whole surrounded by clusters of hop-vines and grain."

16,815.—MIXED PAINTS AND VARNISHES.—*Baum & Co.*, Spokane Falls, Wash. Ter. Application filed March 19, 1889. Used since February 1, 1889.

"The capital letter 'B' set diagonally in a square frame."

16,816.—PREPARATION FOR THE CURE OF YELLOW FEVER.—*William Condory*, Baltimore, Md. Application find June 17, 1889. Used since May, 1880.

"The phrase 'DR. CONDORY'S AQUA-TERRA.'"

16,817.—DYSPEPSIA-PILLS.—*James A. Deane*, Catskill, N. Y. Application filed July 20, 1888. Used since June 1, 1888.

"The letter 'D,' with the upper bar containing 'DR.,' the left-hand upright bar containing a 'D,' the right-hand upright bar a 'D' also, and the lower bar the letter 'P.'"

16,818.—CHEMICALS AND DRUGS TO PRODUCE LAXATIVE EFFECTS.—*The Doctor Thorpe Medicine Company*, New York, N. Y. Application filed May 27, 1889. Used since April 15, 1889.

"The word-symbol 'FRUITILAXI,' associated with the picture of a sheep."

16,819.—TONIC AND STIMULANT, A CLEANSER AND PURIFIER, AND A BALM FOR THE SKIN.—*Charlotte E. Draper*, New York, N. Y. Application filed June 4, 1889. Used since November, 1888.

"The word 'ARLESIAN.'"

16,820.—WATER-PROOF COMPOUNDS FOR PULLEY-BELTS.—*James H. Faulkner*, Gastonia, N. C. Application filed May 14, 1889. Used since January, 1889.

"The representation of a pair of pulleys connected by a belt."

16,821.—MEDICINAL PREPARATION IN THE FORM OF PASTILS FOR CURING UTERINE DISEASES.—*Watson A. France*, Columbus, Ohio. Application filed April 15, 1889. Used since January 1, 1889.

"The words 'OLIVE BLOSSOM.'"

16,822.—SPECIFICS FOR RHEUMATIC, NEURALGIC, AND SCROFULOUS DISORDERS AND THEIR RELATED DISEASES.—*Samuel French*, London, England, and New York, N. Y. Application filed June 4, 1889. Used since February, 1889.

"The word-symbol 'KOPTICA.'"

16,823.—MEDICAL BEVERAGES FROM THE SODA-FOUNTAIN AND TONICS FOR THE STOMACH AND FOR THE NERVOUS SYSTEM.—*Edward W. Healy*, Chicago, Ill. Application filed July 26, 1888. Used since June 24, 1888.

"The word 'ZOZONE.'"

16,824.—MEDICINES OF HISTOGENETIC CHARACTER.—*J. Eugene Jordan*, Seattle, Wash. Ter. Application filed June 19, 1889. Used since March 1, 1888.

"The picture of a phenix with the word 'HISTOGENETIC' across the body and outstretched wings."

16,825.—WALL-FINISHES, PLASTIC COMPOUNDS, AND CEMENT.—*J. B. King & Co.*, of New York, N. Y. Application filed June 13, 1889. Used since 1870.

"The word 'WINDSOR.'"

16,826.—SPICED FOOD FOR CATTLE.—*Thomas Myers*, Liverpool, county of Lancaster, England. Application filed June 18, 1889. Used since August 13, 1865.

"The words 'MYERS FOOD' and a portrait of the registrant."

16,827.—REMEDY FOR RHEUMATISM AND GOUT.—*Bryan G. McSwyny*, New York, N. Y. Application filed March 6, 1889. Used since October 2, 1888.

"The words 'SIR DOMINIC CORRIGAN, M. D., OF DUBLIN, IRELAND, RHEUMATIC AND GOUT REMEDY.'"

16,828.—STICKY FLY-PAPER.—*The National Fly Paper Company*, Cincinnati, Ohio. Application filed May 25, 1889. Used since December 1, 1888.

"The words 'SPIDER WEB' and the representation of a spider's web."

16,829.—MEDICINES TO PREVENT UNNATURAL ACCUMULATION OF FLESH.—*Florence Potter*, New York, N. Y. Application filed May 27, 1889. Used since May 10, 1889.

"The word-symbol 'BONA FORMA.'"

16,830.—MEDICINES FOR STOMACH AND BOWEL DIFFICULTIES.—*Alfred J. Rankin*, Pittsburg, Pa. Application filed April 6, 1889. Used since July, 1883.

"The words 'MINTED GINGER.'"

16,831.—PARASOLS AND UMBRELLAS.—*F. Revel Père et Fils*, Lyons, France. Application filed May 1, 1889. Used since April, 1885.

"The word 'SOLIDOR.'"

16,832.—MEDICINE IN THE NATURE OF A SIRUP FOR CERTAIN DISEASES NAMED.—*De Forest W. Saxe*, Omaha, Nebr. Application filed June 18, 1889. Used since May 1, 1889.

"The word 'PHOSPHO-GUARANA.'"

16,833.—WRITING AND PRINTING PAPER.—*Charles L. Seeger*, New York, N. Y. Application filed May 11, 1889. Used since March 19, 1889.

"The representation of the shield and pen combined."

16,834.—REMEDY FOR RHEUMATISM AND LIKE DISEASES.—*John A. Smith*, South Bend, Ind. Application filed May 29, 1889. Used since April 1, 1889.

"The word 'GLORIA.'"

16,835.—LIQUID MEDICINE TO CURE RHEUMATISM.—*Carrie Wertheim*, New York, N. Y. Application filed May 11, 1889. Used since January 20, 1889.

"The words 'AUNTY CARRIES RHEUMKEENE' and the representation of an athlete or gladiator."

LABELS.

5,966.—Title: "AVERBECK'S BIRCH BEER."—*Max J. Averbeck*, Youngstown, Ohio. Application filed June 19, 1889.

5,967.—Title: "AVERBECK'S BIRCH BEER."—*Max J. Averbeck*, Youngstown, Ohio. Application filed June 19, 1889.

5,968.—Title: "WARRANTED FAST COLORS," (FOR COTTON GOODS.)—*Samuel A. Crozer & Son*, Upland, Pa. Application filed May 13, 1889.

5,969.—Title: "1-7 BALL PUZZLE."—*Lou Mortimer*, New York, N. Y. Application filed April 19, 1889.

5,970.—Title: "WOODRUFF'S CATARRH SNUFF."—*Scott & Co.*, Toledo, Ohio. Application filed April 13, 1889.

5,971.—Title: "BAY SIDE," (FOR PRINTED WOOLEN GOODS.)—*Union Print Works*, New York, N. Y. Application filed May 29, 1889.

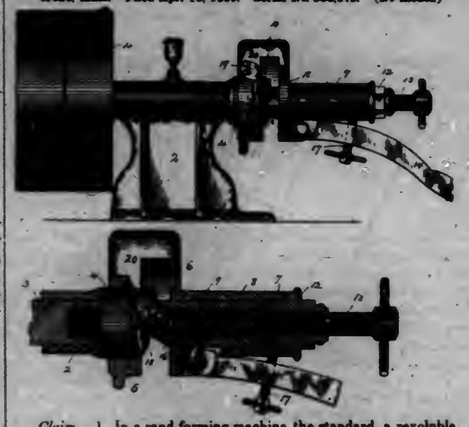
5,972.—Title: "YOUNG'S HEADACHE TABLETS."—*Martin B. Young*, Philadelphia, Pa. Application filed May 13, 1889.

PATENTS

GRANTED JULY 16, 1889.

406,864. **HORSE HAY-RAKE.** HORACE A. ALDEN, Peoria, Ill., assignor to the Acme Hay Harvester Company, same place. Filed Apr. 27, 1888. Serial No. 272,011. (No model.)

Claim.—1. In a horse hay-rake, the combination, with a rake-head having forwardly-projecting teeth and a seat-frame at the rear thereof and hinged with respect thereto, of a shifting-rod in connection with the rake-head, a ratchet-plate at the rear end of said shifting-rod, an operating-lever for effecting the forward and backward movement of the shifting-rod, a pawl carried by said operating-lever for engagement with said ratchet-plate, a spring sustained by and movable with said operating-lever for forcing said pawl into engagement with said ratchet-plate, and a suitable releasing device sustained by said operating-lever, whereby said pawl may be forced out of engagement with said ratchet-plate, substantially as described.



2. In a horse hay-rake, the combination, with a rake-head having forwardly-projecting teeth and a seat-frame at the rear thereof and hinged with respect thereto, of a shifting-rod in connection with said rake-head, an operating-lever for effecting the forward and backward movement of said shifting-rod, a ratchet-plate at the rear end of said shifting-rod, a pawl on the operating-lever for engagement with said ratchet-plate, a spring for forcing said pawl into engagement with said ratchet-plate, and a releasing device for said pawl, comprising a wedge-plate for lifting and holding said pawl and a lever for moving said wedge-plate, substantially as described.

3. In a horse hay-rake, the combination, with a rake-head having forwardly-projecting teeth and a seat-frame at the rear thereof and hinged with respect thereto, of a shifting-rod connected with said rake-head, an operating-lever for controlling the forward and backward movement of said shifting-rod, a ratchet-plate at the rear end of said shifting-rod, a slide-block pivotally connected to the operating-lever and through which said ratchet-plate slides, a pawl for engagement with said ratchet-plate, and a releasing device for said pawl, substantially as described.

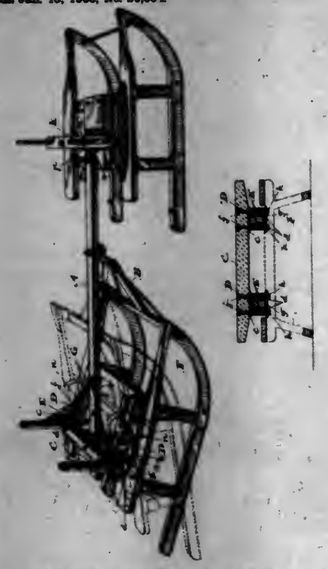
4. In a horse hay-rake, the combination, with a rake-head having forwardly-projecting teeth and a seat-frame at the rear thereof and hinged with respect thereto, of a shifting-rod connected with said rake-head, a ratchet-plate at the rear end of said shifting-rod, a pawl for engagement with said ratchet-plate, a releasing device for said pawl, a slide-block for sustaining said ratchet-plate and pawl, an operating-lever whereon said slide-block is pivotally held, and a draw-bolt and ratchet-plate for determining the position of said operating-lever, substantially as described.

5. In a horse hay-rake, the combination, with a rake-head having forwardly-projecting teeth and a seat-frame at the rear thereof and hinged with respect thereto, and a shifting-rod in pivotal connection with said rake-head, of an operating-lever for controlling the forward and backward movement of said shifting-rod, a ratchet-plate at the end of said shifting-rod, a slide-block pivotally connected to the operating-lever and through which said ratchet-plate slides, a pawl for engagement with said ratchet-plate and sustained by said slide-block, and a releasing-lever pivotally connected with said slide-block, the shorter end of said releasing-lever being provided with suitable means for throwing said pawl out of engagement with the ratchet-plate, substantially as described.

406,865. **RAND-FORMING MACHINE.** FRANCIS P. ARNOLD, Pembroke, Mass. Filed Apr. 10, 1889. Serial No. 306,675. (No model.)

Claim.—1. In a rand-forming machine, the standard, a revoluble arbor, and a removable toothed head thereon, combined with a sleeve-bracket separable from the standard, a hollow spindle axially aligned with the arbor, the presser-block upon said spindle, and means for controlling pressure upon the presser-block, as likewise means—namely, a screw-actuated lever—to effect its endwise travel, substantially as herein described.

2. The combination, with a radially-toothed revoluble head, a presser-block co-operating therewith, and the hollow spindle which carries said block, of the spring actuating said spindle and block and the lever with its prong which engages said spindle to control the endwise movement of the block, substantially as and for the purposes herein stated.



3. In rand-forming machines, a revoluble head 4, having radially-divergent teeth, the co-operating spring presser-block 10, adjustable with respect thereto, the standard 2, and its separable bracket 6, composed of the sleeve 7 and boss 20, combined with the lever 14, its actuating-screw 17, the screw 13, to regulate the pressure, and the throw-off plate 19 upon the bracket, substantially as herein specified.

406,866. **CARPET-FASTENER.** HIRAM W. ATWATER, Rochelle, Ill. Filed Mar. 26, 1889. Serial No. 304,778. (No model.)

Claim.—The combination, with the carpet-fastener bent at its middle to form an eye and at its ends to form upriving prongs, of a tack or screw inserted in said eye to secure the fastener in position, and a staple straddling the branches of said fastener between the eye and the prongs to relieve the strain upon said tack or screw and to prevent the carpet from sliding beneath the fastener, substantially as set forth.

406,867. BOB-SLEIGH. GEORGE A. RAIN, Woodstock, Ontario Canada. Filed Dec. 1, 1888. Serial No. 292,369. (No model.) Patented in Canada Jan. 13, 1888, No. 26,354.

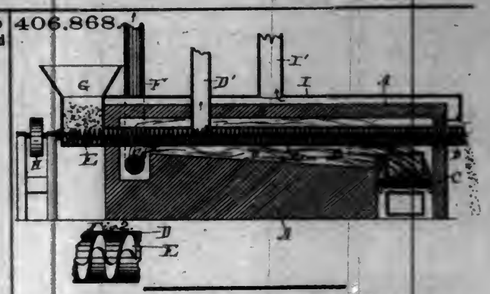
Claim.—1. In a double bob-sleigh, the rear bob provided with curved bearing-blocks for the rear bolster to rest on, the said bearing-blocks being so shaped that they may slide freely under the rear bolster, which is rigidly attached to the long reach, and through sleeves formed below the said bolster, a short reach pivotally attached to the long reach and to the rear bob, and the long reach pivotally attached at its front end to the front bolster by means of eyebolt and swivel, substantially as specified.

2. In a double bob-sleigh, the rear bob pivotally attached to the long reach by a short reach, having bearing-blocks so shaped as to be adapted to slide through sleeves formed under the rear bolster with a surface practically parallel and adjacent to the bottom of the rear bolster, which is rigidly attached to the long reach, substantially as described and specified.

3. In a double bob-sleigh, the long reach attached to the front bolster on the front bob by means of eyebolt and swivel connected therewith, in combination with a rear bolster rigidly attached to the long reach and provided with sleeves formed on its under side, through which curved bearing-blocks formed on the rear bob are adapted to slide under the rocking of the bob, so as to present at all times surfaces practically parallel to the bottom of the rear bolster, substantially as specified.

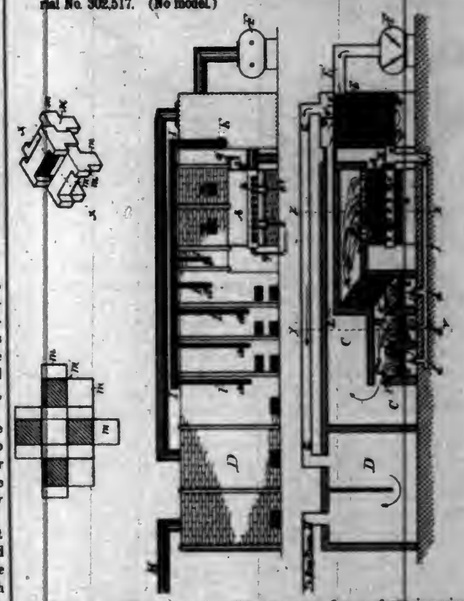
4. In a double bob-sleigh, the combination of long reach A, the bifurcated rod G, bolted to the long reach and having hooked ends adapted to engage in holes *b* in the plate *c*, the rear bolster C, plates *e*, bolts *f*, thimbles *d*, clip *g*, nuts *h*, and curved bearing-blocks D, having the curved metal plates *n* and formed on the rear bob F, substantially as specified.

5. In a double bob-sleigh, the combination of the long reach A and swivel *m*, pivotally attached thereto, the curved plate *p*, rigidly attached to the front bolster H, and eyebolt *o*, connecting the swivel with the curved plate *p*, substantially as specified.



6. In a double bob-sleigh, the combination, with the rear bolster C, of the bolts *f*, metal plate *c*, thimbles *d*, clip *g*, nuts *h*, plates *n*, and curved bearing-blocks D, attached to the rear bob, substantially as specified.

7. In a double bob-sleigh, curved bearing-pieces attached to the rear bob and so shaped as to be adapted to slide under the pitching of the bob when passing over uneven ground, so as to present even surfaces to the adjacent surfaces of the rear bolster, substantially as specified.



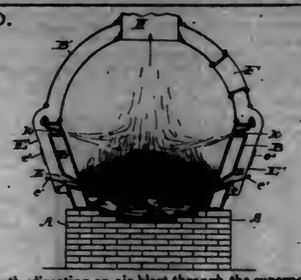
406,868. PROCESS OF REFINING FUMES. FRANK L. BARTLETT, Portland, Me. Filed Aug. 23, 1888. Serial No. 283,568. (No model.)

Claim.—The herein-described process of refining fume, which consists in passing it through a heated tube in the presence of air and continually stirring and scraping it from the walls of said tube during its passage, substantially as described.

406,868.

406,869. PROCESS OF MANUFACTURING PIGMENTS. FRANK L. BARTLETT, Portland, Me. Original application filed Sept. 15, 1887, Serial No. 249,775. Divided and this application filed Mar. 8, 1889. Serial No. 302,517. (No model.)

Claim.—1. The herein-described process of manufacturing pigment, which consists in mixing the ores of lead, zinc, or antimony with carbon, subjecting the mixture to an air-blast in a suitable furnace, then successively supplying air to the fumes thus produced, bringing them into contact with incandescent fire-clay or other refractory material, subjecting them to the action of an oxidizing-flame, then suddenly cooling them, substantially as shown.



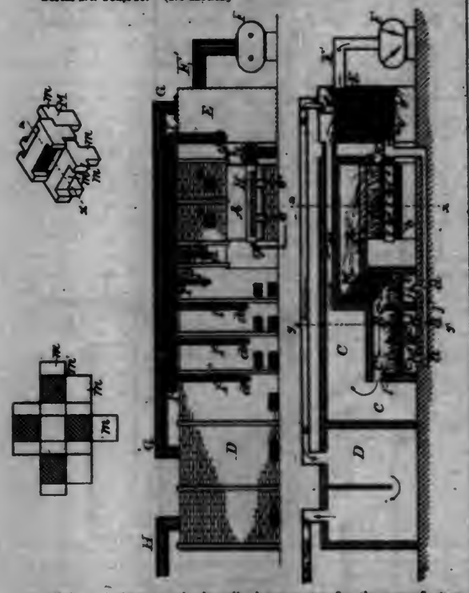
2. The herein-described process of manufacturing pigment, which consists of mixing the ores of lead, antimony, or zinc with carbon, subjecting the mixture to an air-blast in a suitable furnace, then successively supplying air to the fumes thus produced, bringing them into contact with incandescent fire-clay or other refractory material, subjecting them to the action of an oxidizing-flame, and finally collecting them, substantially as shown.

3. The herein-described process of manufacturing pigment, which consists in mixing the ores of lead, zinc, or antimony with carbon, subjecting the mixture to an air-blast in a suitable furnace, then successively supplying air to the fumes thus produced, bringing them into contact with incandescent fire-clay or other refractory material, subjecting them to the action of an oxidizing-flame, withdrawing said oxidizing-flame after the apparatus becomes heated through, then suddenly cooling them when in a highly-heated state, and finally collecting them, substantially as shown.

406,870. PROCESS OF SMELTING ORES. FRANK L. BARTLETT, Portland, Me. Filed Mar. 8, 1889. Serial No. 302,518. (No model.)

Claim.—1. The herein-described process of treating ores containing zinc, sulphur, and other volatile metals, which consists in burning the ore mixed with fuel in a suitable furnace, whereby the non-volatile metals and a portion of the zinc, sulphur, &c., settle down and form

406,870.



a scorifying-bath, directing an air-blast through the superposed mass of unfused ore and fuel down onto the surface of said bath to volatilize the volatile metals, and directing an air-blast at or near the top of the body of ore to prevent the condensation of said zinc and sulphur, substantially as described.

2. The herein-described method of treating ores of the kind described, which consists of burning the ore mixed with fuel in a suitable furnace, whereby the non-volatile and a portion of the volatile metal are fused and form a scorifying-bath, directing an air-blast through the superposed mass of unfused ore and fuel down onto the surface of said bath to volatilize the volatile metals, and keeping up the heat in the unfused ore to prevent condensation of said volatile metals, substantially as described.

3. The herein-described method of treating ores of the kind described, which consists in burning the ore mixed with fuel in a suitable furnace, whereby the non-volatile and a portion of the volatile metals are fused to form a scorifying-bath, and directing an air-blast through the superposed mass of unfused ore and fuel down onto the surface of said bath for driving off said volatile metals, substantially as shown.

406,871. APPARATUS FOR THE MANUFACTURE OF PIGMENT. FRANK L. BARTLETT, Portland, Me. Original application filed May 16, 1888, Serial No. 274,426. Divided and this application filed Mar. 8, 1889. Serial No. 302,519. (No model.)

Claim.—1. The herein-described apparatus for the manufacture of pigment, consisting of a blast-furnace, a passage or flue leading therefrom, an oxidizing-furnace placed in the line of said flue, a mass of refractory material filling said flue between said oxidizing-furnace and the main furnace and having numerous tortuous flues passing through it, a flue leading from said oxidizing-furnace to a cooling-chamber having numerous small flues for the passage of fume, a pressure-blower connected with the space surrounding said small flues, a settling-chamber connecting with said cooling-chamber, and pipes connecting said cooling-chamber with said blast-furnace, oxidizing-furnace, and the flue leading from said blast-furnace, substantially as shown.

2. The herein-described apparatus for the manufacture of pigment, consisting of a blast-furnace, a passage or flue leading therefrom, an oxidizing-furnace in the line of said flue, a mass of refractory material filling said flue between said oxidizing-furnace and the main furnace and having numerous tortuous flues passing through it, a flue leading from said oxidizing-furnace over or by said main furnace and in contact therewith to a cooling-chamber having numerous small flues for the passage of fume, a settling-chamber connected with said cooling-chamber, and pipes leading from said cooling-chamber to said oxidizing-furnace, blast-furnace, and to the flue leading therefrom for supplying air thereto, substantially as shown.

3. The herein-described apparatus for the manufacture of pigments, which consists of a shallow blast-furnace having tuyeres entering at its side or sides, a passage or flue leading from said blast-furnace, an oxidizing-furnace in the line of said flue, a mass of refractory material filling said flue between said oxidizing-furnace and the main furnace and having numerous tortuous flues passing through it, a flue leading from said oxidizing-furnace to a cooling-chamber having small flues for the passage of fume surrounded by an air-space, a pressure-blower and a pipe connecting it with the space surrounding said contracted flues, a settling-chamber connecting with said cooling-chamber, and pipes for blowing air to said blast-furnace, oxidizing-furnace, and to the flue leading from said blast-furnace, said pipes connecting with said cooling-chamber, in combination substantially as described.

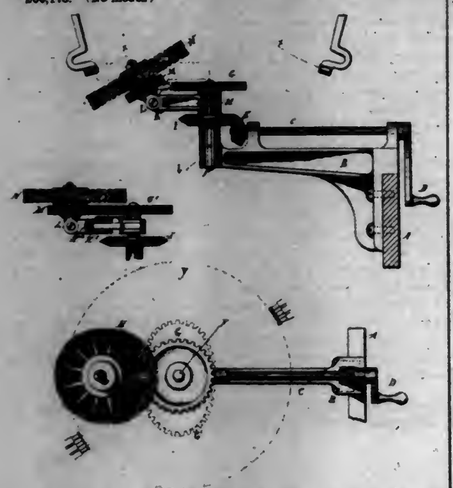
406,872. CHILD'S CARRIAGE. MONTAGUE M. BEAR, Chicago, Ill. Filed Mar. 12, 1889. Serial No. 302,994. (No model.)

Claim.—1. In a knockdown carriage, the combination, with the body and the running-gear, of laterally-folding springs for sustaining the body, substantially as described.

2. In a knockdown carriage, the combination, with the body and the side bars, of the sustaining-springs hinged to the side bars, and slide-blocks to which said springs are also hinged, substantially as described.

3. In a knockdown carriage, the combination, with the body provided on its under side with grooves or ways, and the side bars, of slide-blocks held within said grooves or ways, sustaining-springs hinged to the slide-blocks, and suitable chains attached to said slide-blocks, substantially as described.

4. In a knockdown carriage, the combination, with the axle having tubular ends, of the outwardly-movable and downwardly-movable short journals and wheels on said journals, whereby by moving outwardly the said journals and turning them in downward direction the wheels can be brought to a substantially horizontal position, substantially as described.



5. In a knockdown carriage, the combination of a tubular axle, short journals adapted to fit within the ends of said axle, suitable means for holding said journals normally within the ends of the axle, and wheels on said journals, substantially as described.

6. In a knockdown carriage, the combination of a tubular axle, short journals adapted to fit within the ends of said axle, a spring for holding said journals normally within the ends of the axle, and wheels on said journals, substantially as described.

7. In a knockdown carriage, the combination of a tubular axle having seats at its ends, and short journals adapted to fit in the ends of the axle and having each a reduced portion to enter the corresponding slot of the axle when the journals are turned to a horizontal position, substantially as described.

8. In a knockdown carriage, the combination of the tubular and slotted axles, the coiled springs within said axles, the short journals attached to said springs, and the wheels, substantially as described.

406,873. CLEANER FOR TYPE-WRITING MACHINES. ALEXANDER T. BROWN, Syracuse, N. Y. Filed Sept. 24, 1888. Serial No. 286,175. (No model.)

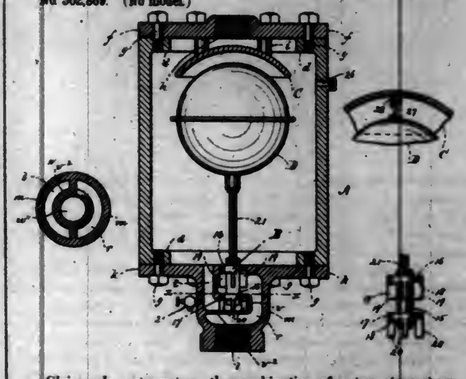
Claim.—1. A cleaning attachment for type-writers, consisting of a supporting-piece, a planetary gear thereon, and a rotating cleaner driven by said gear, so as to turn on its own axis while it traverses the face of the type of the machine, all combined substantially as described.

2. In a type-writer cleaner, a driving-gear and a rotating brush connected thereto, said brush supported on a movable axle, to be thrown into or out of operative position and gear at the same time, substantially as described.

3. In a type-writer, the combination of a rotating brush, a planetary gear by which it is operated, the fixed member of said gear corresponding in general outline to the position of the type on the machine, and an extensible arm supporting the brush, whereby the brush may be brought into contact with the type when arranged in other than circular position, substantially as described.

406,874. ELECTRIC MOTOR. JOHN BUCKLEY, Boston, Mass. Filed June 13, 1888. Serial No. 276,966. (No model.)

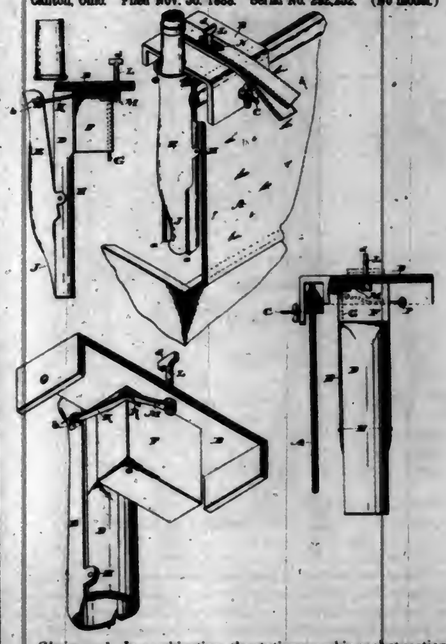
Claim.—1. In an electric motor, two armatures, each consisting of a pair of spools or bobbins, each pair being secured to a separate bar, said bars being insulated from each other and mounted on a shaft to appear as one armature of four spools, the cores of which lie parallel to the shaft on which they are mounted, in combination with a field-magnet and two commutators, substantially as set forth.



2. In an electric motor, the straight bar J and yoke K, secured together, but insulated from each other, in combination with the electro-magnets H H' I I' and shaft F, substantially as and for the purposes set forth.

3. The combination, substantially as set forth, of a field-magnet the two armatures, each consisting of a pair of spools secured to a separate bar, the two commutators, and brushes arranged to send the current successively through the two spools of one armature and then through the two spools of the other armature, substantially as and for the purposes described.

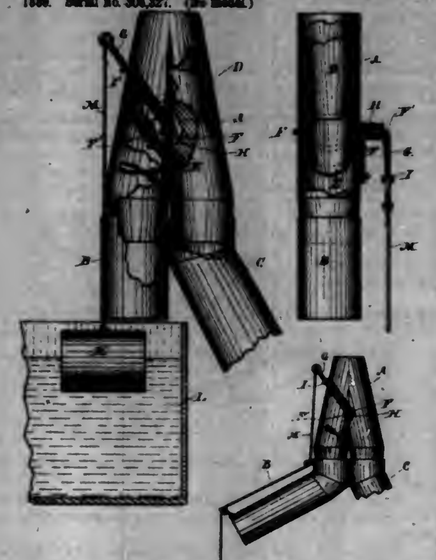
4. In an electric motor, two armatures, each consisting of a pair of spools mounted upon a separate bar and so as to appear as one armature of four spools, and so connected that one armature shall only receive its current after its passage through the other or by a short-circuit through the commutator to the opposite armature, substantially as set forth.



5. In combination with an electric motor, electro-magnets having disk-faces provided with inward extensions which rest upon an insulating-sleeve surrounding the shaft, substantially as and for the purposes set forth.

406,875. STEAM-TRAP. CHARLES A. CARLSTON, Woodstock, assignor to William L. Blake, Portland, Me. Filed Mar. 11, 1889. Serial No. 302,869. (No model.)

Claim.—In a steam-trap, the combination of a steam-trap chamber provided with an inlet in its top, a dome secured within said steam-trap chamber opposite said inlet, two semi-annular valve-chambers in the bottom of said body connected by a circular valve-opening, one of said valve-chambers opening directly into the trap-chamber, and the other being connected therewith by a circular valve-opening, said valve-openings being in alignment, a valve provided with annular flanges fitted to work in said valve-openings, the lower surfaces of said flanges being on inclined planes so as to open and close gradually, and a ball-float on the stem of said valve disposed beneath said dome, substantially as described.



406,876. WHIP AND REIN HOLDER. JAMES L. CAVANAUGH, Canton, Ohio. Filed Nov. 30, 1888. Serial No. 292,252. (No model.)

Claim.—1. In combination, the stationary whip-socket section, the pivoted whip-socket section, the rocking rein-holder post, arms extending laterally from the pivoted socket-section and rein-holder post, and a locking-bolt common to the two arms, whereby the whip and the reins may be simultaneously secured, substantially as set forth.

2. In combination, a frame having a box and a stationary whip-socket section fixed thereto, means for securing the frame to the dash-board, a whip-socket section pivoted to the said stationary socket-section, a rocking rein-holder, arms extending from the pivoted socket-section and from the rein-holder to a point within the said box, and a locking-bolt located within the box and common to the said arms, substantially as set forth.

406,877. AUTOMATIC CUT-OFF. FRANKLIN D. CLARK and FRED RICE, Waukesha, Wis.; said Rice assignor to said Clark. Filed Apr. 5, 1889. Serial No. 306,227. (No model.)

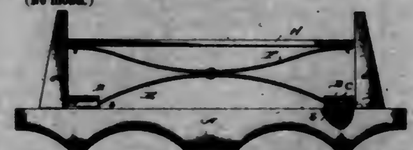
Claim.—1. In an automatic cut-off, a case A, having discharge pipes B and C, in combination with a tilting dam E, having an axle F, shank F', and crank-arm G, a spring H, coiled about the shank F' and secured at one end to the case A and at the other end to the crank-arm G, and a float K, located in a cistern and having sufficient weight to serve for a counterpoise, connected by a cord M with crank-arm G, substantially as described.

2. In an automatic cut-off, the combination of a case A, having discharge-pipes B and C, and a pipe D within the case A, smaller at its lower end than the surrounding part of the case A, with a tilting dam E, in semicircular form, supported on a bent axle F, having a shank F' and crank-arm G, a spring H, secured at one end to the case A and at the other end movably secured to the crank-arm G and adapted to tilt the dam E in one direction, and a float K in a cistern, the float being of sufficient weight to serve as a counterpoise when unsupported by the water, and being connected by a cord M to the outer end of the crank-arm G, substantially as described.

406,878. WINDOW-SCREEN. ALBERT H. CLEAVELAND, Belvidere, Ill. Filed Jan. 28, 1889. Serial No. 297,773. (No model.)

Claim.—1. A window-screen composed of a center frame holding the screen and an outside frame in two or more angular sections made vertically and laterally adjustable with relation to the center frame, each of said sections forming one or more corners of the frame, substantially as set forth.

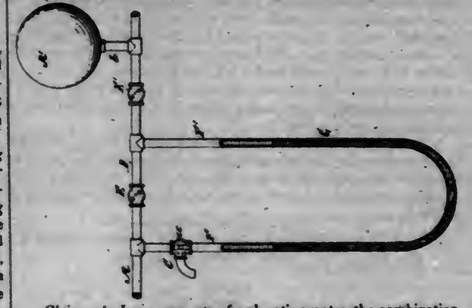
2. A window-screen composed of a center frame holding the screen and an outside frame in two or more angular sections made vertically and laterally adjustable with relation to the center frame, each of said sections forming one or more corners of the frame, and clasps for holding the sections when adjusted, substantially as set forth.



3. A window-screen composed of a center frame holding the screen and an outside frame composed of sections, each section forming one-half of an end and side and made adjustable with relation to the center frame in width and height, substantially as set forth.

4. A window-screen composed of a center frame holding the screen and an outside frame composed of sections, said sections forming one-half of an end and side and made adjustable with relation to the center frame in width and height, and clasps holding the sections together when adjusted, substantially as set forth.

5. A window-screen composed of a center frame and an outside frame, said outside frame completely inclosing the center frame and composed of sections, a clasp connecting the sections, said clasp having slots located at an angle to each other, and screws passing through the slots into the sections, whereby the sections are rendered vertically and laterally adjustable and are retained in their positions, substantially as set forth.



6. A clasp for frames, substantially as herein described, consisting of the sides 10, 11, and 12, the edges of the sides 11 and 12 being provided with inwardly-projecting flanges and the sides 10 and 11 with longitudinal and transverse slots, respectively, substantially as set forth.

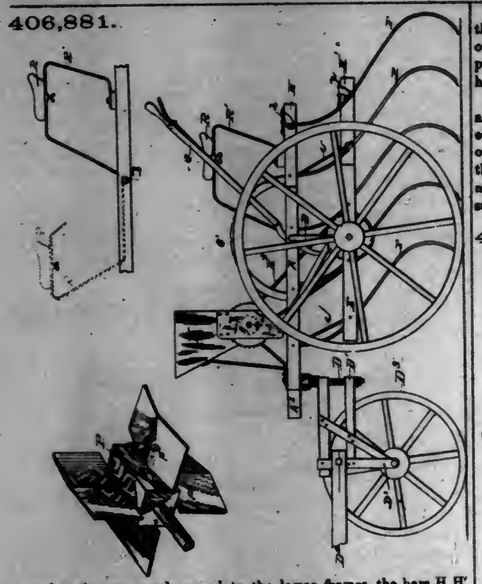
406,879. WAGON BOLSTER-SPRING. WESLEY COLE and VICTOR C. DILLMANN, Kansas City, Mo. Filed Apr. 10, 1889. Serial No. 306,683. (No model.)

Claim.—The combination, with a wagon-bolster, of the sockets secured thereon, the cushion-springs arranged in the sockets, the cross-bar, the ellipsoidal spring having its opposite ends working in sockets or staples on its under side, and the lower ellipsoidal spring connected with the upper one, and having its opposite ends bearing in the sockets on the standards and against the cushion-springs therein, substantially as specified.

406,880. APPARATUS FOR ELEVATING WATER. NATHANIEL A. COWLIN, Brooklyn, N. Y. Filed Dec. 24, 1888. Serial No. 294,460. (No model.)

Claim.—1. In an apparatus for elevating water, the combination, with a supply-pipe, of a pipe D, having check-valves E E', a receiver having its ends connected to the supply-pipe and the pipe D, a plunger in said receiver, and a three-way cock in the receiver adjacent to the supply-pipe, substantially as specified.

2. The combination, with the supply-pipe, of the receiver having the plunger and communicating at its ends with the supply-pipe, the three-way cock in said receiver, the check-valve in the supply-pipe between the ends of the receiver, the check-valve beyond said receiver, and the air-chamber beyond the last-named check-valve, substantially as specified.



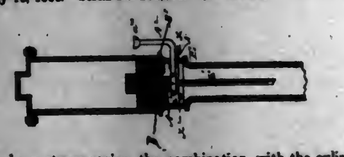
3. In a water-distributing system, the combination, with the supply-pipe, of the pipe D, extended therefrom, the receiver having its ends communicating therewith, the stop-cock in one branch of said receiver, the pressure-storing device in said receiver, the check-valve between the ends of the receiver, the check-valve beyond said receiver, and the air-chamber having connection with the pipe D beyond the last-named check-valve, substantially as specified.

406,881. COMBINED SEEDER AND HARROW. JOHN R. COON, Cold Spring, Phelps County, Mo. Filed Dec. 12, 1887. Serial No. 257,732. (No model.)

Claim.—1. In a combined seeder and harrow, the combination, with the upper frame, of the two lower frames hinged to the upper frame, the spring-teeth pivoted to the upper frame and secured to the lower frames, the arched axle, and the levers fulcrumed on the axle and connected with the lower frames, substantially as described.

2. The combination, with the upper frame, of the two lower frames, the hinges connecting the same, the spring-teeth pivotally se-

406,881.



cured to the upper and secured to the lower frames, the bars H H', the lateral arms on the bars, and the teeth on the arms, substantially as described.

3. The combination, with the upper and lower frames, of the downwardly-extending post D on the upper, the detachable wheel-supporting frame on the post, composed of two substantially U-shaped yokes united at their ends by vertical supports, in which the wheel is mounted, and the tongue secured to the said wheel-supporting frame.

4. The combination, with the upper and lower frames and teeth, of the feed-box, the cups on the box, the shafts and gearing for operating the feed, and the distributers below the cups, composed of revolving rectangular blocks having deflectors of varying incline thereon, substantially as described.

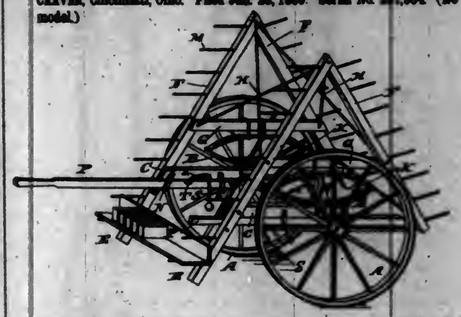
5. The combination, with the upper frame, of the movable seat-support pivoted on the axle of the machine and adapted to be moved forward, the removable tongue, and the front wheel-frame, as described, detachably secured to the main frame, substantially as described.

406,882. STUFFING-BOX. LUCIUS D. COPELAND, Camden, N. J. Filed May 16, 1888. Serial No. 274,071. (No model.)

Claim.—In a steam-engine, the combination, with the cylinder-head B, provided with an interiorly-threaded portion B', and the exteriorly-threaded gland A, having flange *a*, provided with radial holes a^2, of the tube A^2, passing through the slot A' in the casing E, substantially as described.

406,883. LUBRICANT. WILLIAM J. CORDER, Orange, Tex. Filed Sept. 24, 1888. Serial No. 286,262. (Specimens.)

Claim.—The herein-described lubricating compound, composed of sulphate of zinc, plumbago, borax, bicarbonate of soda, and lubricating-oil, in about the proportions set forth.



406,884. CAR-COUPLING. CYRUS W. COURTNEY, Bliss, Idaho. Filed May 15, 1889. Serial No. 310,904. (No model.)

Claim.—1. In an automatic car-coupler, the combination, with the draw-head and coupling-pin having an opening near its lower end, of a spring-actuated slide adapted to enter the hole in the coupling-pin and prevent the same from falling within the opening in the draw-head, substantially as shown and described.

2. The combination, with the draw-head, the coupling-pin having an opening therethrough near its lower end, the spring-actuated slide engaging said opening, and the casting H, connected with said slide, of a spring-actuated slide within the draw-head adapted to engage the casting H and move the same backward to release the slide connected with said casting from its engagement with the coupling-pin, substantially as shown and described, and for the purpose specified.

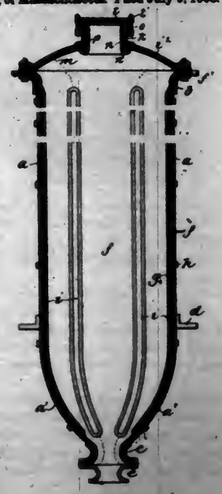
406,885. TRUCK FOR CARRYING BRICK-PALLETS. JOHN R. CRAVEN, Cincinnati, Ohio. Filed Jan. 26, 1889. Serial No. 297,884. (No model.)

Claim.—1. In a truck, pallet-carrying arms provided with pins, as M, substantially as set forth.

2. In a truck, pallet-carrying arms having pins, as M, the arms E extending down to form supports for the truck, substantially as set forth.

3. In a truck, arms E and F, having pins, as M, in combination with adjustable handles, substantially as set forth.

4. In a truck, handles, in combination with a locking-lever, as S, substantially as set forth.



5. In a truck, handles P, pieces C, and lever S, in combination with pallet-carrying arms E and F, having pins M, substantially as set forth.

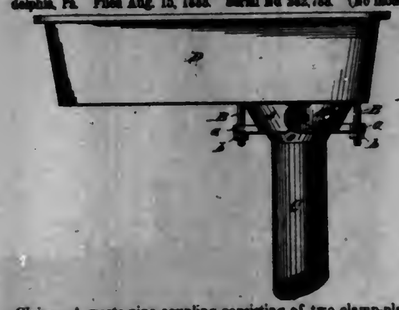
6. In a truck, arms E and F, having pins, as M, spring-bars G, and springs B, substantially as set forth.

7. In a truck, a frame-work provided with pins or projections for carrying the pallets, as specified, mounted on springs, substantially as set forth.

8. In a truck, a suitable frame-work having pins, substantially as set forth, in combination with suitable handles and means for automatically locking and unlocking said handles, substantially as set forth.

406,886. DIGESTER. WILLIAM O. CROCKER and WILLIAM P. CROCKER, Turner's Falls, Mass., assignors of one-half to the New England Fibre Company, of Massachusetts. Filed July 9, 1888. Serial No. 279,405. (No model.)

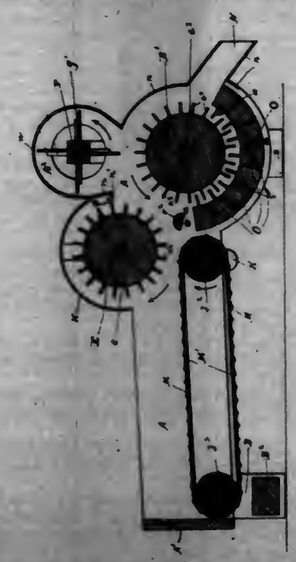
Claim.—1. A digester composed of an outer shell substantially cylindrical through the main portion of its length, combined with a lining composed of longitudinal strips of lining material united along their edges by longitudinal seams, substantially as and for the purpose described.



2. The main outer shell of a digester and longitudinal strips of lining material extending from one to the other end of the side walls of said shell and meeting at their edges, combined with stay-pieces overlapping the meeting edges of two adjacent lining-strips and being fastened to the main shell, and caps of lining material over the said stay-pieces united at their edges with the main lining, substantially as described.

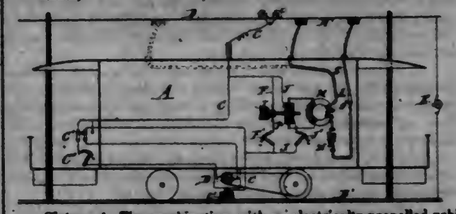
3. The combination of the head or end piece of a digester, having a central opening, with a lining-sleeve extending through the said central opening, provided with a flange at its lower edge that engages the edge of the lining around the opening in the end piece, and a lining for said sleeve extending over the flange thereof and being united with the lining of the end piece, substantially as described.

406,887. WELDING COMPOUND. WILLIAM H. CUTHBERTH and JACOB SOMMER, Hollandsburg, Ind. Filed Apr. 1, 1889. Serial No. 305,515. (No specimens.)



Claim.—A welding compound formed of saltpeter, borax, sulphate of zinc, and white flint sand, in about the proportions set forth.

406,888. WASTE-PIPE COUPLING. WILLIAM H. H. DAVIS, Philadelphia, Pa. Filed Aug. 15, 1888. Serial No. 282,783. (No model.)



Claim.—A waste-pipe coupling consisting of two clamp-plates A A, each provided with a pin E and hole F, and adapted for connection, substantially as specified, and provided with holes to receive bolts for holding them to the waste-pipe and holding the waste-pipe to a sink or basin, substantially as shown and described.

406,889. FEEDING MECHANISM FOR COTTON-GINS. VAN B. DAVIS, Temple, Ga. Filed Aug. 2, 1888. Serial No. 281,804. (No model.)

Claim.—The combination, with the frame A A', of the carrier M, the carrier-drums J^3 J^3, mounted, respectively, in vertically and horizontally adjustable bearings, provisions for adjusting said bearings, as described, the toothed cylinder E, the notting H, the fan F, the guiding-bridge c^3, the toothed cylinder E', and a concave bed formed of separate bars provided with teeth adapted to pass between the teeth of the rotating cylinder E', substantially as set forth.

406,890. ELECTRIC HEATING APPARATUS FOR RAILWAY SYSTEMS. MARK W. DUTTON, Syracuse, N. Y., assignor to the Dutton Corporation, same place. Filed Apr. 10, 1889. Serial No. 307,066. (No model.)

Claim.—1. The combination, with an electrically-propelled vehicle, working-conductors supplied with direct current along the path of said vehicle, conductors on the vehicle in contact with the working-conductors and the electric motor for propelling the vehicle, and controlling devices connected with the vehicle-conductors, of a shunt-circuit of the vehicle-conductor around the said motor and its controlling devices, a second electric motor and controlling device in said shunt-circuit, a second shunt-circuit around both motors and their controlling devices, a pulsator operated by the second motor and primary coil of an inductional transformer in the second shunt-circuit, a secondary circuit of low resistance in circuit with the secondary coil of said transformer, one or more electric heating devices included in the secondary circuit, and means for cutting one or more of said heating devices out of circuit.

2. The combination, with an electrically-propelled vehicle, the supply-conductors on the vehicle and the electric motor for propelling the vehicle, and controlling devices connected with the said supply-conductors, of a shunt-circuit of the said supply-conductors, a second electric motor in said shunt-circuit, a pulsator operated by the second motor and primary coil of a transformer in shunt-circuit, a secondary circuit including the secondary coil of said transformer, and one or more suitable electric heating devices in said secondary circuit.

3. The combination, with a vehicle, the conductors on the vehicle connected with a source of direct current, and a translating device and means for controlling the same connected in circuit with said conductors, of a shunt-circuit around both the said translating and controlling devices, an electric motor in the shunt-circuit, a pulsator operated by the motor and primary coil of a transformer in shunt-circuit, a secondary circuit including the secondary coil of the transformer, and one or more electric heating devices in said secondary circuit.

4. The combination, with a vehicle, the conductors on the vehicle connected with a source of direct current, and a translating device and means for controlling the same in circuit with said conductors, of a shunt-circuit around both the translating and controlling devices, an electric motor and adjustable resistance in the shunt-circuit, a second shunt-circuit around said motor and adjustable resistance, a pulsator operated by the motor and a primary coil of a transformer in the second shunt-circuit, a secondary circuit of low resistance, including the secondary coil of the transformer, and one or more electric heating devices in said secondary circuit.

5. The combination, with a vehicle, the conductors on the vehicle connected with a source of direct current, and a translating device and controlling devices therefor in circuit with said conductors, of a shunt-circuit around said devices, an electric motor and a rheostat in the shunt-circuit, a second shunt-circuit around said motor and rheostat, a pulsator operated by the motor and a primary coil of a transformer in the second shunt-circuit, means for regulating the current flowing through said primary coil, a secondary circuit of low resistance, including a secondary coil of the transformer, and one or more electric heating devices in said secondary circuit.

6. The combination, with an electrically-propelled vehicle, working-conductors supplied with direct current along the path of said vehicle, conductors on the vehicle in movable contact with the working-conductors, and the electric motor for propelling the vehicle and its controlling devices in circuit with the vehicle-conductors, of a shunt-circuit on said vehicle around the motor and its controlling devices, a second electric motor and adjustable resistance in said shunt-circuit, a second shunt-circuit around both motors and their controlling devices, a pulsator operated by the second motor, a primary coil of a transformer and regulating device in the second shunt-circuit, a sec-

ondary circuit, including the secondary coil of said transformer, and one or more electric heating devices on the vehicle in the secondary circuit.

7. The combination, with a vehicle, working-conductors supplied with direct current along the path of said vehicle, the conductors on the vehicle, and a translating device and controlling devices therefor in circuit with said vehicle-conductors, of a shunt-circuit around said devices, an electric motor and a rheostat in the shunt-circuit, a second shunt-circuit around said devices, motor, and rheostat, a pulsator operated by the motor and a primary coil of a transformer in the second shunt-circuit, means for regulating the current flowing through said primary coil, a secondary circuit of low resistance, including a secondary coil of the transformer, and one or more electric heating devices in said secondary circuit.

8. The combination, with a vehicle and a line working-conductor arranged along the path of said vehicle, of a closed electric circuit to be moved with the vehicle, including a conductor of lower resistance than the line conductor, movable contacts connected with the terminals of said low-resistance conductor and in contact with the said line working-conductor, and a portion of the line working-conductor between the terminals and supplied with electric current from a suitable source, for the purpose set forth.

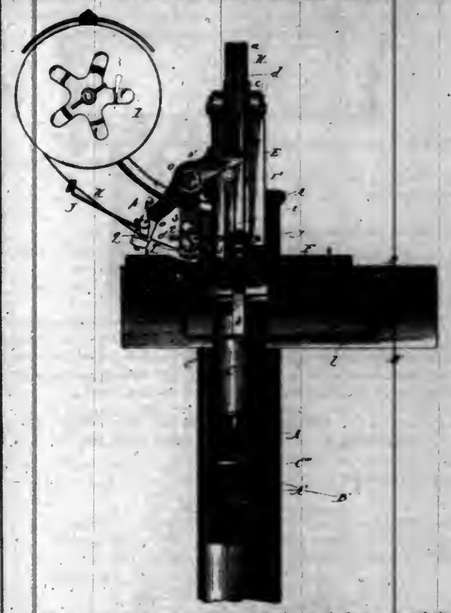
9. The combination, with a vehicle and a line working-conductor arranged along the path of said vehicle, of a closed electric circuit to be moved with the vehicle, including a conductor on the vehicle, terminals of said conductor disposed one in advance of the other and in contact with the line working-conductor, and a portion of the line working-conductor between the terminals and supplied with electric current from a suitable source, for the purpose set forth.

10. The combination, with a vehicle and a continuous line working-conductor arranged along the path of said vehicle, of a low-resistance conductor on the vehicle supplied with electric current, terminals of said vehicle-conductor disposed one in advance of the other in contact with the line working-conductor and the portion of the said line conductor between the said terminals, for the purpose set forth.

11. The combination of an electrically-propelled vehicle, a continuous-line working-conductor arranged along the path of said vehicle, an electric motor propelling said vehicle, an electric connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, a primary coil of a transformer in said shunt-circuit, means to regulate the current flowing through the shunt-circuit, a secondary circuit including the secondary coil of the transformer, terminals of the secondary circuit in contact with the line conductor, and a portion of the line working-conductor between the said terminals, for the purpose set forth.

12. The combination of an electrically-propelled vehicle, a continuous line working-conductor arranged along the path of said vehicle, an electric motor propelling said vehicle, an electric connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, a pulsator and a primary coil of a transformer in said shunt-circuit, means to regulate the current flowing through the shunt-circuit, a secondary circuit including the secondary coil of the transformer, terminals of the secondary circuit in contact with the line conductor, and a portion of the line working-conductor between the said terminals, for the purpose set forth.

13. The combination of an electrically-propelled vehicle, a continuous-line working-conductor arranged along the path of said vehicle, an electric motor propelling said vehicle, an electric connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, a pulsator and a primary coil of a transformer in said shunt-circuit, means to regulate the current flowing through the shunt-circuit, an electric motor operating the pulsator, a secondary circuit including the secondary coil of the transformer, terminals of the secondary circuit in contact with the line-conductor, and a portion of the line working-conductor between the said terminals, for the purpose set forth.



14. The combination of an electrically-propelled vehicle, a continuous-line working-conductor arranged along the path of said vehicle, an electric motor to propel said vehicle, an electric connection between said motor and working-conductor, a shunt-circuit around the motor on the vehicle, a pulsator and a primary coil of a transformer in said shunt-circuit, means to regulate the current flowing through the shunt-circuit, an electric motor operating the pulsator, a secondary circuit including the secondary coil of the transformer, and a plurality of heating devices, terminals of the secondary circuit in contact with the line conductor, a portion of the line working-conductor between the said terminals forming one of said heating devices, and means for cutting in or out of circuit one of the said heating devices independent of the other heating device in circuit, for the purpose set forth.

15. In an electric railway, a line working-conductor, a traveling vehicle, an electric motor to propel said vehicle, an electrical connection between said vehicle and working-conductor, an inductional transformer on the vehicle, a secondary circuit of low resistance, an electric heater to heat said vehicle in the secondary circuit, and means to control the current passing through the transformer independently of the motor.

16. In an electric railway, a line working-conductor, a traveling vehicle, an electric motor to propel said vehicle, an electrical connection between said motor and working-conductor, a current-transformer on the vehicle in electrical connection with the working-conductor, a secondary circuit of lower resistance than the working-conductor, an electric heater to heat said vehicle in the secondary circuit, and means to control the current passing to the transformer independently of the motor.

17. The combination of a vehicle, a line working-conductor arranged along the path of said vehicle, a translating device on the vehicle, an electrical connection between said translating device and working-conductor, a current-transformer on the vehicle in electric connection with the working-conductor, a secondary circuit of lower resistance than the working-conductor, an electric heater to heat said vehicle in the secondary circuit, and means to control the currents passing to the translating device and transformer independently of each other.

406,891. STAPLING-MACHINE. EDWARD P. DONNELL, Chicago, Ill. Filed Dec. 15, 1888. Serial No. 293,733. (No model.)

Claim.—1. The combination, with the staple-former c and the driver d, of the lever H, having an arm b, adapted to become engaged with and disengaged from said former, and an arm a, adapted to come in contact with the upper portion of the driver, substantially as described.

2. The combination of the longitudinally-grooved former c, having in its grooved face a projection f, the driver d, engaged in said grooved face of the former and having a shoulder e, and a lever having an arm to engage said former and an arm to come in contact with the upper end of the driver, substantially as described.

3. The combination of the bent lever r s, having the spring s', a locking-disk v, with the pin r', and former c, substantially as and for the purpose specified.

4. The combination of the bent lever r s, having the slots q', with the pivoted lever t, spring w, and rotatable disk v, substantially as described.

5. The combination of the pivoted lever r s, pin r', former c, with the lever H, having the projecting arms or forks a b, substantially as described.

6. The combination, with the hinged table D D', of the inverted-trough-shaped feed-guide and holding-plate y, supported above said table, and means for giving a vertical adjustment to said guide and holder, substantially as described.

7. The combination, with the driver d, the staple-former c, having a pin r', and the arm a, of the lever-arms r s, and adjustable stop s', substantially as described.

8. The combination and arrangement of the rod G, lever H, having the forks or arms a b, with the driver d, the former c, having the pin r', the pivoted lever r s, operating to feed wire, form, and drive staples by a single movement of the lever, substantially as set forth.

406,892. COASTING-TOBOGGAN. CHARLES H. BRENNON, Yonkers, N. Y. Filed Jan. 30, 1887. Serial No. 225,966. (No model.)

Claim.—1. In a coasting-toboggan, side slats bent at their front ends and disconnected from the cross-bars in the hood, substantially as described.

2. In a coasting-toboggan, side slats bent at their front ends, disconnected from the cross-bars in the hood and coupled together by ties or links beneath the central portion of the hood, substantially as described.

3. In a slat-bottomed coasting-toboggan, the combination, with the bent ends of the slats which form the hood, of the front cross-bar, and re-enforcing leaves interposed between said cross-bar and the slats and extending forward within the hood, substantially as described.

4. In a slat-bottomed coasting-toboggan, the combination, with the slats, of cross-bars having concave under surfaces to which the slats are secured, substantially as described.

5. In a slat-bottomed toboggan, the combination, with the slats, of the cross-bars having concave under surfaces and the cross-bars having straight under surfaces, substantially as described.

6. In a slat-bottomed toboggan, the combination of cross-bars having upwardly-inclined under surfaces at their outer ends, side slats secured to said inclined surfaces and presenting an upwardly-inclined bearing-surface, and intermediate slats which afford a general lateral and longitudinal bearing-surface for the toboggan, substantially as described, and for the purposes specified.

7. In a slat-bottomed toboggan, the combination, with the hood, of adjustable straining and cushion-holding cords extending from the edge bar of said hood downward and thence to the rear cross-bar and adjustably secured thereto, substantially as described.

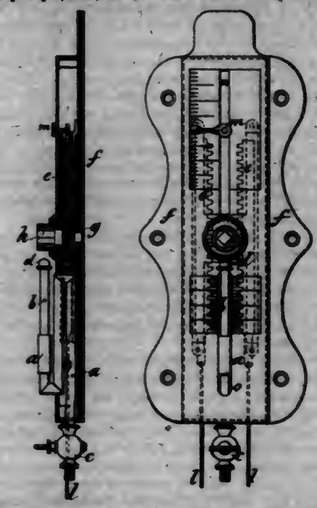
8. In a slat-bottomed toboggan, the combination, with the slats and a cross-bar, of a flexible plate interposed between said bar and the slats and united thereto, substantially as described.

9. In a slat-bottomed toboggan, the combination, with the bearing-slats and a cross-bar, of an interposed metal locking-plate provided with integral spurs for engaging with the slats and binding them together and to said plate, substantially as described.

10. In a slat-bottomed coasting-toboggan, the combination, with the slats and a cross-bar, of a flexible plate interposed between said bar and slats, secured to said slats, and provided with flanges which engage with and secure said cross-bar to said plate, substantially as described.

11. In a slat-bottomed coasting-toboggan, the combination, with the slats and a cross-bar, of a flexible plate interposed between said bar and the slats and provided with slat-securing spurs and also with flanges for engaging with and confining said cross-bar, substantially as described.

12. A toboggan hand-rail post composed of sheet metal bent to form a loop for receiving said rail, in combination with a cross-bar, a nut embraced within the base of said post, and a bolt for securing the post to said cross-bar, substantially as described.

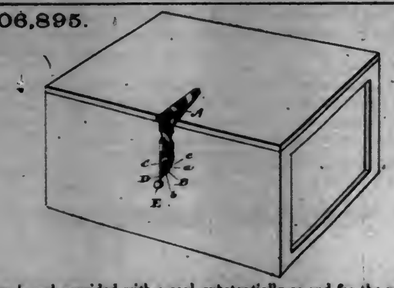


406,893. WIRE BAND FOR BOXES. CLARK W. EVANS, Plainfield, N. J. Filed Oct. 7, 1887. Serial No. 251,719. (No model.)

Claim.—1. As an article of manufacture, a band for securing packages consisting of strands of wire twisted together, and having at convenient intervals staples of wire coiled between the loops of the band, and their sharpened ends turned down between said loops and parallel with the length of the band, substantially as set forth.

2. A band for securing packages, having coiled between its loops at convenient intervals staples of wire, substantially as and for the purpose described.

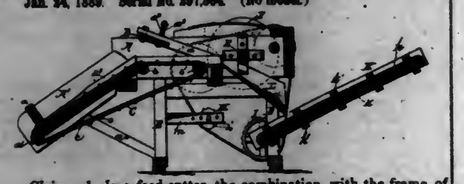
406,894. GAS-PRESSURE GAGE AND REGULATOR. GEORGE B. FRANKLEY, Brixton, County of Surrey, England. Filed July 14, 1887. Serial No. 244,242. (No model.) Patented in England July 15, 1886, No. 8,209; in France Apr. 20, 1887, No. 170,277; in Belgium Apr. 20, 1887, No. 77,260; in Germany Apr. 20, 1887, No. 3,207, and in Austria-Hungary May 3, 1887, No. 7,237 and No. 21,106.



Claim.—In a gas-regulator, the combination, with a pressure-gage consisting of an entry-valve e, and a bent tube comprising one part a of metal and one part b of glass, graduated, as specified, means for introducing gas into said pressure-gage, substantially as set forth, and a supporting-frame by which the apparatus is held in position, of the racks c, sliding in the frame f, the spindle A, journaled in said frame between said racks, the pinion g, mounted on said spindle and meshing into said racks, the index m, carried by one of said racks and adapted to move upon a graduated scale, and means, substantially as specified, for connecting said racks with the key of a gas-supply cock, all substantially as and for the purpose set forth.

406,895. SEALING DEVICE FOR HASP-FASTENERS. WILLIAM A. FERGUSON, Toronto, Ontario, Canada. Filed Dec. 1, 1888. Serial No. 292,261. (No model.)

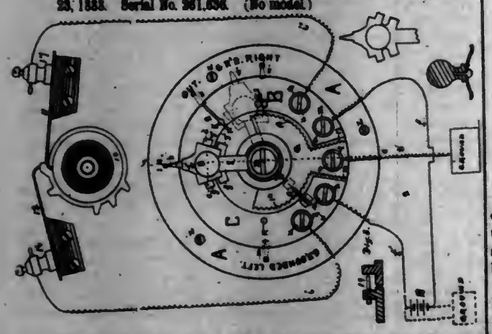
Claim.—The combination, with the hasp having slot, as described, and curved end a, formed with hole c, of the swivel-plate B, having curved extension-piece b, formed with hole, as described, the swivel fastening on the plate B and extending through said slot in the hasp, and wire through the coincident holes in the curved end a and exten-



406,895.

sion *b*, and provided with a seal, substantially as and for the purpose specified.

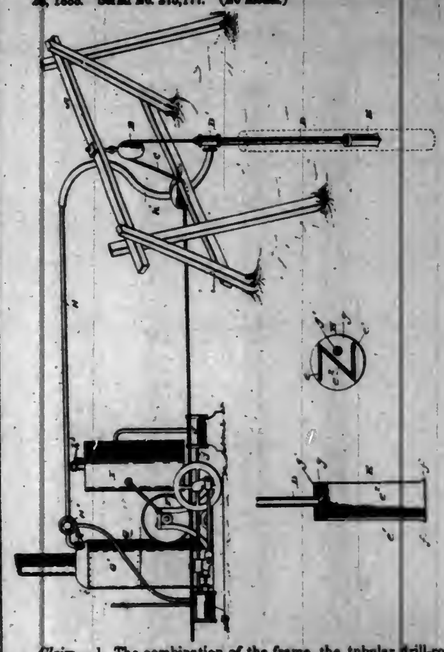
406,896. FEED-CUTTER. DIEDERICH FRESE, Lamoille, Ill. Filed Jan. 24, 1889. Serial No. 297,864. (No model.)



Claim.—1. In a feed-cutter, the combination, with the frame, of the inclined conveyer-trough having parallel compartments therein, yielding fingers above the compartments, shaft E, having knives arranged thereon, the endless chains traveling in the conveyer-trough and beyond the same, having projections thereon, the partitions a^3, and the gearing for moving the several parts, substantially as described.

2. In a feed-cutter, the combination, with the frame, of an inclined conveyer-trough having endless chains traveling therein and beyond its end, which are provided with projections, the partitions a^3, the inclined yielding fingers above the chains in close proximity thereto, a rectangular shaft at the end of the conveyer-trough, and fingers and knives arranged on the shaft, and gearing for operating the several parts, substantially as described.

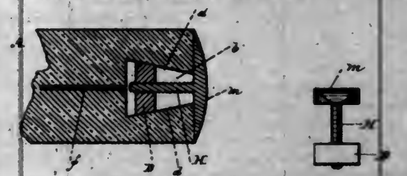
3. The combination, with the frame and inclined conveyer-trough, of the endless chains extending beyond the trough having projections thereon, the partitions a^3, the inclined yielding fingers having concave under faces, the shaft E, the U-shaped knives arranged alternately on the shaft, the hopper below the knives, the elevator into which the hopper discharges, and gearing for operating the several parts, substantially as described.



4. The combination, with the frame and inclined conveyer-trough, of the obliquely-disposed cross-piece, the fingers adjustably secured thereon, the pins d^4, extending through the cross-piece and fingers, spiral springs surrounding the pins, nuts on the ends of the pins, the endless chains in the conveyer-trough extending beyond the same, the rotating knives arranged at the ends of the fingers, and gearing for operating the knives and chains, substantially as described.

406,897. ELECTRIC SWITCH. THOMAS F. GAYNOR, Louisville, Ky., assignor to the Gaynor Electric Company, same place. Filed Jan. 23, 1888. Serial No. 261,636. (No model.)

Claim.—In an electric switch, an insulating-base, in combination with two line-plates, a ground-plate, and a pivoted contact-lever having a spring-tension contact upon the plate and provided with a stop projection, the plates having registering stop-holes for the stop projection of the lever to enter into, the base or plates having characters which designate the nature of the connection made when the index of the lever is brought into registering position therewith, substantially as described.

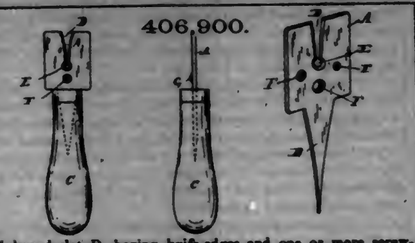


406,898. COMPRESSED-AIR AND STEAM APPARATUS FOR SINKING WELLS. HERVEY K. GOODRICH, Sherman, Tex. Filed May 28, 1888. Serial No. 275,177. (No model.)

Claim.—1. The combination of the frame, the tubular drill-rod, the drill formed with outlet-passages through the lower side of the drill-head, the compressed-air reservoir, the steam-boiler, the steam-engine, connections for reciprocating the drill, and a supply-pipe adapted to be connected at will with either the boiler or the air-reservoir, substantially as described, for the purpose set forth.

2. In an apparatus for sinking wells or shafts, the combination of a tripod or frame having a guide-pulley, a tubular drill-rod provided with a coupling, a drill fixed to the lower end of the rod and having one or more ducts communicating therewith, an air-reservoir and a compressor or pump for feeding the same, a steam-boiler, a valved supply-pipe connected at one end to the drill-rod and adapted to be connected with the air-reservoir or steam-boiler, and a cable connected to the drill-rod, and with mechanism for reciprocating the rod vertically, substantially as described.

406,899. AX-HELVE. HIRAM HALL, Jr., Spruce Head, Me. Filed Mar. 5, 1889. Serial No. 301,823. (No model.)



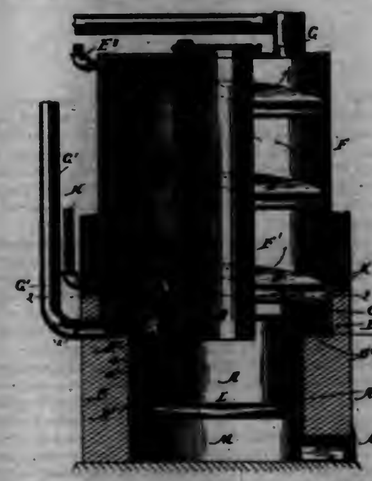
Claim.—1. In an ax-helve, the combination of a chamber having outwardly-converging walls and a saw-kerf extending inward from the bottom thereof, a beveled nut disposed in said chamber, and a screw working in said nut and provided with an oval or button-shaped head, substantially as described.

2. In an ax-helve, the helve A, provided with the chamber *b*, having converging walls *d*, the saw-kerf *f*, the nut D, disposed in said chamber, and the screw H, working in said nut and provided with the oval head *m*, all being combined and arranged to operate substantially as described.

406,900. SLATE-PENCIL SHARPENER. BENJAMIN HAMBURG, Detroit, Mich. Filed May 9, 1888. Serial No. 310,150. (No model.)

Claim.—1. In a slate-pencil sharpener, the plate A, provided with the V-shaped slot D, having knife-edges and one or more screw-threaded apertures, as F, substantially as described.

406,900.

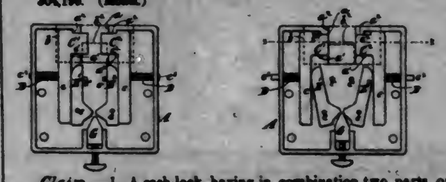


2. As a new article of manufacture, a slate-pencil sharpener consisting of the steel plate A, secured to a handle and provided with the V-shaped slot D, the circular enlargement, and one or more screw-threaded apertures, substantially as described.

406,901. PROCESS OF DRESSING LEATHER. WALTER R. HARTER, West Hesticoke, Pa. Filed Jan. 18, 1889. Serial No. 296,736. (No specimens.)

Claim.—The method of dressing leather, consisting, first, in applying thereto a compound of alum, bicarbonate of soda, borax, and washing-soda dissolved in water, and, second, by applying a coloring composition of iron scales and cider-vinegar, and, third, by coating the leather with castor-oil, substantially as described.

406,902. WATER-CIRCULATING HEATER. MICHAEL HAVEY, Chicago, Ill. Filed Jan. 26, 1889. Serial No. 297,945. (No model.)



Claim.—1. In a water-heating furnace, in combination with a fire-box, a water-chamber constructed in the form of a spiral about an upwardly-extending axis, the successive turns of such spiral being non-communicating except in the direction of their continuous spiral course, whereby the water is compelled to follow that course, and the smoke-passage leading from the fire-box having as its upper and lower walls the coils of said spiral water-chamber, substantially as set forth.

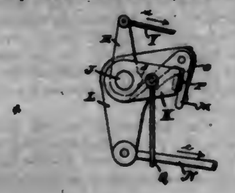
2. In a water-heating furnace, in combination with the fire-box, a water-chamber adjacent thereto and directly exposed to the heat thereof, a water-chamber constructed in the form of a spiral about an upwardly-extending axis, the successive turns of such spiral being non-communicating except in the direction of their continuous spiral course, whereby the water is compelled to follow that course, said spiral chamber communicating at its lower end with the lower part of the water-chamber which is adjacent to the fire-box, a water-supply pipe communicating with the spiral chamber at the upper end, the water-discharge pipe leading from the upper part of the chamber which is adjacent to the fire-box, and a case inclosing the spiral chamber, the smoke-passage from the fire-box leading into said case, whereby the spiral interval between the successive coils of the spiral water-chamber forms part of the smoke-passage to the chimney, substantially as set forth.

3. In a water-heating furnace, in combination with a fire-box, a water-chamber constructed in the form of a spiral duct about an upwardly-extending axis, such duct being quite broad with respect to its thickness, the successive turns of such spiral being non-communicating except in the direction of their continuous spiral course, whereby the water is compelled to follow that course, a case inclosing the entire spiral duct, and the smoke-passage from the fire-box leading into the case, whereby the interval between the turns of the spiral duct forms a continuation of the smoke-passage, whereby such duct exposes to the smoke upper and lower surfaces which are large relatively to the quantity of water in the duct, substantially as set forth.

4. In a water-heating furnace, in combination with the fire-box, a chamber communicating with the same bounded by an outer case F and an interior tube D, a water-chamber in the form of a spiral duct located in the space between the tube D and the case F, the successive turns of such spiral being non-communicating except in the direction of their continuous spiral course, whereby the water is compelled to follow that course, and making close junctions with the walls of said tube and case, respectively, whereby it defines and forms the upper and lower boundaries of a spiral smoke-passage from the fire-box through the chamber constituted by the tube D and the case F, and the smoke-pipe leading from the upper end of said chamber, substantially as set forth.

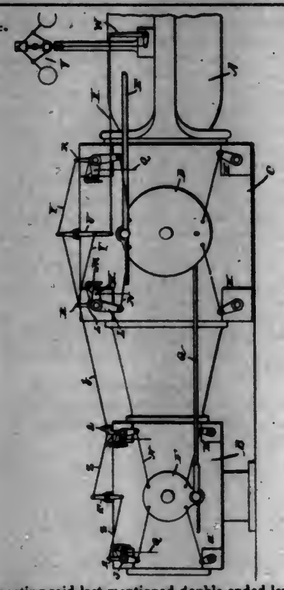
406,903. FASTENER FOR THE MEETING-RAILS OF SASHES. HENRY B. HERBST, New York, N. Y. Filed Mar. 21, 1888. Serial No. 304,199. (Model.)

Claim.—1. A sash-lock having in combination two parts, one made in the form of a box furnished with a sliding bolt or dog and having an opening adjacent to the bolt or dog, a guide-rod for the bolt, and a spring on the guide-rod, and the other part having a plate extending beneath said opening and having an upper portion provided with a head or shoulder, substantially as specified.



2. A sash-lock having in combination two parts, one made in the form of a box furnished with a bolt or dog, said box being provided with an opening and furnished with a lever, and a sliding push-piece for operating the lever, and the other part having a plate extending beneath said opening and having an upper portion provided with a head or shoulder, substantially as specified.

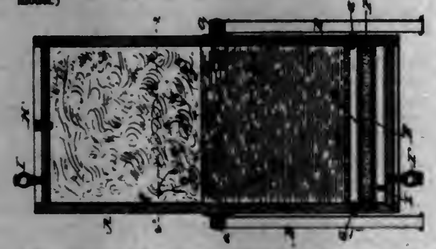
3. A sash-lock having in combination two parts, one made in the form of a box furnished with two opposite sliding dogs or bolts and having an opening adjacent to the bolts or dogs, and guide-rods for said bolts or dogs, and the other part having a plate extending beneath said opening and having an upper portion provided with a head or shoulder, substantially as specified.



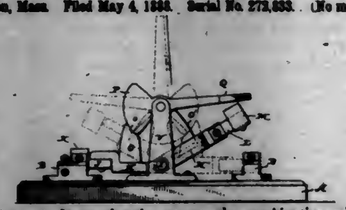
4. A sash-lock having in combination two parts, one made in the form of a box furnished with two opposite bolts or dogs and provided with an opening and having two levers and a sliding push-piece for operating the levers, and the other part having a plate extending beneath said opening and having an upper portion provided with a head or shoulder, substantially as specified.

406,904. VALVE-GEAR. GEORGE H. HELVEY, Hamilton, Ohio, assignor to the Hooven, Owens & Rentschler Company, same place. Filed Jan. 26, 1888. Serial No. 297,591. (No model.)

Claim.—In a compound engine having valve-gear of the Corliss type and having the two cylinders arranged tandem and having at each steam-valve of each cylinder a cam-lever to be adjusted angularly to change the point of valve-closure, the combination, substantially as set forth, with such cam-levers and the governor which is to actuate them, of a double-ended lever pivoted on one cylinder between the two steam-valves of that cylinder, a link connecting said lever with the governor, links connecting said lever with each of the cam-levers of the cylinder on which the lever is pivoted, a link connecting said lever with one of the cam-levers of the second cylinder, a double-ended lever pivoted on the second cylinder between its steam-valves,



406,904.

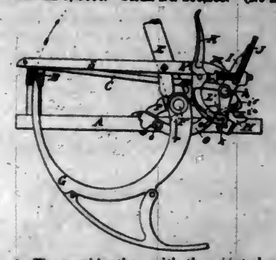


and links connecting said last-mentioned double-ended lever with the two cam-levers of said second cylinder.

406,905. VINEGAR GENERATOR AND FILTER. RUDOLPH H. HERDER, Chicago, Ill. Filed Dec. 21, 1888. Serial No. 294,242. (No model.)

Claim.—In a reversible vinegar-generator balancing on trunnions and in one end thereof, the three perforated diaphragms C, D, and E, with filtering material F, packed between diaphragms D and E, with bung-holes leading from opposing sides into the chamber between diaphragms C and D, and with a faucet reaching into the chamber below diaphragm E, all substantially as set forth, for the purpose specified.

406,906. CUT OUT FOR ELECTRIC CIRCUITS. WARREN S. HILL, Boston, Mass. Filed May 4, 1888. Serial No. 273,333. (No model.)



Claim.—1. In an electric cut-out, the combination, with the main and working circuit terminals, of two pivoted frames, each carrying connecting-conductors, a lever for operating both the frames, a segment on the lever, and projections on the frames arranged in the path of the segment, the segment being wider than the space between the projections, whereby the connections between one set of terminals must be completed before the connections between the other set are broken, substantially as described.

2. In an electric cut-out, the combination, with the main and working circuit terminals, of a pivoted frame carrying connecting-conductors arranged to complete the circuit between the main-line terminals, another pivoted frame carrying connecting-conductors arranged to complete the circuit between the working-circuit conductors and the main line, a lever for operating both the frames, a segment carried by the lever, and projections on the frames in the path of the segment, substantially as described.

3. In an electric cut-out, the combination, with one set of main-line terminals, of a pivoted frame carrying a conductor arranged to complete the circuit between said terminals, another set of main-line terminals electrically connected with the first set, a set of working-circuit terminals arranged adjacent thereto, and another frame carrying connecting-conductors arranged to complete the circuit between the last-named main-line conductors and the working-circuit conductors, substantially as described.

4. The combination, with the base-board, of one set of main-line conductors, another set of main-line conductors electrically connected thereto, a set of working-conductors arranged adjacent to the latter, a standard arranged between the two sets of main-line conductors, a lever mounted in the standard having a segment, and two frames pivotally mounted in said standard carrying connecting-conductors and having projections arranged in the path of the segment, substantially as described.

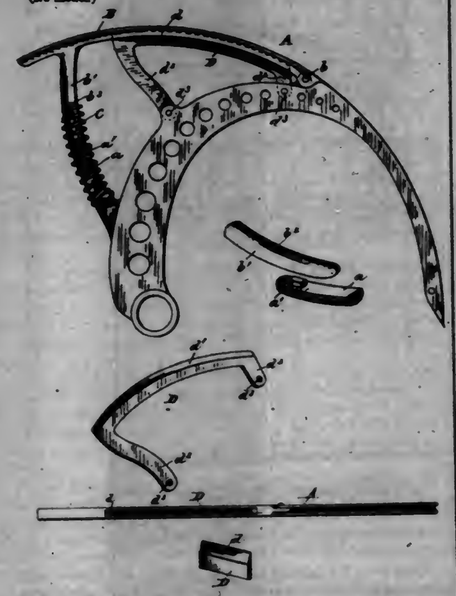
406,907. GRAIN-BINDER. WATSON M. HOLMES, Hoosick Falls, N. Y. Filed Jan. 9, 1888. Serial No. 260,265. (No model.)

Claim.—1. The combination, with the pivoted compressor, of a toggle-joint to lock the compressor in an upright position, and a projection on the needle-arm adapted during the initial descent thereof to engage a rocking bar forming part of said toggle-joint on one side of its pivot to break the lock and on the further descent of the needle-arm to engage the rocking bar on the other side of its pivot to again lock the compressor in an upright position, substantially as and for the purpose specified.

2. The combination of the compressor rocking on a pivot at the outer edge of the binder-platform, a rocking arm pivoted to the machine beneath the binder-platform, intermediate mechanism between the rocking arm and the compressor and forming therewith a toggle-joint, a spring-cam projection on the rocking arm, and a roller on the needle-arm adapted to engage the spring-cam during the descent of the needle-arm, substantially as and for the purpose specified.

3. The combination, with the shaft mounted at the outer edge of the binder-platform independently of the binder-driving mechanism, of a casting pivoted on the shaft, a crank-arm secured to the casting, a rocking arm pivoted to the machine beneath the binder-platform, a link connecting the crank-arm and the rocking arm and forming therewith a toggle-joint, the compressor pivoted to the casting, and a spring interposed between the casting and the compressor, substantially as and for the purpose specified.

4. The combination, with the compressor mounted at the outer edge of the binder-platform independently of the binder-driving mechanism and held in an upright position by a toggle-joint during the binding of the bundle, of a projection on the needle-arm to overcome the lock formed by the toggle-joint, and a heel-extension on the needle-arm to retard the fall of the compressor, substantially as and for the purpose specified.



5. The combination of the compressor, the rocking arm connected to the compressor by the toggle-joint, and a fixed stop on the machine, against which the toggle-joint is forced by the grain accumulating against the compressor, substantially as and for the purpose specified.

6. The combination, with the compressor pivoted to the drop-board mounted at the outer edge of the binder-receptacle independently of the binder-driving mechanism, of a spring interposed between the compressor and the drop-board, a rocking arm pivoted to the machine beneath the binder-platform, a crank-arm attached to the drop-board, a link connecting the crank-arm and the rocking arm and forming therewith a toggle-joint, and the needle-arm formed with a projection to engage the inner end of the rocking arm during the descent of the needle-arm to overcome the lock formed by the toggle-joint, substantially as and for the purpose specified.

7. The combination, with the needle-arm and the compressor, of a rocking arm pivoted to the machine beneath the binder-platform, intermediate mechanism interposed between the rocking arm and the compressor and forming therewith a toggle-joint, and an adjustable piece secured to the needle-arm to engage the inner end of the rocking arm to overcome the lock formed by the toggle-joint, substantially as and for the purpose specified.

8. The combination, with the compressor and the rocking arm pivoted beneath the binder-platform to the machine, and intermediate mechanism interposed between the rocking arm and the compressor and forming therewith a toggle-joint by which the compressor is locked in an upright position, of a projection on the needle-arm to overcome the lock formed by the toggle-joint by engaging with the rocking arm at its inner end during a portion of the descent of the needle-arm and to again lock the compressor in position by engaging on the further descent of the needle-arm with the rocking arm at its forward end, substantially as and for the purpose specified.

406,908. NEEDLE-ARM FOR GRAIN-BINDERS. WATSON M. HOLMES, Hoosick Falls, N. Y. Filed Jan. 11, 1889. Serial No. 296,091. (No model.)

Claim.—1. The combination, with the needle-arm of an automatic grain-binder and a stationary knife attached to the back thereof, of a yielding wing pivoted to the needle-arm, substantially as and for the purpose specified.

2. The combination, with the needle-arm of an automatic grain-binder and a stationary knife attached to the back thereof, of a pivoted wing and a spring interposed between the wing and the needle-arm to normally hold the wing outwardly, so as shield the knife, but adapted to yield upon undue pressure to expose the knife, substantially as and for the purpose specified.

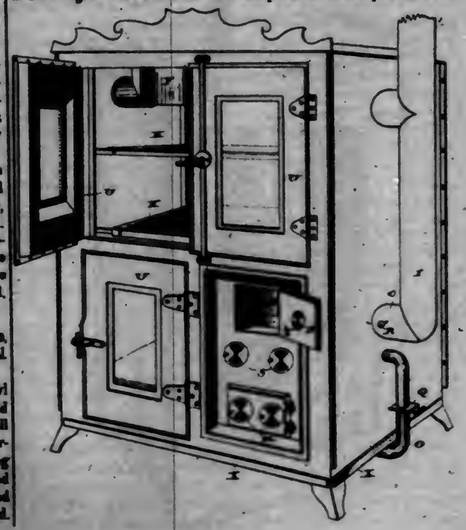
3. The combination, with the needle-arm having the projection *a*, semicircular in cross-section, provided with lug *a'*, of the pivoted wing B, its slotted arm *b'*, semicircular in cross-section, the knife D, and the spiral spring C, substantially as and for the purpose specified.

4. The combination, with the slotted pivoted wing of the needle-arm and the stationary knife, of a spring to hold the wing to sheathe the knife, but adapted to be overcome by undue pressure upon the wing to expose the knife, substantially as and for the purpose specified.

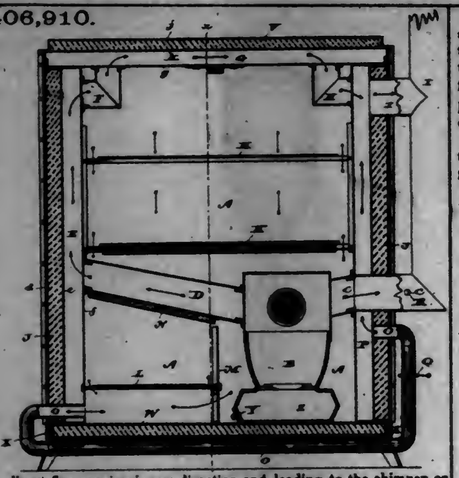
406,909. SQUIRREL-POISONING MACHINE. WILLIS J. HOWARD, Mariposa, assignor of one-half to John W. Farmer, San Francisco, Cal. Filed Jan. 7, 1889. Serial No. 295,703. (No model.)

Claim.—The improved device described, consisting of the bowl having a converging bottom, the discharge-spout leading from said bottom, the spring-pressed gates at the lower end of the tube, the ball secured to the bowl, the hand-lever pivoted to the ball, the triangular-shaped lever secured at one end to the gates, and the cord leading from the opposite end of said lever to one end of the hand-lever, and the spring having one end secured to the tube and its opposite end pressing against the triangular-shaped lever, substantially as specified.

406,909.



406,910. BAKING-OVEN. CHARLES F. HUSBARD, Toronto, Ontario, Canada. Filed Sept. 12, 1888. Serial No. 285,165. (No model.) Patented in England Oct. 20, 1888, No. 16,067.

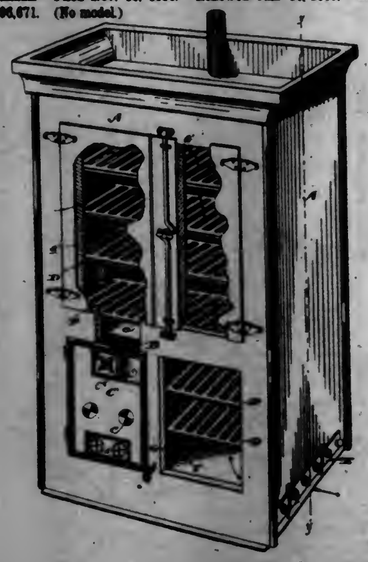


Claim.—1. A double-walled chamber combined with a furnace located entirely within the same and surrounded by said double walls and having its combustion-chamber distinct from said double-walled chamber, and provided with two independent smoke-pipes, one leading directly to the chimney or main flue and the other running in the opposite direction and leading to the air-space between the double walls, substantially as described.

2. A double-walled chamber having located within it a stove or independent furnace provided with an independent flue or flues, said chamber having an air-inlet in proximity to the stove or independent furnace, and an air-outlet connecting with the interior of the chamber and entering the hollow space formed in the vertical walls of said chamber and leading to and connecting with the smoke-flue of the stove or independent furnace, substantially as and for the purpose specified.

3. A double-walled chamber having a casing lined with asbestos and arranged to contain a stove or independent furnace provided with

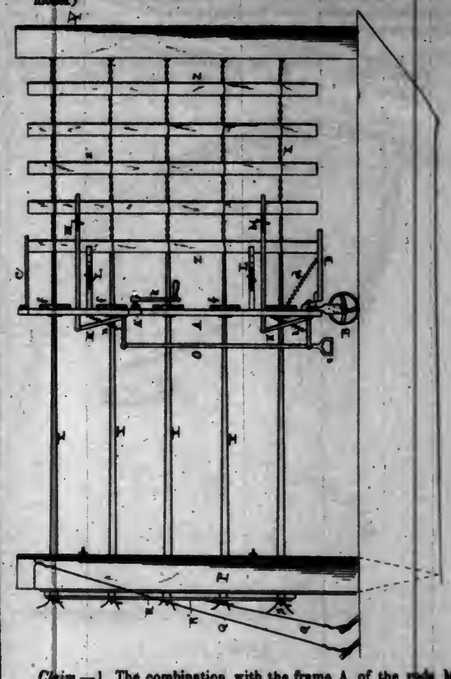
406,910.



a direct flue running in one direction and leading to the chimney or main flue and an independent indirect flue running in another direction and leading to an air-space formed within the walls of the chamber and communicating with the chimney or main flue, substantially as and for the purpose specified.

4. A chamber having a casing lined with asbestus and arranged to contain a stove or independent furnace provided with a direct flue leading to the chimney or main flue and an indirect flue leading to an air-space formed within the walls of the chamber and communicating with the chimney or main flue, in combination with an air-inlet entering the chamber at a point in proximity to the stove or independent furnace and an air-outlet flue entering the chamber at a point remote from the stove or independent furnace and leading to and connecting with an air-space formed in the wall of the chamber and communicating with the main flue or chimney, substantially as and for the purpose specified.

5. A chamber having a casing lined with asbestus and arranged to contain a stove or independent furnace provided with a direct flue leading to the chimney or main flue, in combination with air-spaces formed in the vertical walls of the chamber and connected with a horizontal air-space formed in the top of the chamber by means of elbows projecting into the chamber, the said air-spaces being connected to a smoke-flue of the stove or independent furnace, substantially as and for the purpose specified.



406,911. COOKING-OVEN. CHARLES F. HUBBARD, Toronto, Ontario, Canada. Filed Nov. 18, 1886. Renewed Jan. 17, 1889. Serial No. 296,671. (No model.)

Claim.—1. The case or oven A, provided with a series of shelves and having an opening near its base, and a stove-compartment B in the lower part of said oven and communicating with the upper part thereof through the opening *a*, and provided with an opening *b*, affording communication between the stove-compartment and the lower part of the oven, and the slide G, controlling said opening *b*, the damper *d*, and the slide E, substantially as described.

2. A case or oven formed in sections lined with asbestus, said sections being formed with flanges *b*, and the rivets passed through said flanges outside the oven, substantially as shown and described.

406,912. FENCE-MACHINE. EDWARD HUGHES and BENJAMIN F. WILLIAMS, Cookport, Pa. Filed May 20, 1889. Serial No. 311,369. (No model.)

Claim.—1. The combination, with the frame A, of the rods M, having hooks *m* and abutments *m'*, elbow-levers N, fulcrumed on the frame and connected with the rods M, and a stirrup-rod O, connected with the levers, substantially as described.

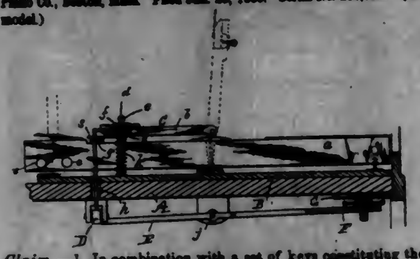
2. The combination, with the frame A, of the rods M, having hooks *m* and adjustable abutments *m'*, elbow-levers N, connected with the rods M, springs *n*, for retracting the levers, and means for simultaneously actuating the levers against the tension of the springs, substantially as described.

3. The combination, with the spacers M and means for moving them, of the forked picket-holder L, composed of two pieces having serrated surfaces clamped together by a thumb-screw *l*, substantially as described.

4. The combination, with the frame of a fence-machine, of a twister having a slot for the fence-wire, and an adjustable piece covering said slot and having itself a slot arranged to cross the slot in the twister and adapted to change the point of intersection when adjusted to different positions, substantially as described.

5. A twister for a fence-machine, provided with two curved symmetrically-arranged eccentric slots, and an adjustable plate covering said slots and provided itself with two similar slots turned in opposite directions to those in the twister, substantially as described.

6. The combination, with the twister F, having a tubular shank, a sprocket-wheel *f*, recess *f'*, and the curved slots *f²*, having enlarged ends, of the disk G, seated in said recess and having the oppositely-curved slots *g*, and means for adjustably securing the disk in the recess, substantially as described.



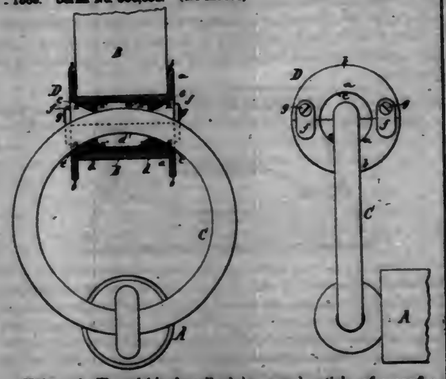
7. The combination, with the frame A, of the sleeve E, the twister F, having a tubular shank inserted through the sleeve and provided with slots *f²*, the adjustable slotted disk G, covering the slots *f²*, the cross-bar I, placed against the end of the shank, and the bolt H, passing through the disk, twister, and cross-bar, substantially as described.

8. A tension device for fence-machines, consisting of the post P,

having the bed R, extending from its top to near its bottom and provided with the concave groove *r*, the plate R', having a convex surface *r'*, matching the groove *r* for substantially its whole length, and the bolts S, provided with nuts *s*, whereby the several wires of a fence can be clamped at one and the same time, substantially as described.

9. A tension device for fence-machines, consisting of the bed R, having the concave groove *r* and suitable holes, the plate R', having a convex surface *r'* and the prongs *r²*, the bolts S, and nuts *s*, substantially as described.

406,913. TOUCH-REGULATING DEVICE FOR MUSICAL INSTRUMENTS. WILLIAM H. IVERS, Dedham, assignor to the Ivers & Pond Piano Co., Boston, Mass. Filed Jan. 26, 1889. Serial No. 297,991. (No model.)

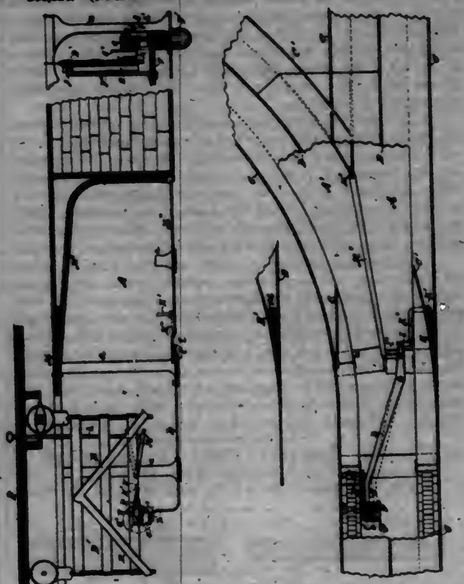


Claim.—1. In combination with a set of keys constituting the key-board of a musical instrument, a rigid transverse rail C, arranged above said keys, arms *b b*, whereby said rail is pivoted to the frame of the instrument, springs attached to said rail and bearing individually on the rear parts of said keys, and adjusting devices for regulating the pressure of said rail and springs on said keys, substantially as set forth.

2. The transverse rail C, consisting of a bar *c* and a truss-rod *d*, held therefrom in the middle by eyes *e*, in combination with springs on the said rail, keys against which said springs bear, and which constitute the key-board of a musical instrument, and adjusting devices for regulating the pressure of said rail and springs on said keys, substantially as set forth.

3. In combination with the keys of a key-board, a transverse rail provided with springs bearing thereon, springs *k* between the said rail and the key-frame, an adjusting-lever E, rocker-arms D, jointly united to said lever, and rods *h*, connecting the outer ends of said rocker-arms to the outer ends of the transverse rail, substantially as set forth.

4. The combination, with the key-board G of a musical instrument, the swinging touch-regulating rail C, trussed as described, mounted above the keys, and one or more springs *k k* beneath the rail, of a series of spring mediums affixed to said rail, the connecting-rods *h h*, rocker-arms D, lever E, and hand-wheel F, substantially as set forth.



406,914. NECK-YOKE RING. WILLIAM H. JOHNSON, Delhi, N. Y., assignor of one-half to Marcus O. Landon, same place. Filed Apr. 30, 1888. Serial No. 308,032. (No model.)

Claim.—1. The within-described improved article of manufacture, consisting of a flanged roller for the neck-yoke ring and breast-strap of harness, said roller being formed with a passage through it which is flared concentrically with the ring at each end, and provided with an interior annular groove between said flared ends, substantially as described.

2. The within-described improved article of manufacture, consisting of the flanged roller for the neck-yoke ring and breast-strap of harness, said roller being formed of halves, the flanges of one half being provided with perforated lugs and of the other half with perforations, and the passage for the ring being flared concentrically with the ring at each end and provided with an interior annular groove between said concentric portions, and the whole united upon the ring by suitable fastenings, substantially as described.

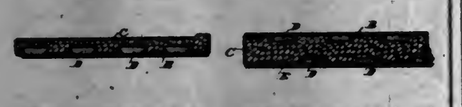
406,915. SWITCH FOR PNEUMATIC STREET-RAILWAYS. WITHROW L. JUDSON, Minneapolis, Minn., assignor to the Judson Pneumatic Railway Company, same place. Filed Apr. 2, 1888. Serial No. 269,236. (No model.)

Claim.—1. In a system of surface street-railways having a slotted underground conduit for the propelling mechanism, the combination, with a car having a dependent portion projecting through said slot into the interior of the conduit, of a vertical shaft at the convergence of the switch and main rails, pivoted to swing in the horizontal plane, provided with a switch-tongue rigidly secured to the top of the same adapted to be thrown into line with either rail, a crank-arm on said shaft, a cam in the conduit in the path of the dependent portion of the car, and a connection from said cam to said crank-arm lever, substantially as described.

2. In a street-railway switch, the combination, with a car having a dependent portion, of a pivoted vertical shaft at the convergence of the main and switch rails, a switch-tongue rigidly secured to said shaft adapted to line with either rail, a crank-arm on said shaft, a segmental cam mounted on a fixed shaft in the path of the dependent portion of the car and provided with a diagonal cam-groove in its periphery, a pivoted horizontal lever arranged lengthwise of the car-track, a link connecting one end of the same with the crank-arm on said vertical shaft, and a vertical arm on the other end having a cam-head working in said cam-groove, substantially as described.

3. In a street-railway switch, the combination, with a car having a dependent portion, of a pivoted vertical shaft at the convergence of the rails, a switch-tongue rigidly secured to the same, a crank-arm on said shaft, a segmental cam mounted on a shaft fixed adjacent to the path of the dependent portion of the car and provided with a diagonal cam-groove on its periphery, a lateral projection on the dependent portion, a segmental plate attached to said cam, an adjustable lateral projection on the dependent portion of the car adapted to engage with said plate, a pivoted horizontal lever arranged lengthwise of the car-track, and having a cam-arm at one end provided with cam-head working in said cam-groove, and a link connecting the other end of said horizontal lever with the crank-arm on said vertical shaft, substantially as described.

4. In a system of surface street-railways having a slotted underground conduit for the car-propelling mechanism, the combination, with a car having a dependent portion, of a pivoted slot switch-tongue at the convergence of the main line and switch-slots adapted to align with either, a crane-shaped lever mounted in bearings within said conduit, and having one arm attached to the free end of said



switch-tongue, a cam in the path of the dependent portion of the car, and a connection from said cam to said crane-shaped lever, substantially as described.

5. In a system of surface street-railways having a slotted underground conduit for the car-propelling mechanism, the combination, with a car having a dependent portion projecting into said conduit, of a pivoted switch-tongue at the convergence of the slots, a crane-shaped lever having its vertical arm pivoted within the conduit at the divergence of the tracks and its horizontal arm attached to said tongue, a crank-lever on said vertical arm, a segmental cam mounted on a shaft fixed in the conduit adjacent to the path of the dependent portion of the car, and having a cam-groove on its periphery and an adjustable lateral projection on the dependent part of the car, a horizontal lever pivotally secured near the bed of the conduit, a cam-arm on one end of the same provided with a cam-head working in said groove, and a link connecting its other end with said crank-lever, substantially as described.

6. In street-railways having slotted underground power-conduits, the combination, with the car having a dependent portion, of pivoted rail and slot tongues at the convergence of the main and branch rails and slots respectively, vertical horizontally-pivoted shafts supported within the conduit, having their upper ends directly attached to said pivoted tongues, crank-arms on said shafts, a cam within the conduit in the path of the dependent portion of the car, and connections from said cam to the crank-arms of said shafts, substantially as described.

7. In street-railways having slotted underground power-conduit, the combination, with a car having a dependent portion, of a vertical horizontally-pivoted shaft at the convergence of the branch and main rails, having a switch-rail rigidly attached thereto, and provided with a crank-arm within the conduit, a pivoted slot-tongue at the convergence of main and branch slots, a vertical crane-shaped lever within the conduit at the convergence of the lines, having its free end attached to said slot-tongue and provided with a crank-arm, a cam within the conduit in the path of the dependent portion of the car, and connections from said cam to said crank-arms, substantially as described.

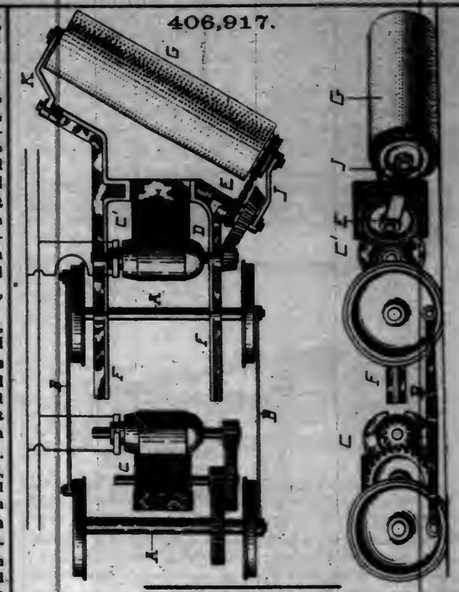
406,916. SECONDARY BATTERY. ISIDOR KITSEE, Cincinnati, Ohio, assignor to Mayer Sulzberger, trustee, Philadelphia, Pa. Filed May 10, 1888. Renewed Mar. 1, 1889. Serial No. 301,727. (No model.)

Claim.—1. An electrode for a secondary battery, consisting of a supporting-plate formed of a porous material and provided upon one or more of its surfaces with a layer of a suitable element substance, substantially as specified.

2. An electrode for a secondary battery, consisting of a supporting-plate formed of a porous and stiff substance unsusceptible to electrolysis and provided upon one or more of its surfaces with a layer of a suitable element substance, substantially as specified.

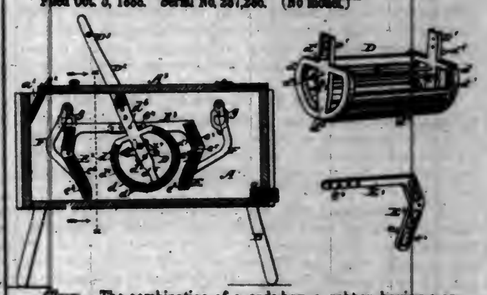
3. An electrode for a secondary battery, consisting of a supporting-plate formed of a porous substance unsusceptible to electrolysis, provided as to parts of its surface with red lead or with other "active" material, and also provided with an exterior layer of lead or of other suitable element substance, substantially as specified.

4. An electrode for a secondary battery, consisting of a supporting-plate formed of a porous substance unsusceptible to electrolysis, provided as to one or more of its surfaces with a series of grooves or cavities containing red lead or other active material, and also provided with an outer layer of lead or other suitable element substance, substantially as specified.



5. In a secondary battery, in combination, a containing box or vessel, a series of electrodes, each consisting of a supporting-plate of porous material provided with a layer of a suitable element substance, metallic conducting-plates each at the respective ends of the said electrodes in contact with the adjacent ends of each alternate electrode of the said series, and conducting-wires respectively attached to each of said conducting-plates, substantially as specified.

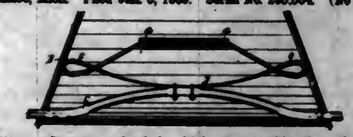
406,917. ELECTRIC TRACK-SWEEPER. WALTER H. KNIGHT, New York, N. Y. Filed Mar. 5, 1889. Serial No. 301,882. (No model.)



Claim.—1. The combination, with an electrically-propelled vehicle, of a track-sweeper connected thereto, consisting of a rotating broom or cleaning device with an independent operating-motor supplied from the same source as the propelling-motor of the vehicle.

2. The combination, in an electrically-propelled vehicle, of a motor geared to one axle thereof, a mechanical connection with the opposite axle, a rotating broom or cleaning device, and an independent operating-motor for said cleaning device supplied from the same source of electricity as the propelling-motor of the vehicle.

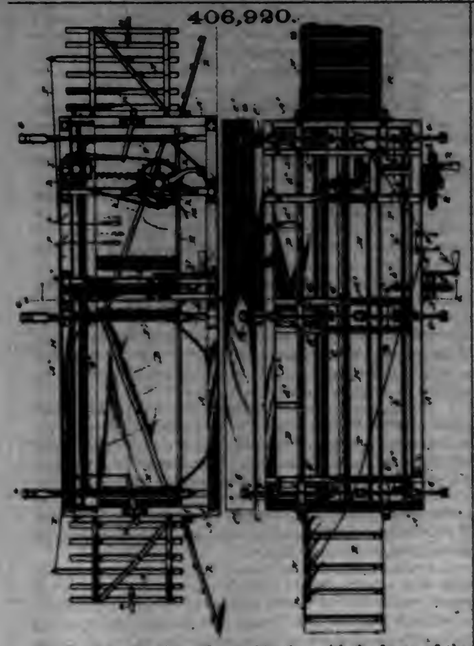
406,917.



406,918. WASHING-MACHINE. JONAS L. KNOLL, Lebanon, Pa. Filed Oct. 5, 1888. Serial No. 287,286. (No model.)

Claim.—The combination of a suds-box, a rubber having a cylindrical rubbing-surface formed of slats having their widest edge at the top and pivoted centrally in said box, arms D', projecting upward from the ends of said rubber and having outwardly-projecting pins d^4, with racks having horizontal arms provided with a series of perforations for adjustable engagement with the pins d^5, and connecting-rods F, having one end pivoted to the lower end of the rack and their upper end pivoted in bearings g to the suds-box, substantially as described.

406,919. TWO-WHEELED VEHICLE. WARREN LAWRIA, Kalamazoo, Mich. Filed Jan. 5, 1889. Serial No. 295,504. (No model.)



Claim.—In a two-wheeled vehicle, the combination of the body fulcrumed at the forward end, the axle, and the spring consisting of the semi-elliptic member, the ends of said member being bent around, downward, thence upward, flatwise, forming complete loops in rear elevation, with the edges of the bar forming said loops presented to the rearward, thence extended upward toward each other and attached to the body by vertical pivots, substantially as set forth.

406,920. BRANDING-CHUTE. EDGAR A. LEHARD and GEORGE W. SHEETS, Karle, Ohio. Filed Jan. 5, 1889. Serial No. 295,913. (No model.)

Claim.—1. In a branding-chute, the combination, with the frame, of the movable side, the arm pivotally connected therewith for moving the same, and the cranked shaft and connections for moving the arm, substantially as described.

406,920.

2. In a branding-chute, the combination, with the frame, of the sides between which the animals are clamped, both pivoted at the top to the frame, a catch or lock for holding one side rigidly in position, and the crank-shaft and connections for moving the opposite side toward and from the same to secure the animals, substantially as described.

3. In a branding-chute, the combination, with the frame, of the movable sides between which the animals are held, and the substantially horizontal supports or timbers connected to one side and adjustably connected to the frame for holding the side rigidly in adjusted position, and mechanism for moving the opposite side toward and from said first-mentioned side, substantially as described.

4. In a branding-chute, the combination, with the sides movable toward and from each other to hold the animals, of the supports or timbers secured to one side and adjustable connections between said supports and the uprights, and the platforms or walks on the ends of the supports, substantially as described.

5. In a branding-chute, the combination, with the sides pivoted at the top and movable toward and from each other to hold the animals, of the supports or timbers connected to one side, an adjustable connection between the supports and the uprights, and mechanism for moving the opposite side toward and from said first-mentioned side, substantially as described.

6. In a branding-chute, the combination, with the sides pivoted at the top and movable toward and from each other to hold the animals, of the supports or timbers connected to one side and adjustably connected to the frame, the arm for moving the opposite side, and the cranked shaft and connections for imparting motion to the arms, substantially as described.

7. In a branding-chute, the combination, with the movable side for securing the animals, of the arms connected thereto, the slides connected to said arms, the cranked shaft connected to the slides, and the crank-handle for rotating the said shaft, whereby the side may be moved, substantially as described.

8. In a branding-chute, the combination, with the movable sides and the supports or timbers for holding the same in adjusted position, of the branding-doors in the side, hinged at the bottom and resting on said supports or timbers, when open, in horizontal position, to form platforms, substantially as and for the purpose specified.

9. In a branding-chute, the combination, with the branding-door, of the catches therefor, formed by the pawls engaging the door at different points and secured on a common shaft, whereby they are moved simultaneously to release the door, substantially as described.

10. In a branding-chute, the combination, with the sides between which the animals are held, converging toward the bottom, of the vertically-movable bottom on which the animals are driven, located below the sides, and operating, when lowered, to leave the animals supported by the sides, substantially as described.

11. In a branding-chute, the combination, with the sides between which the animals are held, adjustable toward each other to secure the animals, of the vertically-movable bottom on which the animals are driven, located below the sides and operating, when lowered, to leave the animals supported by the sides, substantially as described.

12. In a branding-chute, the combination, with the sides between which the animals are held—one stationary and the other movable toward and from the same—of the vertically-movable bottom on which the animals are driven, located below the sides, and operating, when lowered, to leave the animals supported between the sides, substantially as described.

13. In a branding-chute, the combination, with the frame, of the movable bottom, the shaft extending longitudinally of the frame and the chains connected thereto, and connections between said chains and the movable bottom for raising the same, substantially as described.

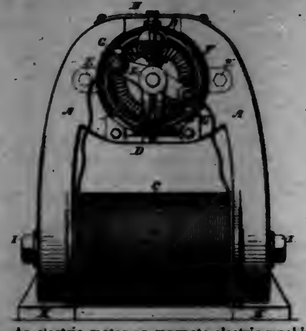
14. In a branding-chute, the combination, with the frame, the movable bottom, and the levers connected therewith, of the shaft and the chains connected thereto and to the said levers for raising the bottom, substantially as described.

15. In a branding-chute, the combination, with the frame, the movable bottom and shaft at the top of the frame, extending longitudinally of the same, and connections between said shaft and the bottom for moving the same, of the sprocket-wheel on the lower portion of the frame, having the crank-handle, the chain, a gearing, and connections uniting the sprocket-wheel and shaft for rotating the same, substantially as described.

16. In a branding-chute, the combination, with the adjustable side and the shaft and connections for moving the same, of the gates and the catches therefor connected to the shaft, whereby when the shaft is rotated to move the side back the gate will be released, substantially as described.

17. In a branding-chute, the combination, with the movable sides and bottom and the crank-handles, and connections between said handles and the side and bottom for moving the side and bottom, respectively, of the gates and cords extending therefrom to a point in proximity to the crank-handles, whereby the operator may close the gates without leaving his station, substantially as and for the purpose set forth.

406,921. KNOCKDOWN MUSIC-RACK. JOHN A. LOHAGEN, Milwaukee, Wis. Filed Oct. 4, 1888. Serial No. 287,181. (No model.)



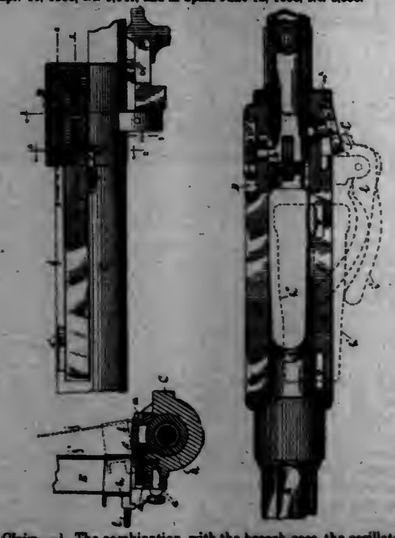
Claim.—1. In a knockdown music-rack, the combination of wire end pieces having loops formed at intervals therein and supporting-bends at their lower front portions with a series of rods whose ends are clipped into said loops, thereby uniting said end pieces, substantially as set forth.

2. In a knockdown music-rack, the combination of wire end pieces having loops formed at intervals therein and supporting-bends at their lower front portions with a series of rods fitting in said loops and connecting said end pieces, and a movable intermediate wire supporting-piece bent to correspond with the supporting-bends of the end pieces and provided with loops, whereby it is fitted on the lower front rod of the rack, substantially as set forth.

3. In a knockdown music-rack, the combination of wire end pieces having loops formed at intervals therein and supporting-bends at their lower front portions with a series of rods fitting in said loops and connecting said end pieces, and a spring-wire clip or clips, each having loops whereby it is secured adjustably on one of the rods of the rack, and a spring end bent back and adapted to bear against a sheet or page of music placed beneath it, substantially as set forth.

4. The knockdown music-rack described, consisting of the combination of wire end pieces having loops formed at intervals therein and supporting-bends at their lower front portions, a series of rods fitting in said loops and connecting said end pieces, a movable intermediate wire supporting-piece bent to correspond with the supporting-bends of the end pieces and provided with loops which receive the lower front rod of the rack, and laterally-movable spring-wire clips having loops which receive one of the said rods, and spring ends bent back toward the other ends of said clips, substantially as set forth.

406,922. ELECTRIC MOTOR. GEORGE W. MANSFIELD, Cleveland, Ohio, assignor to Matthew H. Robinson and Orlando A. Foster, Boston, Mass. Filed Feb. 27, 1888. Serial No. 301,137. (No model.)



Claim.—An electric motor or magneto-electric machine consisting of a magnet having polar extensions between which the armature is arranged, with the part of said polar extensions near the magnet and neutral point fashioned into feet to support the motor, and the horizontal coil mounted between the polar extensions and attached thereto near the feet, substantially as described.

406,923. METHOD OF ORNAMENTING SURFACES WITH MOLTEN METAL. WILLIAM H. MARSHALL, Chelsea, Mass. Filed Oct. 1, 1888. Serial No. 286,914. (No model.)

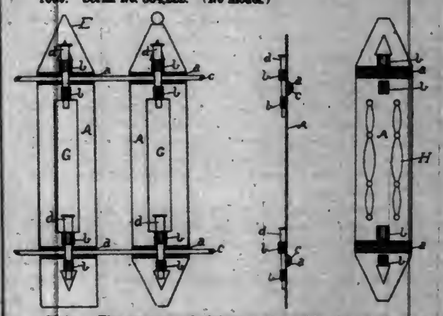
Claim.—The herein-described method of ornamenting surfaces with molten metal, consisting in submerging the surface to be ornamented in a liquid, pouring the molten metal in a stream into the liquid and onto the surface, substantially as described.

406,924. BREECH-LOADING FIRE-ARM. PAUL MAUSER, Oberndorf-on-the-Neckar, Würtemberg, Germany, assignor to the Waffenfabrik Mauser, same place. Filed June 30, 1888. Serial No. 278,657. (No model.) Patented in Germany Mar. 2, 1888, No. 44,328; in Belgium Mar. 9, 1888, No. 80,968; in Italy Mar. 31, 1888, No. 23,202; in England Apr. 16, 1888, No. 5,041, and in Spain June 12, 1888, No. 8,053.

Claim.—1. The combination, with the breech-case, the oscillatory bolt, and the non-rotative bolt-head formed with a recess in one side thereof, and the shell-extractor carried by the bolt-head on the top thereof, of an ejector pivoted in the side of the breech-case and in the same plane with said recess, and a spring for pressing said ejector inwardly, so that on the retraction of the bolt its nose shall enter said recess and encounter the side of the base of the receding cartridge-shell.

2. The combination, with the breech-case and bolt, the non-rotative bolt-head F, formed with a recess g^3, having a sloping bottom, and the shell-extracting claw r, carried by said bolt-head, of an ejector g, pivoted to the breech-case, with its nose in the same plane as said recess, and a spring for pressing the ejector inwardly.

3. The combination, with the breech-case and bolt, of an ejector having a pintle fixed to it, which pintle is flattened on one side and has bearings in the breech-case, and a spring pressing against the flattened portion of said pintle, and thereby tending to project the nose of the ejector into the bore of the breech-case.



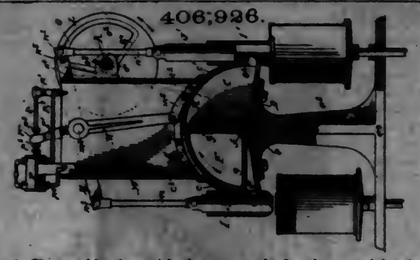
4. The combination of the detachable magazine having an operating-lever with a bolt-gun adapted for the attachment of said magazine, and having a guide-plate connected to and moving longitudinally with its bolt, and an inclined shoulder or cam-face on said guide-plate, and adapted upon the extreme retraction of the guide-plate to effect the displacement of said operating-lever, and thereby cause the delivery of a cartridge to the breech of the gun.

5. The combination of the detachable magazine having an operating-lever with a bolt-gun adapted for the attachment of said magazine, and having a guide-plate connected to and moving longitudinally with its bolt, and an inclined shoulder or cam-face on said guide-plate, and a push-lever pivoted to the gun in a position intervening, when the bolt is retracted, between the said inclined face and the operating-lever of the magazine, and adapted to transmit the movement of said inclined face to said operating-lever, and thereby to displace the latter and operate the magazine.

6. In a bolt-gun, the construction of the breech-case with the portion of its bore forming the cartridge-rest unobstructed at its bottom, and with an opening formed therein adapted for the attachment of a cartridge-magazine from beneath, in combination with a bolt and a guide-plate mounted to slide longitudinally over the opening in the top of the breech-case and connected to the bolt, so as to be moved longitudinally thereby.

7. In a bolt-gun, the construction of the breech-case with an opening p in its bottom for the insertion of a cartridge-magazine from beneath, in combination with the bolt, a shell-extractor carried by the bolt-head, and an ejector mounted in the side of the breech-case, and a spring for pressing said ejector inwardly, so that its nose shall enter the bore of the breech-case, whereby the bottom of the cartridge-rest is left unobstructed.

406,925. FENCE. JAMES T. MATHEW, Vista, Cal. Filed Mar. 21, 1889. Serial No. 304,222. (No model.)



Claim.—The open-panel pickets A, formed by dies of sheet metal, with transverse grooves a upon one side and longitudinal adjoining grooves or loops b on the opposite side, in combination with strings c and keys d, constituting a removable adjustable fence, as described.

406,926. CAN-FILLING MACHINE. GAIUS L. MERRELL, Syracuse, N. Y. Filed July 12, 1888. Serial No. 279,746. (No model.)

Claim.—1. The combination, with the receptacle for the material to be canned, of a fixed measuring-chamber communicating with said receptacle, a movable gate whereby the communication between the receptacle and the measuring-chamber is controlled, a movable piston which is arranged in the measuring-chamber and expels the material therefrom, an open-mouthed discharge-cylinder communicating with the discharge-opening of the measuring-chamber, and a valve-piston which is arranged in said cylinder and closes the discharge-opening of the measuring-chamber while the movable gate is open and the chamber is being filled, and opens the discharge-opening while the gate is closed and the measured quantity of material is being expelled from the measuring-chamber, substantially as set forth.

406,926.

2. The combination, with the receptacle for the material to be canned, of a segmental measuring-chamber communicating with said receptacle and provided with inlet and discharge openings in its periphery, an oscillating piston arranged in said chamber, a movable gate which opens and closes the inlet-opening of the measuring-chamber, a discharge-cylinder communicating with the discharge-opening of the measuring-chamber, and a valve-piston arranged in the discharge-cylinder, substantially as set forth.

3. The combination, with the measuring-chamber provided with discharge-openings at both sides, of an oscillating piston arranged in said chamber, a receptacle for the material to be canned communicating with the top of said chamber, and a movable gate whereby the opening between the measuring-chamber and the receptacle is closed in front of the piston when the measuring-chamber has been filled, substantially as set forth.

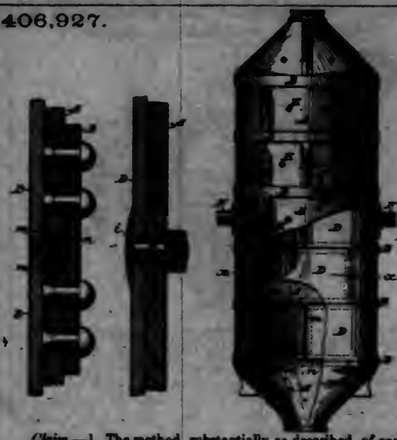
4. The combination, with the receptacle for the material to be canned, of a segmental measuring-chamber communicating at its top with said receptacle and provided with discharge-openings at its sides, discharge-cylinders communicating with said discharge-openings, plungers arranged in said cylinders, an oscillating piston having a curved peripheral face and arranged in the measuring-chamber, and a curved cut-off gate arranged between the measuring-chamber and the receptacle, substantially as set forth.

5. The combination, with the segmental measuring-chamber having discharge-openings at its sides and having its bottom provided with a central depression, of an oscillating piston arranged in said chamber and having its hub seated in said depression, substantially as set forth.

6. The combination, with the receptacle A, of the measuring-chamber C, provided with discharge-cylinders I I' and plungers J J', a piston F, arranged in the measuring-chamber, a movable cut-off gate H, a rock-lever M, connected with the plungers J J', and an arm M', connected with said cut-off gate, substantially as set forth.

7. The combination, with the receptacle A, of the measuring-chamber C, provided with discharge-cylinders I I' and plungers J J', a piston F, arranged in the measuring-chamber, a movable cut-off gate H, a rock-lever M, connected with the plungers J J', an arm M', connected with said cut-off gate, a crank-disk L, connected with the oscillating piston F, and a cam-groove O, engaging with the rock-lever M, substantially as set forth.

8. The combination, with the receptacle for the material to be canned, provided with an agitating device, and the measuring-chamber and piston, of a pump having its delivery-pipe opening into said receptacle, whereby the syrup or other liquid is delivered into said receptacle, substantially as set forth.



9. The combination, with the receptacle for the material to be canned, provided with an agitating device, and the measuring-chamber and piston, of a pump working in unison with said piston and having its delivery-pipe opening into said receptacle, whereby the syrup or other liquid is delivered in measured quantities into said receptacle and mixed therein with the material to be canned, substantially as set forth.

10. The combination, with the receptacle A, of the measuring-chamber C, having discharge-openings at its sides, cylinders I I', plungers J J', a rock-lever connected with the plungers, a liquid-pump, and an arm connected with the rock-lever, whereby said liquid-pump is actuated, substantially as set forth.

11. The combination, with the trough-shaped receptacle for the material to be canned, of a screw-conveyer arranged in said receptacle, a measuring-chamber arranged underneath the receptacle and communicating at its top therewith, a piston arranged in the measuring-chamber, a cut-off gate arranged between the measuring-chamber and the receptacle, and a discharge-cylinder and valve-plunger connected with the discharge-opening of the measuring-chamber, substantially as set forth.

406,927. METHOD OF CONSTRUCTING LEAD-LINED CONVEYING. JOHN HEMMERLE, Saugerties, N. Y. Filed Apr. 24, 1888. Serial No. 272,102. (No model.)

406,927.

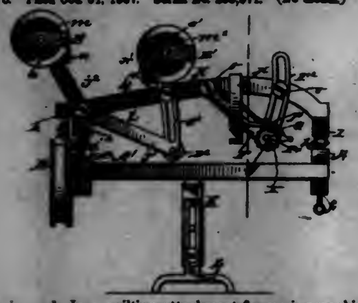
Claim.—1. The method, substantially as described, of constructing a lead-lined iron vessel, which consists in forming inwardly-enlarged recesses in the inner face of the wall thereof, filling said recesses with lead, fixing to the inner face of the wall sheets of lead whose joints coincide with and partly overlap said lead-filled recesses, and finally uniting by fusion the edges of the lead lining-plates to the lead in the seams overlapped thereby.

2. The method, substantially as described, of constructing a lead-lined iron vessel, which consists in rabbeting the edges of the iron plates to constitute its walls, uniting said plates by riveting the same upon bands or strips of iron made to overlap the seams in such manner as that the rabbeted edges shall form an inwardly-enlarged recess along each seam, filling said inwardly-enlarged recesses with lead, bolting upon the inner face of each iron plate a sheet of lead of like configuration, but so enlarged as to partially overlap the lead-filled seams, covering the heads of the bolts with lead joined by fusion to the underlying sheet, and, finally, uniting the edges of each sheet of lead to the lead in the seams by fusion.

406,928. TRACTION-GRIPPER FOR CABLE RAILWAYS. MOSES A. MICHALIS, Allegheny, assignor of one-half to John T. Moore, Pittsburg, Pa. Original application filed May 15, 1888, Serial No. 273,961. Divided and this application filed July 10, 1888. Serial No. 279,515. (No model.)

Claim.—1. The combination, with a grip rail-brake having rotating brake-shaft, of a cable-grip and an interposed rock-shaft having a gearing, and a crank-arm for simultaneously and reversely operating both the grip and brake, substantially as and for the purposes described.

2. In a combined grip and brake mechanism for cable roads, the combination, with a bar which actuates the grip and a grip rail-brake, of an interposed rock-shaft for simultaneously and reversely operating both the grip and brake mechanism, substantially as and for the purposes described.



3. The combination of a grip mechanism, a brake mechanism, and an interposed rock-shaft connected with the gripper-bar, and skew-gearing for connecting the rock-shaft with the rotating shaft which actuates the rail-brakes, substantially as and for the purposes described.

4. In a gripping mechanism for cable railways, the combination of an angle-iron having a rigid jaw, cable-supporting rollers journaled in the ends of said angle-iron, and a movable jaw located beneath said rigid jaw intermediate of said rollers, substantially as and for the purposes specified.

5. In a cable-grip, the combination of the angle-plates d^9, having the fixed half-grip d^8, the cable guide-rollers d^{10}, and the intermediate movable shoe d^7, substantially as and for the purposes specified.

6. In a combined cable-grip and brake mechanism, the combination of the angle-plates d^9, having fixed half-grip d^8, movable shoe d^7, vertical brake-shafts d^{12} d^{13}, shaft d^5, and suitable gearing for connecting the parts, substantially as and for the purposes specified.

406,929. QUILTING-FRAME. URIAH E. MILLER, Kelly's Mill P. O. Filed Oct. 31, 1887. Serial No. 253,571. (No model.)

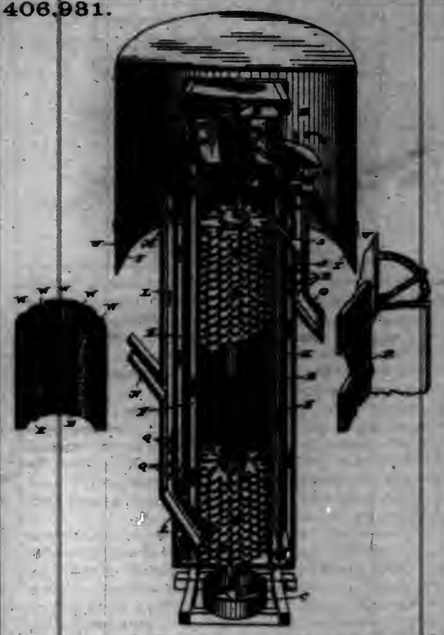
Claim.—1. In a quilting attachment for sewing-machines, the combination, with the frame C and the take-up roller G, adjustably journaled therein, of the brackets *j l*, adjustably secured to said frame, said brackets consisting of horizontal portions *j'*, extended below said frame and forming bearings for the lower roller D^2, upwardly-extending arms j^3 j^3, projecting above the frame and forming bearings for the lining-roller D and covering-roller D', respectively, said brackets pivoted, as at *o*, and means for securing said brackets in proper adjustment, substantially as and for the purpose set forth.

2. The combination, with the frame C, of the brackets *j l*, adjustably secured to said frame, said brackets consisting of horizontal portions *j'*, adapted to extend below said frame, said portions forming bearings for the lower roller D^2, upwardly-extending arms j^3 j^3, provided with bearings for the roller D, and upwardly-extended slotted arms provided with bearings in their upper ends for the roller D', said brackets being pivoted, as at *o*, and adjusted about said pivot by the screws *o'*, passing through the slotted arms, substantially as shown and described.

3. In a quilting attachment for sewing-machines, the carriage C and the quilting-fabric rollers, for the purpose specified, said carriage consisting, essentially, of the longitudinal beams 1 2 and the transverse beams 3 4, one of said beams 1 being stopped short of the cross-bar 3 and connected to said bar by a metal strip X, forming a space Y between said bars, whereby the carriage is adapted to be readily slipped under the needle-bar of the sewing-machine, substantially as and for the purpose described.

406,930. CAR-COUPLING. EDWARD E. MILLER, Avenue City, Mo. Filed Nov. 9, 1888. Serial No. 290,247. (No model.)

Claim.—1. The combination, with the draw-bar having an opening in its side, of a horizontal trip-lever K, having its end projecting into the link-throat, the vertical lever I, having a hook at its upper end, a horizontal hand-lever fulcrumed to the end of the car and having on the inner side a loosely-connected coupling-pin, and a rod extending to the top of the car, the outer end being formed as a handle and arranged to engage with the catch-lever, substantially as described.



2. The combination, with the draw-bar having an opening in its side, of the horizontal trip-lever K, having one end projecting into the link-throat, the vertical lever I, having a hook at its upper end, a horizontal hand-lever supporting the coupling-pin, a spring arranged behind the catch-lever, and a positive-locking seat for the hand-lever arranged beside the catch-lever, substantially as and for the purpose described.

3. The combination, with the draw-bar having a contracted throat with pin-holes and shoulders *e*, of a perforated plate E, hung upon a horizontal bolt at the upper front end of the draw-bar and having its rear end extended past the narrow portion of the throat and weighted at its rear end, as described, to hold the link horizontal.

406,931. GRAIN-SCOURER. ARTHUR MOORE, Toronto, Ontario, Canada. Filed Dec. 1, 1888. Serial No. 292,492. (No model.)

Claim.—1. A vertical conveyer revolving within a perforated cylinder, in combination with a chamber surrounding said cylinder,

406,931.

an air-leg communicating with the said chamber at its upper end and with the cylinder at its lower end, and passage-ways designed to spout the grain into the bottom of the conveyer and to discharge it out of the top of the cylinder, substantially as and for the purpose specified.

2. A conveyer revolving within a perforated cylinder and having its outer edge formed into a series of fingers, each finger being curved or bent, so that one edge shall project slightly above the edge of the finger next to it, in combination with a chamber surrounding said cylinder, an air-leg communicating with the said chamber at its upper end and with the cylinder at its lower end, and passage-ways designed to spout the grain into one end of the conveyer and to discharge it out of the other end, substantially as and for the purpose specified.

3. A vertical conveyer revolving within a perforated cylinder and having its outer edge formed into a series of fingers, each finger being curved or bent, so that one edge shall project slightly above the edge of the finger next to it, in combination with a chamber surrounding said cylinder, an air-leg communicating with the said chamber at its upper end and with the cylinder at its lower end, and passage-ways designed to spout the grain into the bottom of the conveyer and to discharge it out of the top of the conveyer, substantially as and for the purpose specified.

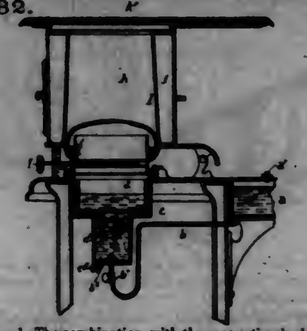
4. A vertical conveyer revolving within a perforated cylinder and having its outer edge formed into a series of fingers, each finger being curved or bent, so that one edge shall project slightly above the edge of the finger next to it, in combination with a chamber surrounding said cylinder, an air-leg communicating with the said chamber at its upper end and with the cylinder at its lower end, and passage-ways designed to convey the grain into the bottom of the conveyer and to discharge it out of the top of the conveyer, and with a suction-fan located above the conveyer, substantially as and for the purpose specified.

5. A vertical conveyer revolving within a perforated cylinder contained within a chamber, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber, in combination with passage-ways designed to spout the grain into the bottom of the conveyer and to discharge it out of the top of the conveyer, and adjustable valves for regulating the passage of air into and from said chamber, substantially as and for the purpose specified.

6. A hollow shaft, a vertical conveyer carried by said shaft and revolving within a perforated cylinder contained within a chamber, the edges of the said conveyer being formed into a series of fingers, each finger being curved or bent so that one edge shall project slightly above the edge of the finger next to it, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber, in combination with passage-ways designed to spout the grain into the bottom of the conveyer and to discharge it out of the top of the conveyer, substantially as and for the purpose specified.

7. A vertical conveyer revolving within a perforated cylinder contained within a chamber, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber into the chamber H, communicating with the chamber K, connected to the chamber containing the conveyer at or near its bottom end, shelves projecting over the openings between the chamber H and chamber K being provided, in combination with passage-ways designed to spout the grain into the bottom of the conveyer and to discharge it out of the top of the conveyer, substantially as and for the purpose specified.

8. A vertical conveyer revolving within a perforated cylinder contained within a chamber, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber into the chamber H, communicating with the chamber K, connected to the chamber containing the conveyer at or near its bottom end, shelves projecting over the openings between the chamber H and chamber K being provided, in combination with said chambers H and K, the air-leg L, connected at its upper end with the chamber containing the suction-fan and at its bottom end with the interior of the perforated cylinder at or near the bottom end of the revolving conveyer, a grain-spout being connected to the said air-leg near its bottom, and a discharge-spout communicating with the interior of the perforated cylinder at the top of the conveyer, substantially as and for the purpose specified.



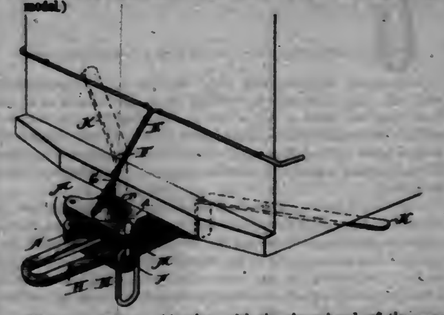
9. A vertical conveyer revolving within a perforated cylinder having a series of brushes arranged in it, said perforated cylinder being contained within a chamber, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber into the chamber H, arranged to communicate with the chamber K, connected to the chamber containing the conveyer at or near its bottom end, in combination with the air-leg L, connected at its upper end with the chamber containing the suction-fan and at its bottom end with the interior of the perforated cylinder at or near the bottom end of the revolving conveyer, a grain-spout being connected to the said air-leg near its bottom, and a discharge-spout communicating with the interior of the perforated cylinder at the top of the conveyer, substantially as and for the purpose specified.

10. A vertical conveyer revolving within a perforated cylinder having a series of brushes arranged in it, said perforated cylinder being contained within a chamber, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber into the chamber H, communicating with the chamber K, connected to the chamber containing the conveyer at or near its bottom end, in combination with an air-leg L, connected at its upper end with the chamber containing the suction-fan and at its bottom end with the interior of the perforated cylinder at or near the bottom end of the revolving conveyer, a grain-spout being connected to the said air-leg near its bottom and above one or more air-regulating valves placed on an opening or openings connecting the air-leg with the chamber K, and a discharge-spout communicating with the interior of the perforated cylinder at the top of the conveyer, substantially as and for the purpose specified.

11. A vertical conveyer revolving within a perforated cylinder having a series of brushes arranged in it, said perforated cylinder being contained within a chamber, a revolving suction-fan contained within the said chamber, in which it is designed to produce an upward draft and an outward blast through the sides of the said chamber into the chamber H, communicating with the chamber K, connected to the chamber containing the conveyer at or near its bottom end, in combination with the air-leg L, connected at its upper end with the chamber containing the suction-fan and at its bottom end with the interior of the perforated cylinder at or near the bottom end of the revolving conveyer, a grain-spout being connected to the said air-leg near its bottom and above one or more air-regulating valves placed on an opening or openings connecting the air-leg with the chamber K, and a discharge-spout communicating with the interior of the perforated cylinder at the top of the conveyer and with the interior of the chamber containing the suction-fans, regulating air valve or valves being placed on an opening or openings made between the discharge-spout and chamber K, below the passage-way leading between the said discharge-spout and the interior of the perforated cylinder, substantially as and for the purpose specified.

406,932. FEEDER FOR STOVES OR LAMPS FOR BURNING OIL. FRANK S. MOORE, Brooklyn, N. Y. Filed Sept. 6, 1888. Serial No. 284,736. (No model.) Patented in England Oct. 4, 1887, No. 12,626; in France Oct. 4, 1887, No. 183,933; in Belgium Oct. 4, 1887, No. 73,980, and in Germany Oct. 4, 1887, No. 44,361.

406,932.



Claim.—1. The combination, with the supporting-body of a stove or lamp, of an oil-reservoir, a water-chamber having its bottom below the level of the oil in the reservoir, and the water-surface about on a level with the bottom of said reservoir, said chambers having a passage leading from one to the other, and a wick-receiving vessel above said water-chamber having a perforated partition between, substantially as described.

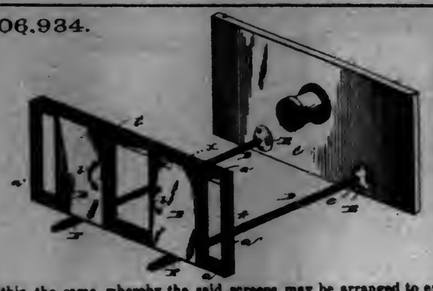
2. The oil-reservoir and a pipe leading therefrom, a water-chamber into which said pipe opens, the bottom of said water-chamber being lower than that of the oil-reservoir, a perforated partition above said water-chamber, and an oil-chamber above said partition, in combination, substantially as described.

3. An oil-reservoir, a water-chamber connected thereto, a partition partially dividing said water-chamber, and a perforated partition above said water-chamber, leaving an oil and wick space above, the combination being and operating substantially as described.

4. An oil-reservoir, a water-chamber connected thereto by a tube which enters said water-chamber below the level of the oil-reservoir, and an oil-chamber above said water-reservoir, the combination being substantially as described, whereby the weight of the oil and water column on one side will form a hydrostatic balance with the weight of the oil on the other side of the balance, and the combustion of oil above the water will cause a feeding of oil from the reservoir to renew the supply for combustion.

406,933. CAR-COUPLING. JOHN S. MORGAN and BENNET M. BEAN, McLEOD, Emporia, Kans. Filed Apr. 24, 1889. Serial No. 308,268. (No model.)

Claim.—1. The combination, with the draw-head, of the coupling-link mounted therein and the horizontal lever pivoted to the bottom of the car and having its inner end connected to the link, as set forth.



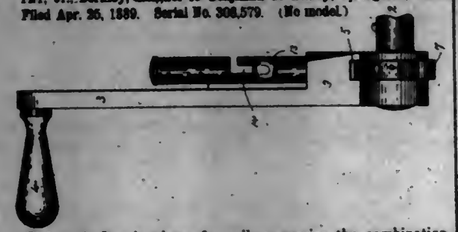
2. The combination, with the draw-head having a longitudinal slot in its bottom, of the coupling-link having a depending stud passing through the said longitudinal slot, and the horizontal lever having its inner end provided with a longitudinal slot engaging said stud, as set forth.

3. The combination of the draw-head having the barrel C on its upper side, the coupling-pin mounted in the draw-head and passing through said barrel, the rock-shaft mounted on the end of the car and connected with the coupling-pin, the link mounted in the draw-head, and the horizontal lever having its inner end connected with the link, as set forth.

406,934. CAMERA ATTACHMENT. OTTO L. MUSSEN, Grafton, Nebr., assignor of one-half to W. C. Powers, same place. Filed Jan. 15, 1889. Serial No. 296,206. (No model.)

Claim.—1. A frame mounted in front of a camera and capable of adjustment relative thereto, and provided with screens sliding

406,934.



within the same, whereby the said screens may be arranged to exclude the light from any portion or portions of a negative, substantially as described.

2. The frame mounted in front of the camera and composed of the guide-strip, V-shaped in cross-section, and the side pieces connecting the ends of said strips, and the screens provided with corresponding V-shaped grooves, whereby they are retained between the guide-strips, substantially as and for the purpose described.

3. The herein-described camera attachment, comprising the rods D, adapted to be secured to the front of a camera, the rectangular frame A, provided with sleeves F, fitting upon the said rods and enabling the frame to be adjusted relatively to the camera, and the screens B, sliding within the frame, substantially as and for the purpose described.

4. The herein-described camera attachment, comprising the rods D, adapted to be secured to the front of a camera by the disks E, the rectangular frame A, consisting of the V-shaped guide-strips and the side pieces, the screens B, provided with corresponding V-shaped grooves, whereby they are retained in between the guide-strips, substantially as described.

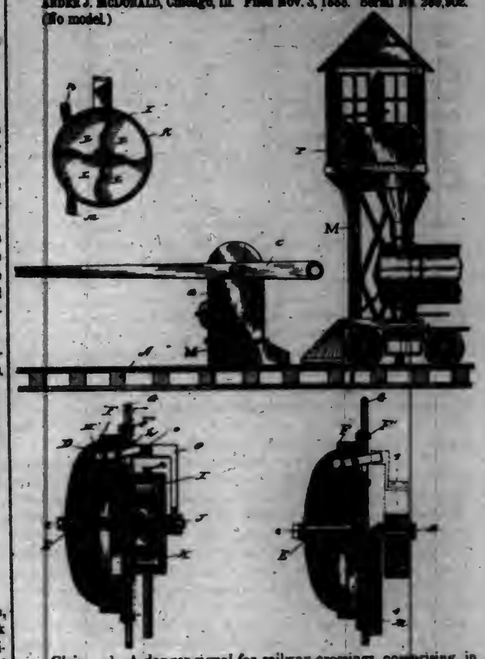
406,935. SAFETY-CRANK FOR HAND-CARS. JEREMIAH MURPHY, Jr., Berkley, assignor to Benjamin F. Handy, Springfield, Mass. Filed Apr. 26, 1889. Serial No. 308,579. (No model.)

Claim.—1. In a hand-car for railway-service, the combination, with the main shaft and the toothed wheel fast thereon, of a crank loose upon said shaft, a hollow tube at right angles to the longitudinal axis of the shaft, and a single pawl within the tube and adapted to turn upon its own axis, as likewise to move endwise with respect to the toothed wheel with which it engages, substantially as herein described.

2. In a hand-car, a revoluble shaft provided with a wheel fast thereon, having oppositely undercut teeth, a crank loose thereon which straddles said wheel, and the reversible spring-actuated pawl having radial movement with the wheel, combined with a slotted tube which incloses the pawl, and an actuating-pin by which the pawl has axial as likewise endwise movement, substantially as herein set forth and specified.

3. In combination with a shaft 2, the crank 3, loose thereon, the tube 8, provided with the slots 14 15, and the wheel 6, with its teeth 7 oppositely undercut, a single pawl, 9, substantially as described, its spring, and an actuating-pin 13, moving in the slots, whereby the pawl is given axial as likewise endwise movement, substantially as and for purposes herein stated.

406,936. HOLDBACK FOR VEHICLES. JAMES R. MCALISTER, Rome, N. Y. Filed Jan. 5, 1889. Serial No. 295,531. (No model.)



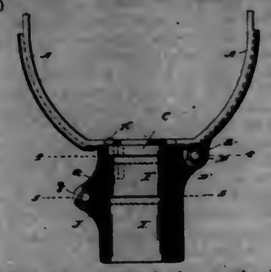
Claim.—1. In a holdback for vehicles, the combination of a holdback-iron having an eye and an extended shank, and a thill having a vertically-inclined slot formed transversely in a diagonal direction across the length of the thill, and in which the shank is snugly fitted, substantially as and for the purpose described.

2. In a holdback for vehicles, the combination of a thill, a plate fixed laterally thereto and having a vertically-inclined slot formed transversely therein in a diagonal direction across its length, and a holdback-iron having an eye for the attachment of a strap and an extended shank adapted to be fitted in said diagonal slot, substantially as described.

3. In a holdback for vehicles, the combination of a plate fixed laterally to a thill and having a longitudinal recess and a transverse diagonal slot, a spring housed in said recess and arranged across the slot at one side thereof, and a holdback-iron fitted in said slot in position for the spring to impinge against one of the lateral faces thereof, substantially as and for the purpose described.

406,937. DANGER-SIGNAL FOR RAILWAY-CROSSINGS. ALEXANDER J. MCDONALD, Chicago, Ill. Filed Nov. 3, 1888. Serial No. 289,902. (No model.)

Claim.—1. A danger-signal for railway-crossings, comprising, in combination, a bell secured at the crossing, a power-wheel having radial curved spokes and adapted through suitable mechanism and by its rotation to operate the bell-clapper, and an air-pump and connections whereby to rotate said power-wheel, substantially as described.



2. A danger-signal for railway-crossings, comprising, in combination, a railway gate-post, a bell secured thereto, a power-wheel having radial curved spokes and inclosed in a case attached to the gate-post, an arm secured upon the axle of said wheel and adapted to engage the bell-clapper, an air-pump having a pipe communicating with the interior of said case whereby to deliver air under pressure to said power-wheel to impart motion thereto, and said arm adapted to engage with the bell-clapper, substantially as described.

3. A danger-signal for railway-gates, comprising, in combination, a bell secured to the gate-post and having a clapper secured upon a pivoted arm projected to the interior of said post, a power-wheel secured within the gate-post and adapted to be rotated by pneumatic pressure and having an arm or lever secured to its axle and rotating therewith and adapted to engage the arm of the bell-clapper when the power-wheel is rotated, substantially as described.

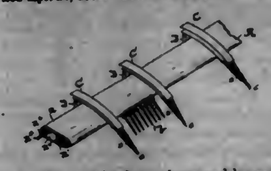
4. A danger-signal for railway-crossings, having, in combination, a power-wheel having an arm or lever adapted to engage the bell-clapper, an inclosing-case surrounding said wheel and forming therewith air-chambers, and a suitable air-pump and connections whereby to supply said chambers with air under pressure to rotate the wheel, substantially as described.

5. In danger-signals for railway-crossings, the combination, with a bell, of an inclosed power-wheel, an arm secured to the axle of said wheel, a clapper secured to an arm projected into the path of the axle-arm, an air-supply pipe, and a discharge-pipe, each communicating with the interior of said casing, substantially as described.

406,938. RAILWAY-GATE. ALEXANDER J. MCDONALD and ROBERT B. BRENT, Chicago, Ill., assignors to the Pneumatic Power and Railroad Gate Company, same place. Filed Nov. 3, 1888. Serial No. 289,905. (No model.)

Claim.—1. A railway-gate arm having a section hinged or pivoted to the base and body of the arm, respectively, and breakable fastenings for said hinged section, substantially as described.

2. A railway-gate arm constructed of tubular sections, one of said sections being connected to the base and to an adjoining section by hinge-joints and break-pins to secure the swinging section normally in line with the base, substantially as described.



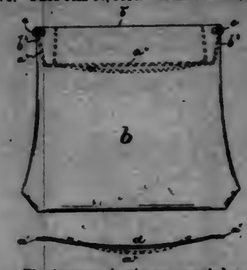
406,939. TOBOGGAN. JOHN R. MCLAREN, Jr., Montreal, Quebec, Canada, assignor to Charles H. Emerson & Co., Burlington, Vt. Filed Mar. 16, 1886. Serial No. 195,464. (No model.) Patented in Canada Dec. 23, 1884, No. 20,785.

Claim.—1. A toboggan having a portion of its bearing stripe or ribs thicker than those intervening, all of said strips or ribs being firmly secured by means of cross-bars and having the faces of said thick strips projected below the faces of the thin strips, substantially as set forth.

2. A toboggan having flat bearing strips or ribs thicker than the interrening strips, the whole being secured by means of cross-bars and having the faces of the thick strips projected below the faces of the thin strips, substantially as shown and described.

406,940. PAPER-RULING MACHINE. WILLIAM MCNAB, Holyoke, Mass. Filed Apr. 27, 1888. Serial No. 272,017. (No model.)

Claim.—1. The combined pen-clamp and beam for paper-ruling machines herein described, consisting of a clamp composed of two members constructed to hold between them at their front side a series of single ruling-pens and having adjustably secured to their rear side a series of extended pen-holders, arranged and operating substantially as set forth, whereby the use of an independent beam is avoided.

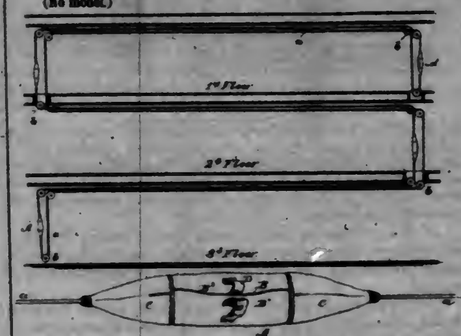


2. The pen-clamp for paper-ruling machines herein described composed of the two members a a', having at their front edges corresponding plane surfaces, whereby they are adapted to hold the single pens b between them, and having standards D adjustably secured directly to their rear edges, said standards having adjustably secured thereto the extended pen-holders C, combined and operating substantially as set forth, whereby the use of an independent beam is avoided.

3. The combination, with pen-clamp A, having the T-shaped opening a^4 in its rear side, of standards D, bolts d^2, having T-shaped heads inserted in said opening a^4 and having their shanks passed through said standards, nuts d^3 upon the outer ends of said bolts, and extended pen-holders C, mounted upon said standards, substantially as and for the purpose set forth.

4. The combination, with pen-clamp A, of standards D, adjustably secured thereto, said standards terminating at their upper ends in ears d^1, extended pen-holders C, having lugs c^3, located between said ears, and screw d^3, inserted through one of said ears and through said lug c^3, substantially as and for the purpose described.

5. The combination, with clamp A and standard D, secured to the rear side thereof, of pen-holder C, mounted upon said standard, said pen-holder consisting of strips c' c^2, connected together near their rear ends by plate c^4, said strip c' projecting at its rear end beyond the end of strip c^2, substantially as and for the purpose described.



406,941. TOBACCO-POUCH. CHARLES L. HEISLER, Clinton, Essex County, N. J. Filed Jan. 17, 1889. Serial No. 296,629. (No model.)

Claim.—1. The improved tobacco-pouch herein described, combining therein a bag-body, a spring having a central portion lying within the bag and extending straight across the mouth parallel with the edges b', a little away from said edges, the bulk of the body portion of the bag being free from said spring, the said spring being bent near its opposite extremities, forming extensions a' a', which engage the ends b^2 b^2 of the bag, and clips fastening the said extensions to the said ends, substantially as and for the purposes set forth.

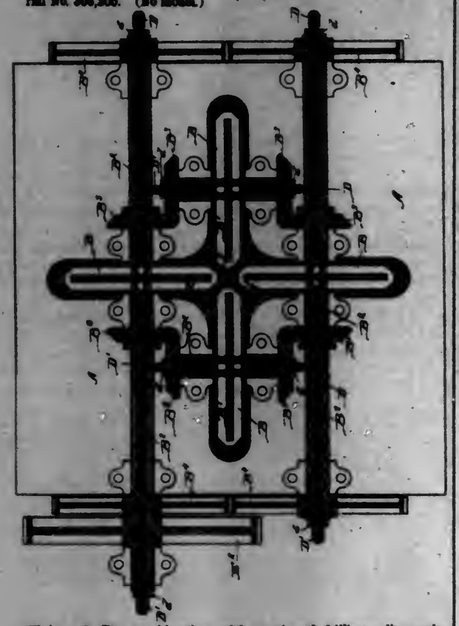
2. The combination, with a bag-body, of a spring having its ends bent toward the mouth of the bag, and having additional bends or turns at suitable points in its length to secure a lateral movement of the central part of the spring when the extremities thereof are pressed toward one another, substantially as and for the purposes set forth.

406,942. STORE-SERVICE APPARATUS. NELSON NEWMAN, Springfield, Ill., assignor of two-thirds to George A. Sanders and Samuel J. Willett, both of same place. Filed Mar. 28, 1888. Serial No. 305,272. (No model.)

Claim.—1. The combination, in store-service apparatus, with an endless traveling cable and suitable supporting-pulleys therefor, of an elastic carrier or pouch interposed between the sections of the cable and forming a continuation thereof, the elasticity of the pouch serving to compensate for the variations in the length of the cable due to atmospheric changes, substantially as described.

2. In store-service apparatus, the combination with an endless traveling cable and suitable supporting-pulleys therefor, of an elastic pouch or carrier interposed between the sections of the cable and forming a continuation thereof, said pouch or carrier having the mouth B, the finger-loops on opposite sides of the mouth to distend and open the same, and the end pieces C, the latter being attached to the ends of the said cable, substantially as described.

406,948. SAD-IRON. SPARROW M. NICKERSON and CALVIN J. HOLMAN, Chicago, Ill.; said Holman assignor of one-half his right to William Kaplinger, same place. Filed Apr. 20, 1888. Serial No. 271,208. (No model.)



Claim.—1. A hollow internally-heated sad-iron having vertical ribs b projecting from the side walls and formed integral with the face of the iron, and perforations between said ribs, substantially as described.

2. A hollow internally-heated sad-iron provided with vertical ribs *b* and horizontal ribs *c*, projecting from the side walls of the iron, the vertical ribs being integral with the face of the iron, substantially as described.

406,944. APPARATUS FOR MANUFACTURING RAILROAD-RAILS.

Edwin Norton and John G. Hodgson, Maywood, assignors to said Norton, and Oliver W. Norton, Chicago, Ill. Filed Apr. 6, 1889. Serial No. 306,205. (No model.)

Claim.—1. The combination, with a series of chilling-rolls revolving together with a space or passage between them, of a pouring vessel or nozzle for directing a stream of molten metal between said rolls, substantially as specified.

2. The combination, with a pouring-vessel, of a series of chilling-rolls having working-faces and bevel rolling or stop faces to limit the extent to which said rolls may approach each other, substantially as specified.

3. The combination, with a pouring-vessel, of a series of hollow chilling-rolls revolving together and having a space or passage for the stream of molten metal between them, and means for causing water to circulate through said hollow rolls, substantially as specified.

4. The combination, with a pouring-vessel, of a series of chilling-rolls revolving together, and a second series of rolls, between which the rail or bar passes as it issues from said chilling-rolls, substantially as specified.

5. The apparatus for producing metal bars directly from molten metal, consisting in a series of rolls revolving together, with a space or passage between them and having their axes in a common horizontal plane, so that a vertical stream of metal may be passed between them tangentially and be compressed and set thereby, substantially as specified.

6. The combination, with a series of chilling-rolls arranged to revolve together, with their axes in a horizontal plane, of means for directing a continuous stream of molten metal tangentially between said rolls, so that the stream of metal will be compressed from all sides while in a fluid or setting state, substantially as specified.

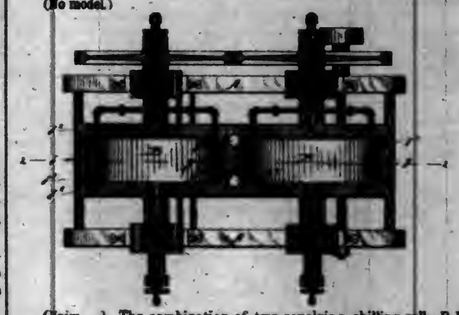
7. The combination, with a series of chilling-rolls revolving together, with a space or passage between them, of a pouring vessel or nozzle for directing a stream of molten metal between said rolls, said rolls revolving at an equal or greater surface speed than the velocity of the flowing metal, substantially as specified.

8. The combination, with a pouring-vessel, of a series of chilling-rolls having working-faces and bevel rolling or stop faces to limit the extent to which said rolls may approach each other, said rolls revolving at an equal or greater surface speed than the velocity of the flowing metal, substantially as specified.

9. The combination, with a pouring-vessel, of a series of hollow chilling-rolls revolving together and having a space or passage for the stream of molten metal between them, and means for causing water to circulate through said hollow rolls, said rolls revolving at an equal or greater surface speed than the velocity of the flowing metal, substantially as specified.

10. The combination, with a pouring-vessel, of a series of chilling-rolls revolving together, and a second series of rolls between which the rail or bar passes as it issues from said chilling-rolls, said rolls revolving at an equal or greater surface speed than the velocity of the flowing metal, substantially as specified.

11. The combination, with a series of chilling-rolls arranged to revolve together, with their axes in a horizontal plane, of means for directing a continuous stream of molten metal tangentially between said rolls, so that the stream of metal will be compressed from all sides while in a fluid or setting state, said rolls revolving at an equal or greater surface speed than the flowing metal, substantially as specified.



12. The combination, with a pouring-vessel, of a series of rolls revolving together, a second series of rolls between which the rail or bar passes as it issues from said first series of rolls, a curved guide, and a horizontal series of rolls, substantially as specified.

13. The combination, with a series of rolls having their axes arranged in a horizontal plane, a pouring-vessel arranged above and between them in a direction tangential to the peripheries of all of said rolls, and a second series of rolls arranged directly beneath the first series, of a curved guide consisting of a series of rolls arranged in a curve, and a horizontal conveyer consisting of a horizontal series of rolls, substantially as specified.

14. In an apparatus for rolling fluid metal, the combination, with chilling-rolls, of a pouring nozzle or vessel above and between them, and a guide or shield C^9, surrounding said pouring-vessel and extending down to near the meeting-point of the rolls, substantially as specified.

406,945. APPARATUS FOR MAKING SHEET METAL.

Edwin Norton and John G. Hodgson, Maywood, assignors to said Norton, and Oliver W. Norton, Chicago, Ill. Filed Apr. 6, 1889. Serial No. 306,206. (No model.)

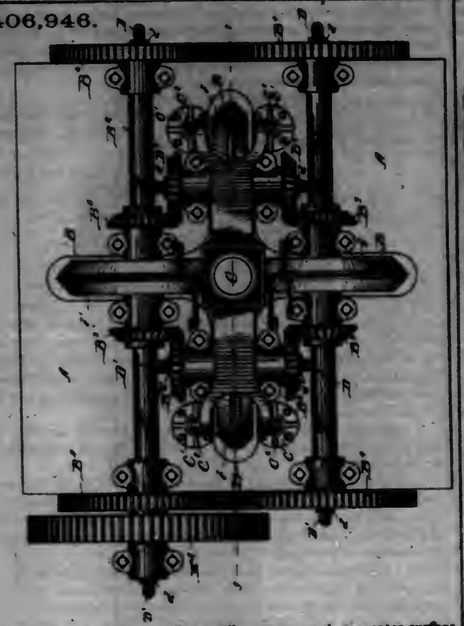
Claim.—1. The combination of two revolving chilling-rolls B B with a pouring-vessel above and between them, said rolls B B having working-faces *b b* and rolling faces or collars b^9 b^9, serving as stops to regulate the space between the working-faces of the rolls, substantially as specified.

2. The combination, with a pair of revolving chilling-rolls, of a pouring-nozzle arranged above and between them, said rolls having working-faces and rolling-faces outside of the working-faces, and grooves or recesses between the rolling-faces and the working-faces, substantially as specified.

3. The combination, with a pair of revolving chilling-rolls, of a pouring-vessel arranged above and between them, and a second pair of rolls G G, substantially as specified.

4. The combination, with a pair of chilling-rolls and pouring-vessel arranged above and between them, of a curved guide for deflecting the sheet-metal strip from the vertical to a horizontal direction, and a second pair of rolls G G, to which the strip is delivered by said guide, substantially as specified.

5. The apparatus for producing sheet metal in a continuous strip as it is poured from a vessel, consisting in a pair of chilling-rolls, between which the molten metal is poured and by which it is set, in combination with a pair of finishing-rolls to farther roll the metal while it is still hot, substantially as specified.



6. The combination, with a pouring-vessel and chilling-rolls, of finishing-rolls, substantially as specified.

406,946. MANUFACTURE OF METAL BARS OR RAILS.

Edwin Norton and John G. Hodgson, Maywood, assignors to said Norton, and Oliver W. Norton, Chicago, Ill. Filed Apr. 11, 1889. Serial No. 306,868. (No model.)

Claim.—1. The process of manufacturing metal bars directly from molten metal, consisting in pouring a continuous stream of molten metal and compressing, setting, and shaping the metal on all sides into a bar by contact with continuously-moving chilling and

406,946.

compressing surfaces or rolls traveling at an equal or greater surface speed than the velocity of the flowing stream of metal, substantially as specified.

2. The process of manufacturing metal bars directly from molten metal, consisting in pouring a continuous stream of molten metal and compressing, setting, and shaping the metal on all sides into a bar by contact with continuously-moving chilling and compressing surfaces or rolls traveling at an equal or greater surface speed than the velocity of the flowing stream of metal, and then rolling the bar as it issues and while still at a high heat, substantially as specified.

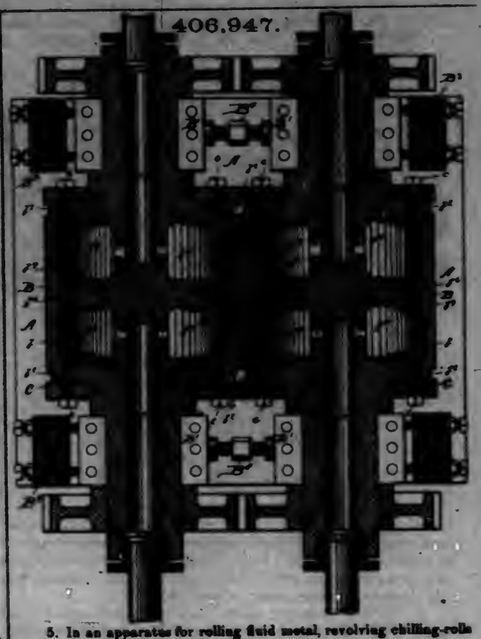
3. The process of manufacturing metal bars directly from molten metal, consisting in pouring a continuous stream of molten metal between a converging series of continuously-revolving chilling-rolls revolving together and surrounding the passing stream on all sides, and thus compressing, setting, and shaping the constantly-moving stream into a bar or rail, substantially as specified.

4. The process of manufacturing metal bars directly from molten metal, consisting in pouring a continuous stream of molten metal between a converging series of continuously-revolving chilling-rolls revolving together and surrounding the passing stream on all sides, and thus compressing, setting, and shaping the constantly-moving stream into a bar or rail, and then farther rolling the bar as it issues and while still at a high heat, substantially as specified.

5. The process of manufacturing metal bars directly from molten metal, consisting in pouring a continuous stream of molten metal directly downward between continuously-revolving chilling-rolls, and thereby compressing, setting, and shaping the metal stream into a bar, then deflecting or curving the hot bar as it issues in a horizontal direction, and finally rolling and straightening it while it is still hot, substantially as specified.

406,947. APPARATUS FOR ROLLING SHEET METAL FROM FLUID METAL.

Edwin Norton, Maywood, assignor to himself, and Oliver W. Norton, Chicago, Ill. Filed May 9, 1889. Serial No. 310,109. (No model.)

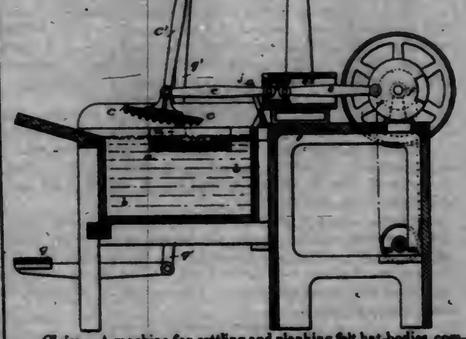


Claim.—1. In an apparatus for rolling fluid metal, the combination, with the revolving chilling-rolls B B, of removable and interchangeable stop-collars to govern the space between the rolls, whereby the same rolls are adapted to produce metal of different thickness, substantially as specified.

2. The revolving chilling-rolls B B, furnished with removable segmental stop-collars C C, substantially as specified.

3. The revolving chilling-rolls B B, in combination with a pouring-vessel D, said rolls being mounted in adjustable bearings and furnished with removable stop-collars C C, substantially as specified.

4. In an apparatus for rolling fluid metal, the hollow chilling-rolls B B, having a central web with water-passages through the same for deflecting water and supporting the peripheral wall of the rolls, substantially as specified.

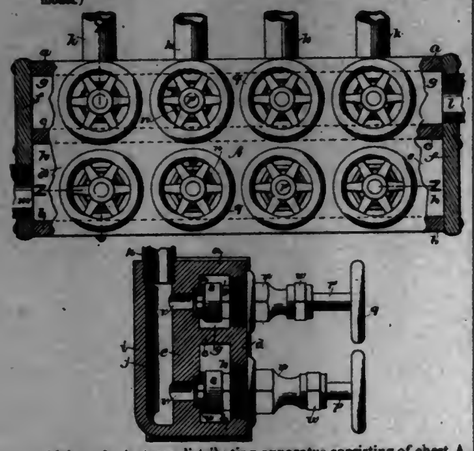


406,947.

5. In an apparatus for rolling fluid metal, revolving chilling-rolls B B, having a hollow space in the interior thereof, divided into two or more compartments by a central web, said web having openings through the same for the passage of the water, and said rolls having hollow shafts for the entry and exit of the water, substantially as specified.

406,948. MACHINE FOR SETTLING AND PLANKING FELT HAT-BODIES.

Joseph Oldham and Orlando Oldham, Denton, County of Lancaster, England. Filed July 26, 1887. Serial No. 245,260. (No model.) Patented in England Jan. 8, 1887, No. 312.

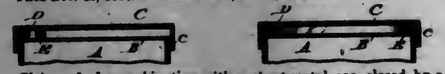


Claim.—A machine for settling and planking felt hat-bodies, comprising the hot-water tub *b*, the immersed platform *c*, having a concave curved working-surface, the elevated rock-shaft *d*, pivotal connections between said rock-shaft and plate, the jointed pitman *e e*, mechanism, substantially in the horizontal plane of the tub, for reciprocating said pitman, a horizontal guide for limiting its vibrations, the treadle *g*, pitmen *g'*, connecting said treadle and rock-shaft, and stops *i*, attached to said pitmen *g'* and engaging with the top of the tub, substantially as hereinbefore specified.

406,949. NON-CONDUCTIVE AND ELASTIC WATER-PROOF COMPOSITION FOR PIPE-JOINTS, &c.

Richard Overlade, Boston, Mass. Filed May 1, 1888. Serial No. 309,268. (No specimens.)

Claim.—An elastic water-proof insulating material, consisting of siliceous sand, resin, bolted whiting, cement, ground glass, oxide of iron, suboxide of copper, raw linseed-oil, and sulphuric acid, compounded substantially in the manner and proportions specified.

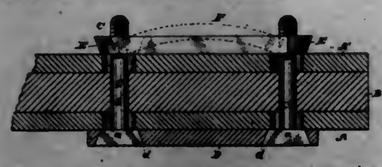


406,950. **STEAM-HEATING APPARATUS.** HENRY PARSONS, Marlborough, Mass. Filed May 3, 1888. Serial No. 273,256. (No model.)

Claim.—1. A steam-distributing apparatus consisting of chest A, having two compartments, with an inlet-pipe for each said compartment, chambers formed in said chest and each communicating with both said compartments, a valve to control each said passage from said compartments to said chambers, and conduits connecting with said chambers, all substantially as specified.

2. The combination of chest A, having compartments *g k*, and inlets *l m* for said compartments, respectively, chambers *j*, each having passage *v*, communicating with said compartments, valves *s*, arranged to control said passages, and conduits *k*, communicating with chambers *j*, all substantially as specified.

406,951. **CAN-OPENER.** GEORGE H. PERKINS, Philadelphia, Pa. Filed Nov. 12, 1888. Serial No. 290,561. (No model.)

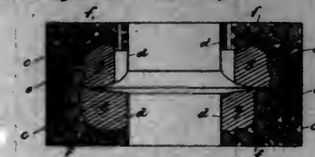


Claim.—1. In combination with a sheet-metal can closed by a head of thin metal, an exterior removable cover from the substance of the head of which a barb or cutter is struck and bent in, substantially as set forth.

2. In combination with a sheet-metal can closed by a head of thin metal, an exterior removable cover the head of which is provided with a fixed inwardly-facing barb or cutter, and a packing interposed between the thin head of the can and the inner face of the head of the cover, substantially as and for the purposes set forth.

406,952. **THIOPARATOLUIDINE.** WILLIAM PFITZINGER, Elberfeld, Prussia, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed Mar. 9, 1889. Serial No. 302,860. (No specimens.) Patented in England Apr. 23, 1888, No. 6,319; in France May 11, 1888, No. 190,535; in Spain Oct. 17, 1888, No. 8,634, and in Italy Oct. 30, 1888, No. 24,011.

Claim.—The new thioparatoluidine herein described, which is nearly insoluble in boiling alcohol and concentrated hydrogen chloride infusible at 220° centigrade, combining with fuming sulphuric acid to form a new sulphonic acid, the soda salt of which possesses the property of dyeing unmordanted cotton yellow in an alkaline bath, substantially as described.

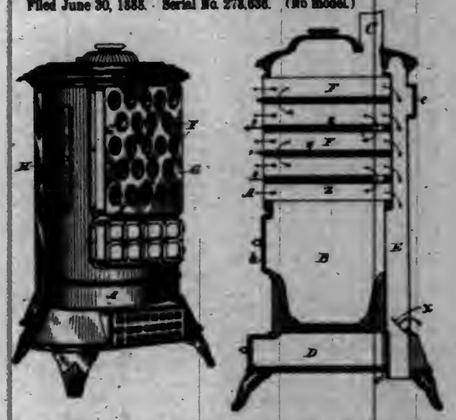


406,953. **NUT-LOCK.** ALEXANDER J. PERRY, U. S. Army. Filed Mar. 23, 1887. Serial No. 232,154. (No model.)

Claim.—1. The combination, substantially as herein set forth, of the bolts, their beveled nuts, and the semi-rigid endwise-expansible locking-plate or bar forked at opposite ends and having beveled tines which correspond with and snugly fit the beveled nuts when the locking-plate is expanded to its greatest extent.

2. The combination, substantially as herein set forth, of the abutting rails, the fish-plates having elongated apertures for the bolts and overlapping the abutting ends of the rails, the bolts having angular beveled heads, and the bolt-locking plate having angular beveled recesses closed on all sides for the bolt-heads.

406,954. **MILLSTONE.** CHARLES J. POTTER, Hoxton Hall, Newcastle, England. Filed July 10, 1888. Serial No. 279,536. (No model.) Patented in England Nov. 2, 1887, No. 14,950.



Claim.—1. A millstone consisting of the combination of small irregular lumps of emery having spaces or interstices intervening between their edges, and cement interposed between the lumps and filling said spaces or interstices, said millstone presenting on its working face alternate portions of stone and cement, substantially as and for the purpose specified.

2. A millstone built up of lumps of emery cemented together, the size of the lumps decreasing from the center outward, substantially as described.

3. A millstone consisting of the combination of lumps of emery separated from each other, as described, leaving spaces or interstices intervening between their edges, Portland cement interposed between the lumps and filling the spaces, and an inclosing metallic cylinder, substantially as described.

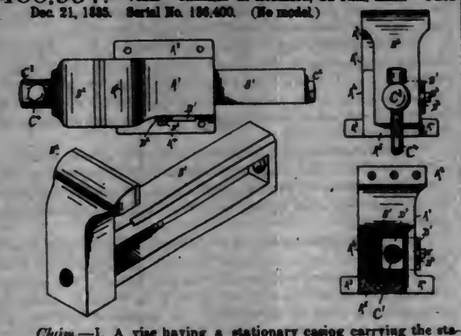
4. A millstone having an interior ring or burr of solid stone and an outer ring filled up with small irregular lumps of emery, and cement interposed between the lumps, substantially as described.

406,955. **HEATING-STOVE.** EBENEZER W. RIDER, Racine, Wis. Filed June 30, 1888. Serial No. 278,636. (No model.)

Claim.—1. In a stove, as described, having a vertical air-flue at the rear, horizontal air-pipes detachably connected at their rear ends with said flue and open at the front ends, and the plate G, said pipes being secured at this point to the said plate, whereby they can be easily attached to or removed from the stove for repair.

2. In a stove, horizontal air-pipes F, located over the fire-chamber, and movable plates Z between the said flues and the rear vertical air-pipe E, provided with the damper *x*, and communicating with said horizontal air-pipes, substantially as and for the purposes set forth.

3. In a stove, substantially as described, a series of open-ended air-pipes placed over or above the fire-chamber and combined with movable plates located between said flues, whereby a direct or zigzag passage for the volatile products of combustion is afforded.



406,956. **GAGE-COCK.** DUGALD H. ROBERTS, Williamsburg, Ontario, Canada, assignor of one-half to William D. McRae, same place. Filed Sept. 12, 1888. Serial No. 285,238. (No model.)

Claim.—1. A gage-cock having two or more seats formed on the face of its pivoted head, in combination with a partition located between the passage-way and the pin on which the head is pivoted, substantially as and for the purpose specified.

2. A gage-cock having two or more seats formed on the face of its pivoted head, sides J formed on the said head to support the pin D, which passes through a hole E, made in the boiler portion A of the cock, in combination with the curved partition H, made in the head C and projecting into a curved recess I, located between the passage-way B and the pin D, as shown.

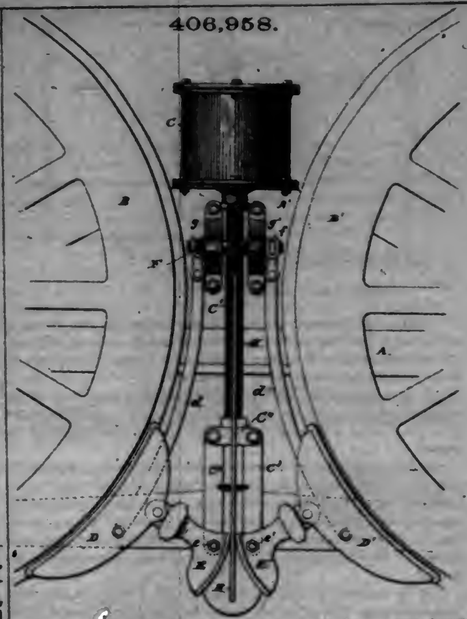
406,957. **VISE.** CHARLES H. ROBINSON, St. Paul, Minn. Filed Dec. 21, 1885. Serial No. 186,400. (No model.)

Claim.—1. A vise having a stationary casing carrying the stationary jaw, and a slide reciprocating with reference to said casing, said slide carrying the movable jaw, in combination with an operating-rod extending along the line of the reciprocation of said slide, said rod being arranged at one side of the longitudinal center of said slide, and said jaws being arranged centrally with reference to said rod, projecting outwardly beyond one side of said slide, whereby they are adapted to hold work vertically and parallelly, substantially as set forth.

2. A vise having a stationary casing carrying the stationary jaw, and a slide reciprocating with reference to said casing, said slide carrying the movable jaw, and said slide being open on one side throughout its length, in combination with an operating-rod extending along the line of the reciprocation of said slide, said rod having its outer edge nearly in line with the edges of the open side of the said slide, said jaws being arranged centrally with reference to said rod and projecting outwardly beyond said open side of the slide, substantially as set forth.

3. A vise having a stationary casing carrying the stationary jaw, and a slide reciprocating in said casing and carrying the movable jaw, said slide having its front side open throughout its length, and having close and solid top and bottom and rear side, in combination with an operating-rod journaled at opposite ends in the ends of said slide close to the open side thereof, whereby the outer edge of said rod is brought nearly in line with the edges of said open side, said jaws being arranged centrally with reference to said rod and projecting outwardly beyond said open side of the slide, and a forward extension formed on said casing composed of a bottom plate extending beneath the bottom of the slide and of the width thereof and of a side wall extending along the closed side of the slide and of the height thereof, substantially as set forth.

406,958. **CAR-BRAKE.** CHARLES V. ROTE, Lancaster, Pa., assignor of part to Bernard J. McGrann, Eugene G. Smith, and Elmer Ellsworth Snyder, same place. Filed Nov. 9, 1888. Serial No. 290,374. (No model.)



Claim.—1. The combination, with the brake-shoes and the cam blocks or levers for throwing the shoes into frictional engagement with the wheels, of the rock-shaft and interposed longitudinally-movable rod or bar connected therewith, substantially as described.

2. The combination of the brake-shoes, the cam blocks or levers for actuating said shoes, the interposed rod or bar, the suspending links or rods to which said cam-blocks are connected, and the rock-shaft to which said rods are attached, substantially as described.

3. The combination, with the brake-shoes and their actuating cam-blocks, of the links or rods and rock-shaft on which said brake-shoes are suspended, and the bar interposed between the cam-blocks and connected with and operated from the brake-shoes, substantially as described.

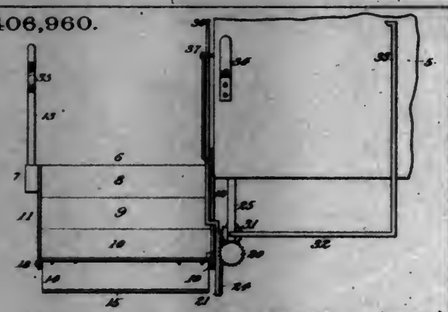
4. The combination, with the brake-shoes and the mechanism for throwing the same into engagement with the wheels, of a rock-shaft and rods connected therewith for upholding said shoes, and a sliding bar actuated by the frictional engagement of the shoes to increase

406,958.

the pressure of the brake-shoes on the wheels, also connected with said rock-shaft, substantially as described.

5. The combination, with the brake-shoes and their actuating cam blocks or levers, of the suspending-rods and the rock-shaft to which said rods are connected, the bar interposed between the cam-blocks and connected with and operated from the rock-shaft, as described.

406,959. **STAIR-ROD SECURER.** MADISON RUSS, Philadelphia, Pa. Filed Jan. 29, 1889. Serial No. 296,013. (No model.)



Claim.—1. The combination, to form a stair-rod securer, of a keeper having clips which form a guideway, and forwardly-bent rod-engaging bottom and top portions, the latter of which embodies an aperture, and a key mounted in said keeper, formed with a head which presents through said aperture, and with prongs, one of which is engaged in the aforesaid guideway and another adapted to engage a staple, substantially as set forth.

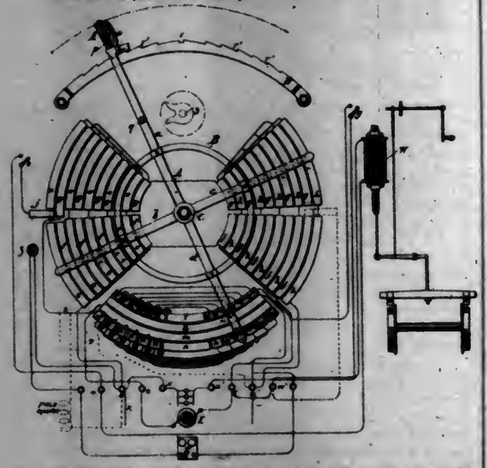
2. The combination, to form a stair-rod securer, of a keeper having staple-slots formed in it, and forwardly-bent rod-engaging bottom and top portions, the latter of which embodies an aperture, and a key mounted in said keeper and formed with a head which presents through said aperture, and with prongs, one of which is engaged in the aforesaid guideway and another adapted to engage a staple, substantially as set forth.

3. In a stair-rod securer, in combination, a keeper provided with devices to engage a stair-rod, clips cut from the substance of the keeper and bent up to form holders for a key, a staple adapted to present through the slot formed by the folding in of a clip, and a key mounted in said keeper, the handle of which projects through an aperture in the upper portion thereof, one prong of which is engaged with said clips and the other adapted to engage with said staple, as specified.

406,960. **CAR STEP AND PLATFORM SAFETY-BAR.** JOHN C. F. SCHENCK, Moline, Ill. Filed Mar. 26, 1889. Serial No. 304,766. (No model.)

406,960.

Claim.—1. In a railway-car, an extensible folding step journaled to the permanent step, with a cog-wheel attached to one of said journals engaging cogs on a segment operated by a lever, with means for locking said lever, substantially as described.



2. In a railway-car, a safety-bar attached to a crank-arm having engagement by cog-wheels with the cogs upon a segment operated by a lever, with means of locking said lever, substantially as described.

3. In combination with a railway-car and with the platform and permanent steps thereof, an extensible folding step journaled to the permanent step, with a cog-wheel attached to one of said journals engaging cogs on a segment, and a safety-bar attached to a crank-arm having engagement through cog-wheels with cogs upon said segment, such segment being operated by a lever, substantially as described.

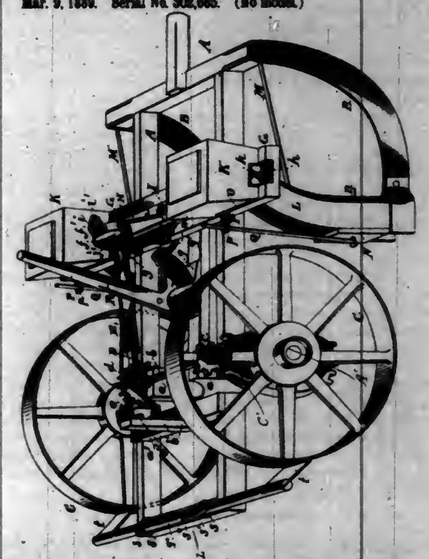
4. In combination with a railway-car and with the platform and permanent steps thereof, an extensible folding step journaled to the permanent step, and a safety-bar attached to the car, with positively-operating devices for folding said step and placing said bar horizontally over the same and supporting such bar, and with positively-operating devices for unfolding said step and removing said safety-bar, substantially as described.

5. In combination with a railway-car and with the platform and permanent steps thereof, a folding step journaled to the lower permanent step, with a positive device for folding such step against the riser of said lower permanent step and temporarily widening the tread of the next permanent upper step, a horizontal guard-bar projecting from the lower surface of the inner edge of the tread of such folding step, and a horizontal safety-bar supported above and across such step, with a positive device for placing said bar in such position or removing it therefrom, substantially as described.

406,961. REGULATING DEVICE FOR ELECTRIC-RAILWAY CARS. WILLIAM M. SCHLESINGER, Philadelphia, Pa. Filed Nov. 6, 1886. Serial No. 218,131. (No model.)

Claim.—1. In an electric-motor circuit, the combination, with circuit making and breaking devices, a pole-changer, a regulator for controlling the speed of the motor, and a regulator for controlling the resistance of the derived circuit containing lamps, of an operating-lever controlling the said devices, the said lever serving also, when operated, to move the brushes of the motor, whereby the moving of the lever to different positions will start the motor, break the circuit of the same, reverse the motor, determine its speed, set the brushes for different directions of the current, and regulate the brilliancy of electric lights.

2. In an electric-motor circuit, the combination, with a speed-regulator for the motor, and a regulator for controlling the resistance of a derived circuit containing lamps, of an operating-lever controlling both the said regulators, whereby the resistance of the lamp-circuit will be adjusted to the speed of the motor.



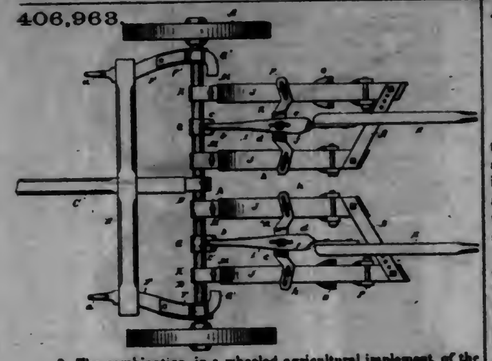
3. In an electric-motor apparatus, the combination, with strips e f f g g h h, contacts l l' l^2, &c., and n n' n^2, &c., strips k and m, bridges i i, and lever A, of contact-piece j, switch s, and brake W, and electrical connections, as and for the purpose set forth.

4. In an electric-motor apparatus, the combination, with circuit making and breaking devices, of the prolonged strip g, contact-piece j, bridge i, lever A, brake W, and electrical connections to the brake, the extension of strip g and the contact-piece j being so placed as to be bridged only after the circuit-controller is on open circuit, as and for the purpose set forth.

5. The combination, with a circuit-controlling lever, as A, of a spring-catch, as o, and a segmental bar, as D, provided with notches r and r', the notch r' being central and adapted to resist the motion of the lever only when moving from the center, as and for the purpose set forth.

6. The combination, with a circuit-controlling lever, as A, of a spring-catch, as o, and a segmental bar, as D, having a point at which the lever is adapted to rest normally, the said bar being also provided with notches which allow the lever to be pushed rapidly toward the said point, but resist its movement in the opposite direction, as and for the purpose set forth.

406,962. SEED-PLANTER. ALBERT C. SMITH, Sardinia, Ind. Filed Mar. 9, 1889. Serial No. 302,665. (No model.)

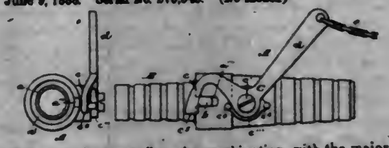


Claim.—The comoination, with the frame A, the transverse bar C, having longitudinal groove A, and the dropper-bar adapted to reciprocate in said groove, of the runners, the open standards L, secured to the under side of the bar G and at their lower ends secured to the runners, the rods M, connecting the standards with the runners, the plates N, secured to the rear sides of the standards, the longitudinal shafts n, having bearings in said plates and the front walls of the standards, the rearwardly-extending plate P, secured to the dropper-bar, and the upright arms Q, connecting said plates P with the rear ends of the shafts n, substantially as described.

406,963. WHEELED AGRICULTURAL IMPLEMENT. NAPOLEON B. SPRADLEY, Ashville, Ala. Filed May 2, 1889. Serial No. 309,330. (No model.)

Claim.—1. The combination of the axle, the wheels, the perforated lugs rigidly secured to said axle, the agricultural implement loosely secured to said axle, the saddle secured to said implement, the slotted handles loosely attached to said saddle and having their ends pivoted in said lugs, and the supports rigidly secured to said axle, substantially as described.

406,963.



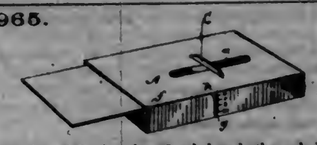
2. The combination, in a wheeled agricultural implement, of the beams J, having the half-clips adjustably secured to the axle, the saddles adjustably secured to said beams, the handles pivotally secured to said axle and adjustably secured to said saddles, and the supports rigidly secured to the axle, whereby a cultivator, a harrow, or a rake may be attached to said axle and a vertical and lateral movement imparted thereto, substantially as described.

3. A wheeled frame adapted to carry various agricultural implements, in combination with the tug-irons, the bars F', extended to form beam-supports in the rear of the axle, the collars having perforated lugs projecting therefrom, and the agricultural implement adjustably attached to said axle, and perforated lugs, whereby said implement may be moved laterally and vertically, substantially as described.

4. The combination, in a wheeled agricultural implement, with the axle having the perforated lugs projecting therefrom, the handles loosely secured to said lugs, and the supports fixed to said axle, of the beams having the perforated half-clips movable on the axle, the adjustable perforated bar connecting said beams, and the adjustable saddles secured to said beams, substantially as described.

406,964. COUPLING FOR HOSE, PIPES, &c. GEORGE A. STEDMAN, New York, N. Y., and DAVID R. STEDMAN, Elizabeth, N. J. Filed June 9, 1888. Serial No. 276,545. (No model.)

Claim.—1. In a coupling, the combination, with the major member provided with a packed socket to receive the minor member and a guide-notch a''' to receive a lug on said minor member, of the minor member provided with a lug b to engage said notch a''', a spring hook-latch mounted on said major member, with its hooked extremity arranged to stand normally across the notch a''' and to engage said lug b when the latter stands in said notch, and the chain or connector c, attached at one end to the arm of said hook-latch and at the other end to the car carrying said latch, substantially as set forth.

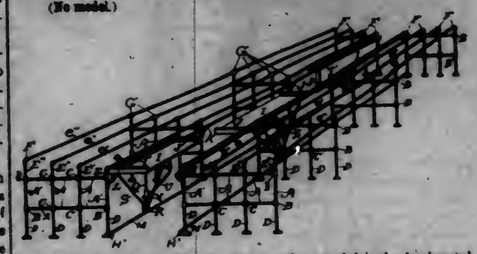


2. In a coupling, the combination, with the major member provided with a packed socket to receive the minor member and with a notch a''', of the spring hook-latch mounted on said major member, its hook having a broad end c^4, which projects beyond the end of said major member and stands normally across and closes the entrance of said notch a''', and the minor member of the coupling provided with a lug b, which engages said notch a''' when said latch is displaced, said lug b standing in front of the broad end of the latch when the minor member is inserted in the major member, whereby partial rotation of the minor member causes said lug to lift and displace said latch and thus open the entrance to said notch, as set forth.

3. The combination, in an interchangeable coupling for use on cars, of the major member A, provided with a socket to receive the minor member and with a notch a''' to receive a stud on the said minor member, the spring hook-latch mounted on said major member, and the double-ended minor member constructed alike at both ends and provided at each end with a stud to engage the notch a''' in the major member, said latch-hook being arranged to engage said stud when the members of the coupling are engaged, as set forth.

406,965. CARD OR TICKET BOX. JOSEPH STOVEL and JOHN W. GORLEY, Toronto, Ontario, Canada. Filed Mar. 26, 1889. Serial No. 305,194. (No model.)

Claim.—1. A box A, designed to contain a given number of



406,965.

tickets or cards and having slots f and d made through its ends and a slot a in its bottom, a plate B, having a flange b formed on one end of it, and a button or projection C, batting against the bottom of the box and connected with the plate B by a suitable shank passing through the slot a, in combination with the top G, false top D, and spring or springs E, substantially as and for the purpose specified.

2. A box A, designed to contain a given number of tickets or cards and having slots f and d made through its ends and a slot a in its bottom, a plate B, having a flange b formed on one end of it, and a button or projection C, batting against the bottom of the box and connected with the plate B by a suitable shank passing through the slot a, in combination with the false top D, provided with a pin g, to project through the slot h, the spring or springs E, and the top G, substantially as and for the purpose specified.

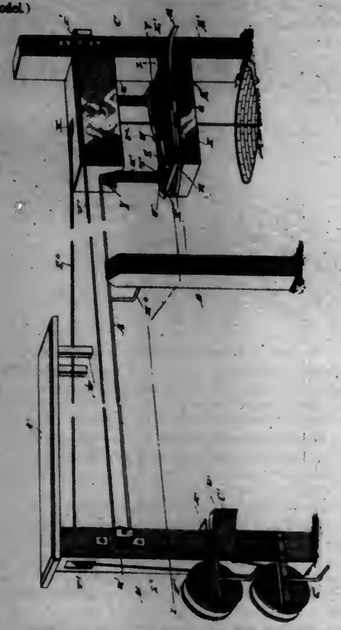
406,966. MAIL-BAG RACK AND DISTRIBUTING-TABLE. STEPHEN STRANGE, Los Angeles, Cal. Filed Sept. 11, 1888. Serial No. 285,130. (No model.)

Claim.—1. In a mail-bag rack, beats for sustaining the horizontal rods, consisting of pipe-sections secured together by pipe-fittings to form a horizontally-united series of perpendicular rectangular frames, a series of pipe-sections of equal lengths screwed into the fittings on the lower side of such frames to form the legs of the bent, and pipe-sections of relatively-increasing length screwed into the fittings on the upper side of the frames and projecting upward therefrom to form supports for the horizontal rods of the rack, and provided with pipe-fittings in which such rods may be secured.

2. A mail-bag rack comprising the combination of two rack-frames fixed parallel to each other with a narrow unobstructed aisle between them, and one or more running distributing half-tables movably mounted upon each rack-frame and projecting therefrom half-way across the aisle to form with its opposing half-table a complete distributing-table when the opposing tables are made to coincide with each other.

3. In a mail-bag rack such as set forth, the combination of two rack-frames fixed parallel to each other with a narrow unobstructed aisle between them, a movable running distributing half-table, provided along the back and ends of its upper face with upright guards J, square at the free edge of the table, mounted upon one of such frames and projecting therefrom half-way across such aisle, and a like table similarly mounted upon the other frame.

4. In a mail-bag rack such as set forth, the combination, with the frame of the rack, of the upright bracket-arms L, secured to the bents of the rack and projecting therefrom into the aisle, the upper running-rail, greater in diameter than the bracket-arms, secured upon the top ends of such arms, the lower running-rail M, two perpendicular grooved wheels O, secured to the under side of the table near to the rear edge thereof with their front peripheries on a line parallel to the axis of the table, two vertical anti-friction rollers secured to the under side of the table, with their rear peripheries on a line parallel with the axis of the table and with a space between the line of the front peripheries of the grooved wheels and the rear peripheries of the anti-friction rollers approximately equal to the diameter of the upper running-rail, a perpendicular support-rod secured to the under side of the table and having at its lower end a grooved caster-wheel resting upon the top of the lower running-rail, longitudinal braces secured to the lower end of the support-rod and to the bottom of the table, and a lateral support-brace secured to the support-rod and extending therefrom up to the under side of the table.



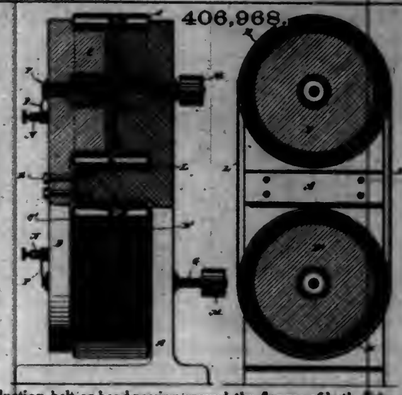
5. In a mail-bag rack such as set forth, the combination of the running movable half-table secured to the rack by suitable mechanism and divided longitudinally near the rear edge between such mechanism and the front edge of the table, hinges securing the front and

rear sections of the table together, the perpendicular support-rod, and the lateral support-brace U, swiveled upon the support-rod.

6. In a mail-bag rack such as set forth, the combination, with the running-rails of the rear section I', of the table rigidly secured to the running-rails by suitable hangers, such hangers, the front section I of the table hinged to the rear section, and a swiveled support-brace secured to the rear section of the table.

7. In a mail-bag rack such as set forth, the combination, with the running-rail of the rear section I', of the running table provided with suitable hanging mechanism, the front section I of the running table hinged to the rear section, the perpendicular support-rod Q, the T-fittings V V', forming journals around the support-rod Q, the collar W and set-screw X, the collar Y, lateral support-brace U, with the convex head *a* on its upper end, and the catch-plate Z, secured to the table and having its under face beveled at the ends and having a slight depression *b* in the under face of the catch-plate.

406,967. **WATER ELEVATOR AND CARRIER.** WILLIAM S. TALLEY, Mountain Home, Ark. Filed Nov. 21, 1888. Serial No. 291,440. (No model.)

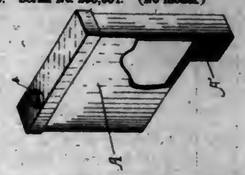


Claim.—1. The combination of the posts B C, the wire stretched between said posts, the carriage traveling on said wire and having the sheave X, the spring-actuated clutch-levers pivoted on the carriage, the catch T, having the hooks U V at opposite ends and pivoted also on the carriage, the keepers attached to the posts and adapted to engage the hooks, cams on said posts to automatically engage and open the clutch-levers, the elevating-cord guided through the carriage and on the sheave X, and the block attached to said cord and adapted to be engaged by the clutch-levers and to trip the catch T, substantially as described.

2. The combination, in a water elevator and carrier, of the post B, having the cams D' on its inner side, the post C, having the cleats M' on opposite sides, the wire stretched between said posts, the traveling carriage suspended from said wire, and the spring-pressed clutch-levers fulcrumed to the carriage, said clutch-levers having the cams L on one end adapted to engage the cams D' and the diverging arms M at the opposite end to engage the cleats M', for the purpose set forth, substantially as described.

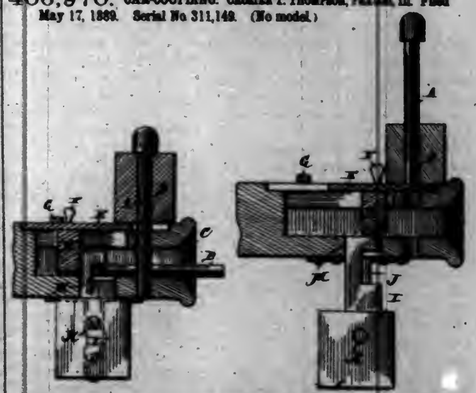
406,968. **DYNAMO-ELECTRIC MACHINE.** NIKOLA TESLA, New York, N. Y., assignor of two-thirds to Charles F. Peck, Englewood, N. J., and Alfred S. Brown, New York, N. Y. Filed Mar. 23, 1889. Serial No. 304,498. (No model.)

Claim.—1. An electrical generator consisting of the combination, with two rotary conductors mounted in unipolar fields, of a flexible conductor or belt passing around the peripheries of said conductors, as herein set forth.



2. The combination, with two rotary conducting-disks having peripheral flanges and mounted in unipolar fields, of a flexible conducting belt or band passing around the flanges of both disks, as set forth.

406,968.

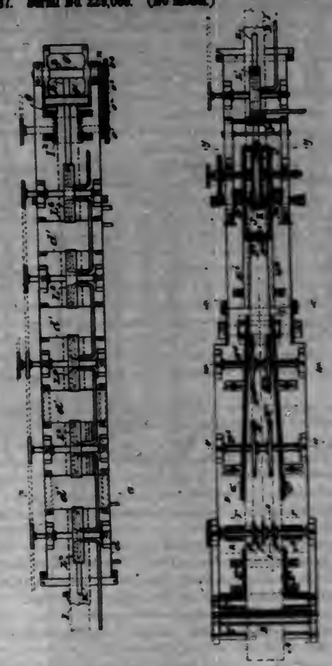


3. The combination of independent sets of field-magnets adapted to maintain unipolar fields, conducting-disks mounted to rotate in said fields, independent driving mechanism for each disk, and a flexible conducting belt or band passing around the peripheries of the disks, as set forth.

406,969. **SECONDARY BATTERY.** CHARLES H. THOMPSON, Detroit, Mich., assignor to the Woodward Electrical Company, same place. Filed Jan. 7, 1889. Serial No. 295,631. (No model.)

Claim.—The method of producing a support for an electrode, which consists in first making a portion of a suitable metallic substance with a solid projection for a terminal, then producing the rest of the metal in a highly porous or cellular body by running the metallic substance among the refractory mass afterward to be removed, substantially as described.

406,970. **CAR-COUPLING.** CROMER T. THOMPSON, Peters, Ill. Filed May 17, 1889. Serial No. 311,149. (No model.)



Claim.—1. The combination, with the draw-head, of the pin-support sliding in the upper portion thereof, and provided with a stop on its upper side and a depending lug on its under side, as and for the purpose set forth.

2. The combination, with the draw-head, of the link-holder playing vertically through the bottom of the same, and provided near its upper end with a notch adapted to receive the end of the coupling-link, as set forth.

3. The combination, with the draw-head and the brackets L on the under side of the same, of the link-holder playing through the draw-head and having lateral studs engaging the brackets L, and provided with a notch near its upper end adapted to receive the end of the coupling-link, as set forth.

406,971. **MACHINE FOR MANUFACTURING WRAPPERS FOR BOTTLES, &c.** ROBERT H. THOMPSON and SILAS H. WILSON, Brooklyn, N. Y.; said Wilson assignor to Henry D. Harris, same place. Filed Feb. 26, 1887. Serial No. 229,060. (No model.)

Claim.—1. In a machine for folding paper or like material, the combination of a bed, a carrying-belt traveling over a portion of said bed, holding-wheels for maintaining the material to be folded in contact with the bed before reaching said belt, folders having their opposite sides flared decreasingly from one end toward the other, and other folders having flanges of increasing projection from one end to the other, substantially as specified.

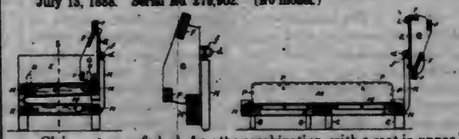
2. In a machine for folding paper and like material, the combination of a bed, a carrying-belt traveling over a portion of the bed, adjustable holding-wheels for maintaining the material to be folded in contact with the bed before reaching the belt, folders having their opposite sides flared decreasingly from one end toward the other, and other folders having flanges of increasing projection from one end to the other, substantially as specified.

3. In a machine for folding paper and like material, the combination of a bed, converging folders having their opposite sides flared decreasingly from one end toward the other, other folders which have on their opposite sides flanges which increase in projection and extend progressively nearer the bed from one end toward the other, and means, substantially such as described, for adjusting the two sets of folders independently of each other, substantially as specified.

4. In a machine for folding paper and like material, the combination of a bed, a pair of folders having their opposite sides converging and flared decreasingly from one end toward the other, holding-wheels above the bed between these folders, another pair of folders having on their opposite sides flanges which increase in projection and extend progressively near the bed from one end toward the other, and a belt traveling over the bed between the last-mentioned pair of folders, substantially as specified.

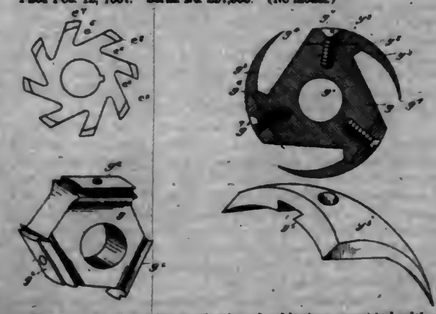
5. In a machine for folding paper and like material, the combination of folders, substantially such as described, and mechanism, substantially such as described, for applying paste or other adhesive substance to a strip and directing said strip to material folded by said folders at the meeting edges of said material, and drying-rollers, substantially as specified.

6. In a machine for folding paper or like material, the combination of folders, substantially such as described, mechanism, substantially such as described, for applying adhesive material to a strip and directing said strip to the folded material, and a steam-chest and rollers for holding the folded material in proximity thereto, substantially as specified.



7. In a machine for folding paper and like material, the combination of folders, substantially such as described, mechanism, substantially such as described, for applying adhesive material to a strip for uniting the meeting edges of the folded material, a steam-chest, and steam-bridges for drying the material, substantially as specified.

406,972. **QUEEN-REARING CHAMBER.** GEORGE L. TINKER, New Philadelphia, assignor of one-half to Winfield S. Kline, Bolivar, Ohio. Filed Feb. 11, 1889. Serial No. 300,087. (No model.)

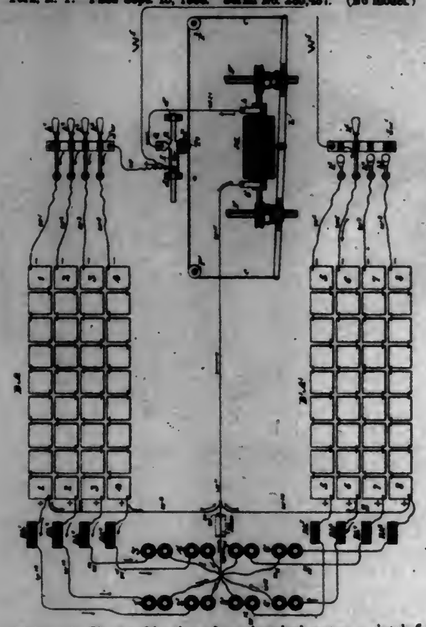


Claim.—A queen-rearing chamber consisting of a rectangular box having a solid vertical partition dividing the box into compartments, said box having queen-bee openings leading to each compartment, supports in each compartment for suspending a comb frame, a comb-frame on such supports, and a top and bottom each consisting of a series of longitudinal slats spaced apart, having in their edges saw-kerfs carrying narrow strips of perforated metal, substantially as and for the purpose set forth.

406,973. **SOFA-BED.** EMIL TOLENDORFF, Cambridge, Mass. Filed July 13, 1888. Serial No. 279,902. (No model.)

Claim.—In a sofa-bed, &c., the combination, with a seat in upper and lower seat-sections hinged together at the front side of the seat and when opened into a horizontal position adapted to be suitably supported, of posts H at the back edge and at opposite ends of the lower seat-section, vertical links *f f*, held on the upper ends of posts H, a chambered back-frame F, to contain bedclothes and adapted to be opened and closed, horizontal links *d d*, held on the back-frame F and engaging the links *f* of posts H, whereby the back-frame can be swung upon the posts to bring either side thereof to the front, substantially as described, for the purpose specified.

406,974. **SOLE AND HEEL TRIMMER.** CHARLES H. TRASK, Lynn, Mass., assignor to the Duplex Shoe Trimmer Company, Portland, Me. Filed Feb. 12, 1887. Serial No. 227,355. (No model.)



Claim.—1. The trimmer having the block *g*, provided with a shaft-hole *g'* and a straight dovetail projection *g²*, with the trimming-

blades g^6, having dovetail recesses g^8 and stops g^9, and fastening-screws g^7, substantially as described.

2. The curved trimming-blade made thick at the butt and having a straight dovetail recess g^8 therein, gradually reduced in thickness from its butt to form the sharp cutting-edge g^4.

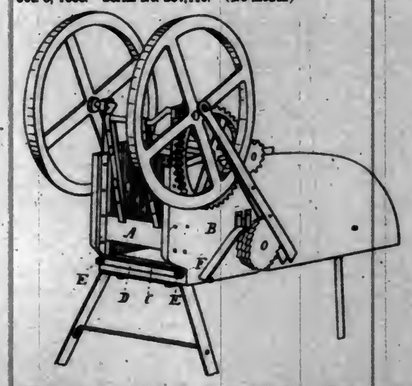
406,975. MOTIVE APPARATUS AND TIME-INDICATOR FOR USE WITH SECONDARY BATTERIES. JEAN T. VAN GEMPEL, New York, N. Y. Filed Sept. 15, 1888. Serial No. 285,457. (No model.)

Claim.—1. The combination of an electrical motor, a clutch for connecting the armature-shaft of said motor to mechanism to be driven, mechanism connected to said clutch for operating it, a generator of electricity, and electrical connections operatively attached to the clutch-controlling mechanism for connecting and disconnecting said generator to and from the motor at the same time that the armature is connected or disconnected to and from the mechanism to be driven, substantially as described.

2. The combination of the following elements: an electrical motor having its armature connected by clutch mechanism to one or more axles or shafts of mechanism to be driven, a clutch-operating shaft and lever for connecting and disconnecting said parts, an electrical generator for operating said motor, electrical connections carried by a rack geared to said shaft for connecting and disconnecting said battery to and from the motor at the same time the clutch mechanism is operated, substantially as described.

3. The combination of the following elements: an electrical motor, a battery divided into sections having multiple-arc connection at one end to one pole of said motor, a series of switches, one for each section of battery, said switches having a common connection to the remaining poles of the battery and motor, clutch mechanism for connecting the armature of the motor to mechanism to be driven, mechanical connections for manipulating said clutch mechanism, and a circuit-controller connected to the clutch-operating mechanism for making and breaking the circuit from the battery to the motor at the same time the armature thereof is connected or disconnected from the mechanism to be driven, substantially as described.

4. The combination of two or more series of storage-batteries or analogous electrical generators, a translating device as a motor, a switch for each series of generators, a time mechanism having mechanical connection with a series of dial-indicators, one for each series of generators, a magnet for each series of dial-indicators, said magnets being in circuit with their respective batteries, and mechanical connection between the armature of the magnets, the dial-indicator shafts, and the clock mechanism for operatively connecting or disconnecting said dial-indicators according as the batteries are cut in or out, substantially as described.



5. The combination of two or more series of storage-batteries having multiple-arc connection at one end of each series to one pole of a motor, with multiple-arc connections from the other end through individual switches, and a single conductor to the remaining pole of the motor, with a time mechanism operatively connected to a main shaft, and electro-magnets located in derived circuits from the first-named several multiple-arc branches and connections in the nature of clutch mechanism between the armatures, the dial-shafts, and the clock-motor shaft, substantially as described.

6. The combination of the following elements: a generator of electricity in circuit with a motor having its armature connected normally to loose-running worm-gear, a mechanical clutch for connecting said armature to a car-axle, a series of levers and connections for operating said clutch mechanism, electrical connections attached to the clutch-operating mechanism for connecting and disconnecting the generator to and from the circuit, and a time-indicator controlled by a magnet located in the battery-circuit, the whole being connected and operating substantially as described.

7. In an apparatus for propelling tram-cars or analogous vehicles, the combination of the following elements: a motor operatively connected by loose running-gear to one or more car-axles, a clutch mechanism, a series of levers, pulleys, and connecting mechanism for operating said clutch mechanism and connecting and disconnecting the motor and the car-axle, a circuit-controller in circuit with a battery for connecting and disconnecting said battery and motor electrically, a time mechanism having a shaft geared to its hour-hand shaft, a dial-hand attached to a counter-shaft normally disconnected from the first-named shaft, intervening clutch mechanism for connecting the shaft and counter-shafting, an armature-lever connected to said clutch mechanism, and an electro-magnet energized by the current from the battery when operatively connected to the motor, substantially as described.

8. In an apparatus for propelling tram-cars or analogous vehicles by electricity, the combination of the following elements: a motor operatively connected to one or more axles of the car by clutch mechanism, levers and connections for manipulating said clutch mechanism, a circuit-controller attached to the clutch-controlling mechanism, a series of batteries having multiple-arc connection through the motor, independent switches for controlling the independent series of battery, a time mechanism, a dial-indicator, one for each series of battery, an electro-magnet operatively connected to each dial-indicator shaft and adapted to be connected or disconnected to a shaft of the time mechanism, said electro-magnets being located in derived circuits from their respective battery-circuits, substantially as described.

406,976. FEED-CUTTER. MORRIS VOICE, Lapeer, Mich. Filed Oct. 3, 1888. Serial No. 287,119. (No model.)

Claim.—1. In a feed-cutter, the combination, with the reciprocating knife, of the stationary cutting-bar C and the adjustable bar D, having its inner upper edge beveled, as at a, and secured in front of and parallel with the bar C by means of the bolts, nuts, and elastic washers, substantially as and for the purpose specified.

2. In a feed-cutter, the combination, with the box and the reciprocating cutting-knife, of the stationary bar C, the bar D, parallel therewith and beveled upon its inner upper face, as shown at a, the bolts passed loosely through the bar D, through the bar C, and into the box, and the elastic washers on said bolts between the nut thereon and the bar D, substantially as and for the purpose specified.

406,977. SOIL OR SEWER PIPE FLUSHING DEVICE. JAMES J. WADE, Chicago, Ill. Filed Nov. 12, 1888. Serial No. 290,515. (No model.)

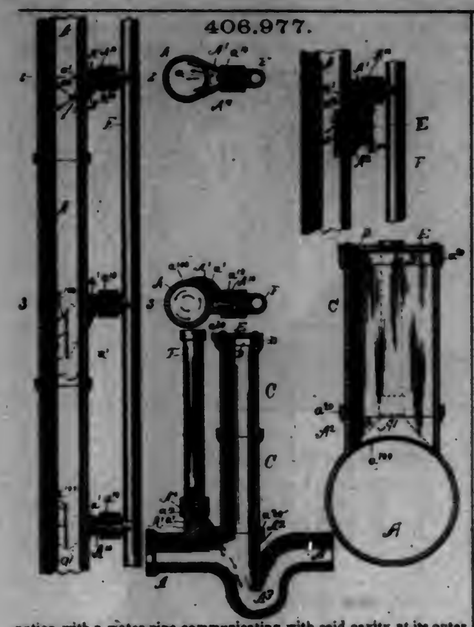
Claim.—1. A soil, drain, or sewer pipe having in the wall thereof a cavity communicating with said pipe through a long narrow orifice, said cavity emerging at the outer surface of the soil-pipe, in combination with a water-pipe communicating with said cavity at its outer end, substantially as set forth.

2. A soil, drain, or sewer pipe having in the wall thereof a cavity communicating with the interior of the soil-pipe and opening exteriorly through the wall of said pipe, said cavity having the orifice through which it opens into the soil-pipe long and narrow, and said cavity diminishing in respect to the longer dimension and increasing in respect to the narrower dimension of said orifice as it extends outward, in combination with a water-pipe communicating with the orifice at its outer end, substantially as set forth.

3. A soil, drain, or sewer pipe having in the wall thereof a cavity communicating with the interior of the pipe through a long narrow orifice extending longitudinally with respect to said pipe, the direction of said cavity at the point where it emerges through said orifice into the soil-pipe being approximately tangential to the inner surface of said soil-pipe, in combination with a water-pipe communicating with said cavity at its outer end, substantially as set forth.

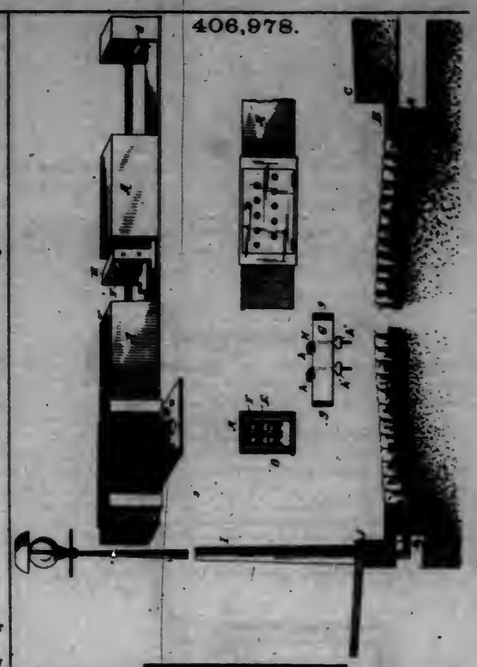
4. A soil, drain, or sewer pipe having in the wall thereof a cavity which communicates with the interior of said pipe, said cavity extending from said orifice back spirally about the pipe, in combination with a water-pipe communicating with said cavity at its outer end, substantially as set forth.

5. A soil, drain, or sewer pipe having in the wall thereof a cavity which communicates with the interior of the pipe through a long narrow opening, and which has adjacent to such cavity a hand-hole provided with a removable cover, in combination with a water-pipe which communicates with the cavity at its outer end, substantially as set forth.



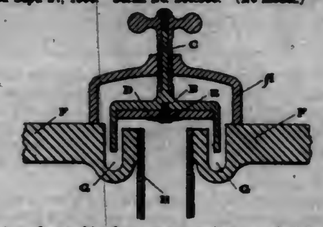
6. In combination with a soil, drain, or sewer pipe having the boss A^3 for the purpose of a hand-hole, said boss terminating outwardly in a hub a^{20}, the thimble D, equal in height to the interior of the hub, and the cover E, consisting of a flat disk adapted to be secured to the outer edge of the thimble, substantially as set forth.

406,978. UNDERGROUND CONDUIT. THOMAS WALLACE, New York, N. Y., assignor to the New York Atmospheric Conduit Electric Light and Power Company, of West Virginia. Filed Jan. 26, 1889. Serial No. 297,569. (No model.)



Claim.—1. An electric conduit consisting of a casing embedded in asphalt or other material and arranged alongside the curb, hollow lamp-posts connected at intervals with the conduit, hand-holes provided with perforated doors, and supports arranged at intervals in the conduit and having insulating spools or rollers upon which the conductors are held, whereby a free circulation may be maintained throughout the conduit in connection with the freely-supported conductors, substantially as described.

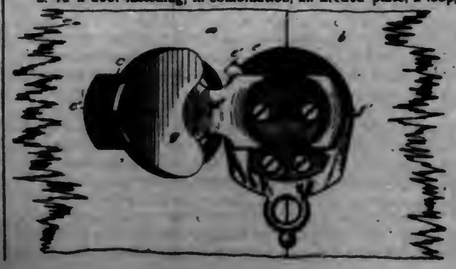
2. The combination, with a conduit, of the insulating guide-rollers to support the conductors and the clamp-beams and clamps for securing the conductors at the hand-holes, substantially as described



406,977.

406,978.

406,979. SEWER-GAS TRAP AND SINK. WILLIAM WALLACE, San Francisco, Cal., assignor to himself and Robert G. BRUNS, same place. Filed Sept. 27, 1888. Serial No. 286,553. (No model.)

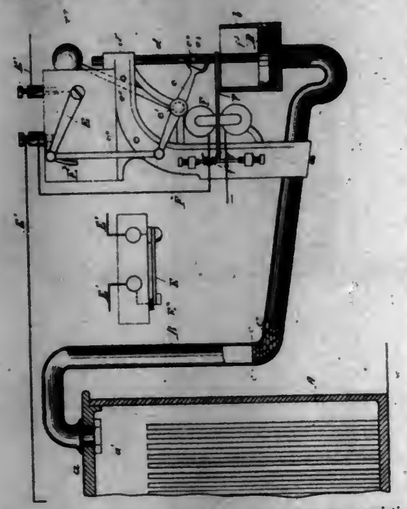


Claim.—In combined sewer-gas excluders and sinks, the combination, with a sink having a groove in its bottom concentric to the discharge-aperture, of the shell A, having its lower edge notched, as shown, to form a strainer, and having a central aperture in its top internally threaded, the trap-cup having a plain vertical stem with its lower edge adapted to enter the groove in the sink-bottom, and the threaded sleeve surrounding the stem of the trap-cup and having a handle portion, substantially as specified.

406,980. DOOR-FASTENING. EDWARD N. WARNER, Rocky Hill, Conn. Filed Nov. 6, 1888. Serial No. 290,152. (No model.)

Claim.—1. In a door-fastening, in combination, a plate adapted to hold a loop, a plate having an outwardly-projecting flange, and a loop loosely held by one plate having a portion of sufficient diameter to extend over the flange on the other plate, while the remainder is of less diameter, substantially as specified.

2. In a door-fastening, in combination, an arched plate, a loop,



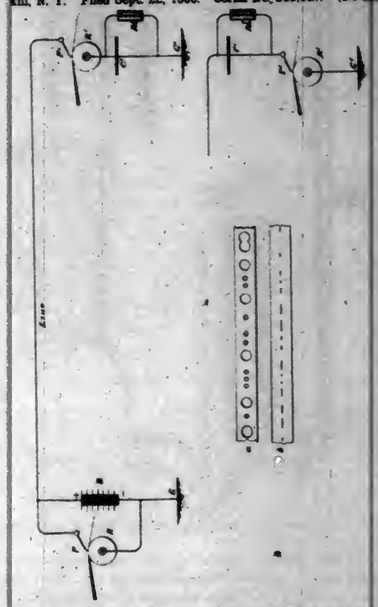
406,980.

portions of which are of different diameters, held under said arch, a lug projecting outwardly from said loop, and a plate having an outwardly-projecting flange, substantially as specified.

406,981. AUTOMATIC CUT-OFF FOR SECONDARY BATTERIES. ARTHUR AHORY and ROBERT AHORY, Boston, Mass. Filed Mar. 19, 1887. Serial No. 231,521. (No model.)

Claim.—1. An automatic cut-off for storage-batteries, consisting of the combination of a tight casing or box inclosing a battery or a cell thereof to prevent the escape of pressure accumulating therein, a chamber, a pipe connecting said casing or box with said chamber and containing a power-transmitting medium, a piston or plunger in said chamber, and a switch connected with said piston or plunger, substantially as set forth.

2. The combination, with a tight casing or box and a battery or a cell thereof inclosed therein, of a plunger-chamber, a pipe connecting said chamber with said casing or box and containing a column or body of mercury or other power-transmitting medium, a piston or plunger arranged in said chamber and provided with a stem or rod, an actuating-lever operated by said rod, a switch connected with said lever, an extended contact-point over which the said switch is moved, and an overbalancing-weight to cause said switch to be engaged with or disengaged from said contact-point, substantially as set forth.



3. The combination, with a storage-battery, of a switch in a charging-circuit, operated or controlled by pressure generated by the action of charging the battery, a weight for moving the said switch, and an electrically-controlled holding device connected with the battery-circuit for holding the switch open until the storage-battery has lost or discharged its electrical energy, as and for the purposes specified.

4. The combination of a storage-battery or a cell thereof inclosed in a tight case or box and the charging-circuit E', a pipe or tube connecting the chamber of said battery or cell with a chamber *b*, and the body or column C of mercury or other power-transmitting medium therein contained, the plunger D, the rod *d*, having a stop f^3, the weighted lever *e*, the switch E in the charging-circuit, the contact-point E^2, and the stop-lever F, operated by an electro-magnet in the battery-circuit F^1 in one direction and by the spring f^2 in the reverse direction, substantially as described.

5. In an automatic cut-off for a storage-battery, a switch in the charging-circuit, and mechanism for operating the same to close the circuit, and a holding device for holding the switch or its actuating mechanism from closing the circuit until the storage-battery is discharged of its electrical energy, controlled in its operation by a circuit connected by said battery, substantially as specified.

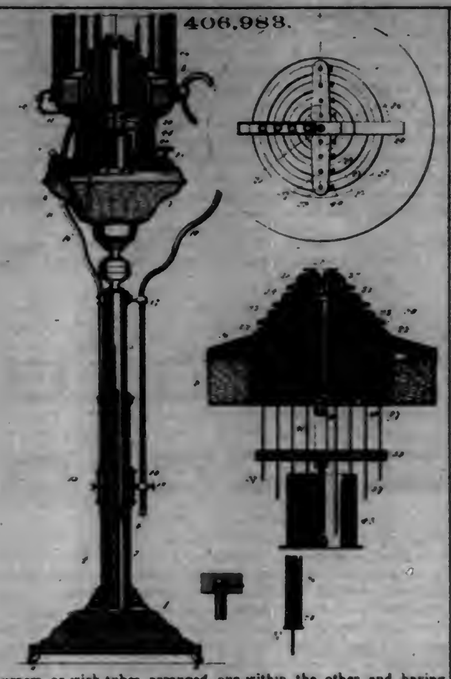
6. The combination of the lever or latch controlling the time of operation of the switch E of the charging-circuit E' of a storage-battery with an electro-magnet operated by said battery and a spring adapted to move the lever in a direction opposite that from which it is operated by the said electro-magnet, as and for the purposes specified.

406,982. AUTOMATIC TELEGRAPH. FRANK ANDERSON, Poughkeepsie, N. Y. Filed Sept. 22, 1888. Serial No. 286,067. (No model.)

Claim.—1. In an automatic telegraph, the following combination of elements: a single transmitting-battery at a transmitting-station connected to earth and directly to a main line, which it normally charges, a shunt around said battery including in its circuit an automatic transmitter adapted to open and close said shunt, a recording-receiver at the distant receiving-station located in the main line, and a condenser also located directly in the main line between the receiver and the earth, substantially as described.

2. An automatic telegraph system consisting of the following elements: a main line earthed at each end and containing a single main-line or transmitting battery normally in circuit, a transmitter consisting of a perforated fillet, a contact brush or pen, and a transmitting-cylinder located in a normally-open shunt around the entire battery, a receiver located at a receiving-station, and a condenser located between the receiver and the earth, substantially as described.

3. A transmitting-fillet for use in automatic telegraphy, consisting of a perforated strip or band, the perforations being in a single row and of two sizes, the large perforations representing the spaces between individual letters only and the small perforations the spaces between the elements of the letters only, the greatest distance between any two elements of an individual letter not exceeding one of the small perforations, substantially as described.



4. A transmitting-fillet for use in automatic telegraphy, consisting of a perforated strip or band, the perforations being located in a single row and of two sizes, the large perforations representing the spaces only between individual letters and being in every instance of uniform size, while the small perforations represent the spaces only between the elements of the letters, the greatest space between any two letters of a word not exceeding the diameter of one of the larger perforations and that between any two of the elements of a letter not exceeding the diameter of one of the smaller perforations, substantially as described.

5. A fillet for use in automatic telegraphy, consisting of a perforated strip, the perforations being in a single row and of two sizes, both circular, the larger-sized perforations representing the spaces between individual letters of a word and the small perforations representing the spaces between the individual elements of a letter, the space between any two letters of a word not exceeding the diameter of one of the larger perforations and that between any two elements of a letter never exceeding the diameter of one of the smaller perforations, substantially as described.

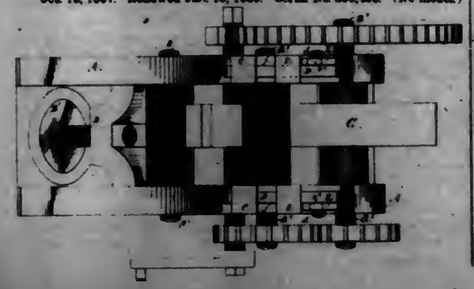
406,983. LAMP. ALLEVI AMBRALE, Chicago, Ill. Filed June 4, 1888. Serial No. 276,046. (No model.)

Claim.—1. The combination, substantially as set forth, of annular

406,983.

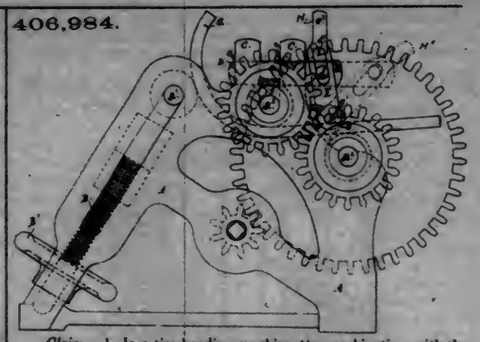
burners or wick-tubes arranged one within the other and having spaces between them for the passage of air, with the flame and air deflectors, as 28, 31, and 32, the base of each air-deflector constituting a button or flame-deflector to turn the flame of the next surrounding burner outward.

2. The combination, substantially as set forth, of an annular reservoir for burning-fluid and a series of burners arranged one within the other in the central space of said reservoir and in communication therewith, each of said burners drawing its supply of fluid from said annular reservoir.



3. The combination, substantially as set forth, of the annular reservoir for containing burning-fluid, the pipe 20, extending across the lower part thereof, the annular burners in the central space of the reservoir above the pipe 20, and the tubes 21, connecting said pipe with each of the burners.

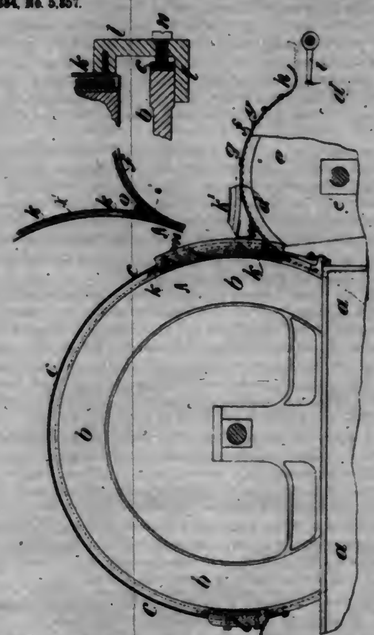
4. The combination, substantially as set forth, of the burners or wick-tubes arranged one within the other, the wick-supporting rings, as 36, within said burner-tubes, the rods extending downward from said rings, and the bar 39, for raising and lowering the wicks.



5. The combination, substantially as set forth, of the annular burners or wick-tubes, the wick-supporting rings, the rods extending downward therefrom, bar 39, the drum 43, and the pulley and chain for actuating the said drum to raise and lower the wicks.

6. The combination, substantially as set forth, of two reservoirs for burning-fluid, arranged one above the other, the upper reservoir being annular in form and supplied with fluid from the lower one, a pump for forcing fluid from the lower to the upper reservoir, and a series of annular burners arranged within the central space of said annular reservoir and each taking its supply of fluid therefrom.

406,984. TIRE-BENDER. ISAAC L. ASWEILER, Columbia, Pa. Filed Oct. 18, 1887. Renewed Jan. 15, 1889. Serial No. 296,468. (No model.)

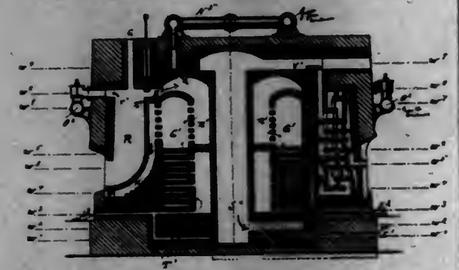


406,984.

Claim.—1. In a tire-bending machine, the combination, with the frame A and central-roll journal a^4, of the wedge-key D and shifting-lever E, said lever E adapted to operate said key D for the purpose of retaining said journals a^4 in position in the frame A, substantially as set forth, and for the purpose described.

2. In a tire-bending machine, the combination of the following elements: the wedge-key D, the lugs C C in the frame A, and the journals a^3 of the central roller, said key D being adapted to pass through slots *c c* in the lugs C C, retaining said journals a^3 in position in the frame A, as set forth, and for the purpose described.

406,985. CARDING-ENGINE. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Aug. 21, 1888. Serial No. 283,368. (No model.) Patented in England Apr. 3, 1884, No. 5,857.



Claim.—1. The combination of the cylinder and side frames of a carding-engine and bands or arcs thereon with the arc-shaped cover *k*, angle-pieces which carry the said cover and are fitted to the frames, and accurately-adjusted stops which bear upon the bands or arcs to determine the distance of the cover from the cylinder, all substantially as set forth.

2. The combination of the doffer-cylinder and pedestals in which its shaft turns with the turned end casings *e*, each cast in one piece with the corresponding pedestal of the doffer, and the adjustable sheet-metal cover fitted to the said turned end casings, and means, substantially as described, for adjusting the cover thereon, substantially as set forth.

3. The combination of the cylinder, doffer, side frames, and turned end casings with the sheet-metal cover *k* on the frames and the adjustable sheet-metal cover *f* on the turned end casings, and means,

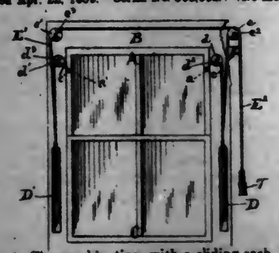
subtantially as described, for adjusting the cover thereon, the adjacent edges of the covers nearly meeting in the space between the cylinder and doffer, substantially as and for the purpose set forth.

406,986. COKE-OVEN. THEODOR BAUER, Munich, Bavaria, Germany. Filed Aug. 2, 1887. Serial No. 245,935. (No model.)

Claim.—1. A coke-oven having a series of radial retorts connected by flues with a central annular combustion-chamber having air and gas ports, substantially as set forth.

2. A coke-oven having a series of retorts arranged radially around and connected by flues with a central annular combustion-chamber, and a central gas conduit or flue for conveying gases to said annular combustion-chamber, substantially as set forth.

3. A coke-oven having a series of radial retorts connected by ducts with a central gas-conduit, said gas-conduit being surrounded by an annular combustion-chamber having air and gas ports, and which annular combustion-chamber is connected with the central conduit by said gas-ports, substantially as set forth.

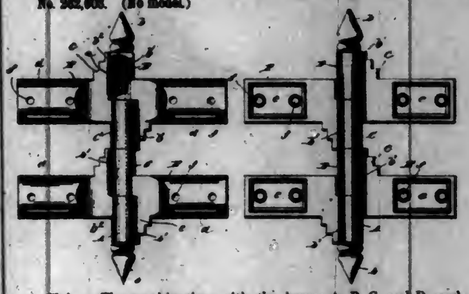


4. A coke-oven having a series of radial retorts, a central gas-conduit with which said retorts are connected by ducts, an annular combustion-chamber provided with air-induction flues and surrounding the conduit and in communication with gas-combustion channels below and between the several retorts, and flues connecting the central conduit and the annular combustion-chamber, substantially as set forth.

5. A coke-oven having a series of radial retorts connected by ducts with a central gas-conduit, an annular combustion-chamber provided with air-induction flues and surrounding the gas-conduit, gas-combustion channels below and between the retorts, which channels are in communication with the combustion-chamber, a chimney which is in communication with the channels below and between the retorts and flues connecting the central conduit and the annular combustion-chamber, substantially as set forth.

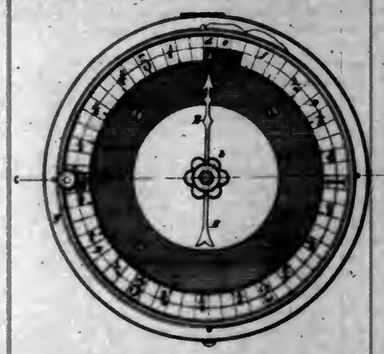
6. A coke-oven having a series of radial retorts connected by ducts with a central conduit, a combustion-chamber surrounding the gas-conduit, channels extending from the combustion-chamber under and around the bottoms and sides of the retorts, channels for conducting air into the combustion-chamber, additional channels for conducting air into the gas-channels between and below the retorts, and flues connecting the central conduit and the annular combustion-chamber, substantially as set forth.

7. A coke-oven having a series of radial retorts connected by ducts with a central gas-conduit, an annular combustion-chamber provided with air-induction flues and surrounding said gas-conduit, flues connecting the central conduit and the annular combustion-chamber, and a central exit-pipe within the gas-conduit having its lower end connected with a series of gas-outlet channels which are so arranged vertically between two series of horizontal air-inlet channels that the air passing through said air-inlet channels is heated by spent gases passing out of said vertical pipe, substantially as set forth.



406,987. SASH-BALANCE. ALEXANDER W. BIDDLE, Philadelphia, Pa. Filed Apr. 22, 1889. Serial No. 308,062. (No model.)

Claim.—1. The combination, with a sliding sash and sash-guiding casing-frame equipped with ordinary sash cords and pulleys, of a pair of equal overbalancing-weights, operating-cords secured thereto, and auxiliary pulleys whereby said cords are led from said weights to an altitude at least as high as that of the ordinary sash-pulleys and thence passed to convenient external operating positions, substantially as and for the purposes hereinbefore described.

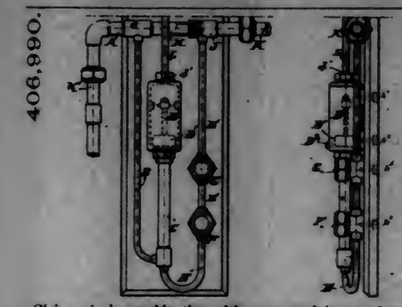


2. The combination, with a sliding sash and sash-guiding casing-frame equipped with ordinary sash-weight cords and pulleys, of a pair of equal overbalancing-weights, overhead auxiliary pulleys, and a forked operating-cord, the common stem of which after branching leads its parts by way of said pulleys to the sash-weights, to which its branched ends are respectively attached, substantially as and for the purposes hereinbefore described.

406,988. HINGE. SAMUEL BIRDSALL, Perrysburg, Ohio, assignor of one-half to John G. Hoffman, same place. Filed Feb. 1, 1888. Serial No. 262,603. (No model.)

Claim.—The combination, with the leaves A, B, C, and D, each of which is provided with the perforated cylindrical portions *b'*, those of the end leaves A and D being extended beyond their upper and lower edges, respectively, and terminating at about the center of the leaves, and the first mentioned terminating in the threaded socketed cap *b*, and each provided with diagonal bracing-webs *c*, and those intermediate sections B and C having their cylindrical portions beginning at about their centers and projecting beyond their adjacent ends and provided with the webs, as *c*, and the pintle *a*, having head *b* and threaded in the opposite head *b*, substantially as specified.

406,989. TIME-SIGNAL. NICHOLAS H. BORSFELDT, Brooklyn, N. Y. Filed Nov. 19, 1888. Serial No. 291,208. (No model.)



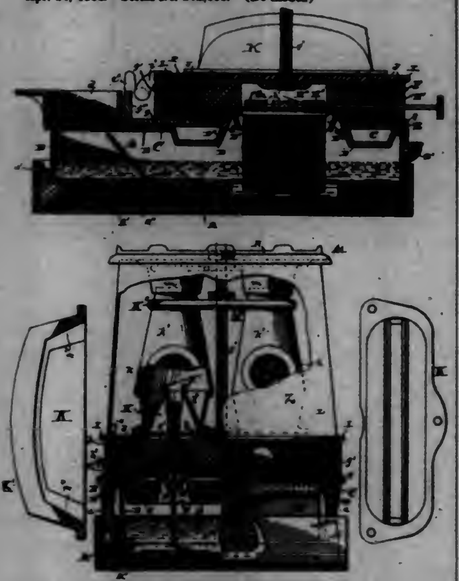
Claim.—1. A clock having a pointer B, and means for automatically moving the same, and a dial D, divided into sections indicating lineal measurement at the rate of double the distance traveled by sound during the motion of the pointer B.

2. In a clock having a pointer B, and means for automatically moving the same, the dial D, having independent sections *e f*, and having its remaining portion divided into sections indicative of double the distance traveled by sound during the motion of the pointer B, substantially as described.

3. In a clock having a pointer B, and means for automatically moving the same, the dial D, having independent sections *e f*, and having its remaining portion divided into sections indicative of double the distance traveled by sound during the motion of the pointer B, in combination with the movable index-hand E, substantially as described.

406,990. COMBINED PRESSURE-GAGE AND SAFETY-VALVE. JOHN D. BOWMAN, Altoona, Pa. Filed Dec. 13, 1888. Serial No. 293,421. (No model.)

406,990.



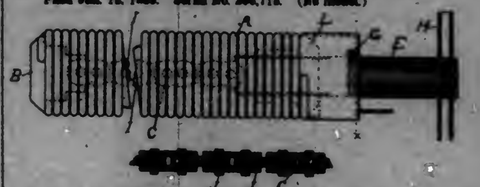
Claim.—1. In combination with a gas-conduit, a perforated diaphragm interposed in the same, an indicator consisting of a U-tube adapted to contain mercury, having one leg connected with and leading down from the conduit on the exit side of the diaphragm, and a blow-off chamber secured on the top of the other leg, substantially as and for the purpose specified.

2. In combination with a gas-conduit, a perforated diaphragm interposed in the same, an indicator consisting of a U-tube adapted to contain mercury, having one leg connected with and leading down from the conduit on the exit side of the diaphragm, a blow-off chamber secured on the top of the other leg, and an inverted cup sustained in the blow-off chamber over the mouth of the open leg of the U-pipe, substantially as and for the purpose specified.

3. In combination with a gas-conduit, a perforated diaphragm interposed in the same, a U-tube adapted to contain mercury, having one leg connected with and leading from the conduit on the exit side of the diaphragm, and the other leg open to the atmosphere, and a pipe connected to the conduit on the entrance side of the diaphragm and to the open leg of the U-pipe above its bottom, substantially as and for the purpose specified.

406,991. LAMP-STOVE. JOSEPH W. BROER, Chicago, Ill. Filed Apr. 27, 1888. Serial No. 272,008. (No model.)

Claim.—1. The herein-described oil-stove, comprising a base-frame having upstanding lugs *a*, the oil-tank supported thereon, the plate closing said tank and forming the water-pan and having flanged wick-openings, substantially as described, and the burner and drum, and the plate supporting the burner and drum, having depending lugs E', that support the same on lugs *a*, all substantially as specified.



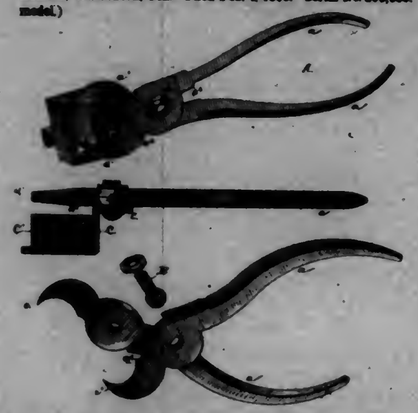
2. The within-described oil-stove, consisting of the bottom frame A, having upstanding lugs *a*, the oil-tank supported thereon, the plate C, closing the open end of the tank and bolted to frame A and formed with a water-pan D, and the plate E, having depending lugs E' resting on the lugs *a* of frame A and supported thereby above plate C, the drip-plate G, and the burner and drum supported on plate E, all substantially as described.

3. The combination of the base-frame, and oil-tank, and burner-supporting plate E, having upstanding bifurcated lug *e'*, with the disk I, having depending feet I' resting on plate E, and inclined studs *i*, formed with laterally-projecting ears *i'*, adapted to engage the lugs *e'* and form hinge-joints therewith, all substantially as specified.

4. The oil-stove herein described, consisting of a base-frame, oil-tank, water-pan, and drip-plate, and thesplate E, substantially as described, and the disk I, supported on plate E and carrying the heating-drum and burner-cones, and the burner having a base-plate supported on the frame E below disk I, all substantially as set forth.

5. The combination of the base-frame A, having upstanding lugs *a*, the oil-tank supported thereon, and the plate C, supported on the oil-tank and bolted to frame A, with the plate E, having depending lugs E' resting on lugs *a* of frame A, the burner carried on plate E, the disk I, having feet I' supported on plate E, the burner-cones and chimneys supported on the disk I, and the drum Z, supported on disk I, having a top disk M, formed with depending flanges *m m*, all substantially as and for the purpose specified.

406,992. PIPE-BENDER. EDWARD L. BURDSON, Los Angeles, Cal. Filed Jan. 18, 1888. Serial No. 266,718. (No model.)



Claim.—1. In a spiral-spring pipe-bender, the combination, with the spring, of a flexible non-twistable connection fixed by one end to one end of the spring and connected at the other end with the other end of the spring by means of a ratchet.

2. The combination of the spiral spring fixed at one end to a head B, to which one end of the flexible non-twistable connection C is fixed, the head L, having the other end of the spring fixed thereto, the cylindrical handle E, attached to the connection C, and the ratchet connecting the head L and the handle.

3. The combination of the spiral spring A, fixed at one end to a head B, the flexible non-twistable connection fixed to the head B, the head L, provided with a female screw, the cylindrical handle E, provided with a screw-thread to screw therein and attached to the flexible non-twistable connection, and the ratchet connecting the handle and the head L.

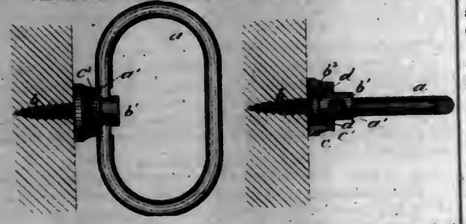
406,993. COMBINATION-TOOL. JAMES T. CARTER and WILLIAM KOEPKE, Warrenton, Tex. Filed Feb. 4, 1889. Serial No. 298,695. (No model.)

Claim.—1. In a combination implement of the character set forth, the combination of the two overlapping fulcrumed or pivoted levers having handles and forward ends of flattened crescent shape bent in reverse directions to cause their extreme reduced ends to abut to form nippers, and provided with beveled shoulders at the bases of their inner edges to form cutters and with serrated projections in rear of the pivot or fulcrum, and an angular arm movably attached to said pivot or fulcrum, carrying a receptacle adapted to be adjusted under the nippers for the reception of staples, substantially as described.

2. The combination, with an implement having a grip or nipper formed therewith, of an angular arm movably attached to the pivot or fulcrum thereof and a receptacle secured to said arm adapted to be adjusted under the grip or nipper for the reception of staples or other articles, substantially as described.

406,994. ELECTRIC WIRING. FRANK R. CHISHOLM, Brooklyn, N. Y. Filed Mar. 30, 1889. Serial No. 305,475. (No model.)

Claim.—1. The combination, with a cleat or back-piece, of an insulator fitting within the same and provided with a flange behind it interlocking with the back-piece, substantially as specified.



2. The combination, with a cleat or back-piece, of an insulator fitting within the same and provided with a flange behind the cleat or insulator, and having a notch for engaging a pin, substantially as specified.

3. The combination, with a cleat or back-piece, of an insulator fitting within the same and provided with a flange behind the cleat or insulator, a cap-piece for the insulator, and a wire or cord passing through the insulator just in front of the cleat or back-piece and across the cap-piece, substantially as specified.

4. The combination of an insulator having in one end a notch for a circuit-wire, a cap-piece provided with a tongue entering said notch and having in its outer end a notch extending transversely to the notch of the cap-piece, and a wire or cord passing from the insulator across the notch of the cap-piece, substantially as specified.

5. The combination of an insulator having in one end a notch for a circuit-wire, a cap-piece provided with a tongue entering said notch, and a wire or connection securing the cap-piece to the insulator on a line transverse to the length of the notch in the insulator, substantially as specified.

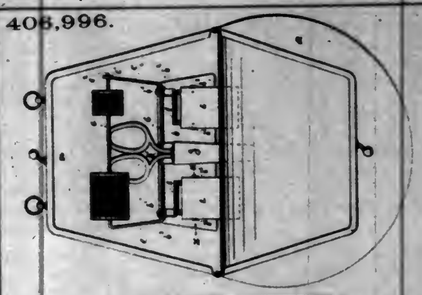
406,995. HAND-HOLD. PERRY F. CRAFTS, Leeds, Mass. Filed June 2, 1888. Serial No. 275,804. (No model.)

Claim.—1. In combination with a handle *a*, the screw *b*, attached to and turning thereon, with a flange b^3, and the clamping-collar *c*, borne on the screw-stem and free to slide on said stem a limited distance, all substantially as described.

2. In combination with a ring-shaped handle, a screw attached thereto by the passage of the handle through a socket in the screw-stem and rotary on said handle, the sliding clamping-collar borne on the screw-stem, with its inner end projecting beyond the base of the screw-head, and the interengaging locking devices, as described, borne on the handle and the collar, respectively, all substantially as described.

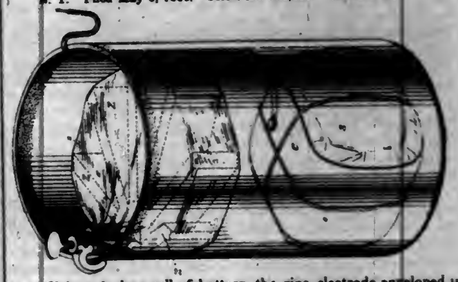
3. In a detachable holding device, a ring-shaped handle, a screw attached to said handle and rotary thereon across the plane of the handle, the clamping-collar borne on the screw-stem, with its outer end projecting beyond the inner side of the screw-head and having a spring-socket, and the spring seated in said socket and forcing the collar normally toward the handle, all substantially as described.

406,996. ATTACHMENT FOR LADIES' SATCHELS. HENRY S. CRAUL, Mount Vernon, N. Y. Filed Apr. 22, 1889. Serial No. 308,073. (No model.)



Claim.—1. The combination of a satchel or work-box with face-plate *b* and with wire *c*, hinged thereto and adapted for the reception of spools, substantially as specified.

2. The combination of a satchel or work-box with face-plate *b* and with spring-wire *c*, hinged thereto and having parallel shanks and interlocking ends, substantially as specified.



3. The combination of a satchel or work-box with face-plate *b* and with wire *c* and sheath *g*, having hook *g'*, substantially as specified.

4. The combination of a satchel or work-box with face-plate *b* and with wire *c*, sheath *g*, and pockets *e*, secured to the face-plate, substantially as specified.

406,996.

406,997. GALVANIC BATTERY. PATRICK R. DELANY, New York, N. Y. Filed May 9, 1889. Serial No. 310,069. (No model.)

Claim.—1. In a cell of battery, the zinc electrode enveloped in a bag or cover of porous material, in combination with a charge of sulphate-of-copper crystals having interposed between it and the battery solution a porous medium.

2. In a gravity-cell of battery, the combination, with the zinc and copper elements, of a cartridge consisting of crystals of sulphate of copper enveloped in porous material, substantially as set forth.

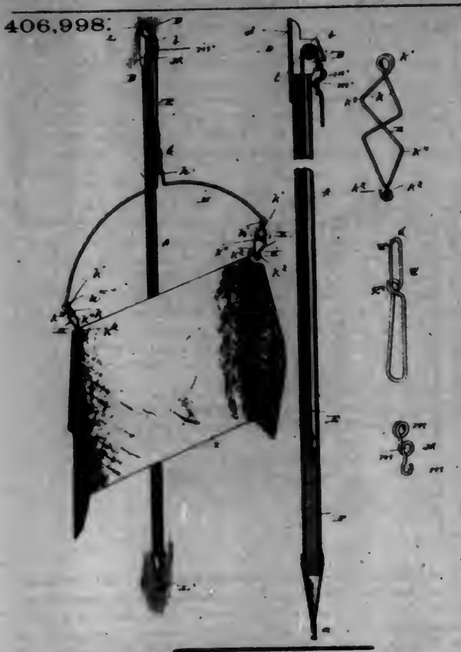
3. The herein-described cartridge for a cell of battery, consisting of a charge of crystals of sulphate of copper, for instance, inclosed in an envelope of porous material.

4. The cartridge of sulphate-of-copper crystals for a cell of gravity-battery, encircled by the copper electrode of the battery and having a porous medium to separate the crystals from the fluid of the battery.

5. The copper element of a gravity-battery, consisting of a band of copper and a bag of sulphate-of-copper crystals encircled by the copper band.

6. A battery-cell having its rim roughened or sanded, for the purpose set forth.

406,998. TOWEL-RACK. THOMAS M. DILL, Davenport, Iowa. Filed Dec. 26, 1888. Serial No. 294,604. (No model.)



Claim.—1. In a towel-rack, the combination of the tubular casing provided at its lower end with an eye *a*, the removable guard B at its upper end having an apertured ear D to receive screws to secure the casing to a support, and the pulley C, journaled transversely in said guard, with the cord passing over the pulley at the upper end of the casing, provided at one end with a clamp to engage the towel and at the other end with a counterbalancing-weight operating in the casing, substantially as specified.

2. In a towel-rack, the combination, with the tubular casing A, the guard B at its upper end having the parallel cheeks *b b*, of the rollers *c*, journaled transversely in said guard, the cord passing over the said roller, provided at its outer end with a clamp to engage the towel and at its inner end with a counterbalancing-weight, and the wire stop M, comprising a series of rings *m m*, through which the cord passes, the said stop being adapted to strike against the cheeks *b b* to limit the movement of the cord, substantially as specified.

3. In a towel-rack, the combination, with the supporting-cord, of the clamp connected to the free end of the cord and consisting of the arms *k k*, connected at their upper ends by the spring-coil k' and having the angular bends k^3 and k^4, the said arms intersecting each other between the said bends, and the oppositely-extending hooks k^2 k^2 on the lower ends of said arms, arranged in a plane at right angles to the plane of the arms and normally in contact, as specified.

4. In a towel-rack, the combination, with the cord passing over a roller and provided with a counterbalancing-weight, of the bow connected to the free end of the said cord and clamps at its ends adapted to engage the towel and hold the latter in a spread condition, substantially as and for the purpose specified.

406,998.

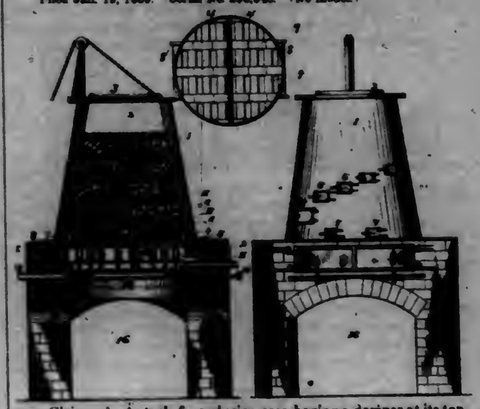
406,999. METHOD OF DECORATING METAL SURFACES. NELLIE C. DUNCOMBE, New York, N. Y. Filed June 1, 1888. Serial No. 275,730. (No model.)

Claim.—1. A metal surface decorated with etched and oxidized portions in two or more different colors, whereby a design is produced by the contrast of such metallic colors.

2. A metal surface decorated with bright lustrous or frosted etched portions and with dull etched and discolored oxidized portions of two or more different colors, whereby a design is produced by the contrast of such metallic colors with each other and with the frosted portions.

3. A metal surface having an etched ground and decorated with etched and oxidized portions of different colors or tones, and with high lights of bright polished metal, whereby a design is produced by the contrast of the polished metal and the metallic colors with the etched ground.

4. A decorated metal surface having an etched ground, and a design produced by different colors or tones of oxidation with the high lights of bright polished metal.



5. The improvement in the art of decorating metal surfaces, consisting in covering the surface to be preserved, immersing in an acid bath in which a metal or alloy is dissolved to etch and prepare the uncovered portions, and subsequently exposing the latter to the air to oxidize the etched surface.

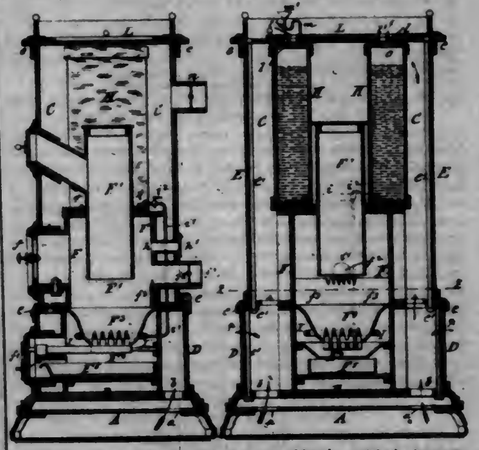
6. The improvement in the art of decorating metal surfaces, consisting in covering the surface to be preserved, immersing in acid to etch the uncovered portions, and then exposing them to the fumes of an acid bath in which a metal or alloy is dissolved.

7. The improvement in the art of decorating metal surfaces, consisting in successive alternations of etching and oxidizing, the portions of the surface to be retained after each oxidation being covered over, and the successive oxidations being effected in different colors or shades.

8. The improvement in the art of decorating polished metal surfaces, consisting in covering the portions to be retained polished in the design, oxidizing the uncovered portions by exposure to an acid bath in which a metal or alloy is dissolved, then covering the oxidized portions to be preserved, etching the uncovered surface, and finally removing the covering medium.

407,000. REDUCING-STACK. CHARLES J. RAHM, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,840. (No model.)

Claim.—1. A stack for reducing ores, having a damper at its top, a drop-grate at its bottom, a slide below the drop-grate, and a series of air-ports at its base just above the plane of the grate, substantially as and for the purposes specified.



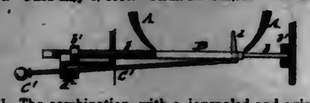
2. A stack for reducing ores, having a dumping-grate at its base, a series of air-ports encircling the stack at its base, a slide arranged below said grate and forming a closed chamber beneath the grate, and a series of charging-doors arranged on successive levels, substantially as and for the purposes specified.

3. A reducing-stack having at its base a drop-grate provided with a facing or checker-work of fire-brick, substantially as and for the purposes specified.

4. The combination, with a reducing-stack having a drop-grate, of a detachable or sliding gas-burner arranged below the grate, substantially as and for the purposes specified.

5. The combination, with a reducing-stack having a drop-grate, of a removable or sliding burner arranged below the grate and a removable slide arranged below the burner, substantially as and for the purposes specified.

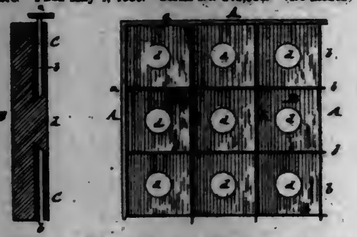
407,001. HEATING-STOVE. OTTO P. ELTERICH and G. OTTO ELTERICH, Newark, N. J., assignors of one-third to Clemens Heitemeyer, same place. Filed May 1, 1888. Serial No. 272,528. (No model.)



Claim.—1. In a heating-stove, the combination, with the fire-box and basket of the same, of a water-box supported on the fire-box, a perforated jet-pipe extending around the basket, the jet-openings being located between the prongs of the basket, and a valved pipe connecting the water-box with the said jet-pipe, substantially as set forth.

2. In a heating-stove, the combination, with a fire-box and basket of the same, of the water-box supported on the fire-box, a pipe con-

necting the lower ends of the water-box, a jet-pipe extending around the basket and having jet-openings located intermediately between the prongs of the same, and a valved pipe connecting one of the water-boxes with the jet-pipe, substantially as set forth.



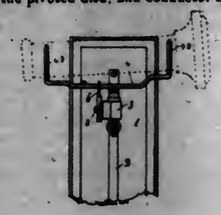
407,002. FURNACE-GRATE. OTTO P. ELTERICH and G. OTTO ELTERICH, Newark, N. J., assignors of one-third to Clemens Heitemeyer, same place. Filed May 1, 1888. Serial No. 272,889. (No model.)

Claim.—1. The combination, with a journaled and axially-movable grate, of a poker provided with teeth or fingers extending into the openings of the grate, a shank or rod extending forward from said poker, and an eye or sleeve for guiding the shank located below the journal of the grate, said eye being rounded off at the edge and provided with an inclined bottom part, substantially as set forth.

2. The combination, with a journaled and axially-movable grate, the rear bar of which is provided with recesses at the inner side, of a poker having teeth or fingers extending into the openings of the grate, a shank or rod extending forward from said poker, and an eye or sleeve for guiding the shank located below the journal of the grate, said eye having rounded-off edges and an inclined bottom part, so as to support the poker when in dropped position, substantially as set forth.

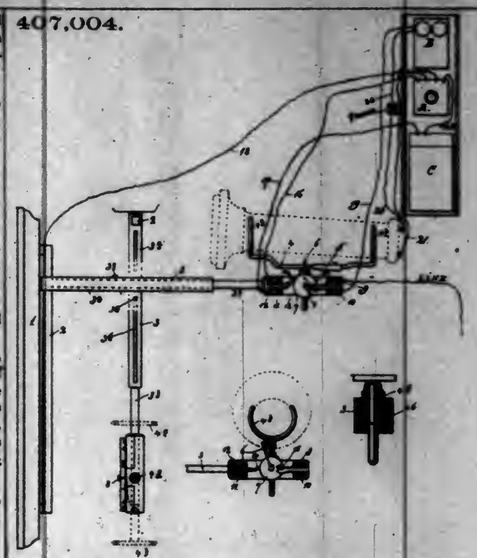
407,003. MANTEL FOR STOVES. OTTO P. ELTERICH and G. OTTO ELTERICH, Newark, N. J., assignors of one-third to Clemens Heitemeyer, same place. Filed May 1, 1888. Serial No. 272,890. (No model.)

Claim.—1. A mantel for stoves, consisting of a metallic supporting frame or grating, tiles or glass plates provided with dovetailed dowels at the back and arranged in front of said supporting-frame, and a layer of cement that unites the dowels at the back of the tiles with the supporting frame or grating, substantially as set forth.



2. A mantel for stoves, consisting of a metallic supporting frame or grating, a number of tiles or glass plates, each provided with a dovetailed dowel at the back, said dowels being located at the front of the supporting-frame, and with dowels projecting into the spaces formed between the strips of the grating, and a layer of refractory cement embedding the grating and dowels at the rear of the tiles for uniting the frames and tiles, substantially as set forth.

407,004. TELEPHONIC APPARATUS. NATHAN S. FIKE, Utica, N. Y. Filed Apr. 15, 1889. Serial No. 307,385. (No model.)



Claim.—1. In a telephonic apparatus, the combination of the projecting arm, the receiver-supporter pivoted upon the arm, and the pivoted disk operated by the turning of the receiver upon its pivot and the contacting conductor-springs, substantially as set forth.

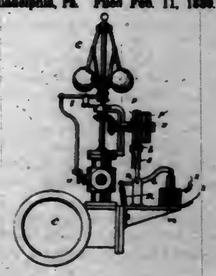
2. In a telephonic apparatus, the combination of a supporting-arm, a receiver-supporter mounted upon a pivot-spindle engaging the arm, the spindle having its bearing end at an acute angle and resting upon an inclined surface, and the circuit former and breaker operated by the turning of the supporter upon its pivot.

3. The combination, in a telephonic apparatus, of a vertical stationary bar, a vertically-movable extension projection-arm, a receiver-supporter mounted upon a pivot-spindle engaging in a socket in the arm and having its bearing end at an acute angle and resting upon an inclined surface, the pivoted disk, and conductor-springs, substantially as set forth.

407,004.

4. The combination, in a telephonic apparatus, of the vertical stationary bar, the vertically-movable extension-arm, the receiver-supporter, having two pairs of fingers, one of which pairs is on a higher horizontal plane than the other, mounted upon a pivot-spindle, the bearing end of which is at an acute angle and resting upon an inclined surface, the pivoted disk, and contacting conductor-springs, substantially as set forth.

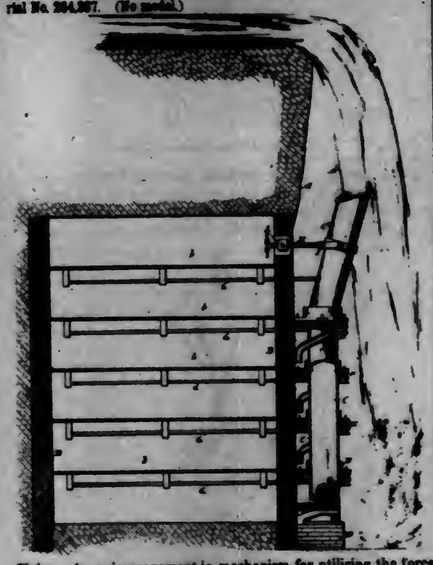
407,005. ORGAN-PEDAL. GRACE I. FOSTER, Milford, Iowa. Filed Jan. 16, 1889. Serial No. 296,460. (No model.)



Claim.—1. A pedal composed of upper and lower portions 4 and 7, pivotal arms connecting said parts, a pivotal pawl adapted to engage with notches in one of said parts, and means, substantially as described, for engaging and disengaging said pawl, whereby the pedal may be expanded or contracted to regulate its height to the requirements of the operator, substantially as set forth.

2. In a pedal, the combination of the parts 4 and 7, forming the bottom and top thereof, respectively, toggle-jointed arms connecting said parts, notches formed on one of said parts, a pawl pivotally connected with said toggle-arms, and a finger-piece connected with said pawl and adapted to engage and disengage the same, all substantially as and for the purpose set forth.

3. In a pedal, the combination of the parts 4 and 7, forming the top and bottom of the same, toggle-jointed arms 5 and 6, connecting the parts 4 and 7 transversely and longitudinally, connecting rod or rods 8, connecting with the arms 5, which fold in the same direction, a pawl 10, engaging with notches 11, and means, substantially as described, for engaging and disengaging the same.



407,006. AUTOMATIC REGULATION OF ELECTRICAL CIRCUITS. WM. W. GIBBON, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed Feb. 11, 1889. Serial No. 299,562. (No model.)

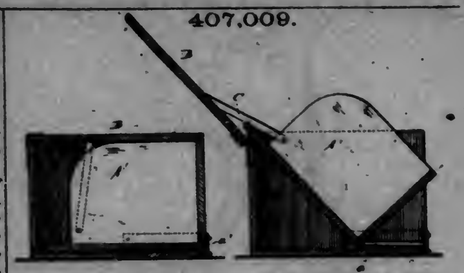
Claim.—1. The combination of a prime motor, a suitable source of power—such as steam, water, or gas—a pipe or passage for conducting or applying such power to said motor, a normally-open valve or gate controlling said passage, a dynamo-electric machine operated by said prime motor, an electrical circuit containing said dynamo, and an electro-magnet having a normally-attracted armature mechanically connected with said valve, whereby the failure of current in said circuit releases said valve and closes the gate or passage, substantially as described.

2. The combination of a prime motor, a suitable source of power—such as steam, water, or gas—a pipe or passage for conducting or applying said power to the motor, a normally-open valve or gate controlling said passage, a governor normally out of action for operating said gate or valve, a dynamo-electric machine operated by said prime motor, an electrical circuit containing said dynamo, an electro-magnet located in said circuit having a normally-attracted armature, and means for establishing an operative connection between said governor and a moving part of the motor controlled by said armature, whereby the failure of current in said circuit releases said valve and closes the gate or passage, substantially as described.

407,007. APPARATUS FOR UTILIZING THE FORCE OF WATER-FALLS. ELIAS H. HAMILTON, New York, N. Y., assignor to the Niagara Hydraulic Electric Company, Alexandria, Va. Filed Sept. 1, 1883. Serial No. 284,867. (No model.)

Claim.—As an improvement in mechanism for utilizing the force of falling water, a motor which is located within the breast of a waterfall in rear of the sheet of water, in combination with a chute that has one end connected with the casing of such motor, and its opposite end made adjustable by mechanism, substantially as shown, toward and from the falling water, whereby a portion of such water may be caused to pass into or impinge upon such motor, substantially as and for the purpose specified.

407,008. COMPOSITION FOR THE TREATMENT OF PAPER-HANGINGS. NORVAL W. HELME, RICHARD STOCKDALE, and ROBERT H. HELME, Lancaster, England. Filed Jan. 28, 1888. Serial No. 261,904. (No specimens.) Patented in England Apr. 7, 1887, No. 5,171; in France Jan. 14, 1888, No. 186,139; in Belgium Jan. 16, 1888, No. 80,289, and in Canada June 25, 1888, No. 30,394.

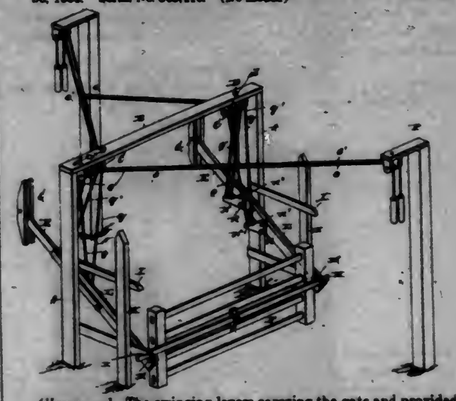


Claim.—1. The composition for the preparation or treatment of paper-hangings, comprising boiled oil, a suitable alkali, mucilaginous matter, an earthy matter—such as china-clay—a pigment, and a vehicle, all in substantially the proportions herein described.

2. The herein-described composition for the preparation or treatment of paper-hangings, comprising boiled oil, an earthy matter—such as china-clay—and a suitable alkali and vehicle.

407,009. CIGAR-BOX. JULIUS H. HOLWITH, New York, N. Y. Filed Apr. 17, 1889. Serial No. 307,800. (No model.)

Claim.—1. A cigar-box the body of which is formed of an outer section open at the front and of an inner section open at the rear end, the inner section being pivoted by corner pins in guide-slots in the outer section, a hinged lid on the outer section, and pivoted straps



407,009.

connecting the lid with the side walls of the inner section, substantially as set forth.

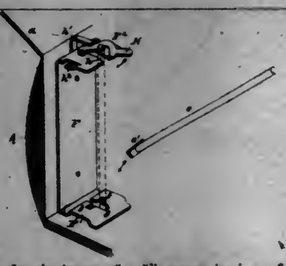
2. A cigar-box the body of which is composed of an outer section open at the front end and an inner section open at the rear end, said inner section being guided by pivot-pins at its lower corners in guide-slots of the side walls of the outer section, substantially as set forth.

407,010. GATE. CHARLES I. HUBLER, Hermitage, Mo. Filed Mar. 30, 1889. Serial No. 305,416. (No model.)

Claim.—1. The swinging levers carrying the gate and provided with counterbalancing-weights, in combination with operating-cords provided with branches which pass over guiding-pulleys and are connected at their free ends to the swinging levers, respectively, on opposite sides of their pivots, substantially as and for the purpose specified.

2. The combination of the swinging levers carrying the gate, the latch-bar projecting at its ends beyond the ends of the gate to engage suitable catches, the sliding bars connected to the said latch-bar, the angle blocks or levers mounted on the swinging levers and connected to the sliding bars, and the operating-cords connected to the said blocks or levers, substantially as specified.

3. The combination of the swinging levers mounted on suitable posts and carrying the gate, the catch-posts provided with suitable catches arranged on opposite sides of the gate, the spring latch-bar projecting at its ends beyond the ends of the gate to engage the said catches, the sliding bars mounted on the swinging levers and connected to the free ends of the latch-bar, and the angle blocks or levers mounted on the swinging levers, respectively, on opposite sides of their pivots, connected to the sliding bars, whereby the latter are operated, and provided with operating-cords, substantially as specified.



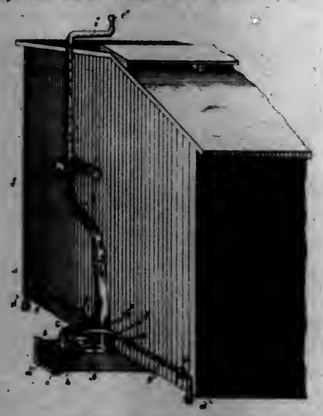
4. The combination, with the side posts supporting a cross-beam and the swinging levers pivoted to the side posts and carrying the gate, of the pulley-blocks swiveled on the cross-beam, the latch-bar projecting at its ends beyond the ends of the gate to engage suitable catches, the sliding bars connected to the free ends of the latch-bar, the angle blocks or levers connected to the said sliding bars, and the operating-cords connected to the angle blocks or levers, and passing through the pulley-blocks, substantially as specified.

407,011. HOLDER FOR LETTER-FILES. LOUIS P. HUNS, Lee, Mass. Filed Nov. 6, 1888. Serial No. 290,114. (No model.)

Claim.—1. A retainer for the leaves of a filing-case, said retainer having at one end a cross-shaped slot and having at the other a notch with a locking-catch.

2. A retainer for the leaves of a filing-case and provided with a foot-piece having a raised portion containing a cross-shaped slot and a top piece with a notch and a locking-catch.

407,011.



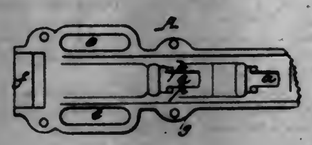
3. A retainer for the leaves of a filing-case, having a foot-piece and a raised portion, leaving a groove behind it containing a cross-shaped slot, in combination with a top piece having a notch and locking-catch therefor and spring-catches on its under side.

4. A retainer for the leaves of a filing-case, having a slotted foot-piece, a notched top piece with a locking-catch, and a holding-down finger.

5. A combination of a detachable headed pin with a retainer having a foot-piece provided with a cross-shaped slot, and a top piece provided with a notch and a locking-catch.

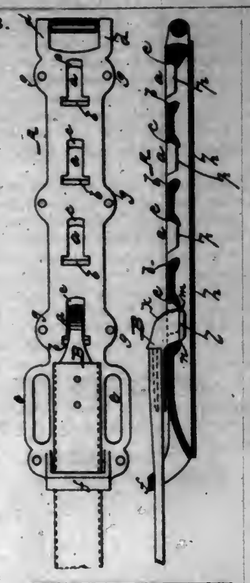
6. A retainer for the leaves of a filing-case, having a slotted foot-piece, and a top piece with a notch widened at its open end, and having a locking-catch for this notch.

407,012. CAR-COUPLING. THOMAS HINES, Northbridge, Mass. Filed Mar. 15, 1889. Serial No. 303,495. (No model.)



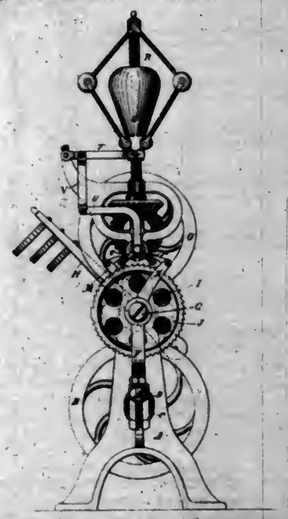
Claim.—1. The combination, in a car-coupler, of the draw-head having the long slots a^3 a^3 in its upper and lower walls, respectively, the coupling-pin B, movable in said slots, as specified, the draw-lever C, the spring E, and the link F, substantially as described.

2. The combination of the draw-head having slots a^3 a^3, the coupling-pin B, the lever C, connected with the head thereof and having a long arm c^2, offset c^3, extending above the top of the car, and having the horizontal extension c^4, and handle c^5, substantially as described.



3. The combination of the draw-head having the slots a^3 a^3, the coupling-pin B, the lever C, and the turning-rods D D', having the handles d^3, substantially as described.

407,013. HAME-TUG. HARN P. JENNER, New Hartford, Iowa. Filed Apr. 8, 1889. Serial No. 306,437. (No model.)



Claim.—The within-described improved article of manufacture, consisting of a hame-tug having a longitudinally-arched plate A, provided with a series of T-shaped beveled slots having under flanges or shoulders *p p* and beveled ends, the bridges provided with outwardly-beveled lips, the strap A, subtending the arch of plate A, and a removable arm having twin plates *i i'*, and a curved end provided with side flanges *l l*, adapted to interlock with the plate A, all as specified and shown.

407,018.

407,014. REGULATOR FOR ELECTRIC MOTORS. JOHN F. KELLY, New York, N. Y., and PAUL H. BRANCH, Newark, N. J., assignors to the United States Electric Lighting Company, New York, N. Y. Filed July 31, 1888. Serial No. 281,569. (No model.)

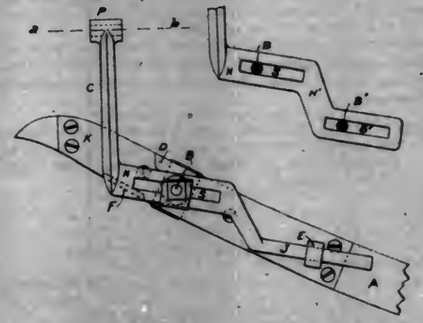
Claim.—1. In a regulating mechanism for electro-magnetic motors, the combination, with a driven shaft formed or provided with two eccentrics or cranks of unequal throw, of two oppositely-acting pawls or pushers oscillated by the cranks, wheels for shifting the position of a rheostat-arm when moved by one or the other of the pawls, and a governor operated by the motor for controlling the action of the pawls, as set forth.

2. In a regulating mechanism for electro-magnetic motors, the combination, with a driven shaft formed or provided with two cranks or eccentrics of unequal throw, of two oppositely-acting pawls mounted on arms oscillated by the cranks, two ratchet-wheels under the pawls and adapted to shift a rheostat-arm when moved by the pawls, stops for maintaining the pawls in an elevated position, or out of engagement with the ratchets, a centrifugal governor adapted to be run by the motor, and connections for raising and lowering the pawls according to its speed of rotation, as herein set forth.

407,015. HANDLE FOR CANES, UMBRELLAS, OR PARASOLS. AUGUST KIESLER, New York, N. Y. Filed Apr. 4, 1889. Serial No. 306,026. (No model.)

Claim.—1. A cane-head formed of a series of interlocking spiral strips of metal, substantially as set forth.

2. A cane-head composed of a body, formed of a series of interlocking spiral strips of metal, a cap, and a base-ring, and a lining of lead or soft solder which firmly holds together the spiral strips, cap, and base-ring, substantially as set forth.



3. A head for canes, umbrellas, or parasols, composed of a shell formed of a series of interlocking spiral strips and a lining of lead or soft solder, which holds the said strips together, substantially as set forth.

407,016. COTTON-GIN ROLLER. REMER Y. KIRKLAND, Benton Fla. Filed Jan. 8, 1889. Serial No. 296,735. (No model.)

Claim.—A gin-roller comprising a shaft or core, in combination with a strip or strips of fabric cut on the bias, wound edgewise spirally upon the shaft or core and having the raw inner edge secured thereto by glue or cement, and the rings mounted upon the ends of the core bearing against and having the ends of the strips of fabric secured thereto, and pegs for securing said rings to the core, substantially as set forth.

407,017. CARRIAGE-POLE COUPLING. JOSEPH KLOTS and FERDINAND KUECHEL, Pittston, Pa. Filed Nov. 1, 1888. Serial No. 289,765. (No model.)

Claim.—1. The combination, in an adjustable carriage-pole coupling, of the shank C, having an eye P and a slotted arm H, terminating in an offset guide-bar J, which is parallel to but not in line with the slot in arm H, with the bolt B, eye E, and plate K, substantially as shown and described.

2. In an adjustable device for attaching carriage-poles, the plate K, having a lug D projecting from one side of it, and a flange F projecting from the opposite side, substantially as shown and described, for the purpose set forth.

3. In an adjustable carriage-pole coupling, the offset arm H H' and parallel slots S S', with the bolts B B', substantially as shown and described, for the purpose set forth.

4. An adjustable carriage-pole coupling consisting of a coupling-eye and a shank having a laterally-projecting arm formed with an offset into two parallel guides, which are out of line with each other, substantially as shown and described.

407,018. OPERATING ORDNANCE. ALFRED C. KOSMOS, Paris, France, assignor, by mesne assignments, to the Hotchkiss Ordnance Company, (Limited,) London, England. Filed Dec. 18, 1885. Serial No. 186,055. (No model.)

407,018.

Claim.—1. The combination, with the gun, the supporting-frame, and the rocking trunnion-arms pivoted to the frame and supporting the gun, of the hydraulic cylinder having a piston connected to said trunnion-arms to resist the recoil of the gun, the bearing-arms 14, extending rearward from the trunnion-arms, and the springs 12, interposed between said arms 14 and the supporting-frame to resist recoil and to restore the gun after recoil, substantially as described.

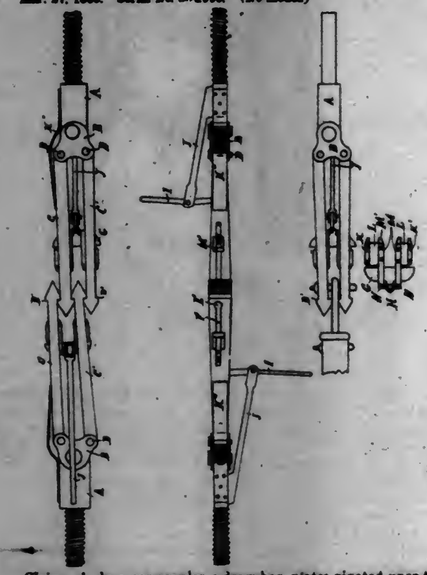
2. The combination, with the gun, the supporting-frame, and the rocking trunnion-arms pivoted to the frame and supporting the gun, of the hydraulic cylinder having a conical bore decreasing in diameter rearward and provided with a piston connected to said trunnion-arms to resist the recoil of the gun, the bearing-arms 14, extending rearward from the trunnion-arms, and the springs 12, interposed between said arms 14 and the supporting-frame to resist recoil and to restore the gun after recoil, substantially as described.

3. The combination, with the bed-plate having a pivot, of a swiveling supporting-frame turning upon said pivot and having one or more rollers which travel upon the bed-plate, a front clip 7, and a rear clip 8, having a screw-clamp 9, for guiding said swiveling frame upon the bed-plate and for locking it in position, a shoulder-piece extending rearward from the swiveling frame, the rocking arms 10, pivoted to the swiveling frame and supporting the gun at their upper ends, the elevating-bar 15, pivoted to the swiveling frame and connected to the gun by the connecting-bar 21, the screw for moving said bar 15, the hydraulic cylinder having a piston connected to the rocking arms 10, the bearing-arms 14, extending rearwardly from the arms 10, and the springs 12, interposed between the arms 14 and the swiveling frame, substantially as described.

407,019. BUCKET OR TUB. JOHN L. KRAMER, Leeper, Pa. Filed Dec. 5, 1888. Serial No. 292,690. (No model.)

Claim.—1. A stave for a tub or bucket, made of wood and having the grain running crosswise or in the direction of the width of the stave, substantially as specified.

2. A bucket or tub composed of a number of staves made of

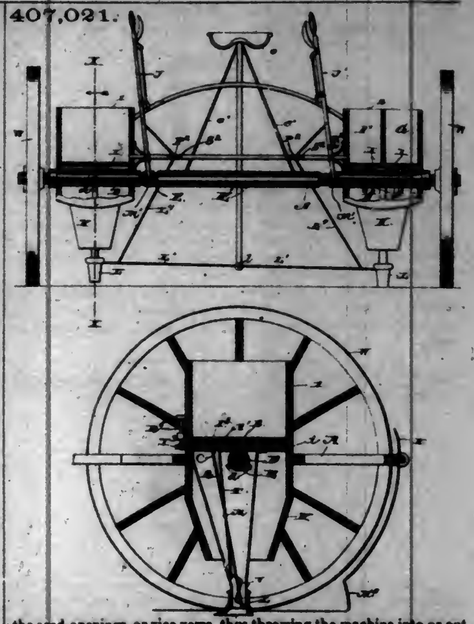


407,019.

wood, said staves having the grain of the wood extending crosswise thereof and in the direction of their widths, substantially as specified.

407,020. CAR-COUPLING. CONRAD KOEHLER, Toledo, Ohio. Filed Mar. 27, 1889. Serial No. 304,969. (No model.)

Claim.—1. In a car-coupler, a draw-bar, plates pivoted upon the same, and duplex coupling-bars having pointed ends and engaging-shoulders pivotally connected to the plates, in combination with movable plates having wedge-shaped ends adapted to uncouple the coupling-bars when in engagement, as and for the purpose set forth.



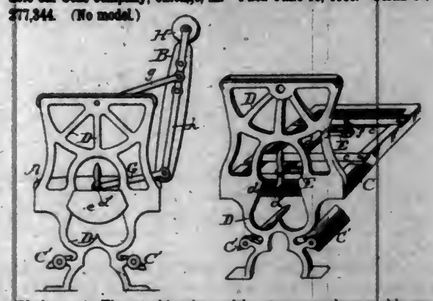
2. In a car-coupler, two coupling-bars formed with inclined ends and engaging-shoulders, each bar having an elongated opening in the body portion thereof, in combination with a plate extending within each opening and connected to a lever and to movable plates within the slots in the coupling-bars, each of the latter having wedge-shaped ends, as and for the purpose set forth.

3. In a car-coupling, two coupling-bars formed with inclined ends and engaging-shoulders, in combination with a lever connected with a movable series of inclined strips adapted to pass between the inclines of the engaging-bars, with which they are connected, as and for the purpose set forth.

407,021. PLANTER. JAMES G. LLOYD, Chicago, Ill. Filed Aug. 9, 1888. Serial No. 282,314. (No model.)

Claim.—1. In a seed-planter, the combination of the frame, the seed-boxes, the longitudinally-reciprocating seed-slides actuated by tappet-sleeves mounted upon the axle, clutches feathered upon the axle and adapted to engage said tappet-wheels, hand-levers pivoted to the frame and connected with said clutches, rods and bell-crank levers connecting said hand-levers with rods extending forwardly from the seed-slides, seed-tubes extending downwardly from the hoppers, shoes mounted upon levers pivoted to the frame, and bell-cranks connecting said levers with the hand-levers, whereby by a single operation of the latter the shoes shall be raised, the clutches uncoupled from the tappet-sleeves, and the seed-slides drawn forward, so as to cover

407,021.

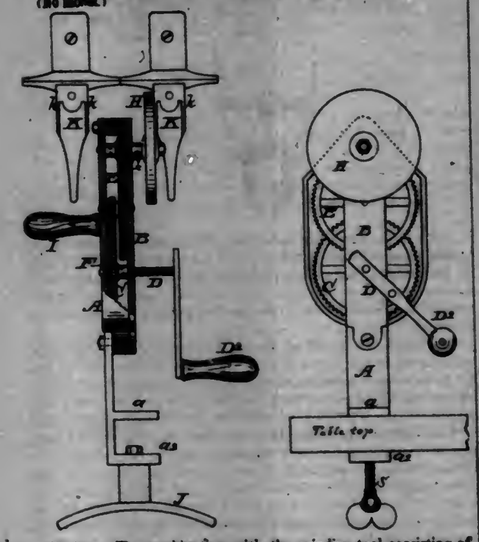


the seed-openings, or vice versa, thus throwing the machine into or out of gear, substantially as set forth.

2. The combination of the seed-spouts, the shoes L, supported upon pivoted rods L', the elbow-levers L^4, mounted pivotally upon pins P^3, sliding in slots S^2 in the frame and having their lower arms connected to the rods L', and the hand-levers connected with the upper arms of the elbow-levers L^4 and adapted to operate the latter, substantially as set forth.

3. In a planter, the combination, with the grain-spout and the partition R, dividing the grain-spout, of the flirt-valve V, pivoted midway of its ends to the said partition and having its ends curving in opposite directions and passing through slots in the partition, and the lever T, having its lower end connected with the flirt-valve and adapted to have its upper end connected with the seed-slide, substantially as described.

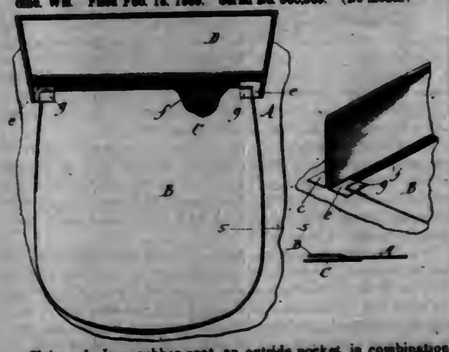
407,022. CAR-SEAT. ATHOL B. MACKLIN, Toronto, Ontario, Canada, assignor, by direct and mesne assignments, to the Macklin Adjustable Car Seat Company, Chicago, Ill. Filed June 16, 1888. Serial No. 277,344. (No model.)



Claim.—1. The combination, with a transversely-movable car-seat and side frames, of the back, and links *g g*, connecting the side edges of said back to the said side frame above the plane of the seat, and links G, connecting the side edges of the back at a point near the lower edge thereof and said car-seat, as set forth.

2. The combination, with a transversely-movable car-seat, back B thereof, links *g*, connecting said back to the seat-frame, and the links G, connecting the lower side edges of said back to said car-seat, of the said frame D, rectangular frame C, and the transverse guide-plates *c*, as set forth.

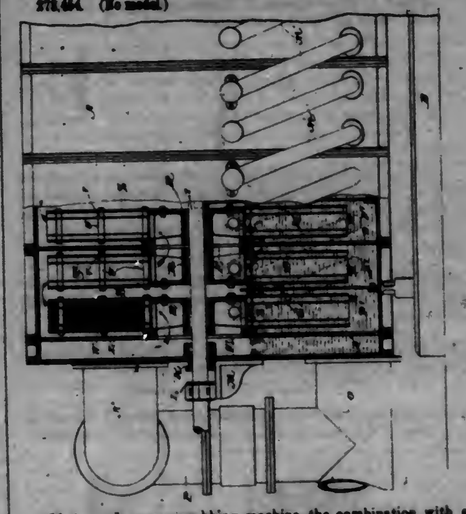
3. The combination, with a transversely-movable seat, transverse plates *a*, secured to its under side, having a flange projecting from one longitudinal edge thereof and provided with a longitudinal series of holes therein, back B, links *g*, connecting the said back to the seat-frame, and link G, connecting the lower side edges of said back to the car-seat, of said seat-frame D, rectangular frame C, supported by said seat-frame D, transverse plates *c*, placed across frame C with reference to plates *a* of the seat, rock-shaft *d*, journaled in the ends of frame C, arms E, projecting from shaft *d*, and bolts *f f*, pivoted in the ends of said arms and extending vertically up through plates *c* into one of the series of holes in plate *a*, as set forth.



4. The combination, with a transversely-movable seat, transverse plates *a*, secured to its under side, having a flange projecting from one longitudinal edge thereof and provided with a longitudinal series of holes therein, back B, links *g*, connecting the said back to the seat-frame, and links G, connecting the lower side edges of said back to the car-seat, of said seat-frame D, rectangular frame C, supported by said seat-frame D, transverse plates *c*, placed across frame C with reference to plates *a* of the seat, rock-shaft *d*, journaled in the ends of frame C, handle *d'*, projecting from one end thereof, arms E, projecting from shaft *d*, and bolts *f f*, pivoted in the ends of the said arms and extending vertically up through plates *c* into one of the series of holes in plate *a*, and a torsion-spring F, wound around shaft *d*, as set forth.

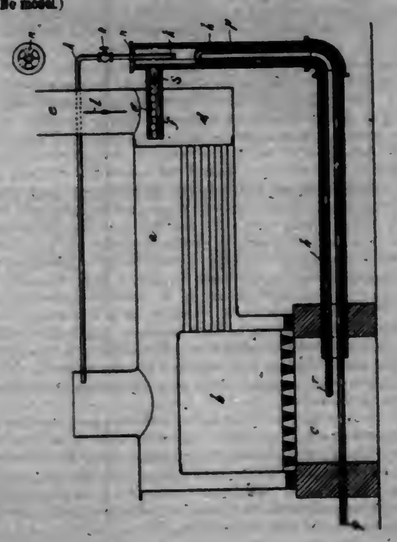
407,023. TOOL FOR GRINDING REAPER-CUTTERS. CHARLES H. MALLORY, Springborough, Pa. Filed Feb. 23, 1889. Serial No. 300,980. (No model.)

Claim.—The combination, with the grinding-tool consisting of the two plates A and B, having the handle I and carrying the gears C E, having their shafts journaled in said plates, shaft D, provided with crank-handle D^2, and shaft G, carrying grinding-wheel H, of the lugs a a^2, formed on the end of plate A, and the removable breast-piece J, attached to lug a, all constructed and arranged to operate substantially as specified.



407,024. POCKET FOR RUBBER COATS. HENRY J. MILLER, Racine, Wis. Filed Feb. 18, 1889. Serial No. 300,269. (No model.)

Claim.—1. In a rubber coat, an outside pocket, in combination with a long pocket-lid which extends over and beyond the ends of the pocket-opening, said lid being provided with a piece *c*, secured to the body of the coat, and with pieces *c c*, integral with the lid, secured to the body of the coat and overlapping the corners of the pocket, substantially as and for the purpose specified.



2. In a rubber coat, an outside pocket, in combination with a long pocket-lid which extends over and beyond the ends of the pocket-opening, said lid being provided with a piece *c*, secured to the body of the coat, and with a piece *d*, divided into three parts *c c* and *f*, the parts *c c* being secured to the body of the coat and overlapping the corners of the pocket, and the part *f* being secured to the back side of the pocket, substantially as and for the purposes specified.

407,025. APPARATUS FOR SCRUBBING AND WASHING GAS. KARL H. MITCHELL, St. Joseph, Mo. Filed June 20, 1888. Serial No. 278,454. (No model.)

Claim.—In a gas-scrubbing machine, the combination, with a shaft arranged to revolve in a suitable casing having transverse partitions, of the hubs mounted upon said shaft, the annular sheet-metal plates secured to the ends of said hubs, the annular foraminous plates arranged between the said sheet-metal plates, the scrubbing-sticks extending through the said foraminous plates, the connecting-bolts, and the spacing-sleeves on the latter, substantially as set forth.

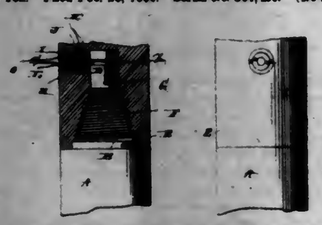
407,026. SMOKE-CONSUMING APPARATUS. JOHN G. MOSS and AARON YELLIS, Reading, Pa. Filed May 10, 1889. Serial No. 310,236. (No model.)

Claim.—1. The combination, with a steam-boiler, of a pipe *f*, communicating with the smoke-flue and also with a pipe *h*, arranged at right angles to said pipe *f* and extending into the ash-pit, a steam-jet pipe *k*, extending through an adjustable cover *n* into said pipe *h*, and a damper *s*, all arranged substantially as set forth.

2. In combination with a steam-boiler, the pipes *f*, *h*, and *k*, arranged substantially as described, said pipe *h* inclosing a water-circulating conduit, substantially as and for the purpose set forth.

3. The combination, with a steam-boiler, of smoke-pipe *f*, blast-pipe *h*, steam-jet pipe *k*, water-pipe *p*, and dampers *l* and *s*, and adjustable cover *n*, all arranged and adapted to operate substantially as set forth.

407,027. DRAWER-PULL. CHARLES P. MORGAN, Meriden, Conn., assignor to Foster, Merriam & Company, same place. Filed Apr. 11, 1889. Serial No. 306,789. (No model.)

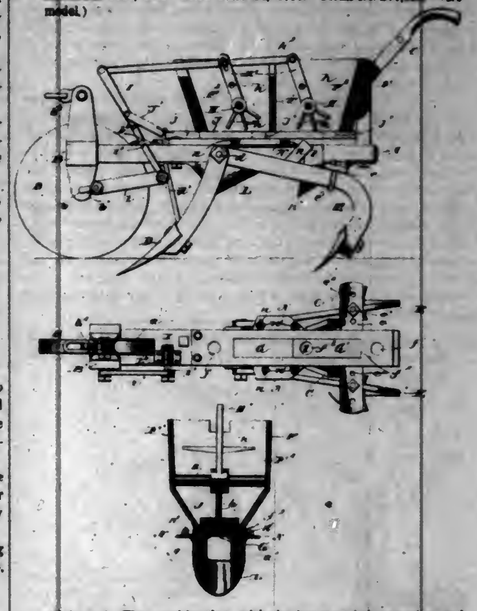


Claim.—1. In a drawer-pull, the combined boss and pull stop consisting of a section surrounding the fastening-bolt of the pull, and an integral extension d^3, bent or formed at substantially a right angle to the portion which surrounds the bolt, as and for the purposes described.

2. In a drawer-pull, the plate D, having the hole d^2, one or more notches d^4, a stop d^3, with the bolt C, having a wing or fin to enter said notch or notches, and a pull connected to said bolt, substantially as described.

3. The combination of the escutcheon-plate, the plates D, having the bolt-holes d^2 and stops d^3, the eyebolts C, and the drawer-pull B, connected with the eyebolts, substantially as described.

407,028. TOOL FOR DRILLING WELLS. HIRAM H. MCLANE, San Antonio, Tex. Filed Feb. 28, 1889. Serial No. 301,429. (No model.)



Claim.—1. The combination, with a drill or well-boring tool or the like having a cylindrical annularly-grooved extension above its screw-threaded portion, of a socket formed for its reception in the lower end of the drill-rod, a transverse opening communicating with said socket, and a non-rotating follower arranged to slide in the said opening and to engage the annular groove in the upper cylindrical portion of the drill, substantially as and for the purpose set forth.

2. The combination, with a drill or well-boring tool or the like having a cylindrical annularly-grooved extension above the screw-threaded portion at its upper end, of a socket formed for its reception in the lower end of the drill-rod, a transverse opening connecting said socket with the outer side of the drill-rod, a screw-threaded plug moving in said opening, and a non-rotating follower engaging the annular groove in the cylindrical portion of the drill, substantially as set forth.

3. The combination of a drill or shaft having a screw-threaded portion and an annular groove with a socket formed in the lower end of the drill-rod, a transverse opening communicating with said socket, a non-rotating follower sliding in said opening, so as to engage the annular groove in the drill, and having an outwardly-extending stem screw-threaded at its outer end, a screw-threaded plug moving in the transverse opening and bearing at its inner end against the shoulders of the follower, and a cylindrical nut adjusted upon the outer screw-threaded end of the stem and seated in a suitable recess formed for its reception in the outer end of the plug, substantially as and for the purpose set forth.

4. The combination, with a drill or shaft having a screw-threaded portion and an annular groove, of a socket formed in the lower end of the drill-rod, a transverse opening communicating with said socket, a follower arranged to slide in said opening and adapted to engage the annular groove in the drill, and means for moving the said follower positively in either an inward or outward direction, substantially as and for the purpose set forth.

407,029. CULTIVATOR AND PLANTER. WILLIAM C. MCTYEIRE, Hatchechubbee, Ala. Filed June 14, 1888. Serial No. 277,088. (No model.)

Claim.—1. The combination, with the beam and the opening and covering plows connected to the sides of the beam by a single bolt, of the brace for the opening-plow, and the cross-bar having a series of openings at each end, and the clips adjustably connecting the rear ends of the covering-plows with the said cross-bar, substantially as described.

2. The herein-described planter, composed of the longitudinal beam having an opening at its front end and a slot near its rear end, the drive-wheel mounted in bearings in a vertical bracket and extending into the said front opening, the crank, the vertical lever I, connected with the crank, the opening-plow, and the coverers connected with the beam at their upper ends by a single bolt, the said plow and coverers being suitably braced, the double hopper, the bottom of the hopper having end and middle discharge-openings, the seed-slide having corresponding discharge-openings and operated from the said lever I, and the block attached to the wall separating the hopper and extending over the middle opening, substantially as described, for the purpose specified.

3. The combination, with the hopper having its bottom extended beyond its ends, provided with discharge-openings at points beyond its ends, and with the intermediate longitudinal slot or opening, of the removable blocks fitted in said slot or opening, the oscillating stirrers in the hopper, the reciprocating removable seed-slide bearing on the blocks and guided through the ends of the hopper, the lever I, and connections between the same and the stirrers and seed-slide, whereby said stirrers and slide are operated simultaneously, substantially as described.

4. The combination, in a planter, of the beam having the vertical longitudinal slot, the cut-off slides N, arranged in horizontal openings communicating with the slot, and provided with the transverse slots *n*, the set-screws *n'*, mounted in said slots and bearing against the beam, the hopper mounted on the beam, the oscillating agitators or stirrers in the hopper, and the lever I, connected to the said stirrers and to the slide, substantially as described.

5. The combination, with the hopper, of the agitator-shaft H, journaled in the sides of the hopper and provided with the vertical lever H', having the agitator-fingers *h* at its lower end below the agitator-shaft, and the agitator-bar K, arranged transversely in the hopper above and parallel with the agitator-shaft, and mechanism for operating the agitators, as set forth.

6. The combination of the beam having a longitudinal slot, the hopper resting on the beam and having a slot in its bottom aligning with the slot in the beam, the slides N, inserted horizontally between the beam and the bottom of the hopper and provided with slots *n*, and the set-screws *n'*, inserted obliquely through said slots and having their ends bearing against the sides of the beam, as set forth.

7. The combination, with the double hopper having a slot in its bottom and having the ends of its bottom extended and provided with discharge-openings, of the two aligned blocks fitted in the said slot, one of said blocks having a discharge-opening, the seed-slide working on the bottom of the hopper and holding the said blocks in place, mechanism for operating the seed-slide, the chute K', arranged under the rear end of the hopper, and the double chute L, arranged under the front end of the hopper, as specified.

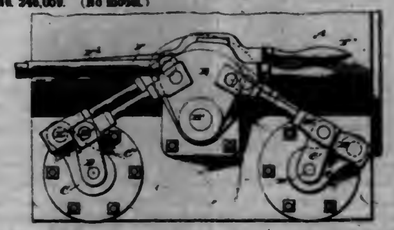
407,030. BRICK-MOLD-SANDING MACHINE. ALBERT H. NEWTON, Cohoes, N. Y. Filed Feb. 3, 1889. Serial No. 299,182. (No model.)

Claim.—1. In a brick-mold-sanding machine, a feed-table having a mold-retarding device at the bottom thereof, substantially as described.

2. In a brick-mold-sanding machine, a feed-table having a movable mold-retarding device at the bottom thereof, substantially as described.

3. In a brick-mold-sanding machine, the combination of a feed-table having a mold-retarding device, with a mold-cylinder and feed-rollers tangential to the path of the molds, substantially as described.

4. In a brick-mold sanding machine, the combination of a feed-table having a mold-retarding device, with a mold-cylinder and positively-rotated feed-rollers tangential to the path of the molds, substantially as described.



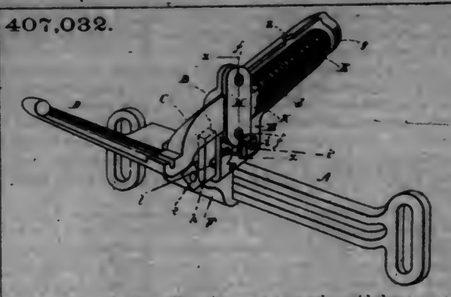
5. In a brick-mold-sanding machine, a feed-table, a sanding-cylinder, belt-rollers, and feed-rollers, in combination with belts passing around said cylinder, belt-rollers, and feed-rollers, substantially as described.

6. In a brick-mold-sanding machine, a feed-table and sanding-cylinder, in combination with a pivoted arm and a stop-rod pivoted to said arm and tangential to the path of the molds, substantially as described.

7. In a brick-mold-sanding machine, a feed-table and sanding-cylinder, in combination with a pivoted arm, a stop-rod pivoted to said arm and tangential to the path of the molds, and a spring attached to said arm for holding it, as described, in an operative position.

8. In a brick-mold-sanding machine, a feed-table and sanding-cylinder, in combination with a pivoted arm, a stop-rod pivoted to said arm and tangential to the path of the molds, a spring attached to said arm for holding it, as described, in an operative position, and pins upon the head of said cylinder moving in a path which intersects the end of said arm, substantially as described.

407,031. VALVE-GEAR. DAVID W. PAYNE, Elmira, N. Y., assignor to R. W. Payne & Sons, same place. Filed Aug. 3, 1887. Serial No. 246,059. (No model.)



Claim.—1. The combination of a fixed eccentric, a wrist-plate, and admission and exhaust valves connected with said wrist-plate with a cut-off, a wrist-plate, and a shifting eccentric directly connected with each other, substantially as described.

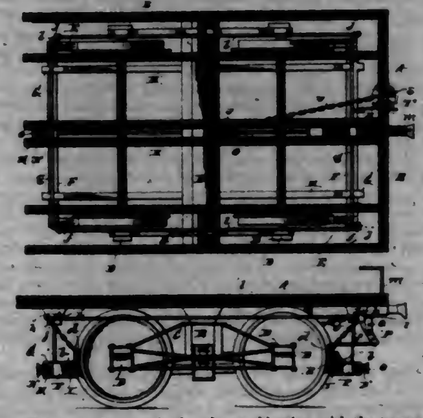
2. The combination, with the cylinder A, having the ports A' A^2, communicating with valve-seats A^3, of the valves P and Q, the latter arranged within the former, valve-stems D D', connecting-rods E E', wrist-plates B and B^3, eccentric-rods F F^3, shifting eccentric M, and fixed eccentric M', substantially as specified.

407,032. LOOM-TEMPLE. JOHN E. PERRY, Northbridge, Mass. Filed Sept. 17, 1888. Serial No. 285,586. (No model.)

Claim.—1. In a loom-temple, the arm C, carrying the head-stock

407,032.

D, the bracket B, clamp H, and means for securing said clamp, a portion of said arm being angular in cross-section and arranged with an angle at its side, and said bracket being provided with a corresponding angular bearing for receiving the angular portion of the arm, whereby the wear of the arm in the bearing may be readily compensated for by tightening the clamp, substantially as described.



2. The arm C, carrying the head-stock D and provided with the spring E, the bracket B, clamp H, and screws *f*, a portion of said arm being angular in cross-section and fitted to work in a corresponding bearing in said bracket, said arm being so arranged that its corners or angles will stand at the top, bottom, and side, respectively, of the bearing, substantially as and for the purpose set forth.

3. In a loom-temple, the plate A, carrying the bracket B, provided with the clamp H, and the arm C, carrying the head-stock D and provided with the spring E, a portion of the body of said arm being triangular in cross-section and fitted to work in a corresponding bearing in said bracket, substantially as described.

4. In a loom-temple, the bar C, provided with the spring E, the plate K, mounted on said bar and provided with the projection *d*, and the bracket B, provided with the notch *z*, substantially as and for the purpose set forth.

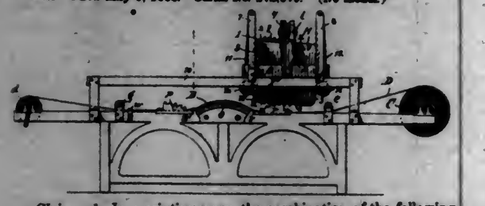
5. In a loom-temple, the combination of the supporting-plate A, the frame F, provided with the dovetail *h* and slot *l*, the clamping device for adjustably connecting said frame and plate, the bracket B, provided with the slot *p* and a dovetail groove adapted to engage the dovetail on said frame, and a clamping-bolt disposed in said slots, whereby the bracket may be longitudinally adjusted and secured in position on said frame, substantially as described.

407,033. CAR-BRAKE. TIMOTHY P. RANDALL, Adrian, Mich. Filed Mar. 12, 1889. Serial No. 303,016. (No model.)

Claim.—1. In a car-brake, the combination, with the transverse bars F, of the brake-shoes, and the links having their opposite ends pivoted to the said shoes and the said bar, as set forth.

2. In a car-brake, the combination of the transverse bars F, the brake-shoes, and the links having their opposite ends pivoted to the shoes and to the said bar, and provided with the shoulders *d c*, adapted to bear against the brake-shoes and the said bar, as set forth.

3. In a car-brake, the combination of the longitudinal beams, the transverse bars mounted at the ends of said beams and carrying the brake-shoes, and the springs bearing on the transverse bars to throw the brake-shoes from the wheels, as set forth.



4. In a car-brake, the combination of the longitudinal beams, the transverse sliding bars mounted on said beams and carrying the

brake-shoes, springs acting on the sliding bars and cushioning the same, mechanism for applying the brakes, and the springs for releasing the same, as set forth.

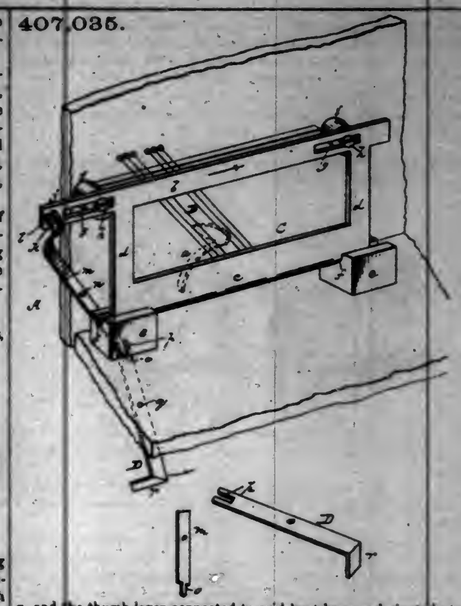
5. In a car-brake, the combination, with the truck and the transverse bars, of the brake-shoes loosely mounted on the transverse bars, the rock-shafts journaled on the truck, the chains connecting the brake-shoes with said rock-shafts, and the longitudinal rods connecting the rock-shafts, whereby the said shafts may be operated to hold the brake-shoes at one end of the truck out of contact with the wheel, while the brake-shoes at the other end may be applied to the wheel, as set forth.

6. The combination, with the truck and the transverse bars, of the brake-shoes loosely mounted on the transverse bars, the rock-shafts journaled on the truck and provided with radial pins playing between stops on its bearings and having crank-arms at its ends, the chains connecting the rock-shafts with the brake-shoes, and the longitudinal rods connecting the rock-shafts, as set forth.

407,034. PRINTING-MACHINE. JOHN R. RANKIN, Indianapolis, Ind. Filed May 5, 1888. Serial No. 273,679. (No model.)

Claim.—1. In a printing-press, the combination of the following elements, namely: a bed-frame, a convex platen secured to said bed-frame, and a type-carrier having a recessed plane surface in which types are set, all arranged to co-operate substantially as specified, whereby an impression from the types is obtained by rolling the type-carrier over the platen and along the bed-frame, as set forth.

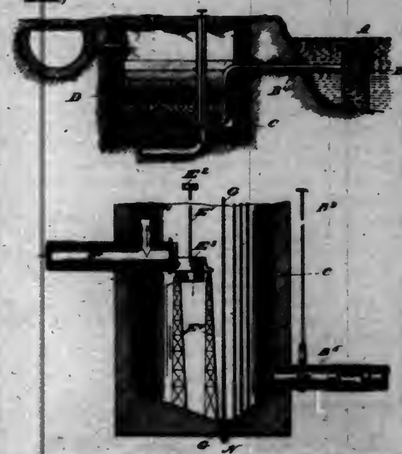
2. In a printing-press, the bed-frame, the convex platen secured to said bed-frame, the type-carrier having a recessed plane surface in which types are set, the curved rack-bars secured to the bed-frame opposite the ends of the platen, the straight rack-bars secured to the type-carrier opposite the ends of the type-surface and arranged to intermesh with said curved rack-bars, and supports for the type-carrier arranged on each side of the platen to receive and support the carrier when off the platen, all combined and arranged to co-operate substantially as and for the purpose specified.



3. In a printing-press, the combination, with the bed-frame, the convex platen secured thereto, and the plane-surfaced type-carrier arranged to be rolled over and in contact with said convex platen, of a pair of rollers mounted on the bed-frame on opposite sides of the platen and carrying a web of paper which is attached to both rollers, and intermediate guide-rollers, all arranged substantially as shown and described, whereby the paper is drawn smoothly over the convex surface of the platen, and an impression of the type carried by the type-carrier is made on the paper by the rolling pressure of the type-carrier, as set forth.

4. In a printing-press, the combination of the bed-frame, the convex platen secured to the bed-frame, the curved rack-bars secured to the frame opposite the ends of the platen, the plane-surfaced rectangular type-carrier arranged to be rolled over and in contact with the platen, the rack-bars secured to the type-carrier opposite the type-surface and arranged to engage said curved rack-bars, the rack-bars secured to the bed-frame on each side of the platen at opposite ends and forming interior angles therewith, and forming also supports for the type-carrier when off the platen, and the rack-bars secured to opposite sides of the type-carrier and arranged to engage said rack-bars, all arranged to co-operate substantially as and for the purpose specified.

5. In a printing-press of the class described, the combination, with the bed-frame and the type-carrier arranged to be rolled thereon, of the guide-bars secured to opposite sides of the bed-frame above and parallel therewith, a shaft projecting from opposite ends of the type-carrier, two frames mounted on said shaft at opposite ends of the type-carrier resting on said bars and carrying ink-rolls which rest on the surface of the type-carrier, whereby the ink-rolls are carried with the type-carrier along the bed-frame and in contact with the surfaces of the type-carrier, substantially as and for the purpose specified.



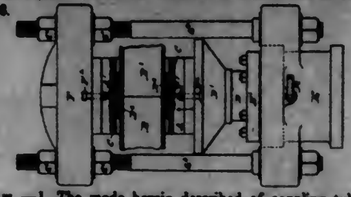
407,035. SHIFTING PIANO-ACTION. CHARLES M. RICHARDS, Fort Scott, Kans. Filed Jan. 7, 1889. Serial No. 295,614. (No model.)

Claim.—The within-described shifting device for pianos and the like, consisting of the sliding frame provided with guideways or grooved blocks *c c*, the upper horizontal bar having guides or slots *g g*, and provided with the pin *k*, the bent forked lever *m*, pivoted at

n, and the thumb-lever connected to said bent lever and pivoted at *q* to the casing, the whole adapted to operate substantially as described.

407,036. FILTERING SYSTEM AND PLANT. JAMES RIGBY, Minneapolis, Minn. Filed Jan. 24, 1889. Serial No. 297,284. (No model.)

Claim.—1. In a filtering plant or system, an intake or supply pipe arranged below the low-water line of a natural source and extended under ground to a receiving-well having agitating, aerating, and screening devices, a filtering-compartment, a pipe leading from the said well to the bottom of said filtering-compartment arranged under ground and below the point of supply, and a conductor leading from said filtering-compartment to a pumping-station, substantially as specified.

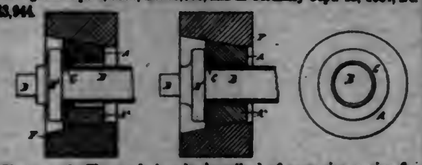


2. In a filtering system or plant, a receiving-well provided with a series of screens, an agitating device, a supply-pipe having an overflow and a by-pass pipe, and suitable controlling-valves, substantially as specified.

3. A filtering system or plant comprising a supply-pipe or intake arranged at a suitable point below the low-water line of a natural source, a receiving-well provided with agitating, aerating, and screening devices, a by-pass connected with the supply and discharge pipes of said well, a series of filtering-compartments having the filters thereof arranged below the point of supply, a discharge-pipe extending from each filtering-compartment to a conduit, and a pump-station

connected with the conduit, the whole being arranged in excavations below the point of supply, substantially as and for the purpose specified.

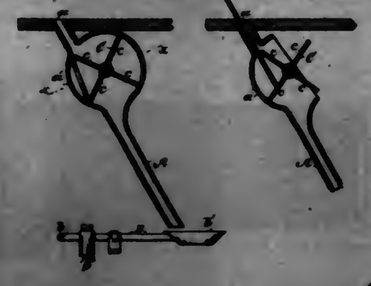
4. In a filtering system or plant comprising a filtering-compartment, layers of filtering material, a mud-well, a cleansing-pipe extending into a layer, and a pipe extending through all the layers and communicating with the mud-well, and a valve located above the filtering-layers and arranged in said pipe, whereby the upper layers of the filter may be cleansed and the solids separated therefrom conducted to the mud-well without passing through the lower layers, substantially as specified.



407,037. MODE OF COUPLING TUBES OR PIPES. JAMES ROBERTSON, Glasgow, County of Lanark, Scotland. Filed Sept. 2, 1887. Serial No. 248,608. (No model.) Patented in England Nov. 18, 1886, No. 14,988.

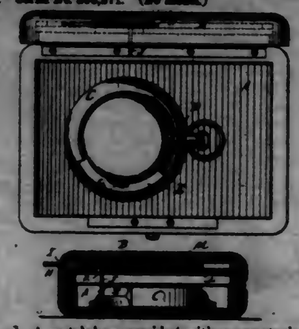
Claim.—1. The mode herein described of coupling tubes or pipes, said mode consisting in placing over the adjacent ends of the tubes or pipes to be coupled a wrought-iron or steel socket and then crushing the hard-metal socket in a cold state onto the said tubes or pipes by direct radial or lateral compression, diminishing the diameter of the socket, all substantially as set forth.

2. The mode herein described of coupling tubes or pipes, said mode consisting in placing over the ends of the tubes or pipes to be coupled a wrought-iron or steel coupling-socket, interposing a jointing material, and crushing this hard-metal socket in a cold state onto the said tubes or pipes and jointing material by direct lateral or radial compression, diminishing the diameter of the socket, all substantially as set forth.



407,038. MODE OF PREPARING PIPES OR TUBES FOR COUPLING. JAMES ROBERTSON, Birmingham, County of Warwick, England. Filed May 22, 1889. Serial No. 311,732. (No model.) Patented in England Nov. 18, 1886, No. 14,988; in France Sept. 6, 1887, No. 185,673; in Belgium Sept. 7, 1887, No. 73,980, and in Germany Sept. 13, 1887, No. 43,944.

Claim.—1. The mode herein described of preparing a pipe for coupling, said mode consisting in placing upon the end of the pipe a boss or socket end of wrought-iron or steel, and compressing this hard-metal boss or socket end in a cold state on the end of the pipe by direct radial or lateral pressure, diminishing the diameter of the socket, as set forth.

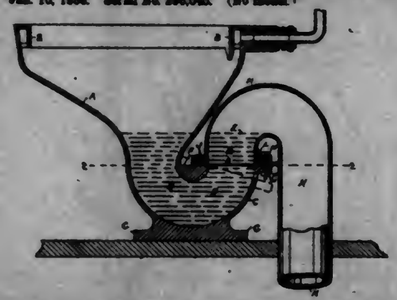


2. The mode herein described of preparing pipes for coupling, said mode consisting in placing over the end of the pipe or tube a wrought-iron or steel boss or socket end, interposing a jointing material, and crushing this hard-metal boss or socket end in a cold state onto the said tube or pipe and jointing material by direct lateral or radial compression, diminishing the diameter of the socket, all substantially as set forth.

407,039. COIN-OPERATED MACHINE. ALFRED W. ROOTHE, Brooklyn, N. Y. Filed Dec. 24, 1888. Serial No. 294,682. (No model.)

Claim.—In a coin-operated machine, the combination, with a pivoted coin-receptacle, of a chute having the internally-concaved portion and contracted portions arranged in a line at opposite sides of the concaved portion, and a wheel adapted to be operated by the weight of a coin, having its axis out of the line of the contracted portions and provided with blades extending to the wall of the concaved portion, and so spaced that two of the blades may have their edges between the two contracted portions, substantially as specified.

407,040. BOX FOR REPEATING-WATCHES. HENRI SANDOZ, Locle, Switzerland, assignor to Adolphe Schwob, New York, N. Y. Filed Feb. 9, 1889. Serial No. 299,871. (No model.)



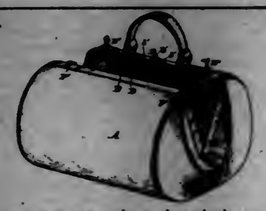
Claim.—1. A watch-box provided with a receptacle for holding a repeating-watch in fixed position, a lever, and a pin projecting from said lever adjacent to the pusher of the repeating-watch in the receptacle, substantially as set forth.

2. A watch-box having a receptacle for holding a repeating-watch in fixed position, a lever provided with a pin which is adjacent to the pusher of the repeating-watch, and a spring acting on said lever, substantially as set forth.

3. A watch-box provided with a receptacle for holding a repeating-watch in fixed position, a lever pivoted to the cover of the box and projecting through a slot in the front edge of the box, and a pin on said lever adjacent to the pusher of the repeating-watch, substantially as set forth.

4. A watch-box provided with an annular receptacle for holding a repeating-watch, which receptacle has a notch for the watch-pendant and a recess in which the pusher of the repeating-watch can be moved, a lever pivoted on the box, and a pin projecting from said lever adjacent to the pusher of the repeating-watch, substantially as set forth.

407,041. WATER-CLOSET. WILLIAM SCOTT, Medford, Mass. Filed Jan. 10, 1888. Serial No. 260,045. (No model.)



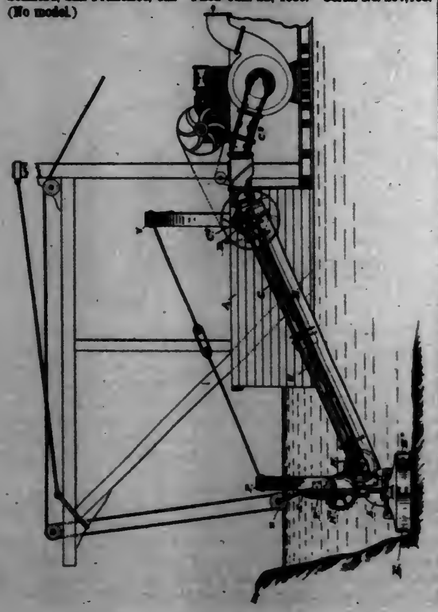
Claim.—A short-hopper closet-bowl having means to flush it, and a discharge leading downward from the lowest portion of the bowl and turned upward therefrom, terminating in a ledge and forming part of a water-trap, having its dip between said ledge and the bowl, all in one piece of earthenware, in combination with a metal waste-pipe shaped to form the other part of the trap and in continuation of said discharge of the bowl and united to said ledge, and its joint suitably packed and submerged in the standing water of the trap, substantially as and for the purpose described.

407,042. TRAVELING-BAG. GEORGE W. STRATTAN, Altoona, Pa. Filed Apr. 10, 1888. Serial No. 307,732. (No model.)

Claim.—1. In combination with a traveling-bag having central and side latches, movable bars secured on the bag-frame with one end substantially in contact with the movable part of the central latch, so as to move with it, and their other ends substantially in contact with

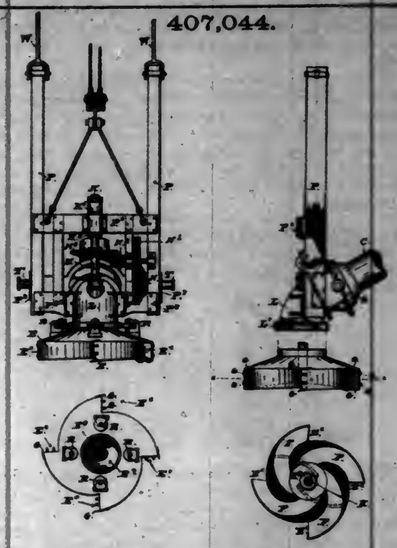
407,042.

the side latches, so as to move them when the bars are moved, all substantially as specified, and so that the unlatching of the central latch will unlatch the side latches.



2. In combination with a traveling-bag having central and side latches, lever-bars pivoted on the frame of the bag, with one end substantially in contact with the movable part of the central latch, so as to move with it, and their other ends substantially in contact with the side latches, so as to move them when the levers are moved, all substantially as specified, and so that the unlatching of the central latch will unlatch the side latches.

407,043. BOILER-FEEDER. FLORENS I. VEERKAMP, Philadelphia, Pa. Filed Oct. 19, 1888. Serial No. 288,562. (No model.)



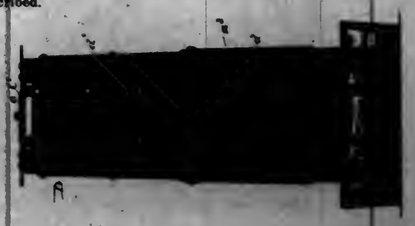
Claim.—A device for automatically supplying water to steam-boilers, consisting of a hollow rotating water-cock D, having a single inlet and outlet port K, an annular band G, adapted to fit water-tight around said cylinder, and within which the latter is rotated, said band G having inlet and outlet openings at opposite points in its periphery and corresponding with the port K of the rotating water-cock D, a pipe *g*, leading from the inlet-port of said annular band to a water-reservoir, and a pipe C, leading from the outlet-port thereof to the interior of the boiler, and terminating at the desired water-level therein, a supporting-casing B, and suitable mechanism to constantly rotate said hollow water-cock D, said parts being combined, arranged, and operated substantially as set forth.

407,044. HYDRAULIC DREDGING-MACHINE. JULIUS H. VON SCHMIDT, San Francisco, Cal. Filed Jan. 22, 1889. Serial No. 297,183. (No model.)

407,044.

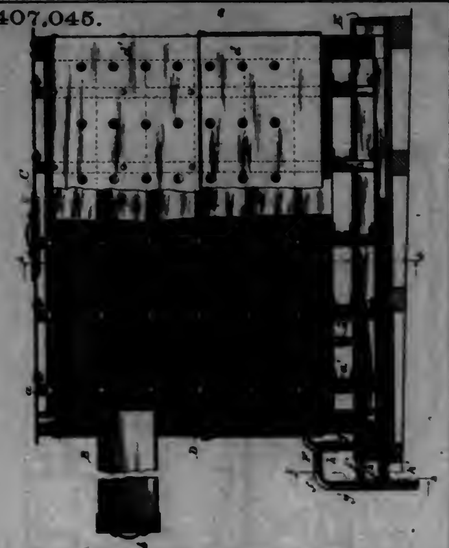
Claim.—1. A rotary excavator for dredging-machines, having a central receiving-chamber, helical passages extending therefrom outward to the periphery, at which point the ends of the passages terminate in cutting mouths or buckets with cutting-edges setting in radial planes, in combination with a suction-pipe having an end section that is connected with the main pipe by a ball-and-socket joint, and is curved at the outer end to take the rim of the open end of the suction-chamber, and driving mechanism adapted to rotate the excavator about a perpendicular axis, substantially as described.

2. A rotary excavator having peripheral openings with cutting-edges, separate passages of helical form leading inwardly and delivering into a common suction-chamber at the center, and a bottom without openings having helical scraping blades or ribs extending from center to periphery in the opposite direction to the turns of the internal passages, said excavator being mounted for rotation about a perpendicular axis, substantially as described.



3. In a rotary excavator, the combination of a body provided with peripheral openings having cutting-edges, a common central chamber E^3, whose walls revolve with the excavator and lie immediately under the end of suction-pipe, and helical passages leading from the peripheral openings to the central chamber, where each passage has a separate discharge always open into the central chamber, as set forth.

4. A rotary excavator for dredging-machines, consisting of a body having peripheral openings, a common central receiving-chamber formed and revolving with the excavator, and helical passages leading from the peripheral openings to the common central chamber and discharging therein at all points of revolution, as set forth.



407,045. REFRIGERATING APPARATUS. FRANK A. WALIN, Chicago, Ill. Filed Apr. 12, 1886. Serial No. 270,405. (No model.)

Claim.—1. In a refrigerator, an ice-chamber and its supporting-bars, in combination with a perforated iron casing composed of the removable part *d* and a stationary part *d'*, the latter being riveted to the supporting-bars, substantially as and for the purpose hereinbefore set forth.

2. In a refrigerator, the ice-chamber having a closed bottom and supports resting in a basin, in combination with a pipe leading from the chamber and having two branches, one leading to the basin and having a cock, the other leading outside of said basin and having a cock-controlled connection with said basin, as and for the purpose described.

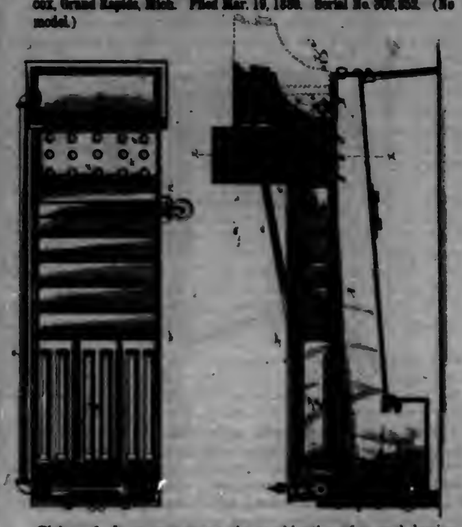
407,045.

407,046. COUPLING. WILLIAM WILCOX and WILLIAM A. WILCOX, Grand Rapids, Mich. Filed Feb. 26, 1889. Serial No. 301,232. (No model.)

Claim.—1. A coupling consisting of sections A B, having screw-threaded extensions at one end, and a fluid-joint at the opposite ends, and a sleeve engaging with both of said sections, in combination with brackets having screw-threaded apertures with which the extensions of the coupling-sections engage, substantially as described.

2. A coupling consisting of a section B, having an enlargement or head, as *f*, a seat, as *g*, shoulders, as *h*, a tubular extension at one end and a conical projection, as *i*, at the opposite end, a counter-section A, having a head, as *b*, a conical seat, as *d*, in said head, and studs *c* on the periphery of the head *b*, in combination with brackets, as D, provided with screw-threaded apertures, and a sleeve, as C, having a flange, as *k*, adapted to the seat *g*, and shoulder *h* on the section B, and angular grooves *m* to receive the studs *c* on the section A, substantially as described.

407,047. VALVE. WILLIAM WILCOX and WILLIAM A. WILCOX, Grand Rapids, Mich. Filed Feb. 26, 1889. Serial No. 301,233. (No model.)

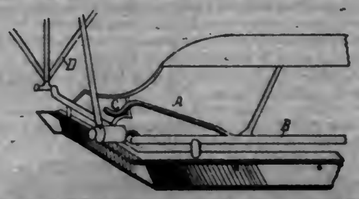


Claim.—1. As an article of manufacture, a valve consisting of a plate or base having a discharge-aperture and provided with a plain flat rear surface, and a raised seat and ways on the opposite side, and a valve pivotally secured thereto, substantially as described.

2. As an article of manufacture, a valve consisting of a plate or base having a straight lower edge and a discharge-aperture, a disk having a surface corresponding with the lower edge of the base, and a beam on its outer side, in combination with a lever secured to a boss on the base and on the valve, substantially as described.

3. As an article of manufacture, a valve consisting of a plate or base having a discharge-aperture, a disk, an arm or lever attached to the base at the rear end of the arm and engaging with a boss on the disk, and a screw passing through the lever and into the disk for preventing the disk from revolving in the lever, substantially as described.

407,048. EVAPORATOR. WILLIAM WILCOX and WILLIAM A. WILCOX, Grand Rapids, Mich. Filed Mar. 19, 1889. Serial No. 303,852. (No model.)



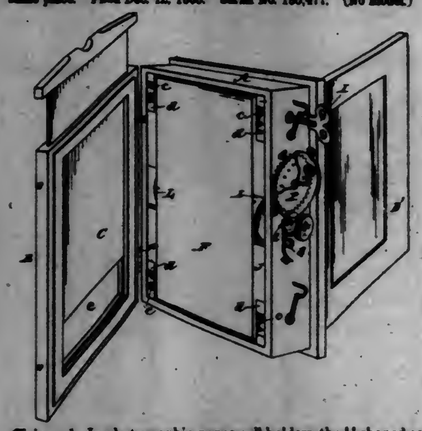
Claim.—1. In an evaporator, the combination of an arch having an uptake provided with an open end, and a removable heater having flues and projecting into the uptake, substantially as described.

2. In an evaporator, the combination of a removable heater provided with flues and an arch having an open uptake and an extension to form a support for the heater when withdrawn from the uptake, substantially as described.

3. In an evaporator, an arch having an uptake supported thereon, one end of said uptake being open, in combination with a horizontally-sliding heater having a horizontal extension provided with a series of tubes and constructed to be inserted into the uptake through the open end, substantially as described.

4. In an evaporator, an arch having an uptake open at one end, in combination with a removable heater having a horizontal extension provided with a series of vertical flues and a vertical extension in the rear thereof provided with a discharge-pipe near its upper end, and a valve for drawing off the contents below the discharge-pipe, substantially as described.

407,049. REST FOR BUGGY-TOPS. HOMER H. ALLEN, Oceanside, Cal. Filed Sept. 7, 1888. Serial No. 284,815. (No model.)



Claim.—1. The buggy-top bow-spring support consisting of a spring-arm attached by one end to the back-seat rod and projecting outward beyond the end of the seat into the path of the buggy-top bow, approximately at right angles therewith, and having a seat at its free end to receive such bow.

2. The buggy-top bow-spring support consisting, as set forth, of the spring-arm attached to the buggy-seat-back rod, and projecting outward beyond the end of the seat into the path of the buggy-top bows, approximately at right angles therewith, and having its end curved, as at C, to form a seat for the bows.

3. The combination set forth of the back-seat rail, the clamp-plate G, provided on its clamping-face with the transverse groove I and the transverse groove J, having a crook therein, the clamp-plate G', provided on its clamping-face with the transverse groove I' and the transverse groove J', corresponding in its reversed form and position with the form and position of the groove J, and the spring-arm having one end formed to fit the socket formed by the grooves J J'

whose the plates are clamped together and having its other end curved to form the seat C.

407,050. PHOTOGRAPHIC PAPER-ROLL HOLDER. ERASTUS B. BARKER, New York, N. Y., assignor to E. & H. T. Anthony & Company, same place. Filed Dec. 12, 1885. Serial No. 185,477. (No model.)

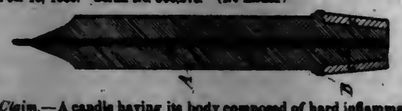
Claim.—1. In photographic paper-roll holders, the U-shaped carrier H, adapted to operate substantially as shown and described.

2. In photographic paper-roll holders, the combination, with the paper-carrying roller, of a spring-carrier detachable from the holder and constructed to form bearings for the ends of the roller and to throw tension on the roller at its ends, substantially as specified.

3. In a photographic camera, the combination of the carrier H, and the pivots G, constructed with flanges *b*, arranged a short distance from the ends of the pivots, substantially as and for the purpose set forth.

4. The combination, with the paper-carrying roller, of the roller-carriers H, and the fixed bearing supports or guides *d* for said carriers, substantially as specified.

5. The combination of the U-shaped carrier H with the paper-carrying rollers, substantially as shown and described.



6. The paper-carrying roller, constructed with a longitudinal groove and a slot at each end of the groove, deeper than the groove, in combination with a rod adapted to fit said groove, and provided at each extremity with a bent end or hook adapted to enter the said slots, as herein set forth.

7. In a photographic paper-roll holder, the body A, provided with supplementary intermediate guides for extra paper-carrying rollers, substantially as and for the purpose herein set forth.

8. In a photographic paper-roll holder, the combination, with the holder, of an automatic numbered index or indicator, actuated by the paper in motion and constructed to show and register each exposure and the number of consecutive exposures of the sensitized paper or sheet, essentially as and for the purposes herein set forth.

9. The combination, with the registering-wheels L and their shaft *k*, of the back or cover D', and one or more springs M, carried by said cover and arranged to bear upon or against said shaft, essentially as and for the purpose herein set forth.

407,051. CANDLE. ANTON F. BAUMER, Syracuse, N. Y. Filed Feb. 18, 1889. Serial No. 300,873. (No model.)

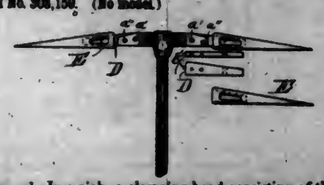
Claim.—A candle having its body composed of hard inflammable material and its base provided with a facing of softer analogous inflammable material, substantially as set forth.

407,052. GRAIN-SEPARATOR. JOHN R. BEYER, Watertown, Wis., assignor of one-half to James B. Murphy, same place. Filed Dec. 11, 1883. Serial No. 296,290. (No model.)

Claim.—1. The combination of a pivoted valve, a rotary adjustable block arranged on the valve-pivot, and a longitudinally-adjustable weight connected to the block, substantially as set forth.

2. The combination, with a hopper and air-flue, of a casing arranged within the hopper, the inner wall of the casing provided with upper and lower openings and the outer wall with a lower opening only, a valve pivoted in said casing and having two surfaces of different areas and planes, and means, substantially as described, for producing a forced current in said air-flue, as and for the purpose set forth.

3. The combination, with a chamber having an outlet-opening, of a hood surrounding the same and provided with a back piece, a valve pivoted in the hood and having two surfaces of different areas and planes, and means, substantially as described, for inducing a forced draft against the valve, as and for the purpose set forth.

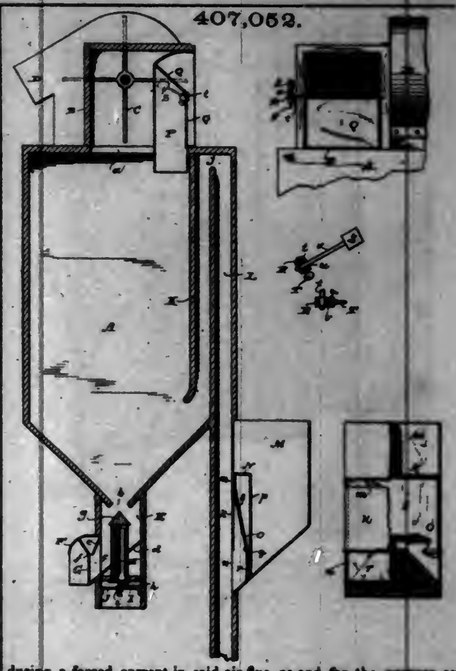


4. The combination, with a flue and its casing, of a flue arranged in said casing, and a valve pivoted in the flue and having two surfaces of different areas and planes, substantially as set forth.

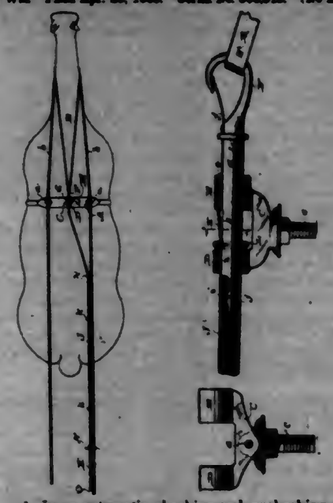
5. The combination, with a flue and its casing, of a flue arranged in the casing, a valve pivoted in the flue and having two surfaces of different areas and planes, and a weight adjustably connected to the valve, substantially as set forth.

6. The combination of the receptacle A, provided with the depending chamber E and partition K, the tube H, having the cap *g*, the adjustable disk I, the valve G, flue L, hopper M, provided with the casing N, the valve O, the casing B, provided with the flue P, the weighted valve Q, and the fan C, all arranged to operate substantially as and for the purpose set forth.

7. The combination of an air-flue having a side thereof provided with an opening, a fan having its casing communicating with the air-passage, and a pivoted valve for the opening having two surfaces of different areas and planes, whereby the suction created, by the fan is normally exerted to maintain the closure of the valve, substantially as set forth.



407,053. PICK. JOHN T. BOSS, Atlanta, Ga. Filed Mar. 13, 1889. Serial No. 303,150. (No model.)



Claim.—1. In a pick, a clamping-head consisting of the head A, having an eye for the insertion of a handle and recesses in its ends having a hole in each of their bottoms for the introduction of a tenon of an inserted part, in combination with the intermediate piece D and the point E, substantially as set forth.

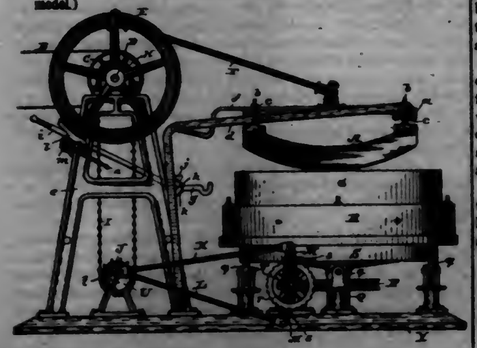
2. In a pick, the combination of the head A, the intermediate piece D, and the point E, and the screws *a'*, *a''*, and *c*, all combined and operating substantially as shown and described, and for the purpose specified.

407,052.

407,054. HORSE-CHECKING DEVICE. PHILIP A. BOOTH, Rib Mountain, Wis. Filed Apr. 23, 1888. Serial No. 271,313. (No model.)

Claim.—1. In an automatic checking and unchecking device, the combination of a bracket having horizontally-arranged sleeves, a check-rein-hook having a shank passing through said sleeves, a strap attached to said shank and extending back to within reach of the driver, a spring secured to said shank, and a spring-controlling device on said shank between the said sleeves, substantially as set forth.

2. In an automatic checking and unchecking device, the combination of a bracket carrying sleeves, a check-rein-hook having a shank passing therethrough and carrying a spring and spring-controlling device, a strap secured to the end of said shank, and a spring attached to the rear end of said strap and to the harness within reach of the driver, substantially as set forth.



407,055. POCKET-KNIFE. WILLIAM BERRY, Hamakua, Hawaii. Filed Aug. 22, 1888. Serial No. 283,397. (No model.)

Claim.—1. In a pocket-knife, the combination, with the cheek-piece *b*, of linings *a a'*, the chambered plate *c*, the cheek-piece *b'*, having the whetstone B attached to its inner side and adapted to enter the chamber of the plate *c*, and means for connecting said cheek-piece and handle, substantially as shown and described.

2. A pocket-knife provided with a chambered plate *c*, notched studs *d d'*, the apertured cheek-piece *b'*, provided with slotted slides *f f'*, adapted to engage the studs *d d'*, and the whetstone B, attached to the cheek-piece *b'* and adapted to be received in the chambered plate *c*, substantially as shown and described.

407,056. MEAT-CUTTER. PETER H. BROCKMEIER and PETER J. TRESER, Milwaukee, Wis. Filed Oct. 1, 1888. Serial No. 286,861. (No model.)

Claim.—1. In a meat-cutter, the combination, with the knife-carrying frame *e* and an arm *f*, rigidly attached thereto, of a shaft A, journaled on the supporting-frame, and a bracket-arm *g*, provided with a handle *i*, rigid on said shaft, substantially as described.

2. In a meat-cutter, a horizontally-rotating wheel S, an arbor Q, rigid to the frame, about which arbor the wheel S rotates, and an arbor *u*, rigid on the arbor Q, eccentric to the axis thereof and entering a recess therefor in the bottom of case R eccentric to its center, in combination with case R, resting movably on the wheel S and rotating eccentrically about the arbor *u*, a small cog-wheel *v*, rigid on the wheel S entirely at one side of the axis of that wheel, and an inwardly-facing cog-wheel W, rigid on case R, eccentric to its arbor, and meshing with the wheel *v*, whereby the case R is rotated eccentrically about its own arbor and is carried eccentrically about the axis of the wheel S, substantially as described.

3. In a meat-cutter, a shaft N, having thereon a wheel meshing with a wheel on the meat-block-supporting mechanism, and a ratchet-wheel *r*, rigid on shaft N, in combination with oppositely-extending arms M M, pivoted at their inner ends on the shaft N, gravity-pawls *s s*, pivoted severally on the arms M M, and connecting-rods K and L, severally pivoted at one end to the outer ends of the arms M M, and at the other ends pivoted eccentrically by a common wrist-pin to a power-supplying wheel, substantially as and for the purpose set forth.

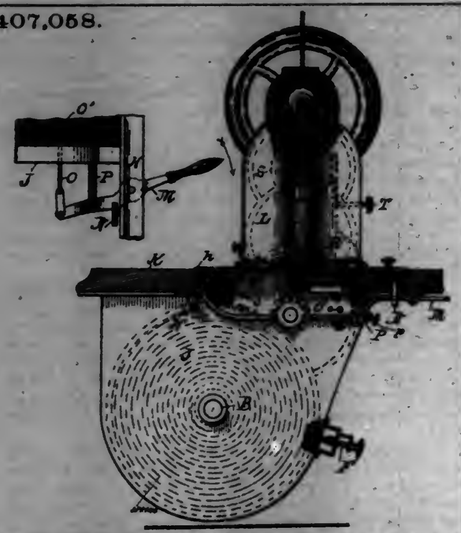
4. In a meat-cutter, a mechanism-driving shaft N, provided with a worm therefor, a ratchet-wheel *r* rigid thereon, and two oppositely-extending arms M M, pivoted at their inner ends on the shaft N, and provided with gravity-pawls *s s*, adapted to engage alternately with the ratchet-wheel *r*, in combination with connecting-rods K and L, pivoted at one end severally to the arms M M, and at the other end pivoted by a common bolt *t* eccentrically to a driving-wheel, and the driving-wheel U, having a slot across its face, in which the bolt *t* is adjustably secured, substantially as described.

407,057. SEAL FOR MAIL-PACKAGES, &c. EDWARD J. BROWN, East Orange, N. J. Filed June 19, 1888. Serial No. 314,803. (No model.)

Claim.—1. A sealing-rivet having a rigid head at one end and a normally hard and brittle but fusible stem, the latter composed of ignitible wax, whereby the same is adapted to be preliminarily and securely attached to the package-jacket and to be ignited so as to prepare it *in situ* for the sealing operation, substantially as hereinbefore specified.

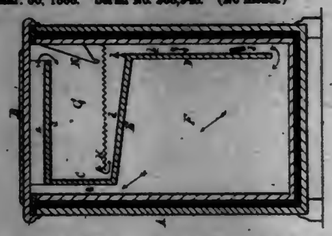
2. A sealing-rivet having a stem of wax and a head formed by the rim of a metallic eyelet, the crown of which surrounds the adjoining portion of the stem, substantially as hereinbefore specified.

407,058. MOTOR FOR SEWING-MACHINES. JOHN M. BROWN, Atlanta, Ga. Filed Aug. 28, 1888. Serial No. 283,565. (No model.)



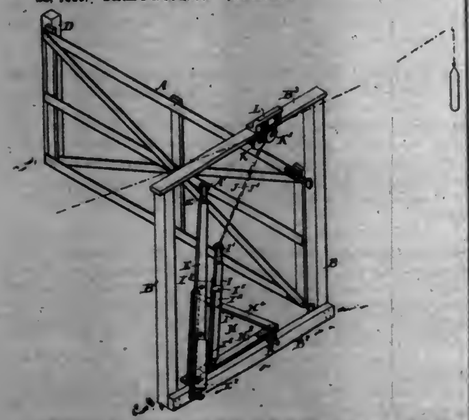
Claim.—1. A means for operating a sewing-machine, consisting of a spring-driven train of gearing connected directly with the machine and mounted partly within the arm of the machine-head and partly in a casing beneath the table, said arm of the machine-head being hinged to the table and adapted to carry with it the portion of the train of gearing therein inclosed, substantially as shown and described.

2. The combination, with the motor-frame, the head, their hinged connection, and the portion of the train of gears contained in said frame and head, of the means employed for connecting them and preventing further movement of the gears when the parts are disengaged, consisting of the notched lug N, lever M, pin O, attached to said lever, and the gear O', provided with holes to receive said pin, substantially as shown and described.



3. As a means for winding driving-springs, the ratchets A and A', the shaft B, and the sleeve G', the lever C, pawls *c'*, spring *c''*, cam D, lever *d*, and connecting-rod *d'*, combined and arranged substantially as shown and described.

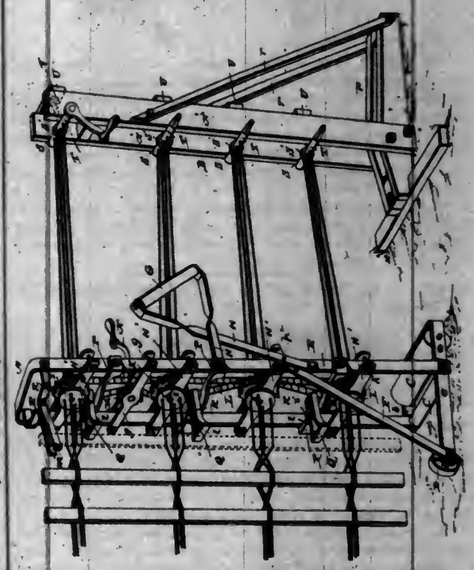
407,058.



407,059. REFRIGERATOR. GEORGE W. BULLER, Ann Arbor, Mich. Filed Mar. 30, 1888. Serial No. 268,948. (No model.)

Claim.—In a refrigerator, the combination of the preserving-chamber F at the bottom, the ice-receptacle G at the top, having the rack H, there being a space between the rack and partition C, the air-passage *a* on one side leading from the top of the chamber F, the air-passage *c* at the top leading from the passage *a* to the opposite side of the receptacle G, and the air-passage *b* at the opposite side from the passage *a*, the passage *b* leading from the bottom of the receptacle G to the bottom of the chamber F, as set forth.

407,060. GATE. AMOS W. CHILCOTT, Mattoon, Ill. Filed Mar. 22, 1889. Serial No. 304,285. (No model.)



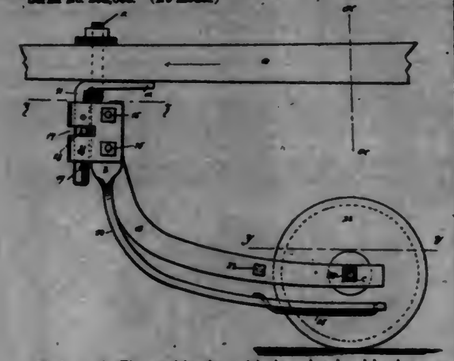
Claim.—1. The combination, with the hinged gate, of a lever pivotally connected at one end to the gate, a triangle hinged at its base and pivotally connected at its apex to the said lever between the ends thereof, and a weight on the projecting end of the lever beyond the apex of the triangle.

2. The combination, with the hinged gate, of the triangle hinged at its base and provided with an operating-arm projecting beyond one of its sides near the apex and an operating-lever E, pivotally connected at its under side between its ends to the apex of the triangle, pivotally connected at its inner end with the gate, and provided at its free end with a weight E', substantially as set forth.

3. The combination, with a gate mounted to swing, of a weighted lever pivotally connected with the said gate, a triangle pivotally connected at its apex with the said weighted lever and mounted to swing at its base, an extension-arm secured to the said triangle, ropes connected with the said extension-arm, pulleys located above the base of the said triangle, over which pass the said ropes, and a second set of pulleys held on posts alongside the gateway and over which the said ropes pass, substantially as shown and described.

4. The combination, with a gate mounted to swing, of a weighted lever pivotally connected with the said gate, a triangle pivotally connected at its apex with the said weighted lever and mounted to swing at its base, an extension-arm secured to the said triangle, ropes connected with the said extension-arm, pulleys located above the base of the said triangle, over which pass the said ropes, a second set of pulleys held on posts alongside the gateway and over which the said ropes pass, and handles held on the downwardly-hanging ends of the said ropes, substantially as shown and described.

407,061. FENCE-MACHINE. GEORGE J. CLINE, Goshen, Ind. Filed Apr. 26, 1889. Serial No. 308,698. (No model.)



Claim.—1. The combination, with the tension-device frame having notched bearings, of the bobbins arranged in said bearings, the eye-bolts holding the bobbins in their seats, the cross-bars secured to the upright frame and receiving the threaded eyebolts, and the nuts on said bolts for adjusting the same, substantially as specified.

2. The combination, with the twisting-machine, of twisting devices applied to transverse bars secured to an inverted-U-shaped frame, the sprocket-wheel also secured to transverse bars of said frame, the adjustable bumpers arranged in the vertical line of the twisters, a roller-base frame provided with long cylindrical rollers C and a guide-roller D, said base-frame being pivoted to the frame A, the brace-arm F, pivoted to the front arm *e* of the base-frame and adjustably attached to frame A, and the handle G, secured to the latter by bars H, all as specified.

3. The combination, in a wood-and-wire-fence-making machine, of wire-twisting devices, longitudinally-adjustable bumpers Q, vertically-adjustable supports H' therefor, and a main frame A, substantially as described.

4. The combination, with the frame A, bearing fence-wire twisters, and fence-panel bumpers, of a supporting-carriage to which said frame is pivoted, composed of the frame *a c b*, the long roller C, and a front guiding-wheel D, the said frame and carriage provided with a bracing-arm F, pivoted to the latter and adjustably attached to the former, as specified.

407,062. ROLLER-COLTER. SIDNEY COOK, Orlando, Fla., assignor to himself and WILLIAM M. OGILVIE, same place. Filed Nov. 26, 1888. Serial No. 292,063. (No model.)

Claim.—1. The combination, with the colter-head having rearwardly-extending arms secured at their forward ends thereto, and the colter journaled in the rear ends of said arms, of the weed-depressing arms secured to the colter-head and curved downward and rearward under the colter-arms, substantially as set forth.

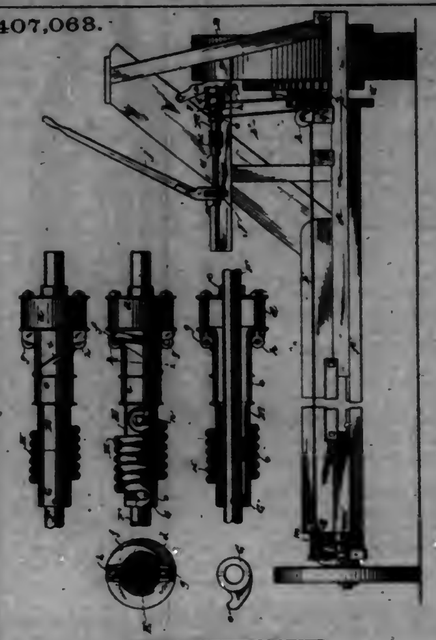
2. The combination, with the colter-arms having a head at their forward ends and the colter journaled in their rear ends, of parallel spring-arms secured at their forward ends to said head, and extending rearwardly under the colter-axis, substantially as set forth.

3. The combination, with the colter-arms set edgewise and projecting upward at their forward ends, and the weed-holding arms extending flatwise under the colter-arms to or beyond the axis of the colter, and having flat upper ends parallel with the adjacent ends of the colter-arms, of the U-shaped head, embracing the ends of said arms and bolts extending therethrough, substantially as set forth.

4. The combination, with the flat weed-depressing arm having apertures near its rear lower end, of a guard wire or rod on the under side of said arm with its ends secured in said openings, substantially as set forth.

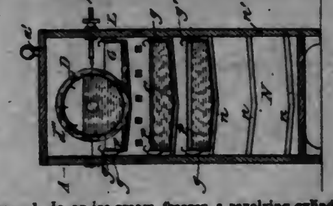
5. The combination, with the colter-arms having longitudinally-aligned apertures in their rear or lower ends, and the socketed bushings 20, inserted in said apertures, and having flanges bearing on the inner sides of said arms, of the colter having a shaft the ends of which turn in the socket in said bushings, and a tie-rod connecting the said arms beyond the colter, substantially as set forth.

6. A colter comprising the vertical pivot-pin 10, having transverse apertures and a rearward-projecting upper end *a*, the U-shaped head 16, having bolt-holes through its sides, and a transverse slot 17 through it at its bend, the pin 18 passed through said apertured pin and slot, the colter and weed-depressing arms bolted flatwise between the rear ends of said head and extending downward and rearward therefrom, the latter arms extending below and in vertical alignment with the former or colter arms, and the colter journaled in the rear ends of the colter-arms above the rear ends of the weed depressing or holding arms, substantially as set forth.



407,063. HARVESTER. HENRY F. CRANDALL, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Sept. 6, 1887. Serial No. 248,983. (No model.)

Claim.—1. The combination, in a harvester, of a bull-wheel, its axle, and the pinions and sheave carried by the axle, with racks fixed to the harvester-frame and receiving the pinions, a lifting-shaft carried by the harvester-frame, a fixed and loose sleeve carried by the shaft, a spring uniting the two sleeves, and a flexible connection having one end secured to the sheave and the other to the loose sleeve, substantially as described.



2. The combination, with the lifting-shaft and its fixed and loose sleeves and uniting-spring, of a flexible connection having one end secured to the loose sleeve and the other end secured to an arm of the lifting mechanism for the outer end of the grain-platform, substantially as described.

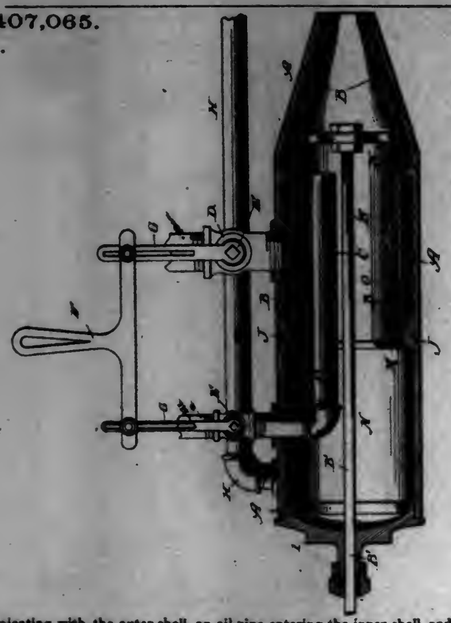
3. The combination, in a harvester, of a bull-wheel, its axle and pinions, a sheave carried by the axle, racks fixed to the harvester-frame and receiving the pinions, a lifting-shaft carried by the harvester-frame, a fixed and loose sleeve carried by the shaft, a spring uniting the two sleeves, ordinary lifting mechanism on the axle of the grain-wheel, and flexible connections leading from the loose sleeve, one having an end secured to the sheave on the axle and the other having an end secured to the lifting mechanism of the grain-wheel, as set forth.

407,068.

407,064. ICE-CREAM FREEZER. EDWIN I. DRAKE, Winchester, Tenn., assignor of one-half to RUFUS W. SMITH, La Grange, Ga. Filed Sept. 21, 1888. Serial No. 286,015. (No model.)

Claim.—1. In an ice-cream freezer, a revolving cylinder having non-conducting ends, in combination with a cream-containing pan provided with laterally-thrusting springs, whereby it is retained in position below the cylinder, but depressible by the layer of cream as it gradually increases in thickness on the cylinder, substantially as set forth.

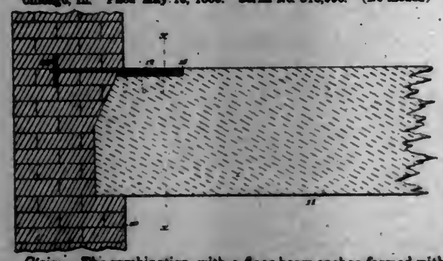
2. In an ice-cream freezer, a revolving cylinder having its ends formed of non-conducting material, in combination with a cream-containing pan provided with laterally-thrusting springs, whereby it is retained in position below the cylinder, but depressible by the layer of cream as it gradually increases in thickness on the cylinder, the chamber inclosing said cylinder and pan, and the adjustable knife attached to the side of said chamber so that its edge can be brought to bear upon the surface of the cylinder to clear it of the frozen cream, substantially as set forth.



407,065. INJECTOR OIL-BURNER. WILLIAM H. ESSON, Chicago, Ill., assignor of one-half to SIMON FRANKENSTEIN, same place. Filed Dec. 18, 1888. Serial No. 294,017. (No model.)

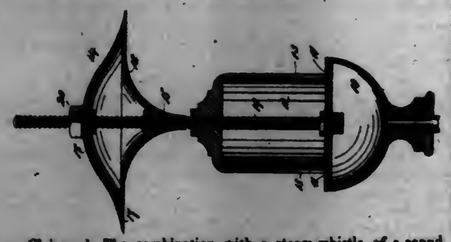
Claim.—1. In an injector oil-burner, the combination of an outer shell, an inner shell, means for adjusting such inner shell, a steam-pipe communicating with the outer shell, an oil-pipe extending within the inner shell, cocks in such pipes, and means for regulating the relative opening of such cocks, substantially as described.

2. In an injector oil-burner, the combination of an outer conical shell, an inner conical shell, means for adjusting such inner shell, a steam-pipe communicating with the outer shell, oil-pipe communicating with the inner shell, cocks for closing such pipes, and means for regulating the relative opening of such cocks, substantially as described.



3. In an injector oil-burner, the combination of an outer shell, an inner shell, means for adjusting such inner shell, a steam-pipe comme-

407,065.

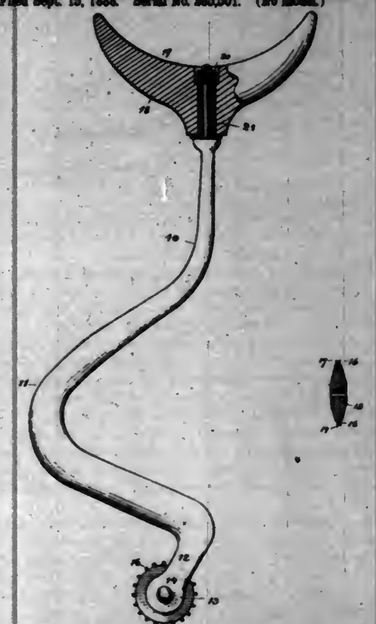


nicating with the outer shell, an oil-pipe entering the inner shell, and a hot-air pipe leading from the fire-chamber and communicating with the outer shell at a point near the rear end thereof, substantially as described.

407,066. FLOOR-BEAM CONNECTION. THOMAS EDWARDS, Sr., Chicago, Ill. Filed May 16, 1889. Serial No. 310,996. (No model.)

Claim.—The combination, with a floor-beam anchor formed with downwardly-extending projections, of a plate formed with apertures adapted to receive said projections and arranged for connection with the floor-beam, substantially as described.

407,067. WHISTLE. JAMES R. ELDRIDGE, Yarmouth, Nova Scotia, Canada, assignor to himself and Reuben McKinnon, same place. Filed Feb. 26, 1889. Serial No. 301,060. (No model.)



Claim.—1. The combination, with a steam-whistle, of a sound-deflector supported above the same, having a curved under surface, substantially as shown and described.

2. The combination, with a whistle, of a sound-deflector supported above the same, provided with a central stem upon the under surface, the exterior of which stem is concaved, substantially as shown and described.

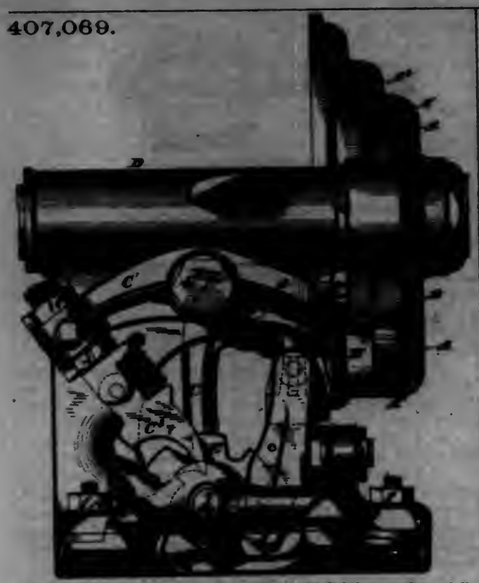
3. The combination, with a steam-whistle, of a sound-deflector supported above the same, provided with a central stem upon the under surface, and having the under face upwardly and outwardly curved from the base of the stem, which curve is merged into an essentially horizontal line near the periphery of the deflector, substantially as and for the purpose specified.

4. The combination, with a steam-whistle, of a sound-deflector supported above the same, provided with a stem upon the under face, and having the under surface curved from the base of the stem essentially to the periphery of the deflector, and provided with a convex outer surface, and means, substantially as shown and described, for supporting the said deflector, as and for the purpose specified.

407,068. PERFORATING-TOOL. WILLIAM FALLON, Newburg, N. Y. Filed Sept. 15, 1888. Serial No. 285,501. (No model.)

Claim.—1. A perforating-tool consisting of a shank bent in V shape near the end, and having the lower end bent slightly back in direction of the V, a marking-wheel pivoted in the said lower end of the shank, and a shoulder-piece swiveled to the upper end of said shank, substantially as shown and described.

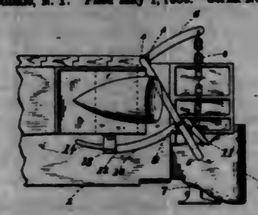
2. A marking-wheel consisting of a disk having a series of solid pins upon the periphery, provided with a recess in the outer end producing a cutting-edge, substantially as shown and described.



407,069. GRAIN-BINDER. JAMES A. GRAHAM, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Jan. 17, 1887. Serial No. 294,541. (No model.)

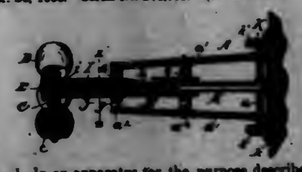
Claim.—1. In a knotter-head for grain-binders, the combination, with the knife-arm and disk-lever, each having an anti-friction roller at its end, of a wheel of unusual depth having formed therein two eccentric cam-tracks, one extending farther into the wheel than the other, the said tracks being for a certain portion of their length concentric to each other and for a certain portion side by side, but non-concentric, substantially as set forth.

2. In a knotter-head for grain-binders, the combination, with the knife-arm C, carrying the anti-friction roller B at one end, and the disk-lever C', carrying the anti-friction roller B' at its corresponding end, of the cam-wheel A, of unusual depth, having formed therein two eccentric cam-tracks $A' A^2$, the former being of greater length, depth, and width than the latter, said tracks being for a certain portion of their length concentric to each other and for a certain portion side by side, but non-concentric, substantially as set forth.



3. In a knotter-head for grain-binders, the combination, with a cam-wheel of unusual depth having formed therein two eccentric cam-tracks, one extending farther into the wheel than the other, the said tracks being for a certain portion of their length concentric to each other and for a certain distance side by side, but non-concentric, of a frame, the disk-lever C', of substantially crescent shape in a horizontal plane and pivoted midway between its ends to said frame, the anti-friction roller B', pivoted to one end of said disk-lever, and the

407,069.



disk-pawl O^3, secured to the other end of said disk-lever, substantially as set forth.

407,070. DEVICE FOR OPERATING CAR-COUPLING PINS. ROBERT GOSS, Buffalo, N. Y. Filed May 1, 1889. Serial No. 308,170. (No model.)

Claim.—A device for operating the locking pin of a car-coupling, consisting of a bar 4, mounted in bearings at the end of a car and provided with a handle and an arm 6, in combination with a curved bar 10, pivoted to the handle 5, and provided with a handle 11 at its forward end and a shoulder at its opposite end, a guide-piece for the curved bar to operate through, and a chain connecting with the arm 6 and the locking-pin of a car-coupling, substantially as described.

407,071. MOVEMENT-CURE APPARATUS. HARVEY L. HOPKINS, Chicago, Ill., assignor to the Portable Machine Company, same place. Filed Apr. 26, 1888. Serial No. 271,906. (No model.)

Claim.—1. In an apparatus for the purpose described, a sliding shaft, in combination with rollers mounted on one end thereof, a support for said shaft on which it is movable lengthwise, and a device adapted to rotate the shaft by the sliding movement of the latter on its support, substantially as and for the purpose specified.

2. The tubular shaft provided with a spiral slot, in combination with balls mounted loosely on journals set radially to the shaft at one end thereof, a supporting-frame provided with bearings for the shaft, upon which it may be reciprocated lengthwise, and a pin on said frame arranged to enter the spiral slot in the shaft, substantially as and for the purposes specified.

3. The frame A, in combination with the tubular shaft B, having a spiral slot *b*, the balls D, set loosely on the journals *c*, arranged at the end of the shaft mounted radially thereto, the pin F, arranged on the frame to enter the slot in the shaft, and a spring arranged to thrust the shaft outward from the frame, substantially as and for the purposes specified.

4. The frame A, provided with the rings a^2 a^2, in combination with the sliding and rotating shaft B, arranged to slide back and forth within said rings, and the balls D, mounted on radial pins on the outer end of said shaft, substantially as and for the purposes specified.

5. The supporting-frame, in combination with the sliding and rotating shaft, and bearing-rollers on the frame set at an angle to the axis of the shaft, substantially as and for the purposes specified.

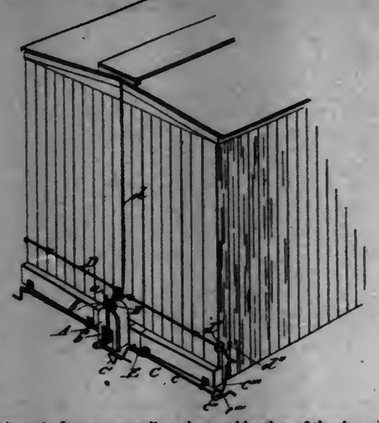
6. The supporting-frame, in combination with the sliding tubular shaft provided with a spiral slot, the stationary pin arranged to enter said slot, and the bearing and guiding rollers on the frame inclined to the axis of the shaft at an angle corresponding to the pitch of the spiral slot, substantially as and for the purposes specified.

7. The supporting-frame A, in combination with the sliding and rotating shaft B, the balls D, mounted on the outer end thereof, the tube H, the rod I, and the spring J, substantially as and for the purposes specified.

8. The sliding and rotating shaft, in combination with the button E, mounted in a loose bearing at the end of the shaft, and the balls D, mounted loosely on journals set radially at the outer end of said shaft, substantially as and for the purposes specified.

9. The supporting-frame mounted on pivotal bearings at its inner end, in combination with the sliding rotary shaft and the balls mounted loosely on the outer end thereof, substantially as and for the purposes specified.

10. The frame A, pivoted to the wall or other suitable support, in combination with the sliding shaft B mounted thereon, the balls D, mounted loosely on the outer end of the shaft, the spring operating to thrust the shaft outward, and the suspending and adjusting chain, substantially as and for the purposes specified.

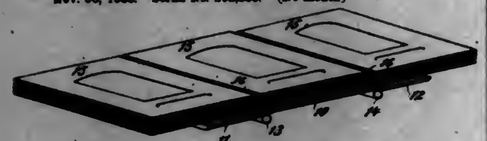


407,072. SCREEN ATTACHMENT FOR WINDOWS. WILLIAM J. HORTON, Halifax, Nova Scotia, Canada. Filed Aug. 24, 1888. Serial No. 283,674. (No model.)

Claim.—1. The combination, with the window-sash having studs 5 5 and the vertical rods 2, fixed beside the jambs inside the window-frame, of the folding screen 1, the recessed cross-bar 3, having its ends notched to receive said rods and its front edge curved downward, and the catches 4, pivoted to said cross-bar and provided with lateral notches and forward projections to adapt them for the functions specified.

2. The combination, with the upper window-sash and the rods 2, fixed on the inner sides of the jambs, of the recessed cross-bar 3, having its ends notched to receive said rods, the brackets 6, which secure the bar rigidly and permanently to the sash, and the folding screen, arranged as shown and described.

407,073. CAR-COUPLING. LEWIS H. HUNT, Hiram, Ga. Filed Feb. 26, 1889. Serial No. 301,142. (No model.)



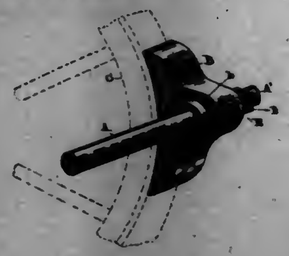
Claim.—1. In a car-coupling, the combination of the draw-head A, and the pin B, having guide-link b^x fastened at both head and point of said pin, substantially as shown and described.

2. In a car-coupling, the draw-head A, having pin *a*, and the pin B, having arm *b* sliding on said pin *a*, all combined and operating substantially as shown and described, and for the purpose specified.

3. In a car-coupling, the link-lifter consisting of the shaft *c*, plate *c'*, spring E, pawl c^x, and ratchet c^w, all combined and operating substantially as and for the purpose specified.

407,074. ALBUM. CHRISTIAN JABSEN, New York, N. Y. Filed Nov. 30, 1888. Serial No. 292,253. (No model.)

Claim.—1. A book formed with two backs and a cover that is divided centrally in a line substantially parallel with the backs.



2. In a book, the combination, with a bottom cover 10, of top covers 11 and 12, backs 13 and 14, by which the covers are connected, strips 16, and leaves connected to the strips, substantially as described.

3. In a book, the combination, with a bottom cover, of backs connected thereto, upper covers connected to the backs, the combined width of the upper covers being about equal to that of the bottom cover, and leaves connected to the covers within the backs, substantially as described.

4. In a book, the combination, with a bottom cover, of upper covers connected to the side edges thereof by backs and alternately-spaced leaves connected to the covers within the backs, substantially as described.

5. In a book, the combination, with a bottom cover 10, of top covers 11 and 12, backs 13 and 14, by which the covers are connected, strips 16, arranged as described, and leaves connected to the strips and arranged to interlock, substantially as described.

407,075. BRAKE-BLOCK. JOHN A. JEWELL, Washington, D. C., assignor of one-half to George B. Starkweather, same place. Filed Sept. 26, 1888. Serial No. 286,460. (No model.)

Claim.—1. A brake-block B, having a lateral aperture through it provided with a seat for the shaft A, and shoulders $g\,g'$, as specified.

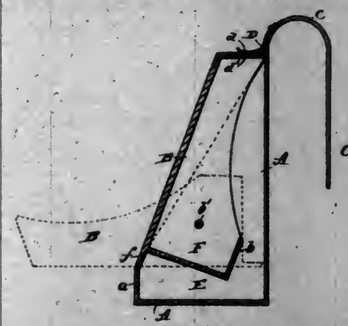
2. The combination, with a brake-block recessed as described, and provided with shoulders $g\,g'$, of a shaft or brake-bar having a flange *a* and washers *d d*, as specified.

3. The combination, with a brake-block recessed as described, of elastic or endwise-yielding washers and a flanged brake-bar, as specified.

4. The combination, with a brake-block, of washers which are interchangeable, and a compressing-nut, with a shaft A, and intermediate shoulders $g\,g'$, and a stop-screw, as specified.

5. The combination, with a brake-block having integral therewith an eye portion *b*, both sides being flush with the sides of the block, of a lug-stop on the brake-shaft, whereby the block is allowed only a limited oscillation about the axis of its shaft, as specified.

6. A brake-block having an eye or lug protruding from its back and adapted to afford internal shoulders for a brake-shaft, as specified.



7. A brake-block B, having a lug provided with a semicircular aperture transversely through it, terminating in converging shoulders or abutments $g\,g'$, in combination with the shaft-section *a*, having a concentric portion a^3 between two lugs $a'\,a'$, and a screw E, tapped through the brake-block lug *b* and entering the free space between the said lugs $a'\,a'$, all substantially as specified.

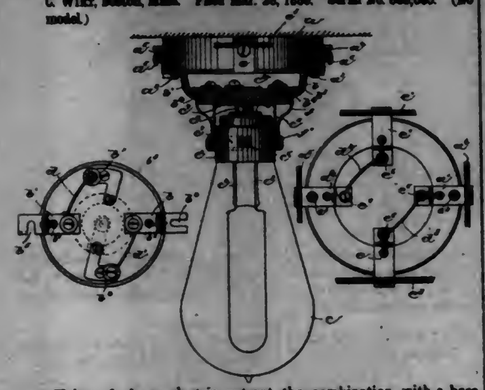
8. The combination of a brake-block having a lug *b*, recessed as described, with the lugs $a'\,a'$, and the intermediate concentric portion a^3, formed on the shaft *a*, and a screw E, tapped through the lug on the brake-block, substantially as specified.

9. The combination, with the brake-block having a lug formed integral with it and recessed as described, of the shaft portion *a*, having two lugs $a'\,a'$, and an intermediate concentric portion a^3, the set-screw E, washers fitted into recesses *c c*, and a nut D, all substantially as described.

10. The combination, with a brake-block having a lug recessed as described, a brake-shaft having a portion *a*, provided with lugs $a'\,a'$, and an intermediate concentric cylindrical portion a^3, of a screw E, entering the broad space between said lugs $a'\,a'$, and yielding or elastic washers recessed into both sides of the brake-block lug, substantially as specified.

407,076. FOLDING SOAP-BOX. ISABELLA B. JOHNS, New York, N. Y. Filed Dec. 14, 1888. Serial No. 293,574. (No model.)

Claim.—1. A soap-box made with a case or body open at one side and formed with a lower drip-chamber, and a soap-tray hinged to the case and adapted to fold therein to conceal the soap, substantially as herein set forth.



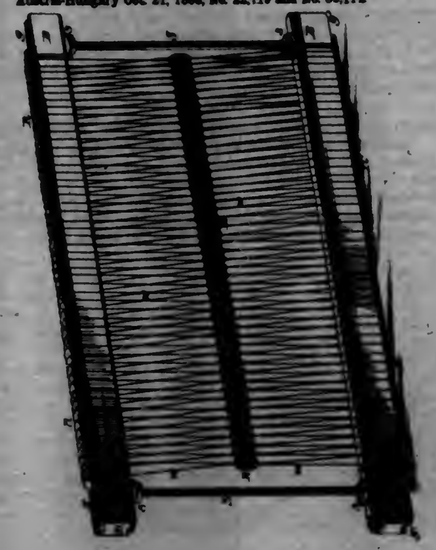
2. A soap-box made with a case or body open at one side, and a soap-tray hinged to the case and provided with a chamber holding the drip when the tray is folded to the case, substantially as herein set forth.

3. A soap-box made with a case or body open at one side and formed with a lower drip-chamber, and a soap-tray hinged to the case and provided with a chamber holding the drip when the tray is folded to the case, substantially as herein set forth.

4. A soap-box made with a case or body open at one side and provided with a hook by which to suspend it from a pail or vessel, and a soap-tray hinged to the case and adapted to fold thereto to conceal the soap, substantially as herein set forth.

5. The combination, in a soap-box, of a case A, having an open side and a low front wall *c* and provided with a hook C, and a tray B, hinged at *b'* to the case and provided with an inner wall *b*, substantially as shown and described.

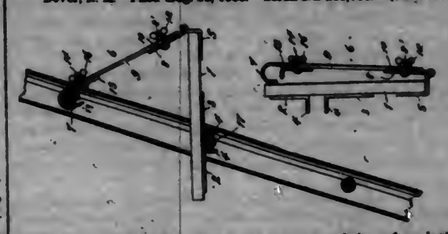
407,077. ELECTRIC CUT-OUT. JAMES L. KINBALL and HERBERT C. WIRT, Boston, Mass. Filed Mar. 26, 1889. Serial No. 305,085. (No model.)



Claim.—1. In an electric cut-out, the combination, with a base provided with contact-arms secured thereto and to which the line-wires may be connected, of a cap or rosette provided with contact-arms extended beyond the said cap or rosette and means to secure positive electrical connection between the contact-arms of the cap and base outside of the said cap, substantially as described.

2. In an electric cut-out, the combination, with a flat base *a* and contact-arms secured thereto and to which the line-wires may be connected, of screws $a^7\,a^8$, secured to said contact-arms, and a cap or rosette provided with contact-arms *b b'*, extended beyond the sides of the cap and provided, respectively, with slots to engage the screws a^7 a^8 on the contact-arms secured to the base, substantially as described.

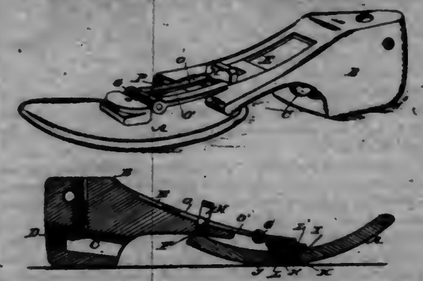
3. In an electric cut-out, the combination, with a base provided with two sets of contact-arms secured thereto to form a main line and a branch line or circuit and fuse-wires secured directly to the said sets of contact-arms to establish electrical connection from the main to the branch line, of a cap or rosette provided with contact-arms extended beyond the sides of the cap and adapted to be secured to said base outside of the said cap, substantially as described.



407,078. HEDDLE-FRAME FOR LOOMS. CALVIN P. LADD, Cambridge, Mass., and WILLIAM MOSS, New York, N. Y., assignors, by mesne assignments, to the National Loom Harness Company, of Maine. Filed Nov. 4, 1887. Serial No. 254,205. (Model.) Patented in England Nov. 23, 1887, No. 16,133; in France Nov. 25, 1887, No. 187,206; in Belgium Nov. 26, 1887, No. 79,080; in Italy July 24, 1888, No. 23,612, and in Austria-Hungary Oct. 21, 1888, No. 32,719 and No. 30,114.

Claim.—1. The combination, with the eyes E, the bars B, grooved in their outer edges, yielding cushions placed in the grooves of the said bars, and the continuous wires W, fastened at the ends thereof to the bars, and each passing alternately around a bar and its cushion and through one of the eyes, as described, of means for straining the bars apart from each other, whereby a tension may be applied to the wires, all substantially as set forth.

2. In a heddle-frame for looms, the combination of the heddle-bars B, having grooves $g\,g'$ in their outer edges, their adjusting screw-rods S S, their nuts *s s*, the rope cushions R R', loosely seated in said grooves, the eyes E, and the two continuous wires threaded through said eyes and looped over and upon the rope cushions of the bars to form the leashes of each bar, and secured at their ends to the bars, whereby the wires of each bar may be drawn uniformly taut from end to end over a free bearing, as shown and described.



407,079. LADDER PLATFORM-BRACKET. LEWIS R. LAMBY, Dover, N. H. Filed Aug. 26, 1888. Serial No. 283,966. (No model.)

Claim.—1. A ladder platform-bracket consisting of a platform with means for engaging it with the round of a ladder, and a brace-bar hinged to the platform, said bar provided with a hook 17 at its free end adapted to engage a ladder-round, and an adjustable guard fitted on said end, said guard consisting of an L-shaped plate 13, sliding on the portion 9 of the hinged bar, and having a pin 14 projecting through a slot 15 in said bar and secured in position by thumb-nut 16, as and for the purposes specified.

2. In a ladder platform-bracket, the combination, with platform 1, provided with catches 2 3 3, and hinge-plate 5, of the brace-bar 6, consisting of the portion 8, hinged to plate 5, having serrations 10, and provided with hinge-pin 8, having nut 12, the portion 9, having hook 7, slots 11 and 15, and serrations 10, and the L-shaped plate 13, provided with pin 14, having nut 16, substantially as shown and described.

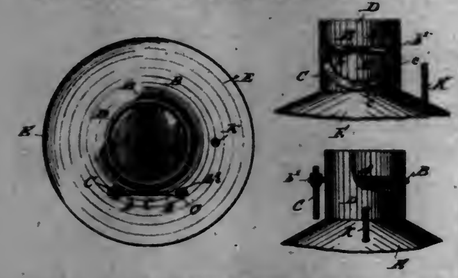
407,080. ADJUSTABLE LAST. ARTHUR M. LEBARON, Port Townsend, Wash., assignor of one-half to James Homer Littlemore, same place. Filed Jan. 17, 1889. Serial No. 296,773. (No model.)

Claim.—1. The combination of a heel part formed with the longitudinal recess, a double-pointed toe part, a hinge pivotally secured at one end to the toe part and having its other end formed with a longitudinal slot, and the retaining-screw, substantially as set forth.

2. In a last, the combination of the heel part formed with the longitudinal recess, the reversible curved toe part formed with a narrow end and a wide end and having the central circular recesses and opening, the lower nut having the central bearing-collar, the connecting-screw, the hinge having the circular projection formed with the central threaded aperture on its forward end, and the rear strap formed with the longitudinal slot, and the thumb-screw, substantially as set forth.

3. In a last, the combination of the heel part formed with the longitudinal recess, the threaded aperture, and the heel-opening having the plug in its rear end, the toe part having a narrow end and a wide end, the hinge pivotally secured at one end to the toe part and having its other end formed with a longitudinal slot, and the thumb-screw, substantially as set forth.

407,081. BOOT OR SHOE LAST. ARTHUR M. LEIGHTON, Port Townsend, Wash., assignor of one-half to James H. Livermore, same place. Filed Mar. 1, 1889. Serial No. 301,608. (No model.)



Claim.—1. A last comprising a heel piece or portion and the improved foot-piece having a socket *b*, a groove extended from one side of such socket, and a ledge overlapping the socket at the side opposite said groove, combined with the stud having a head fitted to said socket, and the fastening-plate, whereby to secure the sted in such socket, substantially as set forth.

2. A last comprising a heel portion, the foot or toe piece provided in its upper side with a circular socket and having a ledge b^2 overlapping one edge of such socket, the connection piece or bar secured at one end to the heel-piece and provided at its opposite end with the stud having a head fitted to the socket of the foot-piece, and the fastening-plate by which to secure the stud in such socket, substantially as set forth.

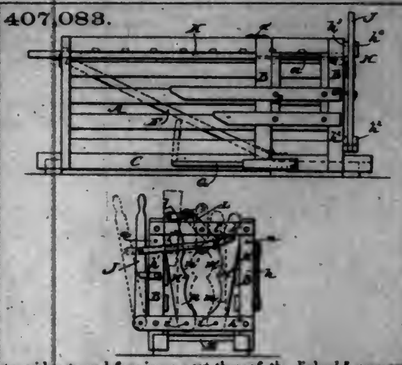
3. The improvement in lasts, substantially as herein described, comprising the heel-piece, the bar secured at one end thereto and provided at its opposite end with a headed stud, the foot-piece having in its upper side a socket *b*, fitted to receive said stud and provided with a groove *b'* leading from and a ledge b^2 overlapping such socket, and the fastening-plate C, fitted to groove *b'* and having at its inner end a ledge C', all substantially as and for the purpose specified.

407,082. PIPE-DAMPER. MARK J. LEDDELL, Mount Pleasant, Mich. Filed Nov. 9, 1888. Serial No. 290,349. (No model.)

Claim.—1. A pipe-damper consisting of two plates pivoted at contiguous edges and a latch device connected to the plate-pivots and adapted to hold the plates at any required adjustment, substantially as herein set forth.

2. A pipe-damper consisting of two plates pivoted at contiguous edges, arms on the plate-pivots, and a latch-bar pivoted to the arm of one plate and engaging the arm of the other plate, substantially as herein set forth.

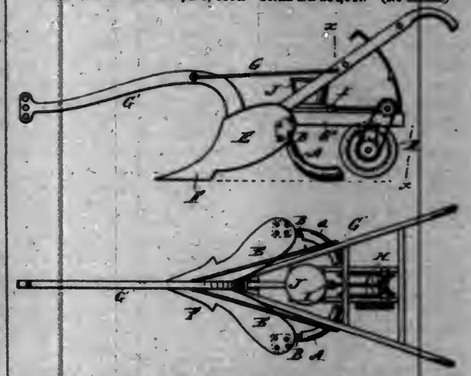
3. A pipe-damper consisting of two plates pivoted at contiguous edges, arms on the plate-pivots ranging in the same plane as the plates, and a latch device held to the arm of one plate and engaging the arm of the other plate, substantially as herein set forth.



4. A pipe-damper consisting of two plates pivoted at contiguous edges, the plate-pivots provided with arms ranging at right angles, and a semicircular latch-bar pivoted to the end of one arm and provided with detents adapted to engage the extremity of the other arm, substantially as herein set forth.

5. The combination, in a pipe-damper, of a pair of plates A A, pivoted by pins or shafts B B to and within a pipe, said pivots having arms *b b* outside the pipe, one arm being provided with an eye or loop *b'*, and a curved latch-bar C, pivoted to the end of the other arm and provided with a series of notches or detents adapted to engage said eye or loop *b'*, substantially as herein set forth.

407,083. HOG-TRAP. SOLOMON LOFTIN, Hartland, Mo. Filed Aug. 16, 1888. Serial No. 282,675. (No model.)

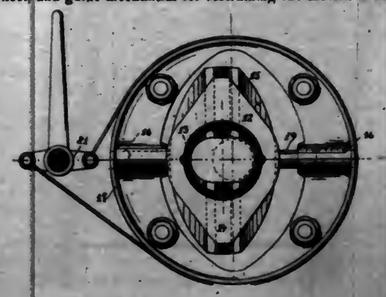


Claim.—The main frame of the trap and the front gate H, hinged to the front end of said main frame, in combination with the stanchions H' H², pivoted in said gate, the vertical levers J and L, pivoted

407,088.

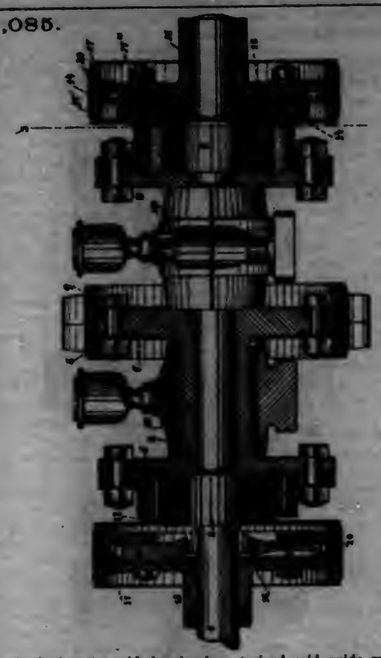
to said gate and forming a part thereof, the links *l l*, connecting the opposite ends of the lever L to the stanchions H' H², respectively, and the link *l'*, connecting the lever L to the lever J, substantially as and for the purposes described.

407,084. COMBINED LISTER AND DRILL. WILLIAM A. LOMBERT, Odessa, Nebr. Filed Sept. 5, 1888. Serial No. 284,647. (No model.)



Claim.—1. The combination, with a listing-plow, of concave and inwardly-curved blades secured to the plow, substantially as described.

2. The combination, with a combined lister and drill, of the concave and inwardly-curved blades A, adjustably secured to the inside of the mold-board, substantially as herein shown and described.



3. The combination, with the combined lister and drill, of two inwardly-curved and concave blades attached to the inside of the mold-board extending downward toward each other, and a grooved wheel held on the combined lister and plow in the rear of the said blades, the said wheel imparting motion to the slide of the said box, substantially as shown and described.

407,085. POWER-TRANSMITTING DEVICE. WILLIAM MAIN, Brooklyn, N. Y. Filed Aug. 27, 1887. Serial No. 248,011. (No model.)

Claim.—1. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and guide mechanism for restraining the motion of said oscil-

407,085.

lating wheel when the guide-bearing is restrained, said guide mechanism being made up of parts having a double sliding motion, substantially as described.

2. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, and a restrainable guide-bearing normally moving with said oscillating wheel and connected thereto by guide mechanism made up of a slide reciprocating in one direction along guiding-surfaces upon the guide-bearing and in a direction at right angles thereto along guiding-surfaces connected to said oscillating wheel, substantially as described.

3. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing connected with said oscillating wheel by guide mechanism made up of parts having a double sliding motion, and a brake for restraining or retarding the movement of the guide-bearing, substantially as described.

4. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable rotatory guide-bearing normally moving with said oscillating wheel, guide mechanism for restraining the motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of parts having a double sliding motion, and a brake for restraining the rotation of said bearing, substantially as described.

5. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable rotatory guide-bearing normally moving with said oscillating wheel, a brake for restraining the rotation of said bearing, and guide mechanism connecting said bearing with said oscillating wheel, said guide mechanism being made up of a sliding piece reciprocating with reference to the guide-bearing in one direction along guiding-surfaces and with reference to the oscillating wheel in a direction at right angles thereto along guiding-surfaces, substantially as described.

6. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally moving with said oscillating wheel, and guide mechanism for restraining the motion of said oscillating wheel when said guide-bearing is restrained, said guide mechanism including a sliding piece having a rectilinear reciprocation with respect to the oscillating wheel and a rectilinear reciprocation with respect to the guide-bearing, said reciprocations being at right angles to each other, substantially as described.

7. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a rotatory pulley mounted loosely upon the driving-shaft, a brake for restraining the rotation of the pulley, and guide mechanism connecting the pulley and the oscillating wheel for restraining the motion of the oscillating wheel, said guide mechanism consisting of a cross-head encircling the driving-shaft and connected, respectively, to the oscillating wheel and the pulley by the engagement of guiding-surfaces extending in directions at right angles to each other, substantially as described.

8. A power-transmitting device for connecting a driving-shaft with a driving mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a rotatory pulley, a cross-head encircling the driving-shaft and having guide-grooves for receiving lugs or projections mounted upon said oscillating wheel and adapted to slide in said guide-grooves, said cross-head also having at right angles to said guide-grooves lugs or projections adapted to slide in guide-grooves formed in the pulley, and a brake for restraining the rotation of said pulley, substantially as described.

9. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of separate sets of differently-proportioned gear-wheels, the members of each set being normally out of operative connection, and a brake for simultaneously throwing into operative connection the members of one set and throwing out of operative connection the members of the other set, whereby the motion due to either set of gears may, as desired, be imparted to the driven mechanism, substantially as described.

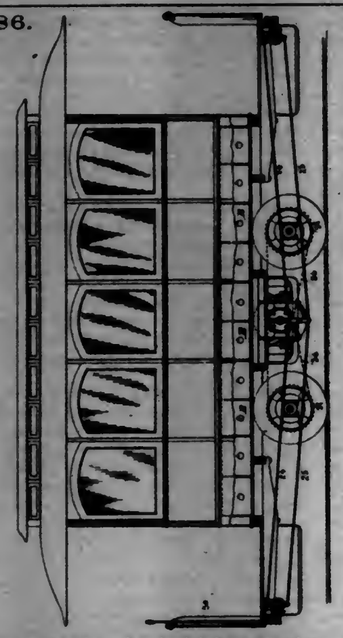
10. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of separate sets of differently-proportioned gear-wheels, one of the wheels of each set having an oscillating motion about a center, and each set having a restrainable guide-bearing normally moving with its oscillating wheel, guide mechanism for restraining the motion of said oscillating wheel when the guide-bearing is restrained, and a brake for simultaneously releasing both guide-bearings or arresting either one and releasing the other, substantially as described.

11. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, one member of which is in operative connection with the driving-shaft and the other with the driven mechanism, a restrainable guide-bearing normally moving with the oscillating member of said sun-and-planet gear, and a guide for restraining the motion of said oscillating gear when the guide-bearing is restrained, the parts of said guide having a double rectilinear motion, one motion with respect to the oscillating wheel and the other with respect to the guide-bearing, substantially as described.

12. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, one member of which is in operative connection with the driving-shaft and the other with the driven mechanism, a rotatory pulley normally moving with the oscillating member of said sun-and-planet gear, a guide connecting the oscillating wheel with the pulley, said guide being made up of parts having a double rectilinear sliding motion, and a brake for arresting the rotation of said pulley for the purpose of restraining the motion of the oscillating wheel, substantially as described.

13. The combination of a driving-shaft, a driven mechanism, a set of sun-and-planet gear-wheels connecting said shaft and mechanism, guides connected to the oscillating member of the sun-and-planet gear, guide-bearings, and a clutch for locking the guide-bearings to said driving-shaft, substantially as described.

14. The combination of a driving-shaft, a driven mechanism, a set of sun-and-planet gear-wheels connecting said shaft and mechanism, the oscillating member of said gear-wheels being eccentrically mounted on said shaft, guides connected to the oscillating member of the sun-and-planet gear, guide-bearings, and a clutch for locking the guide-bearings to said driving-shaft, substantially as described.



15. The combination of two concentric shafts, sun-and-planet gear-wheels connecting the same, a rotatory pulley loosely mounted upon the inner shaft and connected to the oscillating member of said gear-wheels by guide mechanism, and a clutch for locking the rotatory pulley to the inner shaft, substantially as described.

16. The combination of a driving-shaft, a driven shaft concentric therewith, two sets of differently-proportioned sun-and-planet gears connecting said shafts, the oscillating members of each set being mounted upon the driving-shaft and the driven members being rigid with the driven shaft, and guide mechanism for throwing either of said sets of gears into operation, substantially as described.

407,086. POWER-TRANSMITTING CONNECTION FOR VEHICLES. WILLIAM MAIN, Brooklyn, N. Y. Filed Oct. 26, 1887. Serial No. 253,619. (No model.)

Claim.—1. The combination of a storage-battery, an electric mo-

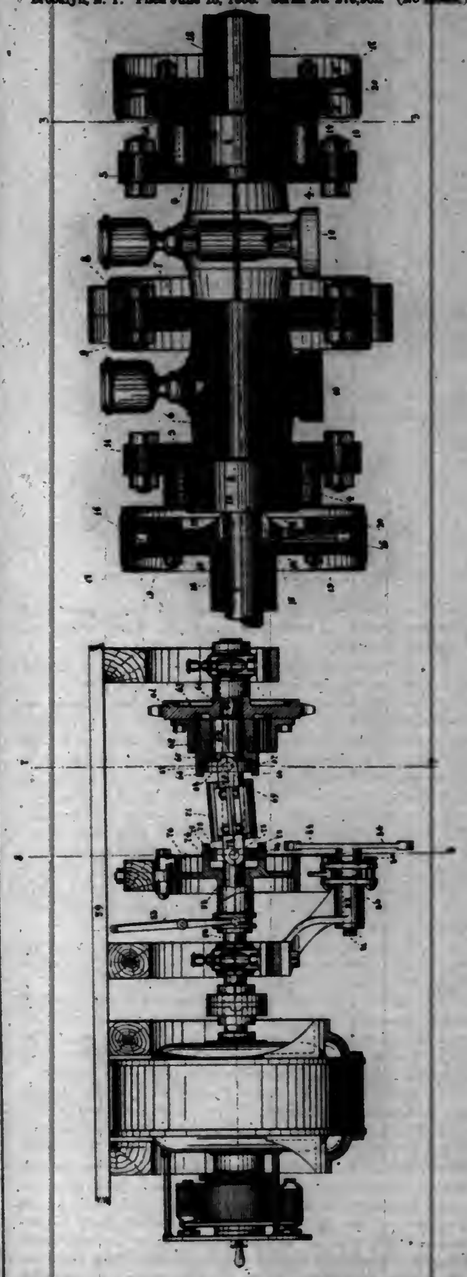
407,086.

tor, a driven mechanism, and a clutch independent of the motor-circuit for establishing or breaking connection between the motor-shaft and the driven mechanism without interfering with the continuity of the said motor-circuit, and consequently without interrupting the uniform discharge of the battery, substantially as set forth.

2. The combination of a storage-battery, an electric motor and its circuit-controlling devices, a speed-transmitting mechanism between the motor-shaft and the driven mechanism, and a friction-brake for controlling said transmitting mechanism, whereby by a greater or less pressure the speed of transmission may be varied without interfering with the motor-circuit and without interrupting the discharge of the battery, substantially as set forth.

3. The combination of a storage-battery, an electric motor, a driven mechanism, and means independent of the motor-circuit for establishing or breaking connection between the motor-shaft and the driven mechanism without interfering with the continuity of said motor-circuit, and consequently without interrupting the discharge of the battery, substantially as set forth.

4. The combination of a vehicle, a storage-battery and an electric motor mounted thereon, and means independent of the motor-circuit for establishing or breaking connection between the motor-shaft and the driven mechanism without interfering with the continuity of said motor-circuit, and consequently without interrupting the discharge of the battery, substantially as set forth.



5. The combination of a vehicle, a battery, an electric motor, the motor and battery being mounted upon the vehicle, sun-and-planet gear-wheels connecting the motor-shaft with the driving-axle of the vehicle, and means whereby the oscillating gear-wheel of the sun-and-planet series may be arrested or permitted to revolve freely, substantially as set forth.

6. The combination of a vehicle, a battery and electric motor mounted thereon, two or more sets of sun-and-planet gear-wheels between the shaft of the motor and the driving-axle of the vehicle, the wheels of each set being differently proportioned to each other, a locking device for each of said sets of gear-wheels for bringing it into operative connection with the motor-shaft, and means for bringing into operation any one of said locking devices, substantially as described.

7. The combination of a vehicle, a battery and electric motor mounted thereon, a train of sun-and-planet gear-wheels connecting the motor-shaft with the vehicle-axle, and a friction-brake controlling the operative engagement of the shaft with the gear-wheels, the transmitted speed increasing relatively to the amount of pressure applied to the brake, substantially as described.

8. The combination of a vehicle, an electric motor mounted thereon, a train of gear-wheels connecting the motor-shaft with the vehicle-axle, one of said gear-wheels having an oscillating and also a rotatory motion, a rotatory pulley normally rotating with said oscillating gear, and friction-brakes for restraining the rotation of said pulley and thereby bringing the train of gear into operative engagement with the shaft, substantially as described.

407,087. POWER-TRANSMITTING DEVICE. WILLIAM MAIR, Brooklyn, N. Y. Filed June 13, 1888. Serial No. 276,962. (No model.)

Claim.—1. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and guide mechanism for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, substantially as described.

2. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, and a restrainable guide-bearing normally moving with said oscillating wheel and connected therewith by guide mechanism having a swinging motion about centers, substantially as described.

3. A power-transmitting device for connecting a driving-shaft and a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing moving with said oscillating wheel and connected thereto by guide mechanism having a swinging motion about centers, and a brake for arresting the movement of said guide-bearing, substantially as described.

4. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing moving with said oscillating wheel and connected thereto by guide mechanism having a swinging motion in two directions, and a brake for arresting the movement of said guide-bearing, substantially as described.

5. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a rotatory pulley normally rotating with said oscillating wheel and connected therewith by guide mechanism having a swinging motion about centers, and a brake for arresting the rotation of said pulley, substantially as described.

6. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a rotatory pulley normally rotating with said oscillating wheel and connected thereto by guide mechanism having a swinging motion in two directions, and a brake for arresting the rotation of said guide-bearing, substantially as described.

7. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, and a restrainable guide-bearing normally moving with said oscillating wheel and connected thereto by guide mechanism joined at one end to the guide bearing by a universal joint and at the other end to the oscillating wheel by a like joint, substantially as described.

8. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear one member of which is in operative connection with the driving-shaft and the other with the driven mechanism, a restrainable guide-bearing normally moving with the oscillating member of said sun-and-planet gear, and guide mechanism for restraining the motion of said oscillating gear when the guide-bearings are restrained, substantially as described.

9. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear, a restrainable guide-bearing normally moving with the oscillating member of said gear, and guide mechanism for restraining the motion of said oscillating member when the guide-bearing is restrained, said guide mechanism made up of parts having a swinging motion in two directions, substantially as described.

10. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear, a movable guide-bearing connected with the oscillating member of said sun-and-planet gear by guide mechanism having a swinging motion in two directions, and a brake for arresting the movement of said guide-bearing, substantially as described.

11. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear, a rotatory pulley connected with the oscillating member of said gear by guide mechanism having a swinging motion in two directions, and a brake for arresting the rotation of said pulley, substantially as described.

12. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear, a guide-bearing, and swinging connecting guide mechanism joined at one end to the guide-bearing by a universal joint and at the other end to the oscillating member of the gear by a like joint, substantially as described.

13. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear, a rotatory pulley mounted on the driving-shaft, a sleeve encircling said shaft and connected at one end to the pulley by a universal joint and at the other end to the driving member of the gear by a like joint, and a brake for said pulley, substantially as described.

14. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear the driving member of which is mounted within the driven member and is in operative connection with the driving-shaft, a restrainable guide-bearing normally moving with the driving member of said sun-and-planet gear, and guide mechanism for restraining the motion of said driving member when the guide-bearing is restrained, substantially as described.

15. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a sun-and-planet gear the oscillating member of which is mounted within the driven member and is in operative connection with the driving-shaft, and a restrainable guide-bearing normally moving with said driving member and connected therewith by guide mechanism having a swinging motion about centers, substantially as described.

16. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and-planet gear the driving member of which is mounted within the driven member and is in operative connection with the driving-shaft, a movable guide-bearing connected with the said driving member by guide mechanism having a swinging motion about centers, and a brake for arresting the movement of said guide-bearing, substantially as described.

17. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and-planet gear the driving member of which is mounted within the driven member and is in operative connection with the driving-shaft, a guide-bearing, and a swinging connecting-piece joined at one end to the guide-bearing by a universal joint and at the other end to the driving member of the gear by a like joint, substantially as described.

18. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and-planet gear the driving member of which is mounted within the driven member and is in operative connection with the driving-shaft, a rotatory pulley mounted on the driving-shaft, and a sleeve encircling said shaft and connected at one end to the pulley by a universal joint and at the other end to the driving member of the gear by a like joint, and a brake for said pulley, substantially as described.

19. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and planet gear, a rotatory pulley mounted upon the driving-shaft, a sleeve encircling said driving-shaft and having a pair of oppositely-disposed lugs at each of its ends, a ring encircling said driving-shaft and connected to the driving member of the sun-and-planet gear and to the lugs upon the proximate end of the sleeve by trunnion-pins, and a similar ring connecting in like manner the opposite end of the sleeve with the pulley, and a brake for said pulley, substantially as described.

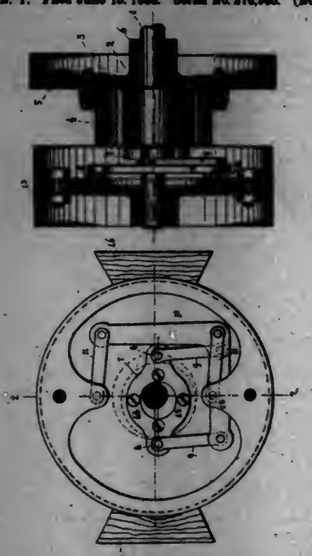
20. In a power-transmitting device, the combination of a driving-shaft provided with an eccentric fast thereon, a hollow driven shaft provided with a so-called "sun-wheel" and mounted upon said driving-shaft, a planet-wheel mounted upon the eccentric and engaging with the sun-wheel, a rotatory pulley mounted upon the driving-shaft, a swinging sleeve connected at one end to the planet-wheel by a universal joint and at the other to the pulley by a like joint, and a brake for said pulley, substantially as described.

21. In a power-transmitting device of the kind described, the combination, with the rotatory pulley, of a brake therefor, consisting of pivoted brake-blocks disposed at opposite parts of the periphery of said pulley, links to which the brake-blocks are attached, a shaft having projecting lugs to which the links are attached, and arms for turning said shaft in one direction or the other, so as to apply or release the brake, substantially as described.

22. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said wheels having a rotary and also an oscillating motion, a bearing, and a guide mechanism joined on the one side to the bearing by a universal joint and on the other side to the oscillating wheel by a like joint, whereby the tendency to rotary motion of the oscillating wheel is restrained, substantially as described.

23. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and-planet gear-wheels, a bearing, and a guide mechanism joined on the one side to said oscillating member by a universal joint and on the other side to said bearing by a like joint, substantially as described.

24. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and-planet gear-wheels, the oscillating wheel of which set is mounted within the other wheel, a bearing, and a guide mechanism joined on the one side to said bearing by a universal joint and on the other side to the oscillating gear-wheel by a like joint, whereby the tendency to rotary motion of the oscillating wheel is restrained, substantially as described.



25. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels connecting the two, one of said wheels having a rotary and also an oscillating motion, a bearing, a sleeve encircling the driving-shaft and having a pair of oppositely-disposed lugs at each of its ends, a ring encircling the driving-shaft and connected to said oscillating wheel by trunnion-pins and to the lugs upon the proximate end of the sleeve by like pins, and a similar ring connecting in like manner the opposite end of the sleeve with the bearing, substantially as described.

26. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said wheels having a rotary and also an oscillating motion, a rotatory pulley mounted concentrically with the driving-shaft normally rotating

with said oscillating wheel, and guide mechanism for restraining the rotary motion of said oscillating wheel when the rotation of the pulley is restrained, substantially as described.

27. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a set of sun-and-planet gear, a rotatory pulley mounted concentrically with said driving-shaft normally rotating with the oscillating wheel of said gear, and guide mechanism for restraining the rotary motion of said oscillating gear when the rotation of the pulley is restrained, substantially as described.

407,088. POWER-TRANSMITTING DEVICE. William Main, Brooklyn, N. Y. Filed June 13, 1888. Serial No. 276,963. (No model.)

Claim.—1. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion about centers in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, substantially as described.

2. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in two directions, said motions being in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, and a brake for restraining the rotation of said guide-bearing, substantially as described.

3. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide consisting of a block connected on the one side by swinging links to the oscillating wheel and on the other side by like links to the guide-bearing, substantially as described.

4. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the driving member of said gear-wheels, and a guide for restraining the rotary motion of said driving member when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in a plane perpendicular to the axis of rotation of the driving member of the gear, substantially as described.

5. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, a guide for restraining the rotary motion of said oscillating member when the guide-bearing is restrained, said guide being made up of parts having a double swinging motion in a plane perpendicular to the axis of rotation of the driving member of the gear, and a brake for restraining the movement of said guide-bearing, substantially as described.

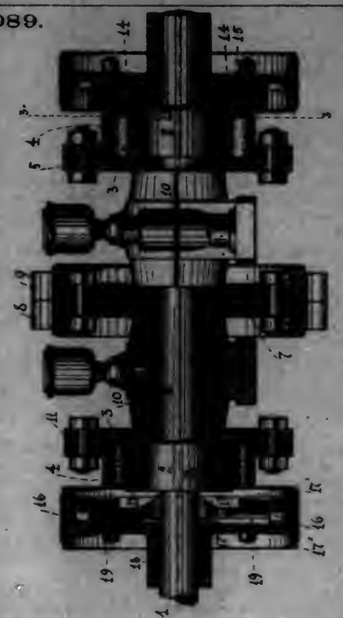
6. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide for restraining the rotary motion of said oscillating gear-wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in two directions in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, substantially as described.

7. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide for restraining the rotary motion of said oscillating gear-wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in two directions in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, and a brake for restraining the rotation of said guide-bearing, substantially as described.

8. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the oscillating gear-wheels by links and to the guide-bearing by links and having a swinging motion in a plane perpendicular to the axis of rotation of said oscillating gear-wheel, substantially as described.

9. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the oscillating gear-wheel by links and to the guide-bearing by links and having a swinging motion in a plane perpendicular to the axis of rotation of said oscillating gear-wheel, and a brake for restraining the rotation of said guide-bearing, substantially as described.

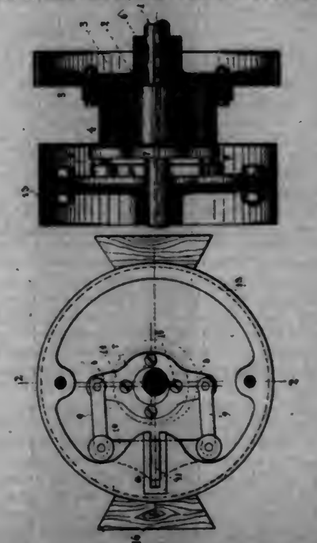
10. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted upon an eccentric formed upon the driving-shaft, a restrainable rotatory pulley loosely mounted upon the driving-shaft and normally rotating with said oscillating wheel, a guide for restraining the rotatory motion of said oscillating wheel when the pulley is restrained, said guide consisting of a connecting-piece joined to the oscillating wheel and to the pulley by links, and a brake for restraining the rotation of said pulley, substantially as described.



11. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted upon an eccentric formed upon the driving-shaft, a restrainable rotary pulley loosely mounted upon the driving-shaft and normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece joined to the oscillating wheel and to the guide-bearing by links and having a swinging motion in two directions in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, and a brake for restraining the rotation of said pulley, substantially as described.

12. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having an oscillating motion about a center, and a restraining guide for said oscillating wheel consisting of parts having a double swinging motion about centers in a plane perpendicular to the axis of rotation of the said oscillating wheel and connecting said oscillating wheel with a relatively fixed guide-bearing, whereby the oscillating wheel is maintained in positions of constant parallelism, substantially as described.

407,089. METHOD OF TRANSMITTING POWER. William Main, Brooklyn, N. Y. Filed June 13, 1888. Serial No. 276,964. (No model.)



Claim.—1. The method of obtaining uniformity of motion in the driven member of a sun-and-planet gear and graduating the speed of transmission from the driving member thereof, which consists in restraining the rotation of the oscillating member of the gear by the application of friction, so that said member shall assume successive positions of parallelism with itself, and graduating the amount of friction so applied to correspond to the speed of transmission desired, substantially as described.

407,089.

2. The method of obtaining uniformity of motion in the driven member of a sun-and-planet gear and graduating the speed of transmission from the driving member thereof, which consists in restraining the rotation of the oscillating member of the gear by the application of friction, so that said member shall assume successive positions of parallelism with itself, and graduating the amount of friction so applied to correspond to the speed of transmission desired.

407,090. POWER-TRANSMITTING DEVICE. William Main, Brooklyn, N. Y. Filed June 13, 1888. Serial No. 276,965. (No model.)

Claim.—1. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, substantially as described.

2. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane perpendicular to the axis of rotation of the oscillating gear-wheel, substantially as described.

3. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the oscillating wheel by pivoted links and playing along guiding-surfaces attached to the guide-bearing, substantially as described.

4. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, and a guide for restraining the rotary motion of said oscillating member when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane perpendicular to the axis of rotation of the driving member of the gear, substantially as described.

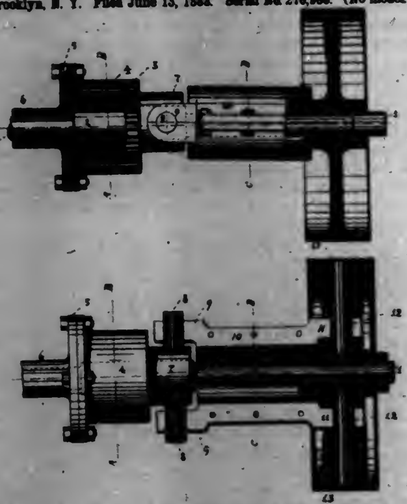
5. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, a guide for restraining the rotary motion of said oscillating member when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane perpendicular to the axis of rotation of the driving member of the gear, and a brake for restraining the movement of said guide-bearing, substantially as described.

6. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, and a guide for restraining the rotary motion of said oscillating member when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the driving member of the gear by links and playing along guiding-surfaces attached to the guide-bearing, substantially as described.

7. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, a guide for restraining the rotary motion of said oscillating member when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the oscillating member of the gear by links and playing along guiding-surfaces attached to the guide-bearing, and a brake for restraining the rotation of said guide-bearing, substantially as described.

8. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide for restraining the rotary motion of said oscillating gear-wheel when the guide-bearing is restrained, said guide being made up of parts having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane perpendicular to the axis of rotation of the oscillating gear, substantially as described.

9. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide for restraining the rotary motion of said oscillating gear-wheel when the guide-bearing is restrained, said guide-bearing being made up of parts having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane perpendicular to the axis of rotation of the oscillating gear, and a brake for restraining the rotation of said guide-bearing, substantially as described.



10. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-

wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the oscillating gear-wheel by links, and moving along guiding-surfaces upon the guide-bearing, substantially as described.

11. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the oscillating gear-wheel by links and moving along guiding-surfaces upon the guide-bearing, and a brake for restraining the rotation of said guide-bearing, substantially as described.

12. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said sun-and-planet gear-wheels being mounted upon an eccentric formed upon the driving-shaft, a restrainable rotatory pulley loosely mounted upon the driving-shaft and normally rotating with said oscillating wheel, a guide for restraining the rotatory motion of said oscillating wheel when the guide-bearing is restrained, said guide consisting of a block connected to the said oscillating wheel by links and playing along guiding-surfaces upon the pulley, and a brake for restraining the rotation of said pulley, substantially as described.

407,091. POWER-TRANSMITTING DEVICE. William Main, Brooklyn, N. Y. Filed June 13, 1888. Serial No. 276,966. (No model.)

Claim.—1. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide mechanism for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide mechanism having a swinging motion in one direction and a sliding motion in another direction, said motions being in planes parallel with the axis of rotation of the oscillating gear-wheel, substantially as described.

2. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide mechanism for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide mechanism having a swinging motion in one direction and a sliding motion in another direction, said motions being in planes parallel with the axis of rotation of the oscillating gear-wheel, and a brake for restraining the rotation of said guide-bearing, substantially as described.

3. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide being made up of a connecting-piece joined to the guide-bearing by trunnion-pins and to the oscillating wheel by trunnion-pins, substantially as described.

4. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane parallel with the axis of rotation of the driving member of the gear, substantially as described.

5. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane parallel with the axis of rotation of the driving member of the gear, and a brake for restraining the rotation of said guide-bearing, substantially as described.

6. A power-transmitting device connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece joined at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating gear-wheel by trunnion-pins, substantially as described.

7. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a sleeve connected at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating gear-wheel by trunnion-pins, substantially as described.

8. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the oscillating member of said gear-wheels, a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a sleeve connected at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating gear-wheel by trunnion-pins, and a brake for restraining the rotation of the said guide-bearing, substantially as described.

9. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane parallel with the axis of rotation of the oscillating gear, substantially as described.

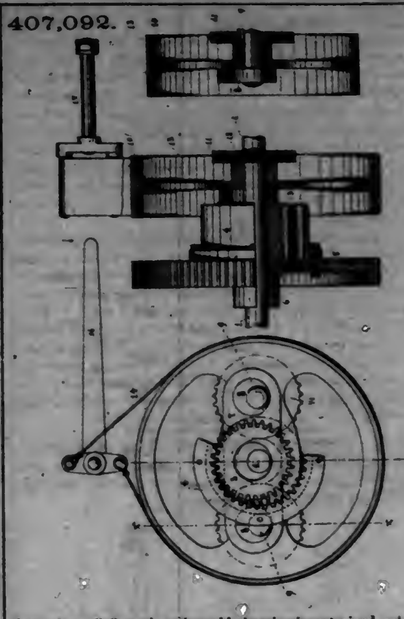
10. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane parallel with the axis of rotation of the oscillating gear, and a brake for restraining the rotation of said guide-bearing, substantially as described.

11. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating wheel, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece joined at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating gear-wheel by trunnion-pins, substantially as described.

12. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a connecting-piece joined at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating gear-wheel by trunnion-pins, and a brake for restraining the rotation of said guide-bearing, substantially as described.

13. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member, a restrainable guide-bearing normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a sleeve joined at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating gear-wheel by trunnion-pins, and a brake for restraining the rotation of said guide-bearing, substantially as described.

14. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said wheels being mounted within the other member and being provided with a projection 7, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide for restraining the rotary motion of said wheel when the guide-bearing is restrained, said guide consisting of a sleeve connected at one end to the guide-bearing by trunnion-pins and at the other end to the projection 7 by trunnion-pins, substantially as described.



15. In a power-transmitting device, the combination of the driving-shaft and driven mechanism, a set of gear-wheels connecting said shaft and mechanism, one of said gear-wheels having a rotary and also an oscillating motion, and a guide for restraining the rotary motion of said oscillating gear-wheel, said guide consisting of a connecting-piece having a swinging motion in one direction and a sliding motion in another direction, said motions being in a plane parallel with the axis of rotation of the oscillating gear-wheel and connecting said oscillating gear-wheel with a relatively-fixed guide-bearing, substantially as described.

16. In a power-transmitting device, the combination of a driving-shaft and driven mechanism, a set of gear-wheels connecting said shaft and mechanism, one of said gear-wheels having a rotary and also an oscillating motion, and a guide for restraining the rotary motion of said oscillating gear-wheel, said guide consisting of a connecting-piece joined at one end to said oscillating gear-wheel by trunnion-pins and at its other end to a relatively-fixed guide-bearing by trunnion-pins, substantially as described.

17. In a power-transmitting device, the combination of a driving-shaft and driven mechanism, a set of gear-wheels connecting said shaft and mechanism, one of said gear-wheels having a rotary and also an oscillating motion, and a guide for restraining the rotary motion of said oscillating gear-wheel, said guide consisting of a sleeve joined at one end to said oscillating gear-wheel by trunnion-pins and at its other end to a relatively-fixed guide-bearing by trunnion-pins, substantially as described.

18. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the oscillating member of said gear-wheels being mounted within the other member and upon an eccentric formed on the driving-shaft, a restrainable guide-bearing loosely mounted upon the driving-shaft normally rotating with said oscillating wheel, a guide for restraining the rotary motion of said oscillating wheel when the guide-bearing is restrained, said guide consisting of a sleeve connected at one end to the guide-bearing by trunnion-pins and at the other end to the oscillating wheel by trunnion-pins, and a brake for restraining the rotation of said guide-bearing, substantially as described.

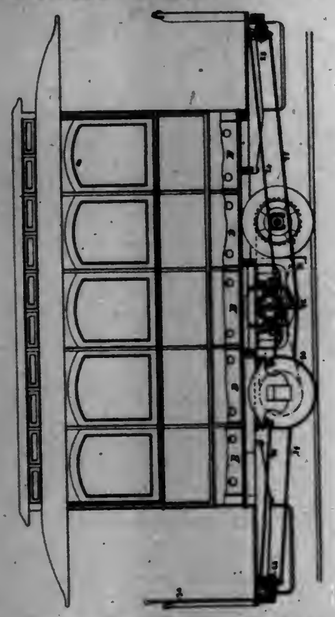
407,092. POWER-TRANSMITTING DEVICE. William Main, Brooklyn, N. Y. Filed June 13, 1888. Serial No. 276,967. (No model.)

Claim.—1. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a set of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide mechanism for restraining the rotary motion of said oscillating gear-wheel when the guide-bearing is restrained, said guide mechanism having a motion of complete rotation about centers, substantially as described.

2. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, and a guide mechanism for restraining the rotation of said oscillating gear-wheel when the guide-bearing is restrained, said mechanism consisting of two or more crank shafts or pins journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, substantially as described.

3. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide mechanism for restraining the rotation of said oscillating gear-wheel when the guide-bearing is restrained, said mechanism consisting of two or more crank shafts or pins journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, and gearing connecting said crank-shafts and the driving-shaft, whereby the rotation of said crank-shafts on their own axes is promoted, substantially as described.

4. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide mechanism for restraining the rotation of said oscillating gear-wheel when the guide-bearing is restrained, said mechanism consisting of two or more crank shafts or pins journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, and a brake for restraining the rotation of said guide-bearing, substantially as described.



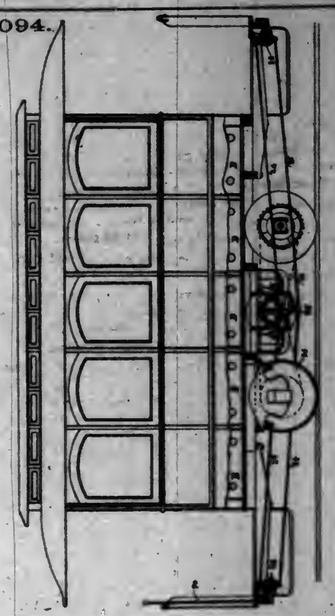
5. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of gear-wheels, one of said gear-wheels having a rotary and also an oscillating motion, a restrainable guide-bearing normally rotating with said oscillating gear-wheel, a guide mechanism for restraining the rotation of said oscillating gear-wheel when the guide-bearing is restrained, said mechanism consisting of two or more crank shafts or pins journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, gearing connecting said crank-shafts and the driving-shaft, whereby the rotation of said crank-shafts on their own axes is effected, and a brake for restraining the rotation of said guide-bearing, substantially as described.

6. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the driving member of said sun-and-planet gear, and a guide mechanism for restraining the rotary motion of said driving member when the guide-bearing is restrained, said guide mechanism consisting of two or more crank shafts or pins journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, substantially as described.

7. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, a restrainable guide-bearing normally rotating with the driving member of said sun-and-planet gear, a guide mechanism for restraining the rotary motion of said driving member when the guide-bearing is restrained, said guide mechanism consisting of two or more crank-shafts journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, and gearing connecting said crank-shafts and the driving-shaft, whereby the rotation of said crank-shafts on their own axes is promoted, substantially as described.

8. A power-transmitting device for connecting a driving-shaft with a driven mechanism, consisting of a series of sun-and-planet gear-wheels, the driving member of said gear-wheels being placed within the driven member, a restrainable guide-bearing normally rotating with the driving member of said sun-and-planet gear, and a guide mechanism for restraining the rotary motion of said driving member when the guide-bearing is restrained, said guide mechanism consisting of two or more crank shafts or pins journaled in the guide-bearing, the crank portions of said shafts moving with the oscillating gear-wheel in its path of oscillation and restraining it to positions of parallelism when the guide-bearing is restrained, substantially as described.

407,098. METHOD OF VEHICLE-PROPULSION BY ELECTRIC MOTORS. WILLIAM MAIN, Brooklyn, N. Y. Original application filed Oct. 23, 1887, Serial No. 253,610. Divided and this application filed Aug. 21, 1888. Serial No. 283,354. (No model.)



Claim.—In the propulsion of vehicles and the like by electric motors actuated by batteries, the method of obtaining the maximum effect from the motor without deterioration of the battery, which consists in maintaining the flow of current from the battery and maintaining continuous revolution of the motor itself during temporary stoppages of the vehicle, whereby the drain upon the battery is continuous and the power of the motor during said stoppages is accumulated in inertia utilizable at the next starting.

407,094. CAR-PROPELLING APPARATUS. WILLIAM MAIN, Brooklyn, N. Y. Filed Aug. 21, 1888. Serial No. 283,355. (No model.)

Claim.—1. The combination, with a vehicle, of a motor therefor, a chain for transmitting power from the motor, a traction-shaft, a gear-wheel mounted so as to turn upon said traction-shaft and engaging with the chain, and springs connecting the gear-wheel with the traction-shaft, said springs having a reversible action and forming a springy connection between the gear-wheel and the traction-shaft in whichever direction the gear-wheel tends to revolve, substantially as set forth.

2. In a vehicle-propelling apparatus, the combination, with the traction-shaft, of a driving gear-wheel mounted thereon and driven

407,094.

from the vehicle-motor, a flange keyed to said traction-shaft, and springs connecting the gear-wheel with the flange, provided at each end with bearings upon the flange and the gear-wheel, whereby the operation of the springs may be reversed on the reversal of the rotation of the gear-wheel, substantially as set forth.

3. In a vehicle-propelling apparatus, the combination, with the traction-shaft 39, of gear-wheel 37 38, mounted thereon and driven from the vehicle-motor, sleeve 40, provided with flanges 41, cap 42, provided with flanges 43, and springs 47, substantially as set forth.

4. In a vehicle-propelling apparatus, the combination, with the traction-shaft 39, of a gear-wheel 37 38, mounted thereon and driven from the vehicle-motor, flanges 43 41, recessed as shown and described, and rods 46, substantially as set forth.

5. The combination, with a vehicle, of a motor therefor, a motor-shaft, a traction-shaft, two sprocket-wheels, one on each shaft, one of said sprocket-wheels being mounted so as to turn upon its shaft, a chain connecting said sprocket-wheels, a sleeve fixed to the shaft alongside of the freely-revolving sprocket-wheel, and flexible connections uniting said sleeve and freely-revolving sprocket-wheel in such manner as to normally tend to hold the hub and wheel in a certain fixed relation to each other and to permit a limited relative motion between them in either direction under tension, substantially as set forth.

6. The combination, with a vehicle-body, of a motor mounted thereon, two traction-shafts, and sprocket-chains connecting the motor-shaft with the traction-shafts, one of the sprocket-chain wheels having a springy connection with its shaft, substantially as described.

7. The combination of a vehicle-body with a truck for supporting the same, springs between the vehicle-body and the truck, a motor mounted upon the vehicle-body, two traction-shafts mounted in the truck, and sprocket-chains connecting the motor-shafts with the traction-shafts, one of the sprocket-chain wheels having a springy connection with its shaft, substantially as described.

8. The combination of a vehicle-body with a truck for supporting the same, springs between the vehicle-body and the truck, a motor mounted upon the vehicle-body, two traction-shafts mounted in the truck, and sprocket-chains connecting the motor-shaft with the traction-shafts, a sprocket-chain wheel for each of the said chain-wheels, having a springy connection with its shaft, substantially as described.

9. The combination of a vehicle-body with a truck for supporting the same, springs between the vehicle-body and the truck, an electric motor mounted upon the vehicle-body, two traction-shafts mounted in the truck, and sprocket-chains connecting the electric-motor shafts with the traction-shafts, one of the sprocket-chain wheels having a springy connection with its shaft, substantially as described.

10. The combination of a vehicle-body with a truck for supporting the same, springs between the vehicle-body and the truck, an electric motor mounted upon the vehicle-body, two traction-shafts mounted in the truck, sprocket-chains connecting the electric-motor shafts with the traction-shafts, and a sprocket-chain wheel for each

of said chain-wheels, having a springy connection with its shaft, substantially as described.

11. The combination of a vehicle, an electric motor mounted thereon, sun-and-planet gear-wheels connecting the motor-shaft with the driving-axle of the vehicle, and guides for securing a constant parallel motion of the driving member of the sun-and-planet gear, substantially as set forth.

12. The combination of a vehicle, a motor mounted thereon, sun-and-planet gear-wheels connecting the motor-shaft with the driving-axle of the vehicle, and a friction-brake connected with one of the said gear-wheels, whereby the said gear-wheel may be thrown into or out of operative engagement, substantially as set forth.

13. The combination of a vehicle, a motor mounted thereon, a shaft for said motor, provided with an eccentric, a train of sun-and-planet gear-wheels between said shaft and the driving-axle of the vehicle, one wheel of said train being loosely mounted upon said eccentric, and a friction-brake connected with the wheel, whereby the said wheel may be locked, so as to partially or wholly check its rotation about its own center, substantially as set forth.

14. The combination of a vehicle, a motor mounted thereon, a shaft for said motor, provided with an eccentric, a train of sun-and-planet gear-wheels connecting said shaft with the driving-axle of the vehicle, one wheel of said train being loosely fitted upon said eccentric and adapted to rotate about the same as a center, a friction-pulley mounted to revolve freely, and guides connecting the wheel fitted upon the eccentric and the pulley, whereby they are caused to revolve together, substantially as set forth.

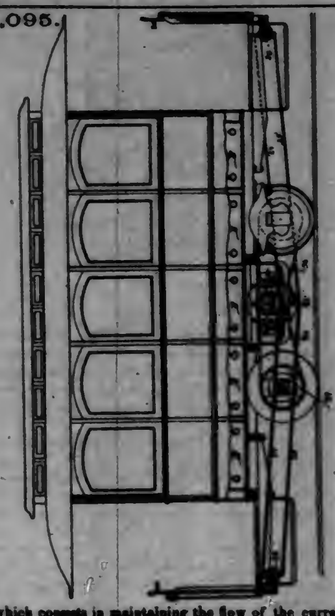
15. The combination of a vehicle, a motor mounted thereon, a shaft for said motor, two or more sets of sun-and-planet gear-wheels between the shaft and the driving-axle of the vehicle, the wheels of each set being differently proportioned to each other, guides for securing parallelism of motion of one member of each of said sets of gear-wheels, and means for bringing into operation either of said guides, substantially as set forth.

16. The combination of a vehicle, a motor mounted thereon, a shaft for said motor, two or more sets of sun-and-planet gear-wheels between the motor-shaft and the driving-axle of the vehicle, the wheels of each set being differently proportioned to each other, guides for securing parallelism of the driving member of each of said sets of gear, and means for controlling said guides, by which either of said guides may be thrown into operation, each of the other guides being in such position of the controlling mechanism thrown out of operation, substantially as set forth.

17. The combination of a vehicle, a motor mounted thereon, a train of gear-wheels between the motor-shaft and the driving-axle of the vehicle, one member of said train being normally rotated by the motor-shaft when the train is out of operative engagement therewith, a rotating pulley connected by guides with the normally-rotating gear, and friction-brakes for arresting said pulley, and thereby bringing the train of gear into operative engagement with the motor-shaft, substantially as set forth.

18. The combination of a vehicle, a motor therefor, a rotating brake device mounted upon the motor-shaft, a set of differential gear-wheels between the motor-shaft and the driving-axle of the vehicle, and guides connecting said gear-wheels and said rotating device, whereby the operation of the gear-wheels may be controlled, substantially as set forth.

19. The combination of a vehicle, a motor mounted thereon, and a train of sun-and-planet gear-wheels between the motor-shaft and the driving-axle of the vehicle, the initial wheel of said train maintaining in its movements positions of parallelism with itself when transmitting power, substantially as set forth.



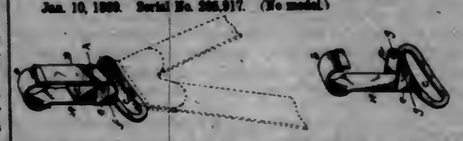
20. The combination of a vehicle, a motor mounted thereon, a series of sun-and-planet gear-wheels between the shaft of the motor and the driving-axle of the vehicle, the initial wheel of said series maintaining positions of parallelism with itself while operative to transmit motion, and guides for partially suspending the operation of said initial wheel, and thereby creating changes of speed in the transmitted motion, substantially as set forth.

21. The combination of a vehicle, a motor mounted thereon, a train of gear-wheels connecting the shaft of the motor with the driving-axle of the vehicle, and a friction-brake controlling the operative engagement of the shaft with the gear-wheels, the transmitted speed increasing relatively to the amount of pressure applied to the brakes, substantially as set forth.

407,095. METHOD OF VEHICLE-PROPULSION. WILLIAM MAIN, Brooklyn, N. Y. Original application filed Oct. 23, 1887, Serial No. 253,610. Divided and this application filed May 15, 1888. Serial No. 273,822. (No model.)

Claim.—1. In the propulsion of vehicles and the like by electric motors actuated by batteries, the method of changing the speed of the vehicle while causing the least possible deterioration of the bat-

407,095.

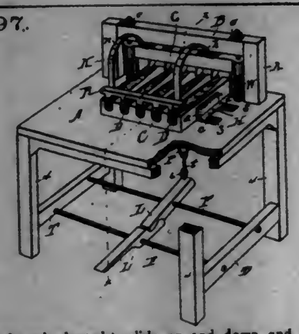


tery, which consists in maintaining the flow of the current from the battery and maintaining, as nearly as practicable, a constant rate of revolution for the motor and varying the ratio of transmission between the motor-shaft and the driving-shaft to correspond to the speed desired, substantially as described.

2. In the propulsion of vehicles and the like by electric motors actuated by batteries, the method of obtaining the maximum effect from the motor in starting while causing the least possible deterioration of the battery, which consists in first causing the motor to revolve disconnected from the driving-shaft of the vehicle and then effecting a power-transmitting connection between the revolving motor-shaft and the driving-shaft, substantially as described.

3. In the propulsion of vehicles and the like by electric motors actuated by batteries, the method of obtaining the maximum effect from the motor in starting while causing the least possible deterioration of the battery, which consists in first causing the motor to revolve disconnected from the driving-shaft of the vehicle, then effecting a power-transmitting connection between the revolving motor-shaft and the driving-shaft, and gradually attaining the speed of locomotion desired by gradually increasing the ratio of transmission between the motor-shaft and driving-shaft, substantially as described.

407,096. SNAP-HOOK. CHARLES A. MAIN, Buffalo, assignor of one-half to Adolph C. Knothe and Frank Knothe, New York, N. Y. Filed Jan. 10, 1889. Serial No. 295,917. (No model.)



Claim.—In a snap-hook, the combination, with the frame A, provided at one end with a hook *b* and at its opposite end with a loop *c*, and having on its lateral edges upwardly-projecting lugs *e*, of a U-shaped spring-tongue D, having its lower branch *d* resting upon the frame A, and provided on its upper branch with laterally-projecting pins *f*, depressed below the upper branch of said tongue and pivoted between the ears of the frame, whereby the tongue is held from both lateral and lengthwise movement on the frame, and an offset formed on the forward front end of the tongue and engaging against the end of the hook *b*, substantially as set forth.

407,097. DEVICE FOR SLITTING THE ENDS OF CIGAR-BUNCHES. EDWARD MARETZ, Detroit, Mich. Filed Feb. 26, 1889. Serial No. 301,606. (No model.)

Claim.—1. A device for slitting the end of cigar-bunches, consisting of a table to which is secured an upright frame, said frame supporting the vertical guide-rods V V, the cross-head G, arranged

407,097.

upon the rods and adapted to slide up and down, and having elongated slots S, the knives located in the slots in said cross-head, and means for adjusting them laterally therein, the coiled springs W W, and the actuating angle-rod P, having its ends secured to the under face of the cross-head G and being connected with the foot-lever L L', substantially as and for the purposes specified.

2. In a device for slitting the end of cigar-bunches, the combination of the table A, upright frame B K, guide-rods V V, and coiled springs W W, with the cross-head G, having the slots S, carrying the knives O O, the arched spring-arms *n n*, bolted to said cross-head and attached at their outer ends to the cross-piece R, the rod P, having its ends secured to the under face of the cross-head G, the link *t*, connecting the downward-extending loop of the rod P with the inner end of the part L of the foot-lever, the duplex foot-lever consisting of the parts L L', mounted on the fulcrum-rods F F', substantially as and for the purposes specified.

3. The combination of the legs, table, gages H H', the upright frame, guide-rods V V, springs W W, cross-head G, having slots S S, carrying knives O O, the spring-arms *n n*, cross-piece R, having blocks 3 3, the mold C, rod P, link *t*, the duplex lever, and rods F F', arranged and operating as and for the purposes specified.

407,098. PIGEON-HOLE CASE. DAVID C. MEEHAN, Columbus, Ohio. Filed Feb. 23, 1889. Serial No. 300,542. (No model.)

Claim.—1. A pigeon-hole case having vertically-moving shutters arranged in series, those of one series overlapping those of adjoining series, substantially as herein described.

2. A pigeon-hole case divided into compartments, in combination with vertically-moving shutters arranged in series, those of one series overlapping those of the series below it, and a rest or support for the upper series of shutters, substantially as herein described.

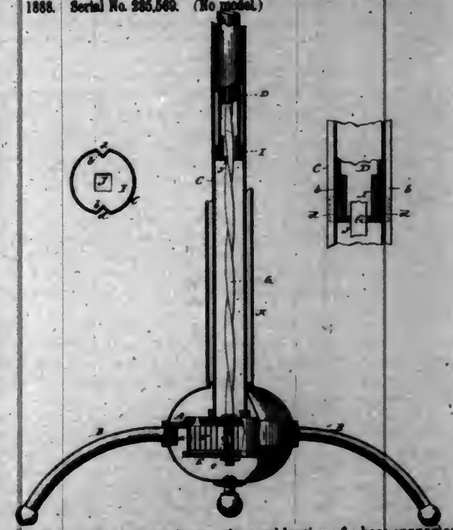
3. The combination, with a case divided into compartments and having horizontal partitions or shelves, of vertically-moving shutters having pivoted gravity-latches engaging said partitions when the shutters are elevated and adapted to automatically fall out of connection therewith when the shutters are moved, substantially as herein described.

4. The case divided into compartments having horizontal shelves or partitions, in combination with vertically-moving shutters arranged in overlapping series, rests or supports for the shutters of the upper series, and gravity-latches carried by the shutters and engaging the horizontal partitions or shelves, whereby said shutters are held in elevated positions, substantially as described.

5. The combination, with a case containing compartments and vertically-moving shutters, of pivoted latches carried by the shutters and engaging the horizontal partitions or floors of the compartments to maintain the shutters in raised positions, said latches being adapted to automatically fall out of engagement with the partitions or floors when the shutters are again moved, substantially as herein described.

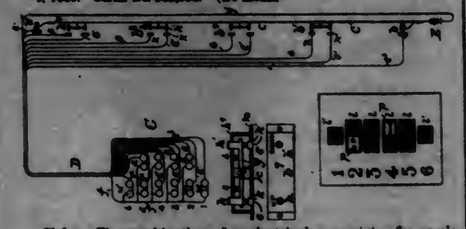
6. The combination, with a case containing compartments and provided with vertically-moving shutters, of the gravity-latch secured to each shutter and comprising a pivoted lever, and a pivoted pawl secured to the lever and having its inner end adapted to engage the horizontal partitions or floors of the compartments, substantially as described.

7. The combination, with a case containing compartments and vertically-moving shutters, of a plate secured to each shutter, a gravity-lever pivoted to the plate, and a pawl pivoted to the lever and extending through the plate and shutter, said pawl having a prong at its inner end for engaging the floors of the compartments or horizontal partitions, substantially as herein described.



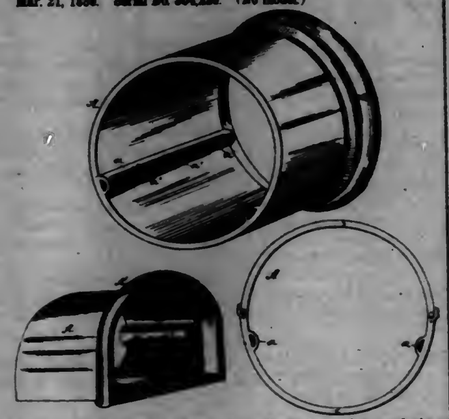
407,099. SWINGING CHAIR OR HAMMOCK. ROBERT W. MEYER, Berlin, Ontario, Canada. Filed Dec. 14, 1888. Serial No. 293,544. (No model.)

Claim.—1. The side rails B, top bar G, side bars I, pivoted on and suspended from said top bar, the cross-bar J, connecting the bars I, and the side bars K, jointed to the bars I and pivoted to the lower ends of the side bars, combined with the suspension-ropes, the cross-bar M, placed between the bars K, below the bar J, and the canvas L, supported at its lower end by the bar M, and at its upper end by the cross-bar connecting the bars B, substantially as described.



2. The top bar G, pulleys F and H, supported thereby, the side rails B, and the ropes E, passed over said pulleys and connected at the ends to the rails B, combined with the side bars I and K, jointed together, the bars I being connected to the bar G, and the bars K, pivoted to the ends of the rails B, the cross-bar J, connecting the bars I, the head-piece C, connecting the upper ends of the rails B, the cross-bar M, placed between the bars K below the cross-bar J, and the canvas L, connected at one end to the head-piece C and at the other end to the bar M, substantially as shown and described, and for the purpose specified.

407,100. STANDARD LAMP. JOHN C. MILLER, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed Sept. 17, 1888. Serial No. 285,569. (No model.)



Claim.—In a standard lamp, the combination of a base supported upon legs and adapted to rest upon the floor, a vertical tube C, stationary on said base and constructed with inwardly-projecting vertical ribs *b*, a second tube D, vertically adjustable in said tube C, a nut I, fixed to the lower end of the said tube D and constructed with grooves to engage the said ribs *b* in the tube C as a guide for the vertical movement of said tube D and so as to prevent its rotation, a coiled spring F, arranged in the base, its axis vertical, one end of said spring stationary in the base, and a vertical screw-rod G, supported in the base, held against vertical movement, but so as to permit its rotation, and extending centrally through the said coiled spring, the inner end of the said spring attached to the said rod, the said rod extending upward through the said nut and so that the vertical movement of the said tube D will impart rotative movement to the said rod, substantially as and for the purpose described.

407,101. SIGNALING APPARATUS. GEORGE P. MILLIKEN, Boston, assignor of one-half to Albert P. Sawyer, Newburyport, Mass. Filed Apr. 1, 1889. Serial No. 305,502. (No model.)

Claim.—The combination of an electrical annunciator for an elevator-car, having indicators for announcing the different floors and words or symbols indicating direction, with transmitting-keys attached to different floors and electrically connected with said annunciator, each floor-indicator and direction-indicator of the annunciator being each electrically connected with its corresponding keys, all substantially as shown and operating as set forth.

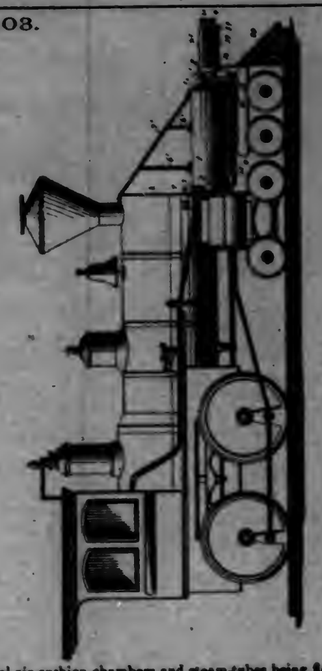
407,102. SEWER-PIPE. JOHN A. MEBUS, New Orleans, La. Filed Mar. 21, 1888. Serial No. 304,220. (No model.)

Claim.—1. A pipe provided with perforated supplemental pipes or tubes arranged upon its inner side, said supplemental pipes formed integral with the main pipe, substantially as shown and described.

2. A pipe provided with supplemental pipes or tubes perforated along the entire length, as shown, said supplemental pipes or tubes cast integral with the body of the main pipe and extended the entire length thereof and disposed on the lower inner surface of said main pipe, substantially as shown.

3. The pipe A, formed of sections, one or more of the lower sections provided with a supplemental perforated pipe or tube extending its entire length cast integral therewith, substantially as and for the purpose described.

407,103. SAFETY-PILOT FOR RAILWAY-TRAINS. NORMAN S. MOREY, New York, N. Y. Filed Nov. 30, 1888. Serial No. 292,270. (No model.)



Claim.—1. The combination, with a locomotive, of a series of telescopic air-cushion chambers, a buffer at the outer end of the telescopic air-cushion chambers, and a rolling support for the telescopic chambers, substantially as shown and described.

2. The combination, with a locomotive, of a series of telescopic air-cushion chambers with a buffer at their outer end, a pilot-car for supporting the telescopic air-cushion chambers, and means, substantially as described, for moving the telescopic air-chambers into extended position, substantially as shown and described.

3. The combination, with a locomotive, of a series of telescopic air-cushion chambers with a buffer at their outer end, a pilot-car for supporting the telescopic air-cushion chambers, and a series of telescopic tubes connected with the telescopic air-cushion chambers and with the locomotive and adapted to be projected by means of steam or compressed air, substantially as shown and described.

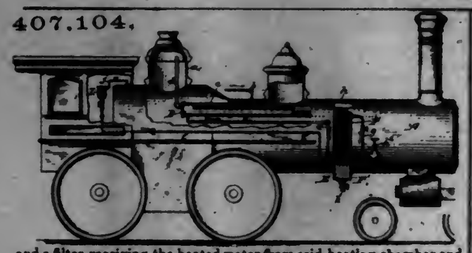
4. The combination, with a locomotive, of a series of telescopic air-cushion chambers with a buffer at their outer end, a pilot-car for supporting the telescopic air-cushion chambers, and a series of telescopic tubes connected with the telescopic air-cushion chambers and with the locomotive and adapted to be projected by means of steam, the several air-cushion chambers and steam-tubes being flexibly connected with the locomotive and the pilot-car, substantially as set forth.

407,108.

5. The combination, with a locomotive, of a pilot-car, a series of telescopic air-cushion chambers forming a connection between the pilot-car and the locomotive, a second series of telescopic air-cushion chambers mounted on the pilot-car with a buffer at their forward end, and means for projecting the first and second series of telescopic air-cushion chambers, substantially as shown and described.

6. The combination, with a locomotive, of a pilot-car, a series of telescopic air-cushion chambers forming a connection between the pilot-car and the locomotive, a double series of telescopic air-cushion chambers mounted on the pilot-car and having a buffer at their forward end, a series of telescopic tubes connected with the several series of telescopic air-cushion chambers and movable therewith and connected with the locomotive to be extended by steam or compressed air, substantially as shown and described.

7. The combination, with a locomotive, of a series of telescopic air-cushion chambers, a buffer at their outer end formed with an open recess having inwardly-projecting spring-clutches, and a rolling support for the telescopic air-cushion chambers, substantially as shown and described.



8. The combination, with a locomotive, of a series of telescopic air-cushion chambers, a buffer at their outer end formed with an open recess having inwardly-projecting spring-clutches, and a detachable head-piece with lateral slots engaging the spring-clutches and projecting out of the buffer, and a rolling support for the telescopic air-cushion chambers, substantially as shown and described.

9. The combination, with a locomotive 2, of a pilot-car 9, a series of telescopic air-cushion chambers 1, connected to the locomotive 2 and having a piston-rod 8 at their forward end flexibly connected to car 9, a double series of telescopic air-cushion chambers 22, mounted on the pilot-car 9 and having a buffer at their forward end, a series of telescopic tubes 38, connected to air-chambers 1 and connecting by a pipe 46 at their rear end with the boiler of locomotive 2, the pipe 46, having a safety-valve 47, and a double series of telescopic tubes 39, connected to air-chambers 22 and connecting by means of branch tubes 45 with tubes 38, substantially as shown and described.

407,104. HEATING AND PURIFYING FEED-WATER FOR STEAM-BOILERS. VIRGIL H. MCCONNELL, Buffalo, N. Y. Filed Dec. 20, 1888. Serial No. 294,967. (No model.)

Claim.—1. The combination, with a steam-boiler, of a water-heating chamber arranged within the boiler and communicating with the interior of the boiler, whereby the water in said chamber is heated by the steam entering the chamber, a spray device whereby the water is delivered into said heating-chamber in a finely-divided condition,

407,104.

and a filter receiving the heated water from said heating-chamber and connected with the interior of the steam-boiler, substantially as set forth.

2. The combination, with a steam-boiler, of a water-heating chamber arranged within the boiler and communicating with the interior of the boiler, whereby the water in said chamber is heated by the steam entering the chamber, a spray device whereby the water is delivered into said heating-chamber in a finely-divided condition, a filter receiving the heated water from said heating-chamber and connected with the interior of the steam-boiler, and a vessel containing alumina or any other coagulating agent and connected with the filter, substantially as set forth.

3. The combination, with a steam-boiler, of a closed heating-chamber B, arranged lengthwise within the boiler and extending along the upper portion thereof, a steam-supply pipe *d*, connected with said heating-chamber and terminating in the dome of the boiler, a spray-pipe arranged in said heating-chamber, a water-supply pipe connected with said spray-pipe, a filter, a pipe connecting the filter with the heating-chamber B, and a pipe whereby the purified water is conducted from the filter into the boiler, substantially as set forth.

4. The combination, with a steam-boiler, of a closed heating-chamber B, arranged within the boiler and connected with the interior of the boiler by a pipe *d*, terminating in the dome of the boiler; a spray-pipe *c*, arranged within said heating-chamber, a water-supply pipe *b*, connected with said spray-pipe, a filter E, a pipe *e*, connecting the filter with the heating-chamber B, a pipe *g*, whereby the purified water is conducted from the filter into the boiler, a vessel I, containing alumina or any other coagulating agent, and connected with the filter supply-pipe *c*, and a steam-pipe *j*, connecting the vessel I with the interior of the steam-boiler, substantially as set forth.

407,105. PAPER HOLDER AND CUTTER WITH PRINTING ATTACHMENT. CHARLES J. MCRAE and HENRY C. BAKER, Kansas City, Mo. Filed May 6, 1888. Serial No. 273,216. (Model.)

Claim.—1. In a paper-holder, a rocking frame adapted to support a roll of paper mounted thereon, said rocking frame being pivoted between supports, substantially as described.

2. In a paper-holder, a rocking frame for supporting a roll of

407,105.

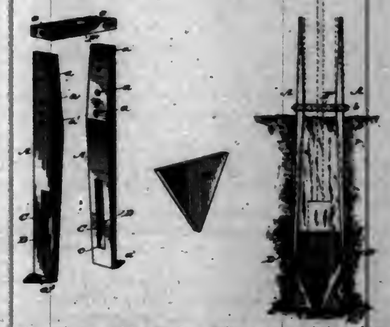
paper, journaled between perpendicular supports, said frame being provided with one or more supporting-rollers for the paper, substantially as set forth.

3. In a paper-holder, a rocking supporting-frame for a roll of paper, and said supporting-frame provided with a printing-roller, substantially as set forth.

4. In a paper-holder, a rocking frame for supporting a roll of paper, and said frame provided with a printing-roller and a cutting-knife, substantially as set forth.

5. In a paper-holder, a rocking frame for supporting a roll of paper, and said frame provided with printing and ink-supplying rollers and a cutting-knife, substantially as set forth.

6. In a paper-holder, a roll of paper, a printing-roll located beneath the roll of paper, and another printing-roll located above said roll of paper, substantially as set forth.



7. In a paper-holder, the combination of a core and shaft for supporting a roll of paper, said shaft being adapted to slide in parallel grooves in the upright frame and a printing-roller above it journaled in a frame which also slides in the same grooves, substantially as described.

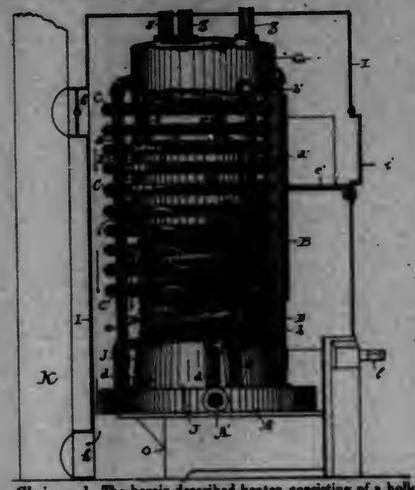
8. In a paper-holder, the combination of a rocking frame for supporting a roll of paper, a shaft or spool mounted in a vertically-grooved support, and a printing-roller mounted in a sliding frame, substantially as described.

9. In a paper-holder, the combination of the supports for a roll of paper and a printing attachment mounted above said roll and having a device for fastening it out of contact with the paper, in the manner substantially as set forth.

10. In a paper-holder, a rocking frame for supporting a roll of paper, said rocking frame being provided with a printing-roller, a supporting-roller, and a double-edged cutting-knife, substantially as described.

407,106. ANCHOR ATTACHMENT FOR WINDMILL-POSTS. LEONARD J. M. NERF, Sutton, Nebr. Filed Apr. 10, 1888. Serial No. 306,741. (No model.)

Claim.—1. An anchor attachment for posts, consisting of two leg portions, a yoke for holding the upper ends thereof apart, the upper ends of said legs having a pivotal bearing in said yoke, and a wedge adapted to be forced between the lower ends of said legs to spread them apart, substantially as and for the purpose described.



2. An anchor attachment for posts, consisting of leg portions A A, having lateral outwardly-projecting feet a^3 at their lower ends, a yoke for holding the upper ends of said legs apart, the upper ends of said legs having a pivotal bearing in said yoke, and a wedge adapted to force the lower ends of the legs apart when forced downward, substantially as shown and described.

3. The combination, with the legs A A, having a substantially pivotal bearing near the upper ends, said legs tapered on their inner faces upwardly and downwardly from said pivotal point, of a wedge-block adapted to be inserted between the lower ends of said legs and spread the same when forced downward, substantially as shown and described.

4. An anchor attachment for posts, consisting of the legs A A, provided with vertically-elongated slots C C near their lower ends, lateral outwardly-projecting feet at their lower ends, a yoke for holding the upper ends of the legs apart, said legs having a pivotal bearing in said yoke, bails D, formed on the outer faces of the legs, projecting over the lower ends of the slots C C, a wedge fitting between the lower ends of the legs, the upper outer edges thereof engaging the slots C, said edges adapted to slip under and engage the bails D when the wedge is forced home, substantially as and for the purpose described.

5. As an improvement in anchor attachments for posts, the combination, with post-section G, of the legs A A, tapered at their upper ends, as shown, means for securing said ends to the post, substantially as described, the lower ends thereof formed into lateral feet a^3 a^3, elongated slots C C, formed near their lower ends, bails D, formed on the outer faces of the legs over the slots, and a wedge disposed between the legs, its upper outer ends engaging the slots and held from upward movement by the bails D, all arranged substantially as and for the purpose shown and described.

407,107. HEATER. CHARLES B. NELSON, Portland, Me. Filed Nov. 30, 1883. Serial No. 302,203. (No model.)

Claim.—1. The herein-described heater, consisting of a hollow base, a plurality of pipes connected with said base and coiled or wound to form a single-cylinder fire-box above it, and a dome or chamber above said coil and connected therewith, in combination with a case inclosing said parts, substantially as shown.

2. The herein-described heater, consisting of a hollow base, pipes connected with said base and formed into a coil or fire-box, a chamber or dome above said coil and connected therewith, a hollow ring or jacket above said coil and below said dome, and pipes connecting said jacket with said dome and said base, in combination with a case inclosing said parts, substantially as shown.

3. The herein-described heater, consisting of a hollow base, pipes connected with said base and formed into a coil or fire-box, a dome or chamber above said coil and connected therewith, a vertical pipe or column connected with said base outside of said coil and extending above said base, and pipes extending from said column around said coil substantially concentric therewith and connecting with said dome, in combination with a case inclosing said parts, substantially as shown.

4. The herein-described heater, consisting of a hollow base, pipes connected with said base and formed into a coil or fire-box, a dome or chamber above said coil and connected therewith, a ring or jacket above said coil and below said dome, and pipes connecting it with said dome and said base, a vertical pipe or column connected with said base outside of said coil and extending above said base, and pipes extending from said column around said coil substantially concentric therewith and connecting with said dome, in combination with a case inclosing said parts, substantially as shown.

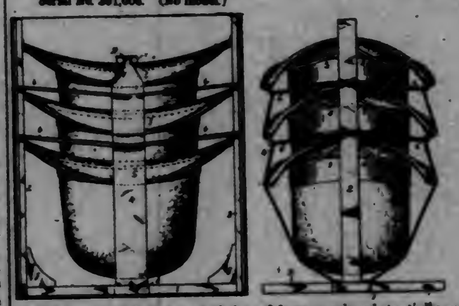
407,108. HAT-STAY. SAMUEL T. NEWMAN, Danbury, Conn., assignor of one-half to Edmund Tweedy, same place. Filed Nov. 16, 1888. Serial No. 291,697. (No model.)

Claim.—1. A hat-stay consisting of frame-work, substantially as described and shown, suspending-strips for holding the hats, and side strips adapted to extend from the bottom over the top of the upper hat.

407,108.

2. A hat-stay consisting of frame-work, substantially as described and shown, suspending-strips for holding the hats, side strips adapted to extend from the bottom over the top of the upper hat, and holding-pieces secured to the side strips to engage the brims of the hats and support the hats when the frame-work is inverted.

3. A hat-stay consisting of frame-work, substantially as described and shown, suspending-strips for holding the hats, an independent cross-piece adapted to lie over the upper hat, and side strips extending from the bottom over said cross-piece, where they are secured, so that in use the hats cannot come in contact with the box.



4. A hat-stay consisting of frame-work, suspending-strips for holding the hats, an independent cross-piece, side strips extending from the bottom over the top of said cross-piece, and holding-pieces to engage the brims of the hats, whereby they are supported when the frame-work is inverted.

5. A device for packing hats, consisting of a base-piece, end pieces, and a cross-piece secured to the base-piece, suspending-strips attached to the end pieces to engage the opposite sides of the hats, and side strips secured to the cross-piece and capable of being passed over the edges of the brims and secured together at the top.

6. A device for packing hats, consisting of a base-piece, end pieces, and a cross-piece secured to the base-piece, suspending-strips secured to the end pieces, side strips having holding-pieces to engage the brims of the hats, and an independent cross-piece for engaging the upper hat, over which the side strips are secured, the end pieces and cross-pieces only coming in contact with the hat-box in use.

7. A device for packing hats, consisting of a base-piece, end pieces, and a cross-piece 3, secured to the base-piece, a cross-piece 7, having a stay on its upper side to lie within the hat, and notches at its ends, suspending-strips and side strips having holding-pieces 6 to engage the brims of the hats, said side strips engaging the notches and being secured together over cross-piece 7.

407,109. HAT-STAY. SAMUEL T. NEWMAN, Danbury, Conn., assignor of one-half to Edmund Tweedy, same place. Filed Nov. 16, 1888. Serial No. 291,698. (No model.)

Claim.—1. A hat-stay consisting of frame-work, substantially as described and shown, suspending-strips for holding the hats, side strips adapted to extend from the bottom over the tops of the hats, and independent strips for inclosing the side strips between each pair of brims, whereby the hats may be held securely in position.

2. A hat-stay consisting of frame-work, substantially as described and shown, suspending-strips for holding the hats, an independent cross-piece for use over the upper hat, side strips extending from the bottom over said cross-piece, where they may be secured, and independent strips for inclosing the side strips between each pair of brims, whereby the hats may be secured in position.

3. A device for packing hats, consisting of a base-piece, end pieces, and a cross-piece secured to the base-piece, suspending-strips secured to the end pieces, whereby the hats may be supported, side

strips secured to the cross-piece and connected over an independent cross-strip 3, and independent strips 6, for inclosing the end pieces and the side-strips between each pair of brims, so that the bats may be held in place in any position in which the box may be placed, the end strips and cross-pieces only coming in contact with the box.

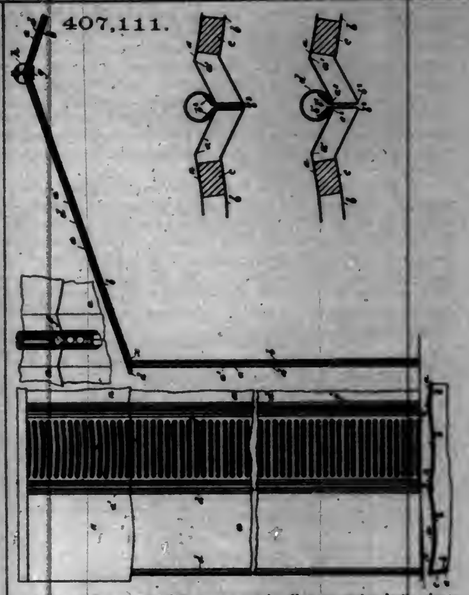
407,110. DEVICE FOR OPERATING DOORS FOR ELEVATOR-WELLS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Mar. 23, 1889. Serial No. 304,531. (No model.)

Claim.—1. In an elevator, the combination of the well-room door C, having a spring L and a spring S of less force, said springs being adapted to respectively open and close said door C, substantially as described, with an elevator-carriage having upon it rods adapted to operate at the option of the attendant the said spring L by means of a movable block L^4, and a chain connecting the block and spring, substantially as described, and for the purpose set forth.

2. In an elevator, a door C, having counteracting springs of different forces adapted to operate in opposition to each other, as described, with a movable block attached to the walls of the elevator well-room and operated by the movement of the elevator-carriage, and a latch-hook K^3, adapted to be released by a lever under the control of the attendant, substantially as described, and for the purpose set forth.

3. In an elevator, the combination of the door C, spring S, spring L_1, sliding block L^4, and an elevator-carriage having rods adapted to engage with the sliding block L^4, substantially as described, and for the purpose set forth.

4. In an elevator, the combination of the door C, the spring L_1, chain L', block L^4, having pawls L^5 L^6, the rod M, and cams M^3 M^4, with the elevator-carriage having engaging rods E' and D^3, substantially as described, and for the purpose set forth.

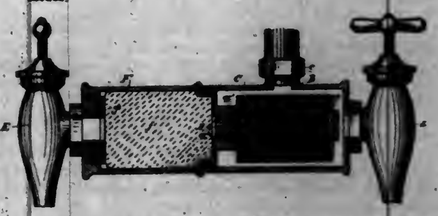


5. In an elevator, the combination of the foot-lever D', rod D^2, lever D^4, rod D^5, with sliding block L^6, having pawls L^5 L^6, chain L', spring L_1, and door C, having a retractor-spring S, substantially as and for the purpose set forth.

6. In an elevator, the combination of the latch-hook K^3, the sliding bar K', having a recess k, with the spring-plate K and actuating-lever H^3, substantially as and for the purpose set forth.

7. In an elevator, the combination of the door C, spring L_1, chain L', and block L^4, adapted to be moved by the carriage, as described, with the piston-rod P, piston P', and cylinder P^2, substantially as described, and for the purpose set forth.

407,111. SHEET-METAL STRUCTURE. WILLIAM ORR and PETER S. BROWN, Glasgow, County of Lanark, Scotland. Filed Mar. 1, 1889. Serial No. 301,632. (No model.) Patented in England Aug. 21, 1888, No. 12,686.



Claim.—1. For use in the erection of metal structures, an anti-thermal panel composed of two plain or corrugated sheets whose edges are bent or folded so as to grip hold upon each other, the sheets being

maintained at required distances apart by distance-strips, bolts, rivets, or equivalents, and the space between them being filled in or not with a non-conducting material, substantially as described.

2. For use in the erection of sheet-metal structures, an anti-thermal panel composed of two plain or corrugated sheets whose edges are so folded that the bent ends of one sheet butt against bends near the ends of the other sheet, the extremities of the second sheet being flared over the bend of the first-mentioned sheet, and the sheets being maintained at required distances apart by distance-strips, bolts, rivets, or equivalents, the space between them being filled or not with non-conducting material, substantially as described.

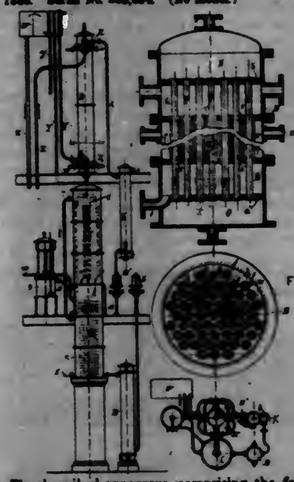
407,112. FILTER. CHARLES H. PARMENTER and GEORGE V. BLACKMAN, Oakland, Cal. Filed Feb. 14, 1889. Serial No. 299,778. (No model.)

Claim.—1. In a filter, a bolt or bar having grooves or channels in its sides and provided with a number of independent disks of cloth or other filtering material encircling it around its grooves or channels and pressed closely together, in combination with an encircling casing connected with the water-supply, a faucet connected with said casing, and a faucet having a nut *a*, connected with the threaded end of said bolt or bar and communicating with its grooves or channels, substantially as described.

2. In a filter, a bolt or bar having openings in its sides and provided with a number of independent disks of cloth or other filtering material encircling it around its grooves or channels and pressed closely together, in combination with an encircling casing connected with the water-supply, a faucet connected with said casing, a cylinder communicating with the grooves or channels of the bolt or bar and containing purifying material, and a faucet connected with said cylinder, substantially as described.

3. In a filter, the bolt or bar having grooves or channels in its sides and provided with a number of independent disks of cloth or other filtering material encircling it around its grooves or channels and pressed closely together, in combination with an encircling casing connected with the water-supply, a faucet connected with said casing, a cylinder communicating with the grooves or channels of the bolt or bar and containing purifying material, a faucet connected with

said cylinder and having a flanged base screwing thereon, and a washer in the cylinder pressed upon by the flanged base of the faucet for compressing the purifying material, substantially as described.

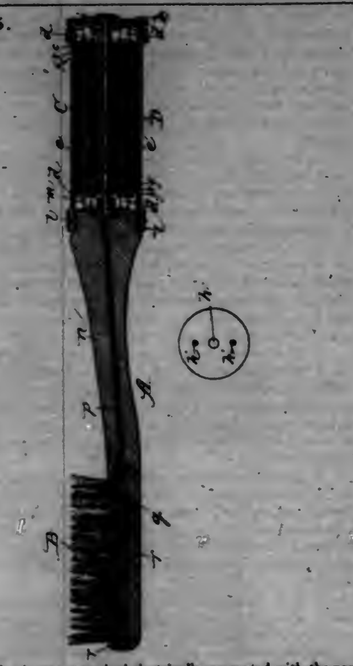


407,113. DEVICE TO PREVENT INTERFERENCE OF HORSES' FEET. CHARLES F. POWELL, Minneapolis, Minn. Filed Apr. 22, 1889. Serial No. 308,103. (No model.)

Claim.—1. In a harness attachment, the anti-interfering device consisting of strips or tongues of springy material having their front ends padded and their divergent rear ends secured to a plate, and means for securing the device to the breeching of a harness, substantially as and for the purpose described.

2. In a harness attachment, the combination of an anti-interfering device consisting of two springy tongues projecting forward from a rear plate uniting them, padding secured to their front ends, and straps secured to said rear plate, with the breeching of a harness, substantially as and for the purpose described.

407,114. APPARATUS FOR SEPARATING LIQUIDS AT DIFFERENT BOILING-POINTS. LOUIS E. A. PEAUDET, Paris, France. Filed Aug. 24, 1888. Serial No. 283,054. (No model.)

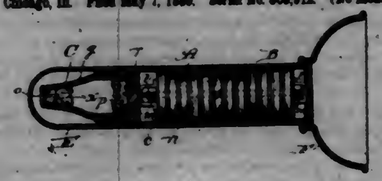


Claim.—The described apparatus, comprising the following elements in combination, namely: first, the regenerator composed of chambers, such as a hollow coil and an inclosing-chamber on opposite sides of heat-conducting walls and provided with individual inlets and outlets; second, the boiler composed of a receiving-chamber and a heater therefor, such as a coil, arranged therein; third, the retarding-analyzer composed of a series of communicating chambers, and, fourth, the analyzing-condenser composed of a vessel provided on the inside with a number of narrow parallel flat passages, such as formed between concentric tubes of nearly the same diameter, and with an inlet and an outlet for the said passages separate from those for the space in said vessel on opposite sides of said passages, the interiors of said four elements communicating with one another, as follows, namely: the outlet for one chamber of the regenerator with the first chamber of the retarding-analyzer, the inlet for the other chamber of the regenerator with the boiler, the last chamber of the retarding-analyzer with said boiler, the inlet to the flat passages in the analyzing-condenser with the said first chamber of the retarding-analyzer, and the inlet and outlet of the space in said condenser on opposite sides of said passages with circulating-pipes, substantially as and for the purpose set forth.

407,115. ELECTRIC BRUSH. HARRY P. PRATT, Chicago, Ill. Filed Mar. 21, 1888. Serial No. 304,164. (No model.)

Claim.—1. In combination, a brush or the like article and a galvanic battery inclosed in the brush with the elements forming it secured together independently of the inclosure containing them, whereby the battery may be readily removed and readjusted with the poles

407,115.



reversed and having one terminal electrically connected with the part of the article to be applied to the body and the other with the part to be held in the hand, whereby, when the article is used, the circuit shall be closed through the body of the user, substantially as and for the purpose set forth.

2. In combination, a brush having its bristles or corresponding portion formed with non-metallic material secured to metal *r* and a handle portion conductive of electricity, and a galvanic battery inclosed in the handle and having one pole connected therewith and the opposite pole with the conductor *r*, substantially as and for the purpose set forth.

3. In combination, a brush or the like provided with a hollow handle conductive of electricity and containing a galvanic battery, formed with perforated plates of suitable materials, a rod *g*, extending through the plates and supported at opposite extremities in the opposite ends of the handle, rods *c*, extending through the plates and having clamp-nuts *d* on their opposite ends holding the plates of the battery together, and a conductor *r*, leading to the bristles B or analogous part of the brush and in contact with the nuts *d* at one end of the battery, these at the opposite end being in contact with the handle, substantially as and for the purpose set forth.

4. An electric brush comprising, in combination, a neck portion *n*, of insulating material carrying a conductor *r*, supporting bristles B or the like and extending through the neck and terminating in a flanged metal socket *m*, a hollow metal handle C, secured to the neck *n* and provided with a removable metal cap *k*, and a galvanic battery D in the handle formed with perforated plates of suitable materials, a rod *g*, extending through the plates and supported at opposite ends in the socket *m* and cap *k*, and rods *c*, extending through the plates and having clamp-nuts *d* on their opposite ends holding the plates of the battery together and in contact with the socket *m* and cap *k* at opposite ends of the battery, the whole being constructed and arranged to operate substantially as described.

407,116. ELECTRO-THERAPEUTIC DEVICE. HENRY P. PRATT, Chicago, Ill. Filed May 7, 1889. Serial No. 309,912. (No model.)

Claim.—1. In an electro-therapeutic device, the combination of a chamber A, having its ends formed of conducting material, a cap B of conducting material covering one of said ends, and an electric generator D in the chamber having its poles in electrical connection with the said ends, whereby, when the device is held at one end in the hand and the cap on the other end is applied to the body, the circuit will be closed through the body, substantially as and for the purpose set forth.

2. In an electro-therapeutic device, the combination of a chamber A, having at opposite ends a cap B and a nozzle C, both of conducting material, and an electric generator D in the chamber, having contacts *l* at opposite ends in electrical contact with the parts B and C, substantially as and for the purpose set forth.

3. In an electro-therapeutic device, the combination of a chamber A, having at opposite ends a cap B and a nozzle C, both of conducting material, an electric generator D in the chamber, having contacts *l* at opposite ends in electrical contact with the parts B and C, and a cap E, of conducting material, removably secured over the nozzle, substantially as and for the purpose set forth.

4. In an electro-therapeutic device, the combination of a chamber A, having at opposite ends a cap B and a nozzle C, both of conducting material, the nozzle being formed with a coupling *r* and tip *q*, separably connected together, and an electric generator D in the chamber having metallic contacts *l* at opposite ends and respectively in contact with the cap B and coupling *r*, substantially as and for the purpose set forth.

5. In an electro-therapeutic device, the combination of a chamber A, having at opposite ends a cap B and a nozzle C, both of conducting material, and a galvanic battery D in the chamber having its elements connected by a rod *n* and clamped together on the rod, and contacts *l* on the projecting ends of the rod confined, respectively, against the cap B and nozzle C, substantially as and for the purpose set forth.

6. In an electro-therapeutic device, the combination of a chamber A, having at opposite ends a cap B and a nozzle C, both of conducting material, the nozzle being formed with a coupling *r* and tip *q*, separably connected together, absorbent material *p* in the nozzle moistened with an inhalent substance, and an electric generator D in the chamber, having contacts *l* confined against the parts B and C, substantially as and for the purpose set forth.

7. In an electro-therapeutic device, the combination of a chamber A, having at opposite ends a cap B and a nozzle C, both of conducting material, an electric generator D in the chamber, having contacts *l* at opposite ends confined against the parts B and C, a cap E of conducting material, removably secured over the nozzle, and a cap F, extending from the cap B, substantially as and for the purpose set forth.

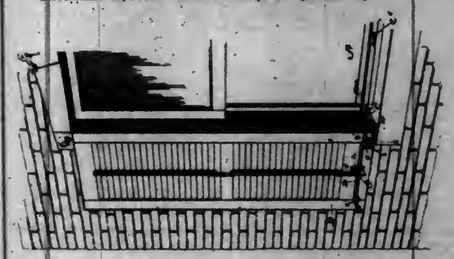
407,117. PROCESS OF CONVERTING CRUDE IRON INTO MALLEABLE IRON OR STEEL. GUSTAVE L. ROBERT, Stenay, France, assignor, by mesne assignments, to the Bookwalter Steel and Iron Company, Jersey City, N. J. Filed Nov. 20, 1888. Serial No. 291,319. (No specimens.) Patented in England May 9, 1888, No. 6,886.

Claim.—1. In the conversion of molten cast or crude iron into malleable iron or steel, the mode substantially as hereinbefore described, consisting in subjecting the molten metal to the action of a converting blast on the surface portion only of the metal, and in lowering the level of the blast as the conversion proceeds, substantially as described.

2. In the conversion of crude iron into malleable iron or steel, subjecting the bath of molten metal to the action of an oxidizing-blast upon a limited portion of the metal at the surface only of the bath, and maintaining the relative positions of the metal surface and the blast during the process of conversion, substantially as described.

407,118. FIRE-HOSE REST OR SUPPORT. CYRUS B. ROBINSON, East Concord, N. H. Filed Dec. 26, 1888. Serial No. 294,583. (No model.)

Claim.—1. In an apparatus for partially supporting one end of a fire-hose and its nozzle, a rod to which are rigidly attached two or



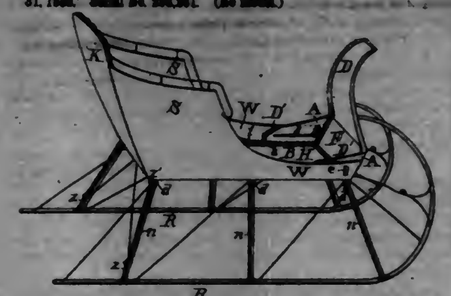
more brackets provided with straps and buckles for securing a section of hose thereto, and rods secured at opposite sides of said brackets and bent in a manner to form handles adapted to be grasped by a fireman in directing a stream.

2. In an apparatus for partially supporting one end of a fire-hose and its nozzle, a rod having one end sharp, and provided near its sharp end with a rigid collar, two or more brackets rigidly secured to said rod provided with straps and buckles for securing a section of hose thereto, and rods secured at opposite sides of said brackets and bent in a manner to form handles adapted to be grasped by a fireman in directing a stream.

3. The combination, with a rod having one end sharp and provided with a rigid collar, as shown, of a bracket rigidly secured to its opposite end, having ears at opposite sides and projecting upward therefrom and provided with horizontal slots, as shown, and flexible straps and a buckle for securing a section of hose thereto, one or more brackets rigidly secured to said rod at points below its top, provided with straps and buckles, as shown, and rods secured at opposite sides of said brackets and bent in a manner to form handles adapted to be grasped by a fireman in directing a stream.

407,119. SHUTTER-WORKER. DAVID H. ROYER, Millmont, Pa. Filed June 19, 1888. Serial No. 277,262. (No model.)

Claim.—1. In combination with the swinging shutter, the jointed rotating and sliding rod passed through the sill at an inclination from the horizontal, and plates, substantially as described, connecting the outer end of the rod to the shutter and arranged with relation to each other to permit the rod to play vertically and also horizontally, substantially as and for the purpose described.



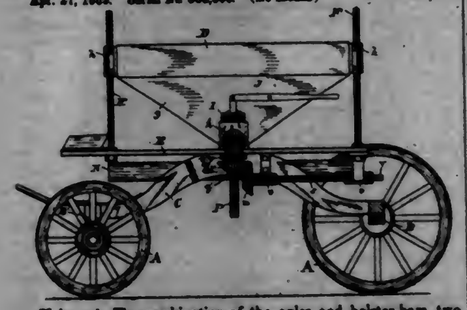
2. In combination with the swinging shutter, the plate *b'*, fixed thereto, the plate c^2, applied to the first-named plate to slide horizontally and provided with a vertical slot *c'*, and the jointed sliding and rotating rod C, extended through the sill or casing and mounted at its outer end in the slot *c'*.

3. In combination with the shutter and window-sill having an inclined surface, the jointed rotating and longitudinally-moving rod connected at its outer end to the shutter, and the tapered covering and supporting plate F, applied to the sill and encircling the rod, as described.

4. In combination with the shutter and the jointed longitudinally-movable rotative rod, the catch or dog E, pivoted to the shutter, and the operating-arm D, fixed to the rod and acting upon the dog, as described.

5. In combination with the shutter and a plate *h* thereon, the jointed longitudinally-movable rotative rod and the arm D, fixed on said rod and provided with shoulder *g* to engage the plate *h*.

407,120. SLEIGH. WILLIAM B. ROBERTS, Detroit, Mich. Filed Jan. 31, 1888. Serial No. 262,261. (No model.)



Claim.—1. In combination with the running-gear of the sleigh, the stationary foot-board, the rearwardly-extending side sections made fast at one end to said foot-board, the horizontal slots in the side sections, the horizontally-sliding box having the reduced sides W, which overlap the side sections A, and the bolts loosely coupling the overlapped portions, substantially as and for the purposes specified.

2. In a sleigh, and in combination, the beams, the rails made fast thereto, the stationary foot-board, the side sections attached thereto, the slots *s*, the shifting box having the bars H' made fast thereto and lying parallel with and outside of the rails H, the reduced sides of the box overlapping the side sections, and bolts coupling movably the sides of the box to the fixed or side sections, as and for the purposes specified.

3. In combination with the beams, knees, and runners of the sleigh, the stationary foot-board, the metal side extensions, the shifting box, the swinging braces coupling the box to the running-gear of the sleigh, and means of adjustably coupling the sides W of the box to the fixed sections A, whereby the box is adapted to be moved forward and backward to decrease and increase its length, for the purposes specified.

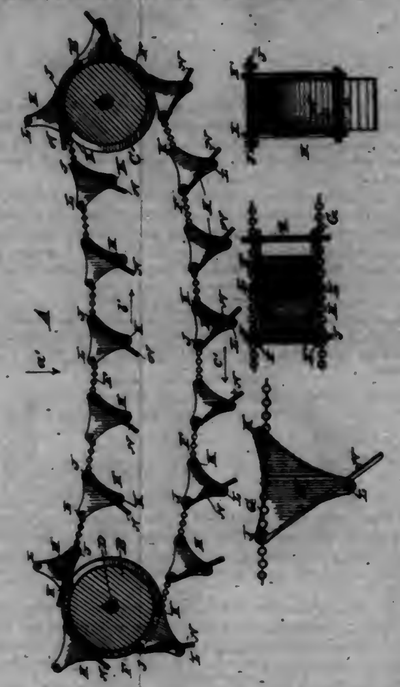
407,121. COAL-CART. JOSEPH R. EARLE, Baltimore, Md. Filed Apr. 27, 1888. Serial No. 272,060. (No model.)

Claim.—1. The combination of the axles and bolster-bars, two arched reach-bars C, horizontal bars E, attached to the reach-bars, vertical guide-bars F, projecting up from the said horizontal bars, and the body D, seated on the elevated part of the arched bars and provided with a side discharge-gate.

2. The combination of the axles and bolster-bars, two arched reach-bars C, horizontal bars E, attached to the reach-bars, vertical guide-bars F, projecting up from the said horizontal bars, a body seated normally on the elevated part of the arched bars, and a lift-screw P, to raise the body above its normal seat.

3. The combination of the axles and bolster-bars, reach-bars, vertical guide-rods F, provided with slots, a body D, having bearings A, which slide on the vertical rods, a lift-screw to raise the body, and keys *w*, inserted in the said slots above the body-bearings.

407,122. LUBRICATOR FOR SPINNING MACHINERY. LAZARUS B. SANFORD and THOMAS GREENWAYTE, Fall River, Mass. Filed Nov. 23, 1888. Serial No. 291,674. (No model.)



Claim.—1. A lubricator for spinning machinery, consisting of a tube provided with a foot having a recess on its inside, an aperture leading from the recess to the tube, and lugs for pivoting it to the tension device of the rolls, as set forth.

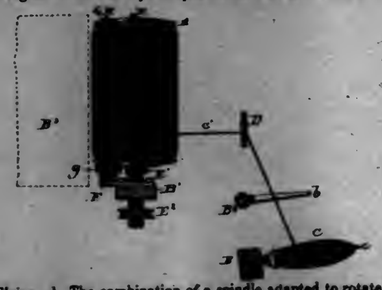
2. The lubricator K, consisting of the tube L, provided with the foot N, having the recess P, the aperture O, leading from the recess to the tube, and with the lugs N', by which it is pivoted to the tension device, the lower end N² of the foot resting against the neck of one of

the rolls and serving as a cleaner for the same, substantially as described and shown.

407,123. WATER-MOTOR. LOUIS P. SAPPY, Gleasonia, Kans. Filed Mar. 27, 1889. Serial No. 305,017. (No model.)

Claim.—1. A water-motor comprising two traveling endless chains and buckets pivoted on the said chains, and each comprising side plates, stays connecting the said side plates with each other, one of the stays forming the pivot for the bucket, and a gate forming the bottom of the bucket pivoted on the pivotal stay and free to swing between the other two stays, all arranged substantially as shown and described.

2. In a water-motor, a bucket comprising two side plates, stays for connecting the said side plates with each other, and a gate forming the bottom of the bucket pivoted on one of the said stays and free to swing between the other stays, substantially as shown and described.

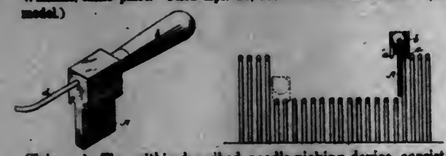


3. In a water-motor, the combination, with two endless chains mounted to travel, of a bucket pivoted between the said chains and each comprising side plates fitted between the said chains, stays connecting the said side plates with each other placed equidistant apart, the said stays projecting at each end beyond the said plates to engage the chains, and a gate forming the bottom of the bucket pivoted on one of the said stays between the said side plates and free to swing between the other stays, substantially as shown and described.

4. In a motor, the combination, with two parallel drums mounted to rotate, of endless chains passing over the said drums, and buckets pivoted on the said chains and each comprising side plates fitted between the said endless chains, stays connecting the said side plates with each other placed equidistant apart, the said stays projecting at each end beyond the said plates to engage the chains, and a gate forming the bottom of the bucket pivoted on one of the said stays between

the said side plates and free to swing between the other stays, substantially as shown and described.

407,124. MACHINE FOR WINDING THREAD OR YARN UPON BOBBINS. LOUISA A. SAUNDERS, Nashua, N. H., executrix of Benjamin Saunders, deceased. Filed Apr. 1, 1889. Serial No. 305,943. (No model.)

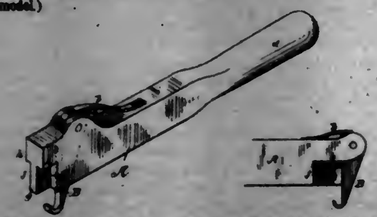


Brief.—The object of the invention is to secure approximately equal lengths of thread or yarn upon all the bobbins of a set.

Claim.—1. The combination of a spindle adapted to rotate a receiving-bobbin by frictional contact, with an idle-roll placed in position near the spindle and adapted to press upon the thread and prevent the further rotation of the bobbin when the thread has accumulated upon the bobbin to the desired amount.

2. The combination of a spindle adapted to rotate a receiving bobbin by frictional contact with a stand near the spindle, provision for adjusting the position of said stand, and an idle-roll carried by said stand and adapted to press upon the thread and prevent the further rotation of the bobbin when the thread has accumulated upon the bobbin to the desired amount.

407,125. NEEDLE-PICKING TOOL FOR KNITTING-MACHINES. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, same place. Filed Apr. 20, 1889. Serial No. 308,947. (No model.)



Claim.—1. The within-described needle-picking device, consisting of a bar for bearing against the side of the needle to be depressed, said bar having a shoulder for overlapping the head of the needle and engaging with the same as the bar is lowered, substantially as specified.

2. The within-described needle-picking device, consisting of a bar for bearing against the side of the needle to be depressed and having two shoulders, one for engaging with needles of the right hand and the other for engaging with needles of the left hand, substantially as specified.

3. The within-described needle-picking device, consisting of a bar for bearing against the side of the needle to be depressed, said bar having shoulders on opposite sides of the same for engaging with the heads of the needles, substantially as specified.

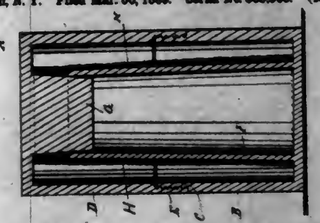
4. The within-described needle-picking device, consisting of a bar for bearing against the side of the needle, said bar having a shoulder for engaging with the head of the needle, and being provided with a suitable operating-handle and with a projecting needle-lifting tongue or prong, substantially as specified.

407,126. NEEDLE-PICKING TOOL FOR KNITTING-MACHINES. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, same place. Filed May 16, 1889. Serial No. 310,963. (No model.)

Claim.—1. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a projecting hook occupying such lateral relation to the side of the bar that when said side of the bar is brought into contact with a projected needle of the machine the hook will be in position to engage with an adjacent needle occupying a different vertical plane, substantially as specified.

2. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a projecting hook midway between the opposite sides of the bar, so that when either side of the bar is pressed against a projected needle of the machine the hook will be in position to engage with an adjacent needle in a different vertical plane, substantially as specified.

3. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a projecting hook for engaging with a needle of the machine when the side of the bar bears against an adjacent projected needle and having said side of the bar recessed so as to form a shoulder for overlapping the needle when the recessed portion of the bar bears against the same, substantially as specified.



4. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a projecting hook for engaging with a needle when the side of the bar bears against an adjacent projected needle, and having recesses forming shoulders, one for engaging with needles on the right hand and the other for engaging with needles on the left hand when the recessed portion of the bar is pressed against the sides of said needles, substantially as specified.

5. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a projectieg hook located midway, or thereabout, of its lateral width, and having in opposite sides recesses forming a central contracted portion, with opposite shoulders at the top of the same, substantially as specified.

6. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a projecting hook free to yield on the bar and a spring acting thereon, the hook occupying such lateral relation to the side of the bar as to engage with one needle of the machine when the side of the bar bears against an adjacent projected needle, substantially as specified.

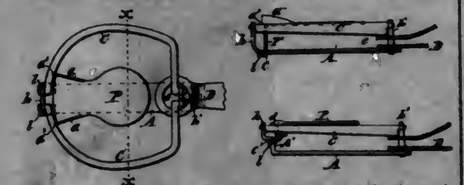
7. The within-described needle-picking device for knitting-machines, the same consisting of a bar having a pivoted hook and a spring acting thereon, the hook bearing such lateral relation to the side of the bar as to engage with one needle of the machine when the side of the bar bears against an adjacent projected needle, substantially as specified.

407,127. PHONOGRAM-RECEIVING BOX. HARRY P. SHARLE, Brooklyn, N. Y. Filed Mar. 30, 1889. Serial No. 305,395. (No model.)

Claim.—1. A phonogram-receiving box comprising a hollow box-body, a conical offset held concentric in the said box-body and projecting above the top of the said box-body, and a cover adapted to be secured on the said box-body and serving to lock the phonogram-cylinder in place, substantially as shown and described.

2. A phonogram-receiving box comprising a hollow box-body, a conical offset held concentric in the said box-body, adapted to receive the hollow phonogram-cylinder and extending above the top of the said box-body, a cover screwing on the said box-body and serving to lock the phonogram-cylinder in place, and a conical lug held in the said cover and adapted to engage the top of the said offset, substantially as shown and described.

407,128. AUTOMATIC PNEUMATIC INSTRUCTOR. JOHANN SETZEITS, Vienna, Austria-Hungary, assignor to Alfred J. Cotheimer, Philadelphia, Pa. Filed May 9, 1889. Serial No. 310,132. (No model.) Patented in Germany Feb. 1, 1888, No. 45,141; in England Feb. 10, 1888, No. 2,041; in France Mar. 9, 1888, No. 189,232, and in Austria-Hungary Apr. 10, 1888, No. 419 and No. 11,466.



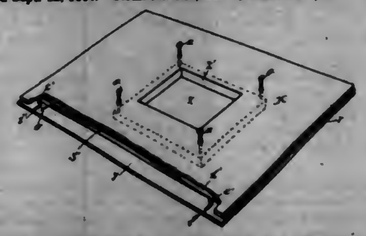
Claim.—1. A pneumatic toy or instructor comprising a series of tubes corresponding with questions to be answered, each tube being connected by an air-passage with another tube corresponding with the answer to such question, a sounding device, a flexible pipe for connecting any of the first group of tubes with said sounding device, and an aspirator or device for injecting a current of air into any of the second group of tubes, substantially as described.

2. The combination of two groups of tubes, each tube of one group being connected with a tube of the other group, a sounding device—such as a bell—a flexible pipe for connecting the same with any of one group of tubes, and a movable air-forcing device—such as a hollow ball or bulb—for connection with any of the other group, substantially as described.

3. The combination, with a desk or stand, of two groups of connected tubes projecting therefrom, a pneumatic signaling device thereon, an aspirator or air-forcing device adapted to be placed at will over any of one of the groups of tubes, and a flexible pipe for connecting any of the other group with said signaling device, substantially as described.

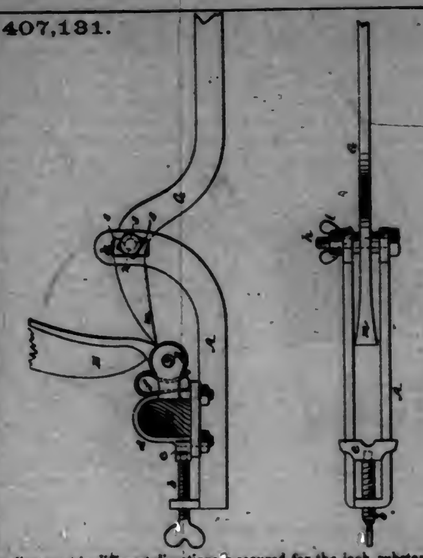
4. The combination of the sounding device, the group of question-tubes and the group of answer-tubes projecting from a desk or stand and connected as described, the movable aspirator, the connecting-pipe for the sounding device, and a series of question and answer sheets having perforations corresponding to the positions of said tubes, as set forth.

407,129. ANIMAL-TRAP. HENRY J. SETHOUR, Niagara, Ontario, Canada. Filed Jan. 7, 1889. Serial No. 295,693. (No model.)



Claim.—1. In an animal-trap, the combination of the frame A, provided with posts *b b'* and with the notches *c c* in the edges of the frame in proximity to one of said posts, the jaws C C, hinged to said post, and the bait-pan P, formed with lugs *l l*, passing through the said notches and upset or bent at their protruding ends, and two catches integral with the side edges of the bait-pan and engaging the two jaws when in their set position, as set forth.

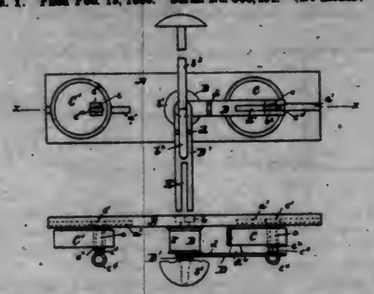
2. In an animal-trap, the combination of the frame A, provided with posts *b b'* and with the notches *c c* in the edges of the base of one of the posts, the jaws C C, hinged to said posts, and the bait-pan P, formed with the downward extension P', terminating with lugs *l l*, passing through the aforesaid notches and upset or bent at their protruding ends, and the flanges *a a*, integral with the bait-pan and formed with rearward projections *a' a'*, engaging and holding both jaws in their set position, substantially as described and shown.



3. In combination with the frame A, provided with posts *b b'*, and the jaws hinged to said posts, the spring D, hung at one end on the post *b'* and having its opposite end in a plane approximately parallel with that of the frame A and encircling the hinged ends of the jaws adjacent to said post, substantially as and for the purpose set forth.

407,130. WASHING-MACHINE. DAVID D. SHANDON, Ovid, Mich. Filed Sept. 12, 1887. Serial No. 249,422. (No model.)

Claim.—In combination with the suds-box, the plunger-head having the rubber strip let into one edge of said head, the cleat Y, and spring for actuating said cleat located in the edge of said plunger-head at right angles to the rubber strip, as and for the purposes specified.

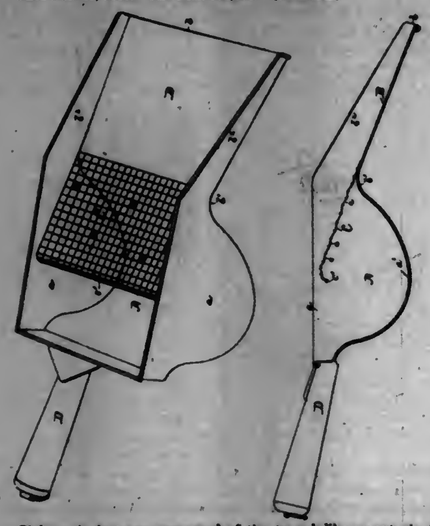


407,131. THILL-COUPLING JACK. JAMES M. SMITH, Greenwich, Conn. Filed Nov. 24, 1888. Serial No. 291,762. (No model.)

Claim.—1. In a thill-coupling jack, the combination, with a strap-like clamping-frame, of an adjustable clamping-screw at the rear end thereof and an operating-lever arranged at the forward end of the same, and having its fulcrum adjustable up or down, whereby a double adjustment in different directions is secured for the jack, substantially as specified.

2. The within-described thill-jack, composed of a clamping-frame A, having an adjustable clamping-screw *b* at its rear end, with attached loose bearing-block *c*, in combination with the lever G at the opposite end of the clamping-frame, having a chisel-pointed inner end portion *m*, and having its fulcrum adjustable up and down within the clamping-frame, substantially as shown and described

407,132. HOLDING-BRACKET. WILLIAM P. SPURGIN, West Point, N. Y. Filed Feb. 19, 1889. Serial No. 300,401. (No model.)



Claim.—1. In a holding-bracket, the combination, with the base-plate A and the post B, fixed rigidly therein, of a roller C, having a continuous cylindrical periphery provided with the described frictional tires and journaled eccentrically on and free to revolve upon a shaft set in said base-plate alongside said post, substantially as and for the purpose set forth.

2. In a holding-bracket, the combination, with the base-plate A and the post B, fixed rigidly therein, of a roller C, journaled eccentrically and free to revolve upon a shaft mounted upon the base-plate and adjustable relatively to said post on said base-plate, substantially as set forth.

3. In a holding-bracket, the combination, with the base-plate A and the post B, fixed rigidly therein, of a roller C, journaled eccentrically and free to revolve upon a shaft mounted on said base-plate, a hasp D, journaled on said post, and a staple c^4 on said roller-shaft, said hasp being adapted to swing to and engage said staple, together with a locking device to fasten said hasp to said eye, substantially as and for the purpose set forth.

4. In a holding-bracket, the combination, with the base-plate A and the post B, fixed rigidly therein, of a roller C, journaled eccentrically and free to revolve upon a shaft mounted on said base-plate, a hasp D, journaled on said post, a staple on said roller-shaft adapted to be engaged by said hasp, and a projection d^3 on said hasp adapted to engage said roller perimetally, together with a locking device to fasten said hasp to said eye, substantially as and for the purpose set forth

407,133. DUST-PAN. WILLIAM P. STUBBS, West Point, N. Y. Filed Feb. 26, 1889. Serial No. 301,201. (No model.)

Claim.—A dust-pan composed of the trough-like receptacle A, having the described bottom *a'*, the inclined platform B, extending forwardly and downwardly from the front edge of said receptacle, with its lower edge *b* substantially in line with the crown or apex of said bottom of said receptacle, and the perforated plate C, extending from the junctures of said platform with said edge of said receptacle rearwardly over said receptacle to a line substantially midway of the front and rear edges thereof, as and for the purpose specified.

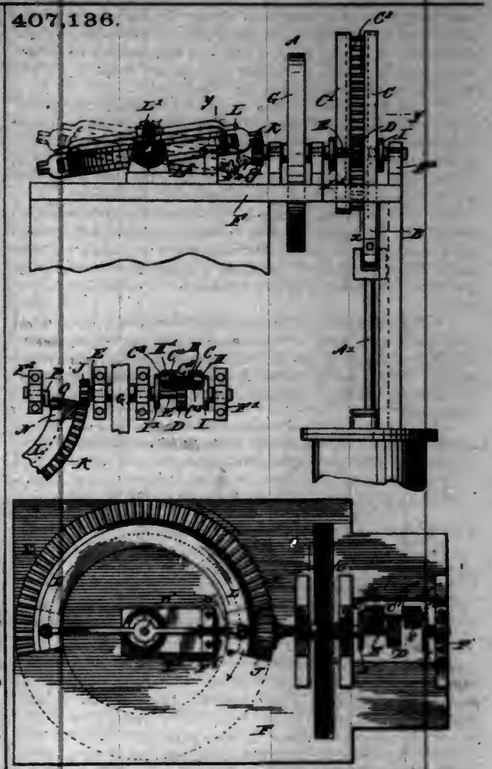
407,134. HEATING GAS-BURNER. SAMUEL STEWART, Newark, N. J. Filed Aug. 14, 1888. Serial No. 282,727. (No model.)

Claim.—1. A heating gas-burner consisting in the tube *a*, the collar *d'*, provided with flange *e*, the diaphragms *d d'*, separated by such collar, and the collar fitted over the collar and projected above the diaphragms, substantially as herein set forth.

2. A heating gas-burner consisting in the tube *a*, having open bottom, the transverse pipe *b*, with aperture *c* opening within the tube, the collar *d'*, with flange *e* fitted to the top of the tube, the diaphragms *d d'*, separated by the flange, as described, and the collar *f*, provided with base *f'*, fitted over the collar, and with bead *g*, fitted upon the edge of the diaphragm *d'*, as and for the purpose set forth.

407,135. COMPOSITION OF MATTER FOR CEMENT, &c. CARL STRAUB, Syracuse, N. Y. Filed Oct. 20, 1887. Serial No. 253,334. (No specimens.)

Claim.—1. The herein-described composition of matter, consisting of acid, a retarder, as glue or oil, a calcined calcareous base, as plaster-of-paris, and silicate of potash or natron, combined substantially in the proportions specified.

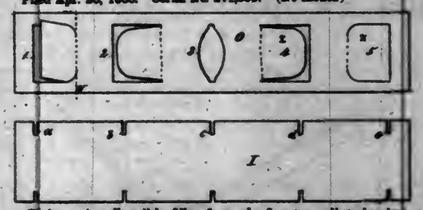


2. The herein-described composition of matter, consisting of sulphuric or muriatic acid, an acid retarder, as glue or oil, calcined calcareous base, as plaster-of-paris, silicate of potash, and land-plaster, in about the proportions specified.

407,136. MECHANICAL MOVEMENT. GEORGE W. THOMAS, Ogallala, Nebr. Filed Sept. 24, 1888. Serial No. 286,178. (No model.)

Claim.—1. In a mechanical movement, the combination, with a pitman consisting of two grooved bars and teeth connecting the bars with each other, of a gear-wheel meshing into the said teeth, a main shaft carrying the said gear-wheel, and crank-disks engaging by their crank-pins the grooves in the said bars of the pitman, substantially as shown and described.

2. In a mechanical movement, the combination, with a pitman



407,136.

provided with two grooved bars connected with each other by gear-teeth, of a gear-wheel adapted to mesh in the said gear-teeth at either side, a main driving-shaft carrying the said gear-wheel, friction-rollers fitting into the grooves in the said bars, and crank-disks carrying the said friction-rollers and held in axial line with the said main driving-shaft, substantially as shown and described.

3. In a mechanical movement, the combination, with a main driving-shaft and a gear-wheel secured on the same, of a segmental wheel having gear-teeth adapted to mesh at either side into the said gear-wheel, a shaft carrying the said segmental wheel and mounted to turn and to swing, and a crank-arm held in axial line with the said main shaft and carrying friction-rollers engaging a segmental groove in the said segmental wheel, substantially as shown and described.

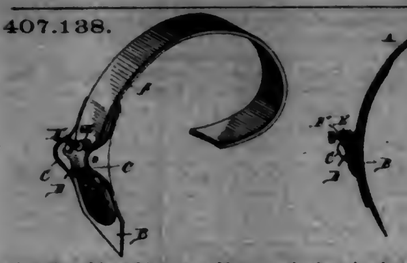
407,137. SHIPPING-CASE. EVERT M. THOMPSON, Evansville, Ind. Filed Apr. 30, 1888. Serial No. 271,355. (No model.)

Claim.—A collapsible filler formed of outer splints having openings formed in the body thereof for admitting inter splints, such openings closed by gates moving upon scored or perforated hinges at the rear of such gate, the gated openings at the ends of such splints formed in a reverse position with reference to each other, in combination with inter splints I, having notches cut in their edges and interlocking with the outer splints at each joint, substantially as shown and described.

407,138. HARROW-TOOTH. FREDERICK VAN PATTEN, Auburn, N. Y. Filed Apr. 19, 1888. Serial No. 307,775. (No model.)

Claim.—1. The combination, with a spring-tooth, of a supplemental point or tooth having perforated ears extending rearwardly from its side edges past the sides of the spring-tooth, a clamping-

407,138.



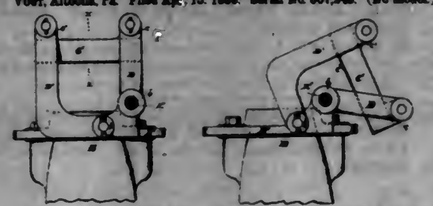


plate pivoted in and between said ears and adapted to bear against the spring-tooth, and a clamping-screw mounted in said clamping-plate and adapted to bear against the spring-tooth, as set forth.

2. The combination, with the spring-tooth, of the supplemental tooth provided at its edges with ears passing beyond the edges of the spring-tooth, and the clamping-plate pivoted in said ears and bearing against the spring-tooth, as set forth.

3. The supplemental point or tooth carrying as a fixed part thereof a pivoted clamping-plate, as set forth.

4. The supplemental point or tooth carrying as a fixed part thereof a pivoted clamping-plate provided with a set-screw, as set forth.

407,139. EXHAUST-MUFFLER FOR LOCOMOTIVES. AXEL S. VOGT, Altoona, Pa. Filed Apr. 15, 1889. Serial No. 307,343. (No model.)

Claim.—1. In combination with the exhaust-nozzle of a locomotive, a perforated muffling-screen and swinging links pivotally secured in pairs at four points on the screen and at four points to the nozzle, so as to hold the screen securely above the nozzle and permit it to be folded to one side thereof, substantially as and for the purpose specified.

2. In combination with the exhaust-nozzle of a locomotive, a perforated muffling-screen, a pair of links pivotally secured to opposite points on the screen and upon the nozzle, a second pair of links pivotally secured to opposite points on the screen at a distance from the points where the first links are attached and to opposite points on the nozzle situated closer to the points where the first links are attached than the distance between the ends of the links on the screen, whereby the screen is held securely above the nozzle and permitted to fold to one side and turn downward, all substantially as and for the purpose specified.

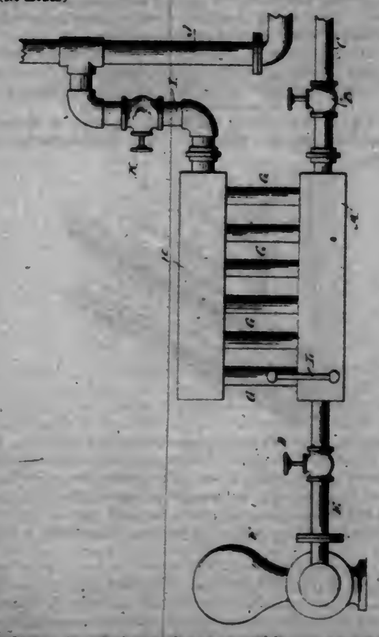
3. In combination with the exhaust-nozzle of a locomotive, a perforated muffling-screen, a pair of links pivotally secured to opposite corners of the screen and to lugs on the exhaust-nozzle, a second pair of links pivotally secured to the other two corners of the screen at one end and at their other ends to lugs on the exhaust situated close to and below the lugs to which the first pair of links are attached.

4. In combination with the exhaust-nozzle of a locomotive, a perforated muffling-screen, a pair of straight links pivotally secured to opposite corners of the screen and to lugs on the exhaust-nozzle, a second pair of L-shaped links pivotally secured to the other two corners of the screen at one end and at their other ends to lugs on the exhaust situated close to and below the lugs to which the first pair of links are attached.

5. In combination with the exhaust-nozzle of a locomotive, a shaft journaled in lugs attached to the nozzle and extending out through the wall of the smoke-box, a perforated muffling-screen, a pair of links attached at one end to said shaft and pivoted at their other ends to opposite corners of the screen, and a second pair of links pivoted at one end to the other corners of the screen and at their other ends pivoted to the nozzle.

6. In combination with an exhaust-nozzle of a locomotive, a shaft journaled in lugs attached to the nozzle and extending out through the wall of the smoke-box, a perforated muffling-screen, a pair of links attached at one end to said shaft and pivoted at their other ends to opposite corners of the screen, and a second pair of longer links pivoted at one end to the other corners of the screen and at their other ends pivoted to the nozzle at points below the level of the shaft and close to it.

7. In combination with the exhaust-nozzle of a locomotive, a shaft journaled in lugs attached to the nozzle and extending out through the wall of the smoke-box, a perforated muffling-screen, a pair of links attached at one end to said shaft and pivoted at their other ends to opposite corners of the screen, a second pair of links pivoted at one end to the other corners of the screen and at their other ends pivoted to the nozzle, detents secured on the outside of the smoke-box and around the shaft, a lever attached to said shaft, and a catch secured to said lever, so as to engage with the detents and lock the shaft in the desired position.



407,140. DOOR-FASTENER. CHARLES L. WARD, Cavendish, Vt. Filed Apr. 8, 1889. Serial No. 306,407. (No model.)

Claim.—1. The door having the slotted casting or bracket C, in combination with a combined handle and latch consisting of the handle portion pivoted at its lower end to the door and having its upper end playing loosely in said slotted casting and being guided thereby, a latching-arm projecting from the handle portion above the pivot-connection, and a catch or keeper with which the head of the latching-arm engages, substantially as described.

2. A door-fastener consisting of the door with its slotted casting, a pivoted handle portion secured to the door having its upper end playing loosely in the slotted casting, and an integral latching-arm projecting therefrom having its head spear-shaped and tapered or beveled, in combination with a slotted catch or keeper having its inner walls beveled, substantially as described.

407,141. FEED-WATER HEATER AND CONDENSER. JOHN WILLERSDINE, New Richmond, Ohio. Filed Apr. 10, 1889. Serial No. 306,715. (No model.)

Claim.—1. A feed-water heater comprising a water-supply pipe connecting with the pump discharging into the boiler, and a number of vertical pipes opening into the said water-supply pipe and connect-

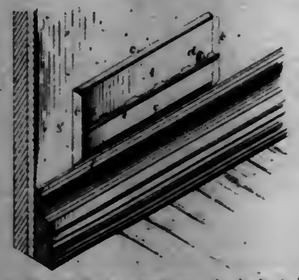
ing with the exhaust-pipe of the steam-engine, substantially as shown and described.

2. A feed-water heater comprising a supply-pipe having a valve near each end, a pump connected with one end of the said supply-pipe and discharging into the boiler, a number of vertical pipes opening into the said water-supply pipe, and an exhaust-pipe into which discharges the exhaust-steam of the engine and which is disconnected from the said vertical pipes, substantially as shown and described.

3. In a water-heater, the combination, with a water-supply pipe provided with valves near each end, of a number of pipes extending from the said water-supply pipe, a horizontally-extending pipe connected with the upper ends of the said number of pipes, and an exhaust-pipe connected with the said horizontally-extending pipe, substantially as shown and described.

4. In a water-heater, the combination, with a water-supply pipe provided with valves near each end, of a number of pipes extending from the said water-supply pipe, a horizontally-extending pipe connected with the upper ends of the said number of pipes, an exhaust-pipe connected with the said horizontally-extending pipe, and a branch pipe connecting the said exhaust-pipe with the said horizontally-extending pipe, substantially as shown and described.

5. In a feed-water heater, the combination, with a water-supply pipe, of a pump connected with one end of the said water-supply pipe and discharging into the boiler, a number of vertical pipes opening into the said water-supply pipe, a horizontal pipe extending from the upper ends of the said number of pipes, and an exhaust-pipe discharging into the said horizontally-extending pipe, substantially as shown and described.



407,142. TOY. CHRISTIAN WORITZ, New York, N. Y., assignor of one-half to Julius Kamaler, same place. Filed Apr. 12, 1889. Serial No. 306,998. (No model.)

Claim.—1. As a new article of manufacture, a toy comprising a main body, wings hinged thereto a spring for holding the wings normally closed, a return-cord, and links connecting the spring and return-cord to the wings, substantially as described.

2. The body A, having openings *d f*, in combination with the hinged wings B, rods *c*, connected thereto, spring *b*, and return-cord C, all arranged substantially as and for the purpose set forth.

407,143. WALL-PAPER PROTECTOR. FREDERICK W. WOODHULL, Lincoln University, Pa. Filed Apr. 11, 1889. Serial No. 306,828. (No model.)

Claim.—1. In a wall-paper protector, the body A, having like opposite longitudinal marginal protecting portions *c c*, backwardly-turned ends *b b*, and a handle intermediate of the width of said body, whereby the protector may be reversed to make either of its longitudinal margins a protecting edge, and the hand used in cleaning is prevented from working beyond the protector, substantially as specified.

2. In a wall-paper protector, the body A, having opposite longitudinal marginal protecting portions *c c* and partly-spherical protuberances *d* on its face intermediately of its width, essentially as described.

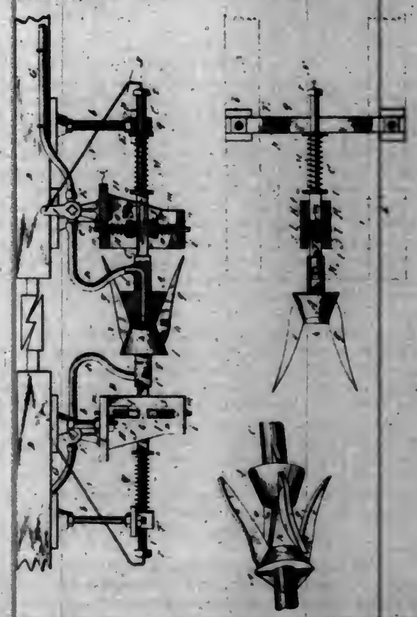
3. As a new article of manufacture, the within-described wall-paper protector, consisting of a body A, having opposite longitudinal marginal protecting portions *c c*, backwardly-turned ends *b b*, a handle on its back intermediate of the width of the protector, and partly-spherical protuberances *d* on its face, also intermediate of the width of the body, as set forth

407,144. RULER. WILLIAM J. WRIGHT, San Francisco, Cal. Filed Mar. 16, 1889. Serial No. 303,610. (No model.)

Claim.—A ruler formed with a groove on its upper back portion, serving as a finger-hold, a groove in its base or under surface, forming narrow bearing-edges on which the ruler rests, and a round ruling portion on its front projecting over its base, substantially as described.

407,145. ORNAMENTAL BRICK. JAMES C. ANDERSON, Highland Park, Ill. Filed Aug. 6, 1887. Renewed Nov. 26, 1888. Serial No. 291,930. (No specimens.)

Claim.—A brick or block the main body color of which is of copper and the surface thereof spotted or splotched with the drops of the metal contained therein, as set forth.



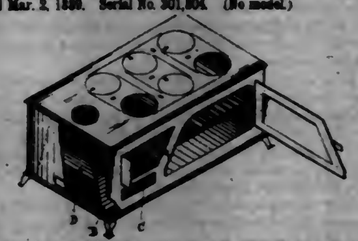
407,146. ORNAMENTAL BRICK. JAMES C. ANDERSON, Highland Park, Ill. Filed Aug. 6, 1887. Renewed Nov. 26, 1888. Serial No. 291,931. (No specimens.)

Claim.—A brick for architectural purposes the body color of which is bronze and the surface of which is spotted or splotched with the drops of the metal contained therein, as set forth.

407,147. ORNAMENTAL BRICK. JAMES C. ANDERSON, Highland Park, Ill. Filed Aug. 26, 1887. Renewed Nov. 26, 1888. Serial No. 291,932. (No specimens.)

Claim.—A brick or block the main body color of which is of brass and the surface thereof spotted or splotched with the drops of the metal contained therein, as set forth.

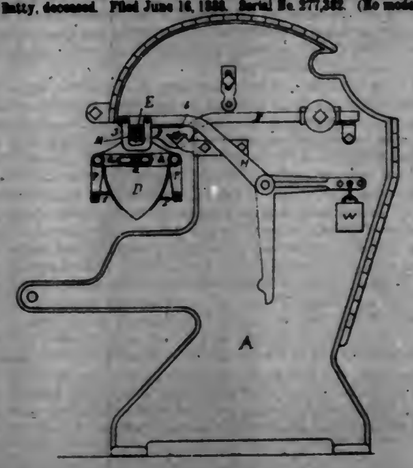
407,148. AUTOMATIC COUPLING AND VALVE-CONTROLLING MECHANISM FOR THE STEAM OR AIR PIPES OF CARS. JAMES D. BAGG, Springfield, Mass. Filed Dec. 4, 1888. Serial No. 292,679. (No model.)



Claim.—1. The steam or air pipe of a car and the frames D E, one in advance of the other, the former comprising the upper and lower cross-girders *i i* and the longitudinal vertical walls H, and the latter the suspended cross-beam *p* with the transverse aperture *q* therein, in combination with the coupling-bar having in its head a longitudinal passage open at its outer end and connected with said pipe and provided with the shoulders *o r*, and extending between said walls H H and through said beam-aperture *q*, the vertical springs *o o*, bearing between the said girders and the said bar, and the spring M between the bar-shoulder *s* and the said beam, substantially as described.

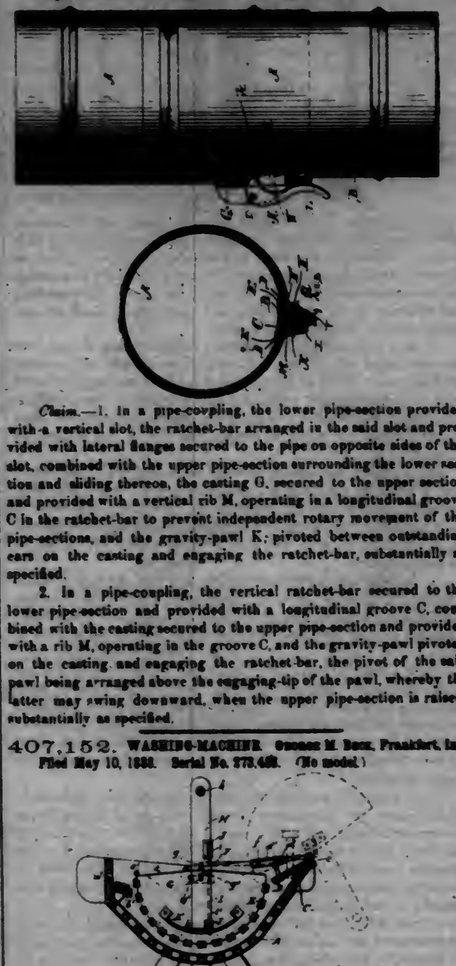
2. The steam or air pipe of a car and the frames D E, one in advance of the other, the former comprising the upper and lower cross-girders *i i*, provided with the guide-sockets *n*, and the longitudinal vertical walls having the ways *j j* therein, and the latter comprising the cross-beam transversely apertured, in combination with the coupling-bar having in its head a longitudinal passage open at its outer end and connected with said pipe and provided with the shoulders *r s*, and extending between said walls H and through the said beam-aperture, the bearing-blocks J J above and below the said bar, guided in said ways *j* and having the guide-spindle *m* playing through said sockets, and the springs *o o*, substantially as described.

3. In combination, the steam or air pipe of a car provided with a valve having a radial arm *f* on its stem, the frames D E, one in advance of the other, the former comprising the upper and lower cross-girders *i i*, provided with the guide-sockets *n*, and the longitudinal vertical walls having the ways *j j* therein, and the latter comprising the suspended cross-beam having the transverse aperture *q*, the coupling-bar having a head the nose of which is formed of rubber and provided with a longitudinal passage open at its outer end, and the shoulders *s* and *r*, and extending between said walls and through the said beam-aperture, the bearing-blocks J J above and below said bar, guided in said ways *j*, and having the guide-spindles *m* playing through said sockets, the springs *o o*, the flexible pipe K, connecting said valved pipe with the passage in the coupling-head, and the connecting-rod N between said coupling-bar and said valve-arm, all substantially as described and shown.



4. The combination, with the steam or air pipe of a car, of a coupling-bar spring supported from the car and adapted to have an endwise and vertical and horizontal swinging movements, provided at its forward end with a coupling-head of truncated conical form, the taper of which is outward, provided with oppositely-disposed forwardly-projecting and outwardly-diverging horns having the angle and distance between the inner faces thereof corresponding to the angular surface of said conical head and having a longitudinal passage open at its outer end and connected with said pipe, substantially as described.

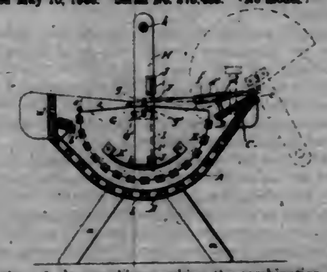
407,149. COOKING-STOVE. VARAN M. BARRETT, Atlanta, Ga. Filed Mar. 2, 1889. Serial No. 301,804. (No model.)



Claim.—In a cooking-stove, the fire-chamber E, the ash-chamber F, subdivided by partition D, the flue A, passing backwardly over the oven, thence downwardly under the oven and ash-chamber into the outlet, and the deflectors B, all arranged substantially as and for the purpose set forth.

407,150. FEEDING DEVICE FOR CARDING-MACHINES. HANNAH BATTY and ALBERT BATTY, Philadelphia, Pa., administrators of Job Batty, deceased. Filed June 16, 1888. Serial No. 277,382. (No model.)

Claim.—The combination, with the scale-beams B and the lever H, carrying the iron J, of the hopper having the supporting-shaft M, the movable sides, the shafts N, carrying said sides, the arms G, mounted on said shafts N, the pin *a*, the arms P, mounted on shafts N, and the spring S, connecting said arms P, substantially as described.

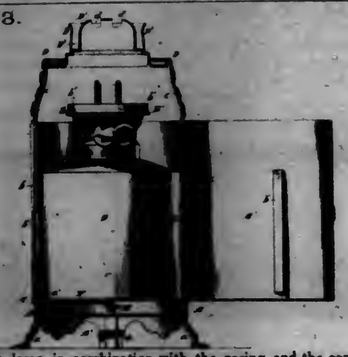


407,151. PIPE-COUPLING. EDWARD BEAN, Chicago, Ill. Filed July 25, 1888. Serial No. 280,905. (No model.)

Claim.—1. In a pipe-coupling, the lower pipe-section provided with a vertical slot, the ratchet-bar arranged in the said slot and provided with lateral flanges secured to the pipe on opposite sides of the slot, combined with the upper pipe-section surrounding the lower section and sliding thereon, the casting G, secured to the upper section and provided with a vertical rib M, operating in a longitudinal groove C in the ratchet-bar to prevent independent rotary movement of the pipe-sections, and the gravity-pawl K, pivoted between outstanding ears on the casting and engaging the ratchet-bar, substantially as specified.

2. In a pipe-coupling, the vertical ratchet-bar secured to the lower pipe-section and provided with a longitudinal groove C, combined with the casting secured to the upper pipe-section and provided with a rib M, operating in the groove C, and the gravity-pawl pivoted on the casting and engaging the ratchet-bar, the pivot of the said pawl being arranged above the engaging-tip of the pawl, whereby the latter may swing downward, when the upper pipe-section is raised, substantially as specified.

407,152. WASHING-MACHINE. GEORGE M. BEEM, Frankfort, Ind. Filed May 10, 1888. Serial No. 273,468. (No model.)



Claim.—1. In a washing-machine, the combination, with a reciprocating pivoted rubber, of adjustable uprights provided with handles and pivoted to the rubber, locking-rods attached to the uprights, and plates secured to the rubber and provided with holes for the locking-rods to engage with, so that the uprights may be held in various positions, substantially as set forth.

2. The combination, with a washing-machine tub, of the sloping drip-board provided with the supporting-ledge *e* and the rod D, pivoted in a groove in the under side of the drip-board and provided with the cranked pivot-arm *d* at each end, journaled at the top edges of the tub, substantially as and for the purpose set forth.

407,153. LAMP. WILLIS BROWN, New York, N. Y. Filed July 23, 1888. Serial No. 281,209. (No model.)

Claim.—1. In a lamp, in combination with the casing and the cone or deflector supported therefrom, the lamp-body provided with the burner and made movable up and down in the casing, and means on the casing for positively forcing the lamp-body up in the casing and locking it as raised, substantially as and for the purpose shown.

407,153.

2. In a lamp, in combination with the casing and the cone or deflector and chimney-holder supported therefrom, the lamp-body made movable within the casing and carrying the burner, guides on the casing and lamp-body to guide the body and prevent its rotation, and positively-acting means on the casing for raising the lamp-body with reference to the cone-deflector and holding it as raised, substantially as and for the purpose described

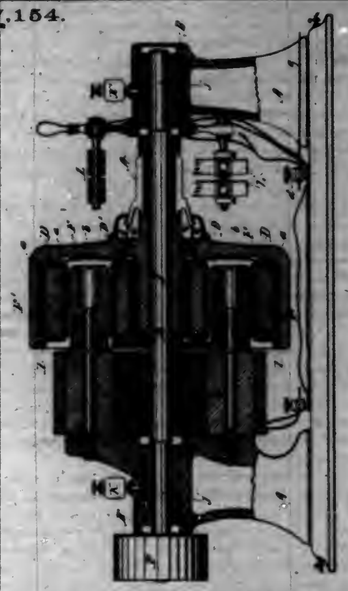
3. In a lamp, in combination with a suitable casing or frame and the uprights thereon, the ring supported on the uprights and provided with the cone or deflector, the movable lamp-body carrying the burner, and a cam device on the casing or frame engaging the lamp-body, so as to raise it to bring the burner to the cone or deflector, and holding the body as so raised, substantially as and for the purpose described.

4. In a lamp, in combination with the casing and the stationary cone or deflector, the rising-and-falling lamp-body within the casing, provided with the burner, guides on the casing and lamp-body to guide and steady the latter, and a swinging arm below the lamp-body adapted to raise the same and hold it raised, substantially as and for the purpose shown.

5. In combination with the casing and the stationary cone or deflector, the movable lamp-body provided with the burner, the rock-shaft provided with the arm to engage the lamp-body, and suitable means for rocking such shaft, substantially as and for the purpose set forth.

6. In a lamp, in combination with the casing or frame for supporting the cone or deflector and chimney-holder, the movable lamp-body carrying the burner, the rock-shaft supported in the frame or casing and provided with the lamp-body-engaging arm, the lever on the shaft, and a catch on the casing to lock such lever when the shaft has been turned to raise the lamp-body, substantially as and for the purpose described.

7. In a lamp, in combination with the movable lamp-body carrying the burner, the lamp-casing provided with means for supporting the cone or deflector and with a door to admit of the removal of the lamp-body, the rock-shaft having the lamp-body-engaging arm, the operating lever or handle on the rock-shaft, and a suitable catch on the casing-door to engage and hold the shaft, lever, or handle, substantially as and for the purpose specified.



8. In a lamp, in combination with the movable lamp-body carrying the burner, the casing provided with a door to allow removal of the lamp-body from the casing, guides on the door and casing to engage the lamp-body, guides on the lamp-body adapted to engage some of the guides on the casing to prevent rotation of the lamp-body, and means for raising and lowering the body within the casing, substantially as and for the purposes shown

9. In a lamp, in combination with the movable lamp body or reservoir carrying the burner, the casing provided with a door to admit of removal of the lamp-body, the stationary cone or deflector and chimney-support, the lamp-body-engaging guides on the casing and casing-door, the guides on the lamp-body, the rock-shaft provided with the arm to engage the bottom of the lamp-body, and the lever or handle for rocking the shaft, substantially as and for the purpose set forth.

10. In a lamp, in combination with the movable lamp-body having the burner, the casing having the door, the upright guide-bars within the casing, having their lower ends continued downward to form feet for the lamp and their upper ends forming supports for the ring carrying the cone or deflector, the guide-strip on the door, and means for raising and holding the lamp-body up within the casing, substantially as and for the purpose described.

407,154. ELECTRIC MACHINE. EDWIN H. EMMERT, Jr., Bayonne, N. J. Filed Feb. 23, 1889. Serial No. 300,907. (No model.)

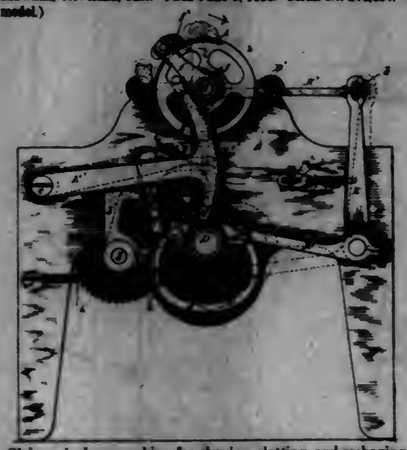
407,154.

Claim.—1. In an electric machine, an inner and outer armature confined within and secured to a frame fast to and revolving with said shaft, in combination with field-magnets having pole-pieces projecting between said armatures, substantially as described.

2. In an electric machine, an inner and an outer revolving ring-armature confined within and supported by a frame mounted upon and fast to the shaft of the machine, in combination with the field-magnets having pole-pieces projecting between said armatures, substantially as described.

3. In an electric machine, the combination of a revolving ring-armature mounted upon a shaft, bearings for said shaft, stationary magnets fast to or formed integral with the bracket forming the bearing for one end of said shaft, pole-pieces fast to or formed integral with said magnets and extending between said armature and another ring-armature confined within and secured to a frame fast to and revolving with said shaft, substantially as described.

4. In an electric machine, the combination of a revolving armature mounted upon a shaft, bearings for said shaft, stationary magnets fast to or formed integral with the bracket forming the bearing for one end of said shaft, pole-pieces fast to or formed integral with said magnets and extending between said armature and a ring-armature confined within and secured to a frame fast to and revolving with said shaft, substantially as described.

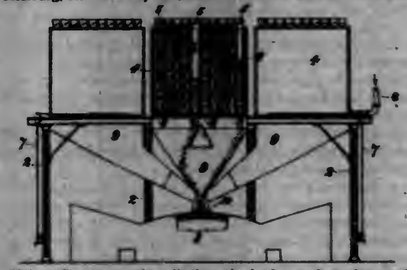


5. In an electric machine comprising two revolving ring-armatures, between which are arranged the pole-pieces of stationary field-magnets, a frame or spider for supporting said armatures and connecting them to the shaft, consisting of a hub mounted on said shaft and having flanges to receive the inner armature, and arms radiating from said hub and terminating in flanges to receive the outer armature, substantially as described.

6. In an electric machine comprising two revolving ring-armatures, between which are arranged the pole-pieces of stationary field-magnets, a frame or spider for supporting said armatures and connecting them to the shaft, consisting of a hub mounted on said shaft and having flanges to receive the inner armature, and arms radiating from said hub and terminating in flanges to receive the outer armature, in combination with a collar H and ring I, substantially as described.

7. In an electric machine comprising two revolving armatures, between which are arranged the pole-pieces of stationary field-magnets, a frame or spider for supporting said armatures and connecting them to the shaft, consisting of a hub mounted on said shaft and having flanges to receive the inner armature, and arms radiating from said hub and terminating in flanges to receive the outer armature, in combination with a collar H and ring I, substantially as described.

8. In an electric machine, an inner and outer armature confined within and secured to a frame fast to and revolving with the shaft, in combination with field-magnets having pole-pieces projecting between said armatures, and electrical connections, as described, whereby the current passes from one armature to the field and from the other armature to the line, as and for the purpose set forth.



407,155. MACHINE FOR SLOTTING SCREW-HEADS. JAMES A. BIDWELL, Cleveland, Ohio. Filed June 9, 1888. Serial No. 276,857. (No model.)

Claim.—1. In a machine for shaving, slotting, and reshaving the heads of wood-screw blanks, the combination, with pin f and stop L, of wheel e, whose outer periphery is provided with pin-holes e' and whose hub is provided with circular cams e^3, having end walls e^4, substantially as set forth.

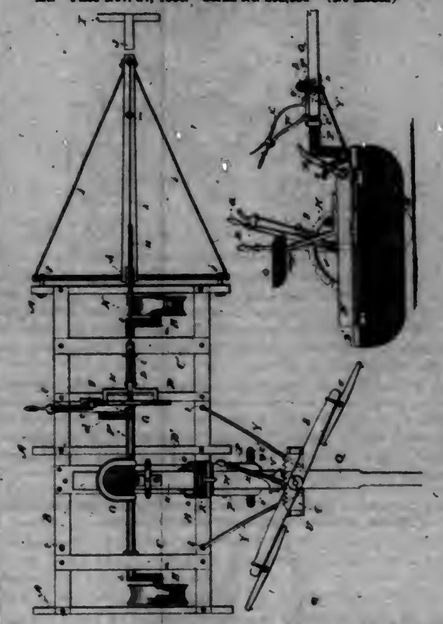
2. In a screw-machine, the combination of a rotary shaft B, carrying cam-wheel e, stop L engaging with said wheel, rotary cam d and levers K K' K^2, connecting said cam and stop L, substantially as set forth.

407,156. MANUFACTURE OF STEEL. THOMAS S. BLAIR, Jr., Pittsburg, Pa. Filed Apr. 28, 1887. Serial No. 235,747. (No model.)

Claim.—The herein-described method of manufacturing steel direct from ore, which consists in heating the ore mixed with carbonaceous material in an air-tight retort for the purpose of deoxidizing the ore, charging the deoxidized ore or spongy iron into a bath of molten cast-iron directly into the furnace in such masses as will cause the ore or sponge to sink, and finally subjecting the combined metals to the ordinary open-hearth process, substantially as set forth.

407,157. BOTTLE-STOPPER. RUDOLPH BLOSSER, Scranton, Pa. Filed Feb. 15, 1889. Serial No. 299,994. (No model.)

Claim.—1. In a bottle-stopper, the combination, with the top and bottom plates, the bolt for drawing the plates together, the central elastic portion, and the locking device, of the link passing through the top of the bolt to prevent the withdrawal of the bolt, and a pivotal connection between said link and the neck-wire, substantially as described.



2. In a bottle-stopper, the combination, with the top and bottom plates, the bolt for drawing the plates together, having a slot in the upper end, and the central elastic portion, of the U-shaped link passing through the slot in the bolt, a pivotal connection between the ends of said link and the neck-wire, and the locking-lever pivoting on said link, substantially as described.

3. In a bottle-stopper, the combination, with the top plate or cap, the central stud with the enlarged lower end or plate, and the locking-lever, of the link uniting said bolt and locking-lever, and the link pivotally connected to the neck-wire and also pivotally connected to said first-mentioned link, substantially as described.

4. In a bottle-stopper, the combination, with the top and bottom plates, the elastic center portion, the bolt, and the locking-lever for drawing said plates toward each other, having the shoulder thereon, of the link with which said shoulder engages to withdraw the stopper, connected to the stopper, and a pivotal connection between said link and the neck-wire, substantially as described.

5. In a bottle-stopper, the combination, with the top plate or cap, the central bolt with the enlarged lower end or plate, and the locking-lever having the shoulder thereon, of the link with which the said shoulder engages, uniting the locking-lever and bolt, and the link pivotally connected to said first-mentioned link and also pivotally connected to the neck-wire, substantially as described.

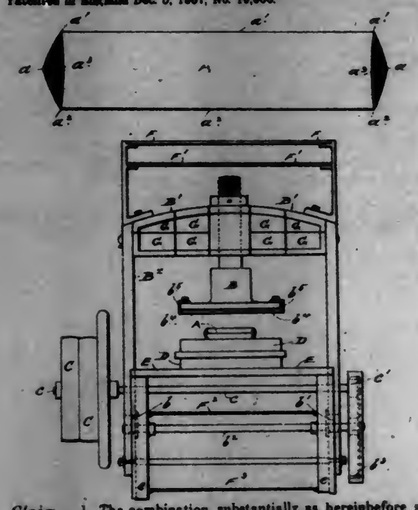
407,158. CORN-ROW MARKER. SAMUEL T. BOATHAM, Roanoke, Va. Filed Nov. 27, 1888. Serial No. 292,060. (No model.)

Claim.—1. In a corn-marker, the combination, with the runners and the frame, of the rock-shaft having the cranked ends and spindles, the truck-wheels thereon, the arm on said rock-shaft having the projection, the slotted lever pivoted to the frame, the spring-actuated dog, and the arc rack, substantially as specified.

2. In combination with the double end runners and the frame, the guide-shoe having the rod pivoted to the runner, the brace-rods, the pivoted lever having the spring-actuated dog thereon, the arc rack secured to the frame, the pivoted shifting fulcrum-bar, and the lifting-line, substantially as specified.

3. In a corn-marker, the combination, with the pivoted guide, and its operating-lever and line, of the shifting fulcrum-rod engaging said line, substantially as specified.

4. In a corn-marker, the combination, with the runners rounded or curved at both ends, of the shifting tongue and the wing-braces, substantially as specified.

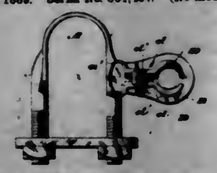


5. In a corn-marker, the combination, with the runners rounded or curved at both ends, of the tongue secured to the pivoted shifting-bar and the seat having its leg rigidly secured to said bar, substantially as specified.

6. In combination with the runners rounded at both ends, the frame, and the pivoted shifting-bar, the pole having the angle-irons pivoted to said shifting-bar, the rearward curved arms on said angle-irons, and the yoke pivoted to the shifting-bar and adapted to engage the curved arms, substantially as specified.

7. The combination, with a corn-marker having the runners rounded or curved at both ends and the shifting tongue, of the rack-

plate having the whiffletree thereon and the rib, the transverse channel-plate engaging said rib, and the journaled segment-gear engaging the rack-plate and having the rearward-extended lever, substantially as specified.

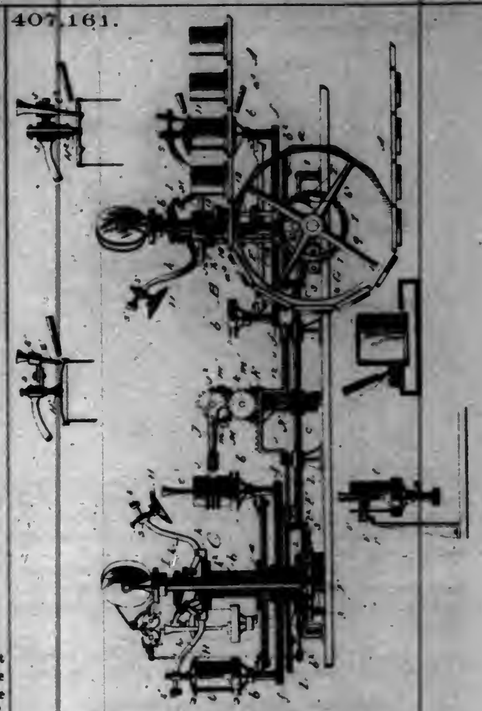


407,159. MACHINE FOR CUTTING SHOE-UPPERS. THOMAS BRIMBE, Leeds, County of York, England, assignor of one-half to George Lister, same place. Filed Feb. 13, 1889. Serial No. 299,794. (No model.) Patented in England Dec. 5, 1887, No. 16,690.

Claim.—1. The combination, substantially as hereinbefore set forth, of the knife formed with upper and lower cutting-edges, the frame of the cutting-press, the block D, of soft material, on which the leather is placed and which supports the cutting-knife, the buffer B, having a facing b^6 of soft material, and means for reciprocating the buffer, substantially as set forth.

2. In cutting the upper leathers of boots or shoes, the combination of the knife A, having two edges a' a^3 opposite to each other, the buffer B, covering b^4, head B', side bars B^3, eccentrics b b', shaft b^3, pulleys C, shaft c, pinion c', internal spur-wheel b^2, wood block D, table E, legs e, shelves F F^2 F^3, and pockets G, all arranged as and adapted for the purposes set forth.

407,160. THILL-COUPLING. THOMAS DAWSON, Eagle Rock, Idaho. Filed Feb. 28, 1889. Serial No. 301,467. (No model.)



Claim.—1. In a thill-coupler, the combination of the axle-clip having forwardly-projecting apertured arms B, the bolt C, provided with an annular groove, the spring secured at center to the outer face of one of the arms and provided at its ends with jaws designed to engage the groove of the bolt, and a key E, secured to rotate in said arm and provided with a flattened shank to engage the shanks of the jaws and with shoulders or projections to overlap the outer faces of said shanks, substantially as described.

2. The combination, in a thill-coupling constructed substantially as shown, of a bolt or pin having a recess c, the spring-actuated jaws D D, curved to lie within the recess of the bolt, said jaws being connected by members d, the inner sides of which are provided with recesses d' and spring portion e, and a key E, having a flattened portion f, said key being secured to the clip, substantially as shown, and for the purpose set forth.

407,161. CAN-SOLDERING MACHINE. WILLIAM D. BROOKS, Baltimore, Md., assignor of one-third to D. D. Mallary, same place. Filed May 13, 1889. Serial No. 310,500. (No model.)

Claim.—1. In combination with a soldering-machine comprising can-seats, an inverter and transferrer for the cans positively operated to remove them from one seat and place them upon another, and means for operating said transferrer, substantially as described.

407,161.

2. In combination with the two tables B C, with a series of can-seats and with soldering devices, the positively-operating can inverting and transferring mechanism for moving the can from one table to the other and means for operating said mechanism, substantially as described.

3. In combination, two can-seats arranged in the same horizontal plane, and a positively-operating inverter and transferrer with operating means, substantially as described.

4. In combination, the two can-seats and a gripping inverter and transferrer with operating means therefor, substantially as described.

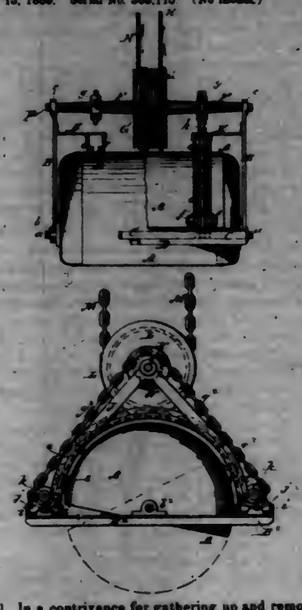
5. In combination with the soldering-machine comprising can-seats, the oscillating pivoted arm and gripping mechanism carried thereby for moving the can from one seat to another and inverting it, substantially as described.

6. In combination with the soldering-machine, the pivoted arm having rack-teeth, the reciprocating rack in connection with the teeth of the pivoted arms for operating the arm, and the automatic gripping devices, substantially as described.

7. In combination with the two tables, the transferring arm and grip, said arm having rack-teeth, the reciprocating rack, and the intermediate pinion, substantially as described.

8. In combination, the tables, the transferring-arm, the reciprocating bar having connection thereto for operating the same and the cam for operating the bar in one direction, and the means for retracting the bar, substantially as described.

9. In combination, the can-seats, the transferring-arm, the gripping-fingers carried thereby, and the cam for operating said fingers, substantially as described.



10. In combination, the can-seats, the transferring-arm, the gripping device, and the cam for operating said device, the said cam being arranged with its center to one side of the pivot of the transferring-arm, substantially as described.

11. In combination, the two tables, the shaft extending between them, the transferring-arm, the gripping device carried thereby, and the operating connection between said gripping device and the said shaft, substantially as described.

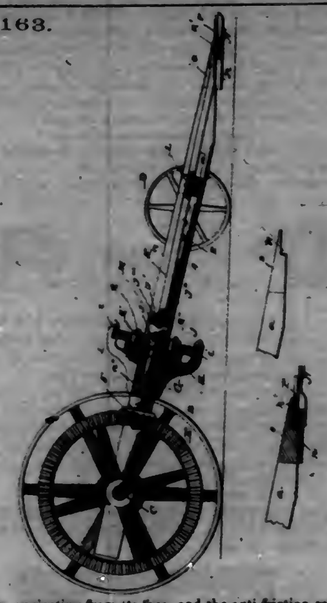
12. In combination, the two tables with can-seats, the transferring-arm, the gripping device, the cam with connections for operating said device, and the worm and the intermediate pinions for operating the cam, substantially as described.

13. In combination with the can-seats and can-holders, the sockets S and the upper solder-tubes held in these sockets, substantially as described.

407,162. GRAB-BUCKET. ALEXANDER E. BROWN, Cleveland, Ohio. Filed Mar. 13, 1889. Serial No. 303,115. (No model.)

Claim.—1. In a contrivance for gathering up and removing coal or other material, a single bucket-like device or receptacle having an axis of motion located within itself and the working or entering edges of which move downwardly into the mass of material to be gathered up, and thence move upwardly through said mass, in combination with suitable means for imparting such action to said bucket-like device, all in substantially the manner and for the purpose hereinbefore set forth.

2. In a contrivance for gathering up and removing coal or other material, the combination of the following instrumentalities, viz: first, a single oscillatory bucket or receptacle adapted to pass downwardly into and thence upwardly through the material in substantially the manner specified; second, a suitable frame-work adapted to rest on top of the material to be handled and having the said bucket pivotally connected therewith, substantially as described, and, third, means which effect a partial rotation of said bucket round about its pivotal connections with the said frame, the said combination being and operating in the manner and for the purposes hereinbefore set forth.

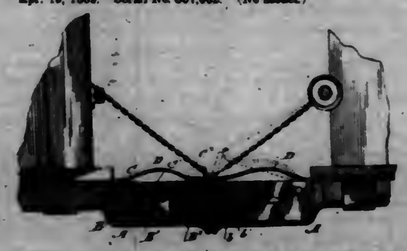


3. In combination with a suitable frame-work adapted to rest on the material to be handled, an oscillatory bucket or receptacle pivotally connected with said frame-work and a drive-shaft mounted in the upper portion of said frame-work, one or more drive-wheels mounted on said shaft, one or more chains arranged in engagement with said wheels, a series of chain-wheels mounted on the lower portion of said frame-work, and chain channels or housings e, within which travel such portions of the chain as effect an engagement with the bucket to be rotated, all substantially in the manner and for the purposes hereinbefore set forth.

407,163. LAWN-MOWER. LAURISTON S. BROWN, Oriskany Falls, N. Y., assignor of one-half to Minnie L. Brown, same place, and Cora A. Todd, Lebanon, Mo. Filed Sept. 10, 1888. Serial No. 285,047. (No model.)

Claim.—1. In a lawn-mower, the combination, with the rotary disk provided with the pins projecting from its face, and rollers mounted on said pins, of bracket-arms secured to the main frame, a transverse frame supported and retained in place by said bracket-arms and provided with a rectangular opening having spurs j at its opposite sides, an arm j', extending laterally across the forward face of the transverse frame and provided with rearwardly-curved ends attached to said frame, and a centrally-located transverse slot j'', intersected by a centrally-disposed aperture, and a pitman pivoted in the slot of the arm j' at one end, pivoted through its intermediate portion upon the main frame, and connected at its other end to the reciprocating cutter-bar of the cutting mechanism, substantially as specified.

2. In a lawn-mower, the combination, with a crown-wheel mounted on the axle, a pinion meshing with said crown-wheel, a shaft journaled longitudinally in the main frame of the mower and having said pinion on its rear end, the disk secured to the front end of said shaft

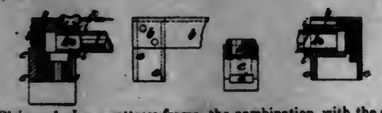


407,163.

with pins projecting from its face, and the anti-friction rollers on said pins, of the bracket-arms secured to the main frame, the transverse frame supported by and reciprocating upon said arms and provided with an opening having the curved spurs j, the transverse arm j', secured to said reciprocating frame, the pitman pivoted at its rear end to said arm and intermediately to the main frame, and the cutter-bar pivoted to the front end of the pitman, substantially as specified.

3. In a lawn-mower, the combination, with the main frame provided with the adjusting openings R in its side bars, and the wheels D, having shafts adapted to be journaled in any pair of the openings R to change the adjustment of the main frame, of the blocks O, bolted to the inner surfaces of the front ends of side bars of the main frame and having the horizontal recesses n' in their front ends, the finger-bar having rearwardly-extending arms secured to said blocks, the cutter-bar with its rear edge seated in the recesses n', the pitman pivoted to the main frame and at its front end to the cutter-bar, the reciprocating transverse open frame having the curved spurs j in its opening and suitably supported upon the main frame, the arm or bar j', secured to the transverse frame and having the rear end of the pitman pivoted upon it, the rotary disk provided with pins projecting from its face and mounted on a longitudinal shaft journaled in the main frame, and the anti-friction rollers mounted on said pins, substantially as specified.

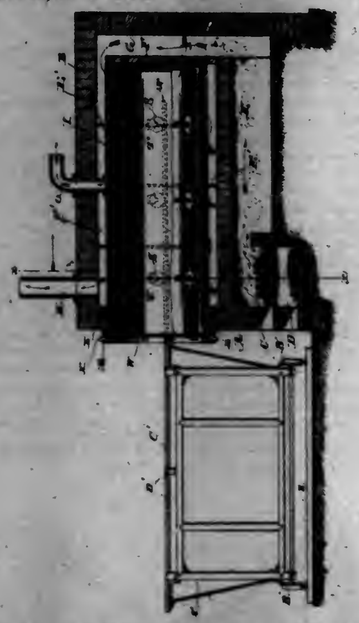
407,164. CAR-COUPLING. JOHN M. BURDEN, Huntsville, Ky. Filed Apr. 19, 1889. Serial No. 307,962. (No model.)



Claim.—1. In a car-coupling, a draw-head comprising a body or main section B, having a flared forward end provided in its upper side with a recess B' and having a groove B^2 extending between the said recess B' and the flared forward end, and the spring-actuated section C, hinged to section B, having a flared forward end provided in its under side with a recess C', and having a groove C^2 extending from recess C' forward to the front flared portion, all substantially as and for the purposes set forth.

2. The combination of the body or main section, the section C, the shaft F, having a bevel-gear f', a connection between shaft F and section C, and the shaft G, having a bevel-gear meshing that of the shaft F, substantially as set forth.

3. The improved car-coupling, substantially as described, consisting of the draw-head having a section B, formed with recess B' and groove B², section C, hinged at its rear end to section B and formed with recess C' and groove C², the dowels *b*, provided on one of such sections and entering the other, the spring for actuating the section C, the shaft F, connected with section C and having a bevel-gear *f*', and the shaft G, having a bevel-gear meshing the gear *f*'

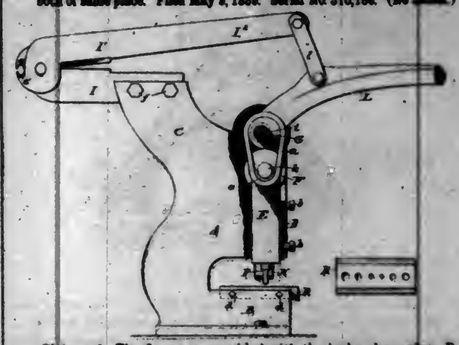


407,165. BED-FRAME. ISAAC CROMPTON and GEORGE L. SCOTT, Manchester, County of Lancaster, England. Filed Oct. 24, 1888. Serial No. 288,997. (No model.) Patented in England Aug. 17, 1885. No. 9,743.

Claim.—1. In a mattress-frame, the combination, with the sides, and the corner-brackets *c*, carried thereby, and having sockets open at their upper ends, of the end angle-irons *b*, provided with the tongues *c*, adapted to fit said sockets, substantially as set forth.

2. In a mattress-frame, the combination, with the sides, and the corner-brackets *c*, carried thereby, and having sockets open at their upper ends, of the end angle-iron *b*, provided with tongues *c*, adapted to fit said sockets, an opposing end piece *b*', a flexible mattress-bottom connected with said end pieces, and means for moving end piece *b*' to strain said bottom, substantially as set forth.

407,166. RETORT FOR DISTILLING WOOD AND MAKING CHARCOAL. FRANKLIN S. CLARK, Wilmington, N. C. Filed Jan. 5, 1888. Serial No. 259,834. (No model.)

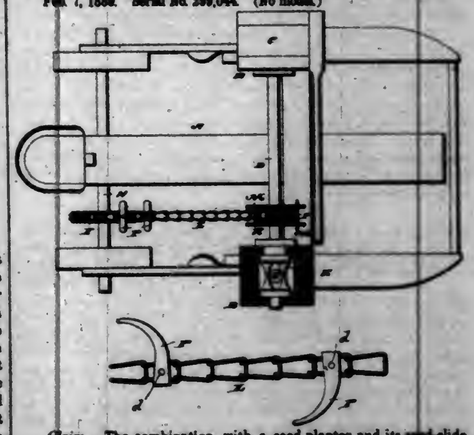


Claim.—1. The furnace having the fire-chamber C at the front end, the arch E, extending from the fire-chamber to the rear of the furnace, the rear end of the arch being open, the flue G at the rear end of the furnace communicating with the open rear end of the arch E, said flue G being formed by the back wall of the furnace and the vertical wall F, said wall F being arranged at a suitable distance from the back wall of the furnace and terminating at its upper end a short distance below the roof of the furnace, the roof B, provided with the escape-flue H at the front end, the furnace-chamber, the retort placed within the furnace-chamber between the arch E and the roof, but out of contact with both, the rear end of the retort being close to the wall F, and the baffle-plates E', arranged in the space separating the retort and the furnace, and each alternate plate open at its opposite ends, so as to provide tortuous passages F' for the hot air escaping from the flue G to the flue H.

2. In a wood-distilling apparatus, the outer cylinder I, having its outer end open and provided with the ring or mouth L, having flange M, combined with the inner cylinder having the plate W, of greater diameter than the inner cylinder, and adapted to fit snugly within the flange M and bear against the mouth L, and the wedges or keys X, passing through perforations of the flange M and bearing against the outer plate W, so as to hold the inner cylinder in place, provide an air-tight connection, and dispense with the necessity of a separate door, as set forth.

3. In a wood-distilling apparatus, the furnace, combined with the stationary outer cylinder I, arranged within the furnace, and the removable inner cylinder P, to contain the wood and having the openings T in its sides, said inner cylinder being smaller than the outer cylinder and arranged within the latter, so as to provide an air-space around the inner cylinder, with which air-space the openings T communicate, and the doors U on the inner cylinder for closing the openings, said doors being carried by the inner removable cylinder when it is drawn out, as set forth.

407,167. COMBINED PUNCH AND SHEARS. JASPER CLARK, Elmira, N. Y., assignor to Theodore C. Northcott and Cynthia Jane Clark, both of same place. Filed May 2, 1889. Serial No. 310,186. (No model.)



Claim.—1. The frame A, provided with the bed or base plate B, and having the slide E, provided with the friction-roller F, mounted in said frame, in combination with the hand-lever L, having the eccentric G formed thereon, and the connecting loops or links *a*, all constructed and arranged to operate substantially as shown and described.

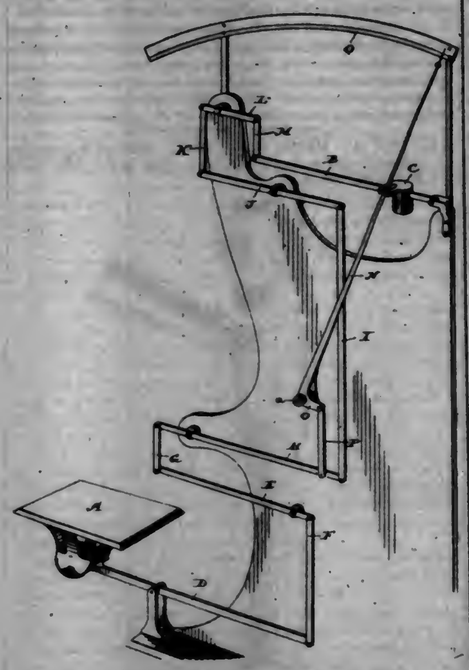
2. In combination with the frame A, having the pivoted lever L arranged to operate a punch, the fixed shear-blade I, and the movable blade F, having its arm connected to said lever L, substantially as shown and described.

3. The curved cutting-bades *c* and *d*, formed on the projecting ends of the shear-blades, for cutting round or other shaped rods, substantially as shown and described.

407,168. CORN-PLANTER. GEORGE J. CLINE, Goshen, Ind. Filed Feb. 7, 1889. Serial No. 299,044. (No model.)

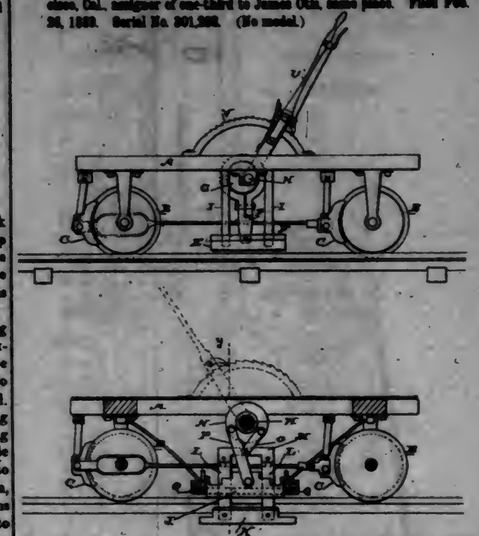
Claim.—The combination, with a seed-planter and its seed-slide having lugs or triggers, of the endless chain L, the triggers P, tapering and curved outwardly and having their inner ends formed with an elongated loop *b*, and a perforation *a* transversely through the loop, and the rivet or stud *d*, passing through the perforation in the loop and through links in the chain, so as to secure the triggers alternately on opposite sides of the chain, substantially as specified.

407,169. STOPPER FOR BOTTLES. JOHN W. COLLINS, Washington, D. C., assignor of one-half to John Proffit, Atsel, same place. Filed May 13, 1889. Serial No. 310,497. (No model.)



Claim.—1. In a bottle-stopper, the combination, with the cork fitting within the mouth of the bottle for closing the same, of the cap extending down around the top of the bottle, removably united to the cork by the spiral or screw, which passes only partially through the latter, whereby the cap may be applied to the cork after the same is in place, substantially as described.

2. In a bottle-stopper, the combination, with the cork fitting within the mouth of the bottle for closing the same and the cap extending down around the top of the bottle, removably secured to the cork, of the bail pivotally connected to the top of the cap and free to swing up to enable the cork to be withdrawn, substantially as described.



3. In a bottle-stopper, the combination, with the cork fitting within the mouth of the bottle for closing the same, the cap having the long depending edge entirely surrounding the top of the bottle and removably united to the cork by the screw or spiral secured to the cap and entering the cork, of the neck-wire having the ears thereon, the bail pivoted freely on the cap and having the hooked portions engaging said ears to hold the stopper in place, and the handle to facilitate the removal of the cork, substantially as described.

407,170. AUTOMATIC WEIGHING-SCALES. JAMES CORMICK, Port Arthur, Ontario, Canada. Filed Nov. 1, 1888. Serial No. 289,730. (No model.)

Claim.—An automatic weighing-scale consisting of a series of levers arranged in connection with an adjustable weight calculated when at zero to balance the weighing table or platform and mechanism connected therewith, a pivoted pointer being connected to the levers and to the adjustable weight, whereby the movement of the levers shall operate the pointer so as to adjust the said weight to a point on the weigh-beam which will produce an equilibrium between the article being weighed and the adjustable balance-weight, substantially as and for the purpose specified.

407,171. CABLE-RAILWAY BRAKE. OLIVER COPE, San Francisco, Cal., assignor of one-third to James Otis, same place. Filed Feb. 26, 1889. Serial No. 301,362. (No model.)

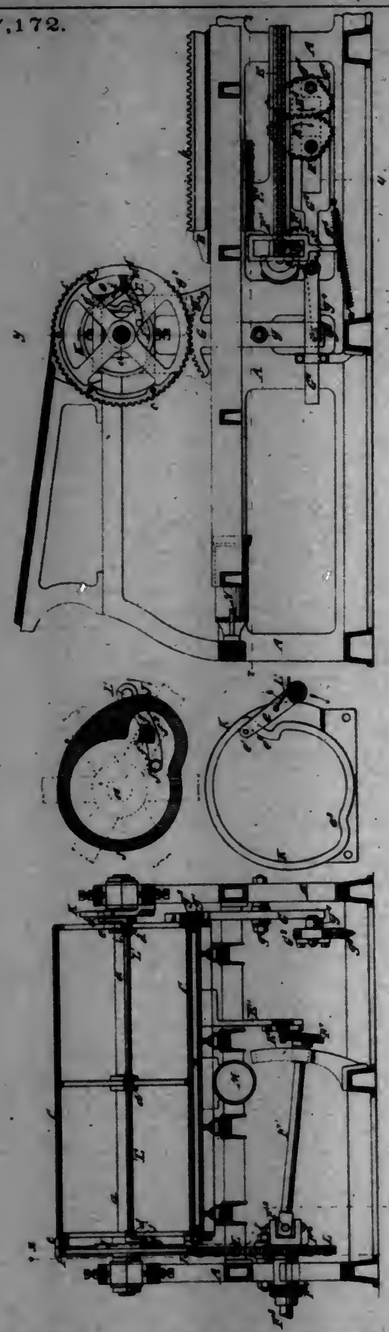
Claim.—1. The vertically-moving grip-shoes, one above and one below the slot-irons of a cable-railway tube or tunnel, a guide upon the car through which the shoe shanks or connections move, a horizontal shaft journaled upon the car, having a disk mounted thereon, and connecting-rods extending from opposite sides of said disk to the shoes or their connecting-yokes, so that the rotation of the disk will move the shoes in opposite directions, substantially as described.

2. A horizontal shaft journaled upon a cable-railway car or dummy, having a disk upon it and a lever by which the shaft and disk may be rotated, gripping-shoes supported, respectively, above and below the slot-irons of the cable-railway tube or tunnel, and the links connecting said shoes with a disk upon the opposite sides of the rotary shaft, whereby the rotation of the shaft will cause the gripping-shoes to approach to or recede from each other, substantially as described.

3. The slot-iron gripping-shoes, the connecting-links, and rotary shaft and disk whereby they are actuated, in combination with the fixed guids supported from the car-body, whereby the shoes are caused to retain their position and are guided in their movements, substantially as described.

4. The vertically-moving gripping-shoes, with the connecting-links, and a disk fitted loosely upon the horizontal shaft which is journaled across the car-frame, in combination with a clutch-sleeve traveling longitudinally upon a feather upon the shaft and having its end adapted to engage the disk, and a lever whereby said clutch-sleeve is moved upon the shaft, substantially as described.

5. The vertically-moving brake-shoes, the disk fitted loosely upon a horizontal shaft journaled across the car-frame, said disk connected with the shoes by links, whereby they are actuated, a clutch-sleeve traveling longitudinally upon a feather upon the shaft, a lever by which said sleeve is moved in one direction, and a spring acting against said lever or the sleeve, so as to throw it into engagement with the disk when released, substantially as described.



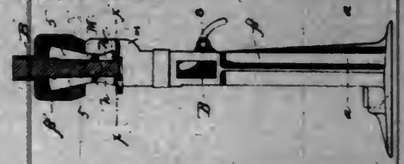
6. The loose spring-actuated sleeve fitted upon the horizontal shaft which is journaled to the car-frame, the clutch connected therewith and moved to engage with the disk, and a pawl or stop acting against the end of the clutch-sleeve when the latter is in engagement with the disk, so as to prevent its becoming disengaged, substantially as described.

7. A brake mechanism for cable-railway cars, consisting of the vertically-moving slot-iron grip-shoes, the track-brake consisting of shoes adapted to be pressed downward upon the track, a horizontal shaft journaled across the frame and having a central disk by which the grip-shoes are actuated, and eccentrics upon its outer end, whereby the track-brakes are actuated simultaneously with the slot-grip by the rotation of the shaft, substantially as described.

407,172. STOP-CYLINDER PRINTING-MACHINE. CALVERT B. COTTRELL, Stonington, Conn. Filed Aug. 25, 1888. Serial No. 283,773. (No model.)

Claim.—1. The combination, with the main shaft and impression-cylinder and a bed having a rack for engaging with teeth on the said

407,172.

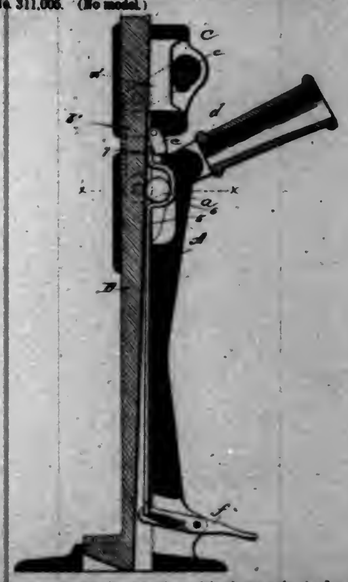


cylinder for driving the same during printing, a cam-actuated toothed sector-lever, and teeth upon said cylinder gearing with said lever for starting the said cylinder, of a wheel loose upon said cylinder and in gear with the main shaft to run always in one direction and a cam-actuated clutch for clutching said loose wheel with the cylinder after the starting of the same by the sector-lever and unclutching the said loose wheel from the cylinder after printing, substantially as herein set forth.

2. The combination, with the main shaft and impression-cylinder and a bed having a rack for engaging with teeth on the said cylinder for driving the same during printing, a cam-actuated starting-lever, and teeth upon said cylinder gearing with said lever, of a wheel loose upon said cylinder to run always in one direction, an intermediate wheel gearing with said loose wheel and with a gear upon the main shaft, and a clutch for clutching said loose wheel with and unclutching it from the cylinder, substantially as and for the purpose herein set forth.

3. The combination, with the impression-cylinder of a printing-machine and a gear-wheel loosely attached thereto, of a clutch mechanism for connecting them together and disconnecting them, consisting of a rotary clutch-piece attached to and rotating with said wheel, and a stationary cam and rock-shaft carried by said cylinder and having one arm for engaging with said rotary clutch-piece and another arm engaging with said stationary cam for causing the engagement of the first-mentioned arm with the said rotary clutch-piece and its disengagement therefrom, substantially as and for the purpose herein set forth.

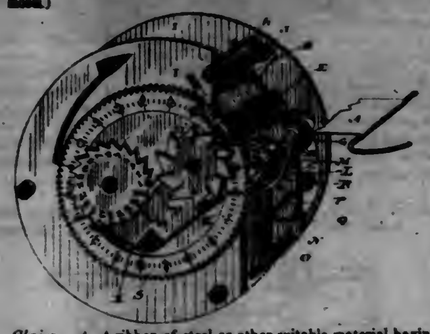
407,173. LIFTING-JACK. LOUIS J. CRESSLIUS, St. Louis, Mo., assignor to Andrew Warren, same place. Filed May 15, 1889. Serial No. 310,846. (No model.)



Claim.—1. In combination, a standard, a head, and a suitable lifting-lever, with gripping mechanisms in the standard and head, and a lifting-bar having a separate taper for each gripping mechanism, substantially as described.

2. In combination, the standard, the head, and suitable lifting-lever, duplicate gripping mechanisms for the standard and head, and a lifting-bar having duplicate tapers, one set for each gripping mechanism, arranged in relation to each other substantially as described.

3. In combination with the standard and a lifting-bar, a gripping-wedge in the standard, a head having gripping-wedges with extensions downward, a plate having notches to receive these extensions when the plate is in normal position, and a projection on the standard-wedges, adapted to move the plate out of normal position when the standard-wedges are raised, substantially as and for the purpose explained.



407,174. LIFTING-JACK. LOUIS J. CRESSLIUS, St. Louis, Mo., assignor to Andrew Warren, same place. Filed May 16, 1889. Serial No. 311,005. (No model.)

Claim.—1. In combination with the standard of a lifting-jack and with its head having a pivoted lug a grip located in a chamber in the standard and adapted to bear against the lifting-bar and a releasing-rod arranged to bear against the upper and under sides of said grip and extending to the pivoted lug, substantially as described.

2. In combination with the standard of a lifting-jack and a grip arranged in a chamber in said standard, a releasing-rod bent to bear against the upper and lower sides of said grip and working in a groove in rear of the grip, substantially as described.

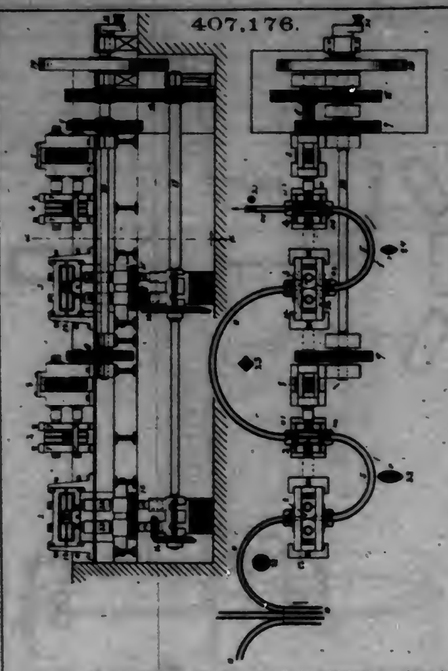
407,175. LUMBER-MEASURE. ALEXANDER CRUICKSHANK, Weston, Ontario, Canada. Filed Sept. 1, 1888. Serial No. 284,362. (No model.)

Claim.—1. A ribbon of steel or other suitable material having stamped or otherwise formed on its surface a series of divisions substantially similar to the divisions on an ordinary lumber-rule, each division representing one foot board-measure, or other fixed proportion in a board of a given length for which the particular divisions may be marked, in combination with a disk actuated by said ribbon and its accessories, by which the movement of the ribbon while measuring the width of a board shall act upon a counter by which the board-measure of all the pieces measured shall be automatically summed up and registered, substantially as and for the purpose specified.

2. A ribbon A, having stamped or otherwise formed on its surface a series of divisions substantially similar to the divisions on an ordinary lumber-rule, each division representing one foot board-measure, or other fixed proportion in a board of a given length for which the particular divisions may be marked, in combination with a disk arranged to engage with the ribbon A, and so connected to a counter that the movement of the ribbon shall cause the counter to move and register the quantity of lumber measured, substantially as and for the purpose specified.

3. A ribbon A, marked with a series of divisions substantially similar to the divisions on an ordinary lumber-rule, substantially as described, and wound upon the spring-drum D, the said ribbon extending past and held against the roller E, in combination with the disk C, having spokes B radiating from it to engage with the elongated holes made in the ribbon A, and with counting mechanism connected, as described, to the spindle of the disk C, substantially as and for the purpose specified.

4. A ribbon A, marked substantially as described and wound upon the spring-drum D, the said ribbon extending past and held against the roller E, which is supported in suitable journals made in the adjustable plate H, in combination with the longitudinally-adjustable disk C, having spokes B radiating from it to engage with the elongated holes made in the ribbon A, and with counting mechanism connected, as described, to the spindle of the disk C, substantially as and for the purpose specified.



5. A ribbon A, marked substantially as described and wound upon the spring-drum D, the said ribbon being provided with perforations extending past and engaging with the disk C, which is provided with spokes and journaled on a sleeve F, longitudinally adjustable upon the spindle G, in combination with the bracket N and screw P, substantially as and for the purpose specified.

6. A ribbon A, marked substantially as described and wound upon the spring-drum D, the said ribbon being provided with perforations extending past and engaging with the disk C, which is provided with spokes and journaled on a sleeve F, longitudinally adjustable upon the spindle G, in combination with a bracket N, pointer Q, and adjustable screw P, substantially as and for the purpose specified.

407,176. WIRE-ROD-ROLLING MILL. FRED H. DANIELS, Worcester, Mass. Filed Jan. 31, 1888. Serial No. 262,260. (No model.)

Claim.—1. A wire-rod-rolling train composed of a series of pairs of rolls arranged in sets, each set consisting of two pairs of rolls having, respectively, oval passes and square passes, and disposed with the axes of one pair at right angles with the axes of the other pair, and an overfeed-guide connecting each pair of rolls with the succeeding pair, the rolls and guides being arranged and operating substantially as described.

407,176.

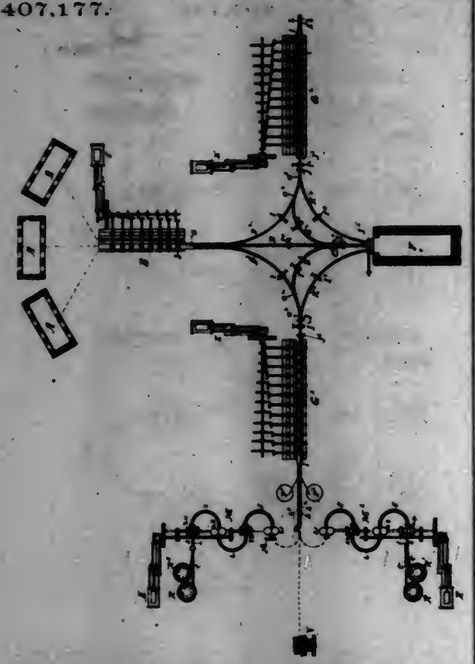
2. A rolling-mill having a pair of rolls in which the rod is given a square section and another pair of rolls in which the rod is given an oval section, in combination with an overfeed-guide that automatically and without twisting conducts the oval rod from the rolls which give it an oval section into the pairs of the rolls which give it a square section, the oval-pass roll being arranged axially at right angles with the square-pass rolls, all substantially as and for the purpose set forth.

3. A rolling-mill composed of a series of rolls disposed in pairs for successive reductions of the rod by back and forth feeding, and having the successive pairs of rolls disposed with the axes of each pair relatively at right angles to the axis of the next preceding pair, substantially as described.

4. In a rolling-mill, the combination, with a pair of rolls 1 and a pair of rolls 2, of the overfeed-guide 5, said guide and rolls being arranged, as described, to prevent twisting the rod while bending it, the whole combination being and operating substantially as described.

5. In a wire-rod-rolling mill, the combination, with the oval-pass reducing-rolls, of guide 5, the inner surface of its flange shaped, as shown, to match the side of a rod of oval section and curved from end to end, substantially as set forth.

6. A rod-rolling mill having a series of pairs of reducing-rolls, the alternate pairs having oval passes, in combination with a guide for directing an oval rod from one pair to another pair of rolls, and a pair of yielding feed-rolls that form a part of the guide and also advance the rod to the reducing-rolls, substantially as described.



7. In a wire-rod-rolling mill, the combination, with two pairs of reducing-rolls, of a semicircular overfeeding repeater-guide 5, for conducting the end of the rod from its place of issue from one pair of reducing-rolls to the place of entry to the other pair of reducing-rolls, and a pair of feed-rolls 23, disposed in the line of said repeater-guide near its delivery end, substantially as and for the purpose set forth.

407,177. ROLLING-MILL PLANT. FRED H. DANIELS, Worcester, Mass. Filed Jan. 31, 1888. Serial No. 262,260. (No model.)

Claim.—1. In the rolling-mill plant described, the arrangement of a first train of rolls, a conductor, a second rolling-train through which the product is delivered from said conductor, a second conductor through which the product is delivered from said second rolling-train, and a third rolling-train for finishing the product, all disposed and operating as and for the purpose specified.

2. In a rolling-mill plant, the arrangement, substantially as described, of a first rolling-train, a second rolling-train, a supplemental storage chamber or furnace, a conductor leading from said first rolling-train to said second rolling-train, a conductor from said first rolling-train to said storage-furnace, and a return-conductor through which the product can be withdrawn from its approach to the second

407,177.

rolling-train and directed to said storage-chamber, said conductors being respectively provided with switches and with feed-rolls for advancing or retracting the product, as set forth.

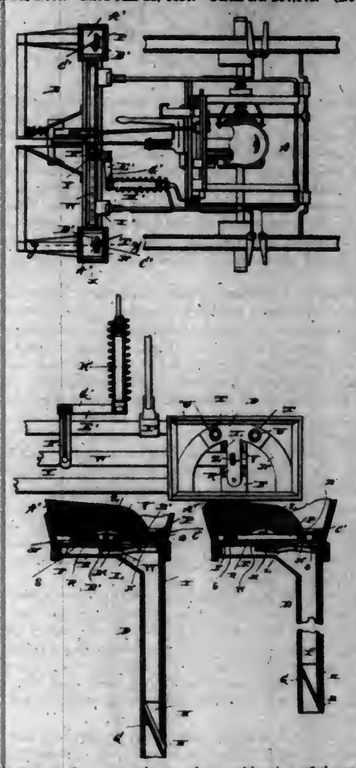
3. In a rolling-mill plant, the arrangement, substantially as described, of the billet-mill, a plurality of rod-mills, a supplemental furnace or receiver, a series of conductors leading from said billet-mill to the rod-mills and supplemental furnace, with a switch for directing the product to either conductor, feed-rolls and cutters in the line of said conductors, and return-conductors with feed-rolls for withdrawing the billets from the rod-mill conductor for delivery to the furnace, as set forth.

4. In a rolling-mill plant, the arrangement, substantially as set forth, of the billet-mill, the rod-mill, a conductor leading from said rod-mill to said billet-mill and having feed-rolls and cutters in the line thereof, as indicated, a finishing-mill, a conductor from said rod-mill to said finishing-mill provided with a switch and cutter having a branch guide, and an automatic reel to which the rod is delivered by said branch guide, for the purpose set forth.

5. In the rolling-mill plant described, the arrangement, with a rod-mill having a train of rolls arranged in pairs for operating in continuous order, of a plurality of finishing-trains consisting of pairs of rolls with the axes of the several pairs of rolls disposed at right angles, a series of overfeed-guides for leading the end of the rod through said finishing-train, and a conductor between the rod-mill and the finishing-trains, substantially as set forth.

6. In a rolling-mill plant, the arrangement, substantially as described, of the billet-mill, the rod-mill, a conductor with shears and feed-rolls for trimming and advancing the product from said billet-mill into the rod-mill, a plurality of finishing-trains having their rolls disposed at right angles and provided with overfeed-guides, conductors from said rod-mill to said finishing-trains, a switch for directing the rod to either finishing-train, and reels for coiling the finished rods, substantially as set forth.

7. In a rolling-mill plant, the arrangement, substantially as described, of the billet-mill, the rod-mill, a conductor with shears and feed-rolls for trimming and advancing the product from said billet-mill into the rod-mill, a finishing-train, conductors from said rod-mill to said finishing-train, and a reel for coiling the finished rods, as set forth.



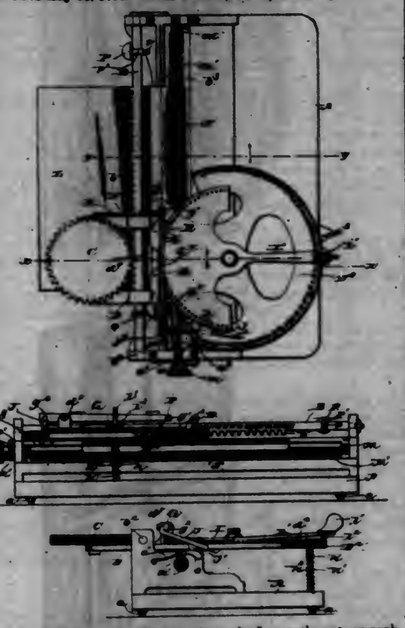
8. The rolling-mill plant consisting of a billet-mill, an inclosed conductor for maintaining the heat of the product of the billet-mill and for conveying it to the rod-mill, a rod-mill, an inclosed conductor for maintaining the heat of the product of the rod-mill and for conveying it to the finishing-mill, a finishing-mill, and a reel for coiling the product of the finishing-mill.

407,178. TRUNK TRAY AND COVER. SERENA H. DAVENPORT, St. Paul, Minn. Filed Feb. 5, 1889. Serial No. 298,751. (No model.)

Claim.—The trunk-tray 3, having its bottom extending beyond the sides and ends of the tray for the purpose of forming a supporting-ledge 4 for the cover to rest upon when in place, and having straps 5, provided with buckles, as shown, secured to the bottom of the tray, as described, in combination with the independent removable cover of the tray constructed of suitable water-tight material and adapted for use as a bath-tub, as and for the purpose described.

407,179. CHECK-ROW CORN-PLANTER. DANIEL H. PILLOW, Nelson, Nebr. Filed Jan. 22, 1889. Serial No. 297,175. (No model.)

Claim.—1. In a corn-planter, the combination of the seed-spouts having the forwardly-extending hollow arms, the vertically-movable slides or valves arranged in said seed-spouts, the levers mounted upon transverse pivots in the said hollow arms and having forked rear ends connected to the slides or valves and provided with cams or enlargements at their front ends, and the transverse reciprocating bar having cams to engage the cams at the front ends of the levers, substantially as set forth.



2. In a corn-planter, the seed-spouts provided with the forwardly-extending hollow arms, in combination with the levers located in the latter and operating the vertically-sliding valves in the seed-spouts, substantially as specified.

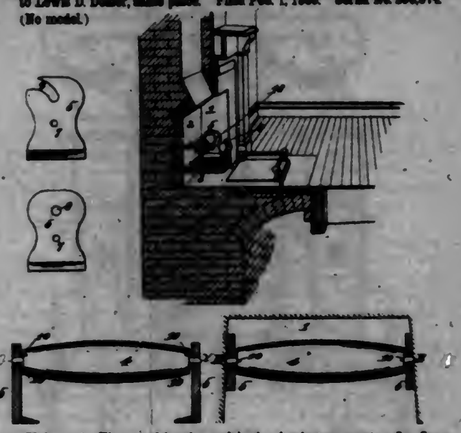
3. In a corn-planter, the combination of a seed-spout provided at its bottom with an inclined plate and a discharge-opening at the lower end of the same, with a vertically-sliding valve-plate arranged to slide against the rear side of the spout, and provided at its lower end with flanges bent forwardly and having inclined edges adapted to bear against the inclined bottom plate, substantially as set forth.

4. In a corn-planter, the combination of a seed-spout having a forwardly-extending hollow arm, an inclined plate, and a discharge-opening at the bottom of said seed-tube, a vertically-sliding valve-plate provided at its lower end with beveled flanges adapted to bear against said inclined plate, a lever mounted in the hollow arm of the seed-spout, and having a forked rear end engaging the valve-plate, and operating mechanism, substantially as described.

5. In a corn-planter, the combination of the hoppers having suitable seed-openings, the seed-spouts having forwardly-extending hollow arms, the curved plates N, having seed-openings O, the oscillating seed-plates having slots V, the vertically-sliding valve-plates arranged in the seed-spouts, the levers arranged in the hollow arms of the spouts, engaging said valve-plates and having cams at their front ends, and the transverse reciprocating bars having cams to engage the said cam-levers, and pins engaging the slots in the seed-slides, substantially as set forth.

407,180. TYPE-WRITING MACHINE. ISAAC B. DODSON, Danville, Va. Filed May 31, 1888. Serial No. 275,614. (No model.)

Claim.—1. The combination of the main frame, the rotary rack-bar B, journaled in the frame, the carriage mounted on the said rack-bar and sliding thereon, the spring-actuated wheel secured to the back of the carriage and engaging the rack-bar, mechanism for preventing the movement of the carriage, the pin K^1, depending from the front portion of the carriage, and the spring surrounding said pin and having its upper end secured to the carriage and its lower end resting on the base of the main frame, as set forth.



2. In a type-writer, the combination of the main frame, the carriage suitably mounted in the frame and capable of being elevated and depressed, a lever pivoted to the carriage and provided with a striking-pin, a connecting-lever having one end secured to an end of the lever carrying the striking-pin and the other end secured to the carriage and fulcramed intermediate of its ends on the main frame, whereby the striking-pin will be caused to descend upon depression of the front of the carriage and the type arranged in the path of the striking-pin, substantially as described.

3. In a type-writer, the combination of the main frame, the square bar having upon its under side teeth, the carriage, the lever provided with a striking-pin, a curved spring-arm pivoted to the carriage and adapted when elevated to engage the teeth of the square bar, the said arm being capable of a lateral spring movement, and a spring to hold the curved arm elevated, substantially as specified.

4. In a type-writer, the combination of the main frame, the bar provided upon its lower face with teeth, the carriage mounted upon the said bar and capable of being elevated and depressed, the lever provided with a striking-pin and secured to the carriage, the connecting-lever fulcramed on the main frame and having one end attached to the carriage and the other secured to the lever provided with the striking-pin, and the curved spring-arm F engaging the teeth on the lower face of the said bar and supporting an end of said lever provided with the striking-pin, whereby the curved arm will be disengaged from the teeth of the bar and the striking-pin lowered upon depression of the carriage, substantially as described.

5. In a type-writer, the combination, with the main frame having the toothed bar B, of the tilting carriage sliding on the said bar and carrying the type, the lever G, connected to the carriage and carrying a striking-pin to engage and depress the type, the laterally resilient arm F, pivoted to the carriage and connected to the lever G and adapted to normally engage the toothed bar, and the shouldered set-screw S on the carriage to limit the lateral swing of the arm F, substantially as specified.

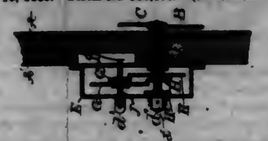
407,181. FIRE-PLACE. JAMES H. DOSTER, St. Louis, Mo., assignor to Lewis D. Doster, same place. Filed Feb. 1, 1889. Serial No. 298,374. (No model.)

Claim.—1. The combination, with the basket or grate of a fire-place, of a horizontal radiating-bar extending over the fuel and having end supports, substantially as described.

2. The combination, with the basket or grate of a fire-place, of a horizontal radiating-bar and the side pieces for supporting the ends of the bar, substantially as described.

3. The fire-place radiator consisting of the side pieces 5 and the radiating-bar 4, mounted on said side pieces, substantially as described.

4. The fire-place radiator consisting of the side pieces 5 and the radiating-bar 4, journaled in the side pieces, substantially as described.



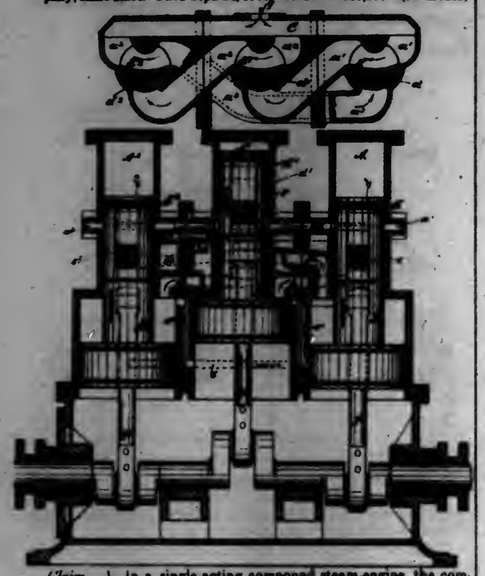
5. The fire-place radiator consisting of the side pieces 5 and the radiating-bar 4, formed with notches 10 at each end and journaled in the side pieces, substantially as described.

6. The fire-place radiator consisting of the side piece 5 having journal-perforation 8, the side piece 5 having journal-slot 9, and the radiating-bar 4, having end notches 10 and journaled in the side pieces, substantially as described.

407,182. PROCESS OF REFINING OILS. JAMES A. DUNN, Allegheny Pa. Filed Dec. 2, 1888. Serial No. 292,507. (Specimens.)

Claim.—As an improvement in the art of refining oils containing sulphur, the herein-described method, which consists in adding arsenium or its salts to the oil, subjecting the compound to a volatilizing-heat, and then condensing the vapors so produced, substantially as set forth.

407,183. TEACHER'S DIAL. AYERS M. EDWARDS, Lewiston, Me. Filed Apr. 19, 1889. Serial No. 307,809. (No model.)



Claim.—1. The herein-described teacher's dial, having an hour and a minute hand, an hour-hand dial-wheel and a center pinion connected with said hands, a pintle having thereon a dial-wheel, and a pinion adapted to engage said center pinion and hour-hand dial-wheel and having a longitudinal movement in its bearings, a spring for forcing said dial-wheel and pinion out of gear, and a cam for forcing them into gear, substantially as shown.

2. The herein-described teacher's dial, having an hour-hand and an hour-hand dial-wheel connected therewith, a minute-hand and a center post attached thereto, a center pinion and an extra pinion on said center post, a shaft having on one end a knob or handle and on

the other end a gear for engaging said extra pinion, an independent dial-wheel and pinion adapted to connect said hour and minute hands, and means for throwing the same in and out of gear, substantially as shown.

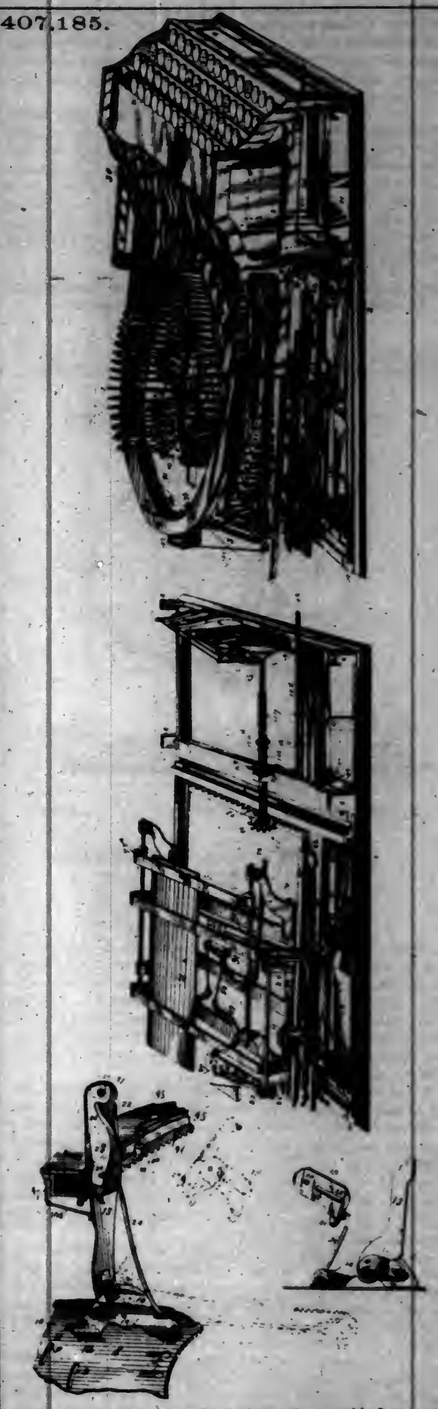
3. The pintle movable longitudinally in its bearings, gears thereon for connecting the hour and minute hand gears, a spring for moving said pintle in one direction, and a hand-controlled cam for moving it in the other, whereby said gears are connected and disconnected, substantially as shown.

407,184. SINGLE-ACTING COMPOUND ENGINE. JOHN H. RICKERMONT, Cincinnati, Ohio, assignor to the Triumph Compound Engine Company, same place. Filed Sept. 24, 1888. Serial No. 286,268. (No model.)

Claim.—1. In a single-acting compound steam-engine, the combination of a series of cylinders, each of two diameters, having pistons working therein, and passages through said pistons and connecting said cylinders, said passages being opened and closed by said pistons, in the manner and for the purpose described.

2. The combination, in a single-acting compound steam-engine, of a series of cylinders, each of two diameters, having pistons working therein, and passages in which steam flows through one cylinder-piston into a second cylinder and actuates the piston working in said second cylinder, substantially as and for the purpose specified.

3. The combination, in a single-acting compound steam-engine, of a series of cylinders, each of two diameters, having pistons working therein, passages in which steam flows through one cylinder-piston into a second cylinder and actuates the piston working therein, and a piston governing the flow of steam, in the manner and for the purpose specified.



4. In a multiple-cylinder single-acting compound steam-engine, the combination of a series of cylinders, each of two diameters, pistons working therein, and a valveless exhaust connecting one cylinder with the free end of a second cylinder, the flow of steam in said exhaust being controlled by the piston of said second cylinder, substantially as described.

5. In a compound single-acting engine, cylinders A A' A^2, each of two diameters, pistons B B' B^2, working therein, live-steam passages a' a^2 a^3, and exhaust-passages c c' c^3, combined in the manner and for the purpose specified.

6. In a compound single-acting engine, cylinders A A' A^2, each of two diameters, pistons B B' B^2, working therein, live-steam passages a' a^2 a^3, expansion-steam passages b b' b^2, and exhaust-passages c c' c^2, combined in the manner and for the purpose specified.

7. In a compound single-acting engine, cylinders A A' A^2, each of two diameters, pistons B B' B^2, expansion-steam passages b b' b^2, working therein, and exhaust-passages c c' c^2, combined in the manner and for the purpose specified.

407,185. TYPE-WRITING MACHINE. WILLIAM H. BLLING, Cleveland, Ohio. Filed Jan. 24, 1887. Serial No. 225,408. (No model.)

Claim.—1. In a type-writer, the main frame, a movable frame supported in transverse guides on said main frame, a letter-spacing carriage supported in transverse guides on the movable frame, and a line-spacing carriage supported in longitudinal guides on the letter-spacing carriage, all combined and operating substantially as set forth.

2. In a type-writer, a letter-spacing carriage and a line-spacing carriage supported in guides at right angles to one another, in combination with a printing-table formed in two separate sections supported on the line-spacing carriage, and levers, as 89, pivoted beneath said table and connected by levers and links with the sections of the table to raise and lower the same, substantially as set forth.

3. In a type-writer, a letter-spacing carriage and a line-spacing carriage one upon the other, in combination with a sectional printing-table, main lever, as 86, levers, links, and evener, as 89 90 91, respectively, a yoke with arms and links connecting the leaves of the table and the levers 89, and the cross-bars 92 and 93, substantially as set forth.

4. In a type-writer, a letter-spacing carriage having a cross-bar, as 92, attached thereto, and a line-spacing carriage having a bar, as 93, attached thereto, in combination with a printing-table formed in sections longitudinally, and levers, as 89, and connecting-links, with a main operating-lever to operate the same for pressing the printing-table up to the cross-bars 92 93, substantially as set forth.

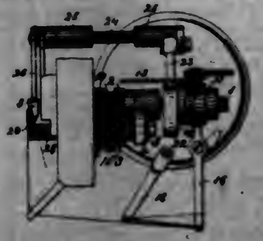
5. In a type-writer, a printing-table, a fixed plate having an opening over said table, and a series of radial and concentric slots 8 9 about said opening, in combination with a standard adjustable in said slots, type-arms pivoted on said standards having hooks, as 15, keepers, as 16, and lips, as 18, to guide them on the standards, substantially as set forth.

6. In a type-writer, a fixed plate above the printing-table, with an opening over said table, said plate having radial and concentric slots 8 9, standards secured to said plate through said slots, in combination with type-arms pivoted to said standards, stops and guides for said arms connected with said standards, type-hammers on said arms having each a longitudinal slot, and a rod working in said slot, and a slot in the type-arm for reversing said hammer when lowered to strike, substantially as set forth.

7. In a type-writer, a type-arm and a type-hammer pivoted to the said arm, in combination with an inking-carriage, and an inking-pad behind said hammer, and a spring attached to the inking-carriage frame to engage the type-arm and hold the type normally out of contact with the inking-pad, substantially as set forth.

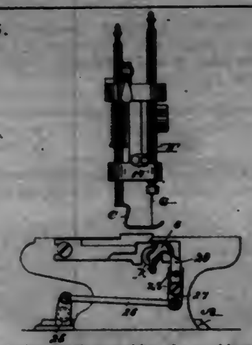
8. In a type-writer, a type-arm having a curved slot, as 22, in combination with a type-hammer having a slot, as 23, and pivoted on said arm, and a rod having one end bent and passing through said slots, substantially as set forth.

9. In a type-writer, a supporting-frame, an inking-carriage supported on rollers in said frame and having an inking-pad on its outside and gear along its edge, in combination with an actuating-wheel meshing with the gear on said carriage, and connections between said gear and the spacing-carriage, whereby the inking-carriage is rotated by the spacing-carriage, substantially as set forth.



10. In a type-writer, a type-arm having a curved slot 22, in combination with a type-hammer pivoted, as at 20, and having a straight slot 23, and a rod pivoted on a different center from the type-arm and having its end working in said slots, substantially as set forth.

11. In a type-writer, the combination of a track-frame, as 97, of circular form, a circular carriage thereon, anti-friction rollers 96, supporting the carriage, removable plate 98 on the frame, inking-pad 94, and gear 100 on the said carriage, pinion 101, meshing with the said gear, retracting-drum 102, and a cord on the drum actuated by the line-spacing carriage, substantially as set forth.



12. In a type-writer, the letter-spacing carriage and the line-spacing carriage, one supported on the other, in combination with a printing-table formed in sections longitudinally, and having means to operate the same, consisting in yoke-arms 82, connecting posts 83 and ears 87 on the table-sections, links 88, likewise connecting said parts below the yoke-arms, main lever 86, levers 89, and links 90, and evener 91, connecting said levers, and links 85, uniting levers 89, and projecting yoke-arms 84, substantially as set forth.

13. In a type-writer, a circular inking-pad constructed to be rotated around its axis, type-levers with reversed type striking against said pad, and ink-distributing rolls at intervals between said type-levers, substantially as set forth.

407,186. SEWING-MACHINE. HENRY H. PEPER, Philadelphia, Pa., assignor of one-half to Thomas A. Pearce, same place. Filed Aug. 30, 1888. Serial No. 284,115. (No model.)

407,186.

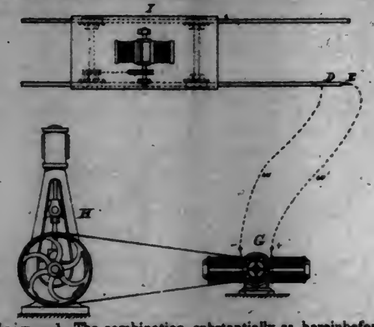
Claim.—1. In a sewing-machine, the combination, with the reciprocating needle, of the driving-shaft having a socket in one end, a shaft carrying the hook or looper fitted in said socket, gearing on the driving and hook shafts, gearing meshing with said gearing for driving the hook and driving-shafts at different speeds, and a sliding looper operating in conjunction with the needle and rotary hook or looper, substantially in the manner and for the purpose described.

2. In a sewing-machine, the combination, with the reciprocating needle, of the driving-shaft having one end socketed, said shaft also carrying gearing, a hook-shaft carrying a gear-wheel fitted in the socket of the driving-shaft, and gearing meshing with the gearing of the looper and driving-shaft for imparting different speeds thereto, substantially in the manner and for the purpose described.

3. In a sewing-machine, the combination, with the reciprocating needle, of a driving-shaft, a hook-shaft having a journal-bearing in said driving-shaft, a stud parallel with said driving and hook shafts, meshing gearing on said driving and hook shafts and said stud, one of said gear-wheels on said stud being of twice the diameter of the meshing gear-wheel on the hook-shaft, substantially as and for the purpose set forth.

4. In a sewing-machine, the combination of a reciprocating needle, a driving-shaft and a hook-shaft carrying gear-wheels, a stud carrying a gear-wheel of different diameter from those on the driving-shaft and hook-shaft, gear-wheels on the stud meshing with the gear-wheels on the driving and hook shafts, and a sliding looper operating in conjunction with the revolving looper and needle, substantially in the manner and for the purpose described.

5. In a sewing-machine, the combination of the driving-shaft carrying gear-wheels, a hook-shaft having a bearing in an end of said driving-shaft, a stud parallel with said shafts, meshing gearing on said shafts and stud, substantially as described, an eccentric on the driving-shaft, a band encircling the same and having an arm, a crank-shaft, a link, and a pivoted lever carrying a curved looper at one end, substantially as and for the purpose set forth.

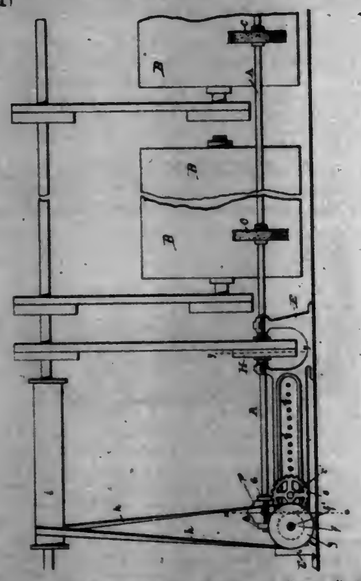


407,187. GLASS-FURNACE. ANDREW FERRARI, Glassborough, N. J., assignor, by mesne assignments, to the Whitney Glass Works, of New Jersey. Filed Sept. 15, 1887. Serial No. 249,741. (No model.)

Claim.—1. A glass-furnace consisting of a fire-box, a batch-chamber with a separate front wall from the back wall of the fire-box, and a bridge forming a top passage and a lower channel, a pot-chamber communicating with said batch-chamber by said passage and channel, a stack above said pot-chamber, and side chamber leading from top passage to said stack and having valves therein, said parts being combined substantially as and for the purpose set forth.

2. A glass-furnace consisting of a fire-box, a batch-chamber with a bridge having an air-space in the same, said bridge forming a top passage and a lower channel, a pot-chamber in communication with said passage and channel, and side chambers provided with valves and leading from said top passage to a stack above the said pot-chamber, the floor of the lower channel being on a level with the floor of the batch-chamber and below that of the pot-chamber, and the air-space in the bridge being above the lower channel, said parts being combined substantially as described.

407,188. ELECTRIC RAILWAY. STEPHEN D. FIELD, New York, N. Y., assignor to David Dudley Field, trustee, and Stephen J. Field, Cyrus W. Field, Henry M. Field, and Stephen D. Field. Filed Mar. 10, 1890. Serial No. 4,732. (No model.)

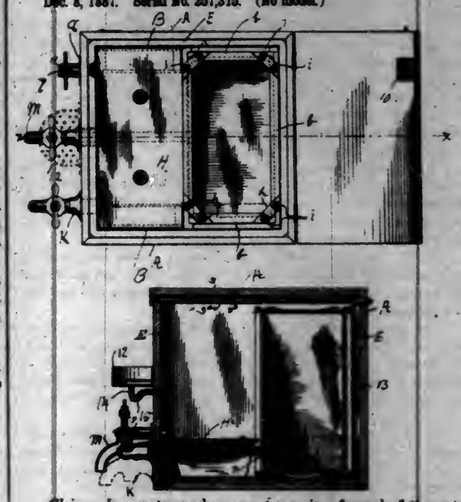


Claim.—1. The combination, substantially as hereinbefore set forth, of a stationary dynamo-electric generator driven by a suitable motor, a circuit of conductors composed in part of an insulated or detached section of the line of rails of a railroad-track, a wheeled vehicle movable upon or along said insulated section of track, an electro-magnetic motor mounted upon said vehicle for propelling the same and included in said circuit of conductors, and a circuit-controlling device placed upon said vehicle.

2. The combination, substantially as hereinbefore set forth, of a railway carriage or vehicle propelled by an electro-magnetic motor mounted thereon, with a continuous hollow chamber inclosing an insulated electric conductor and provided with a longitudinal slot to permit the entrance of an arm projecting from said carriage, so as to form a traveling electric connection with said insulated conductor.

3. The combination, substantially as hereinbefore set forth, of a wheeled carriage or vehicle, an electro-magnetic motor mounted thereon, and a yielding or frictional mechanical connection between the driving-wheels of said vehicle and the electromotor.

407,189. CLEANER FOR CARDING-CYLINDERS. CHARLES H. FOSS, Tewksbury, Mass. Filed Nov. 16, 1888. Serial No. 291,074. (No model.)



Claim.—1. In mechanism for stripping carding cylinders or combs, the combination, with the rotary shaft carrying toothed wheels, of the carriage applied to said shaft and having a mangle-rack and pinion-actuating mechanism, substantially as and for the purposes hereinbefore set forth.

2. In mechanism for stripping carding cylinders or combs, the combination, with the traveling shaft, the toothed wheels on said shaft, and the carriage or head having a pinion, of the table having a rack engaging said pinion, a guiding slot or way receiving one end of the shaft of said pinion, and driving mechanism for said pinion, substantially as and for the purpose set forth.

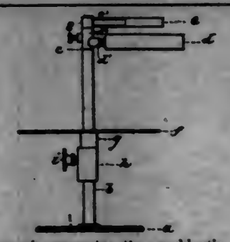
3. The combination of the traveling shaft, the stripping-wheels thereon, the shaft-carriage D, provided with mangle-pinion *e*, pinions *e f*, and pulley or wheel *g*, the driving belt and cylinder for said pulley *g*, and the mangle-rack *d* and its supporting-frame, substantially as and for the purposes hereinbefore set forth.

4. In a mechanism for stripping carding cylinders or combs, the combination of the traversing head or carriage carrying the rotary traveling shaft, the toothed or card-clothing-armed wheels arranged upon said shaft alongside of the carding cylinders or combs, the driving-pulley for imparting rotary motion to said shaft, having a splined connection with the latter, the carriage-supporting table, the mangle-rack and its engaging-pinion applied to the carriage-supporting table and the carriage, respectively, the intergearing pinions, one being on the shaft of the aforesaid pinion, the pulley or wheel upon the shaft of the other of said pinions, and the driving belt and cylinder for said wheel, substantially as specified.

407,190. WATER-COOLER. MERRITT S. FOYE, Lynn, Mass. Filed Dec. 8, 1887. Serial No. 257,315. (No model.)

Claim.—In a water-cooler, an outer casing formed of the outer and inner walls A B, having an air-space E between them and constituting an ice-chamber, a drip-faucet K, leading from said ice-chamber, a water-tank within the casing having a pipe leading therefrom through the ice-chamber to the outside, said outer casing having an opening through it for the admission of outside air to the ice-chamber and air-space E, and exhaust-openings at the bottom thereof from the ice-chamber and air-space E, respectively, whereby the cold air may pass out and the temperature of the receptacle be regulated, substantially as described.

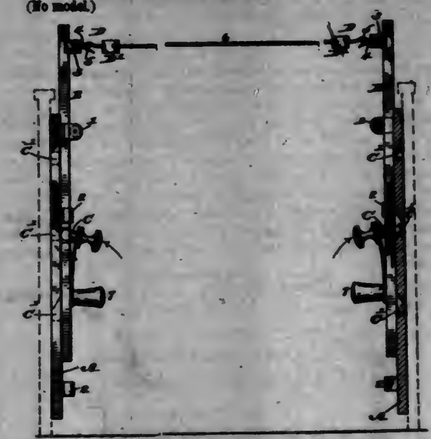
407,191. HORSE-DETACHER. GEORGE C. FRENCH, Crane's Mills, Pa. Filed Feb. 26, 1889. Serial No. 301,214. (No model.)



Claim.—The combination, with the lever for actuating the thill-coupling, of the spring-holder consisting of the spring metal plate e^3, having one apertured right-angular arm e' clipped to the front axle, the outer free end of said plate having the recess *g*, formed in part by the flange *h* at its upper end and the lip *i* at its lower end, substantially as shown and described.

407,192. MICROSCOPE. STILES FROST, Newton, Mass., assignor to George Frost, same place. Filed Nov. 5, 1888. Serial No. 290,067. (No model.)

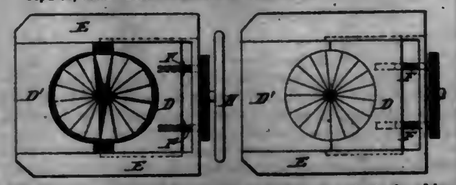
Claim.—1. In a microscopic apparatus, the combination of a standard, lenses *d e*, having arms of different lengths, a disk upon said standard, and a slide and thumb-screw, said slide being under and independent of said disk, whereby the disk may be rotated without disturbing the focus of the lenses, substantially as set forth.



407,192.

2. In a microscopic apparatus, the combination of a standard, the lens *e* and its frame and arm, the tube d^3, the lens *d* and its supporting-arm *d'*, secured to said tube nearer to one of its ends than to the other end, and a disk *f*, adjustably supported upon the standard, substantially as described.

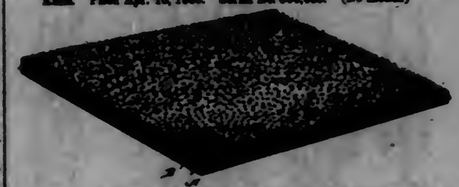
3. In a microscopic apparatus, a lens *d*, with arm which rotates around and also has a vertical movement on the standard *b*, with a thumb-screw *s* on said arm to hold the lens *d* at any place on the standard *b*, with the disk *f* permanently attached to the standard *b*, as shown and described.



407,193. CLOTHES-LINE SUPPORT AND HOLDER. JOSEPH H. GARAND, Philadelphia, Pa. Filed Sept. 27, 1888. Serial No. 286,066. (No model.)

Claim.—1. A clothes-line support and holder consisting of stationary posts, each with a roller and guides thereon and having openings therein, vertically-movable posts within said guides and between said rollers and stationary posts, a spring-catch secured to said movable posts in fixed position, a cross-bar secured to the upper end of each of said movable posts and provided with eyes, and a line-holder consisting of bars with openings and hooks, said parts being combined substantially as described.

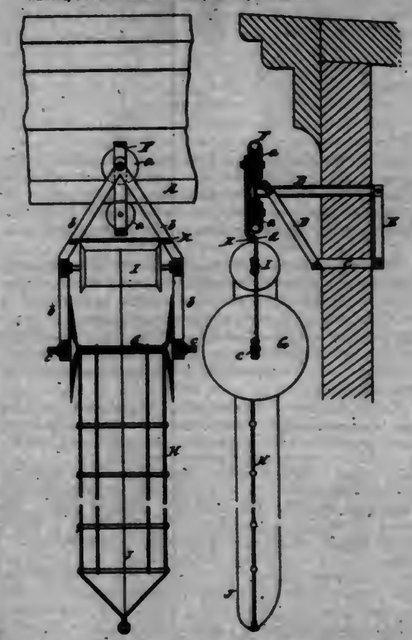
2. Posts A and B and the cross-heads 3, in combination with the line-holder D, having cross-bars D', and the hooks and eyes 5 4, connected with said bars and heads, substantially as and for the purpose described.



407,194. METHOD OF MAKING ROLLERS FOR JUTE-SLIVERING MACHINES. HOWARD P. GARLAND, San Francisco, Cal. Filed Sept. 10, 1888. Serial No. 284,977. (No model.)

Claim.—1. The herein-described improved method of making wheels or rollers for use in jute-slivering and similar machines, consisting, essentially, in first producing a series of wedge-shaped sections or segments sufficient to form a complete wheel, then in interposing between any two adjacent sections an extra section, then in forcing the sections together, and finally securing the sections together, to form a complete wheel, substantially as described.

2. The herein-described improved method of making wheels, disks, or rollers for use in machines for slivering jute and like purposes, consisting, first, in providing a series of narrow wedge-shaped wooden sections having the grain or fiber lengthwise, said sections being sufficient to form a complete wheel, then in interposing between any two adjacent sections an extra section, then compressing all the sections firmly together, and finally securing the sections together, substantially as described.

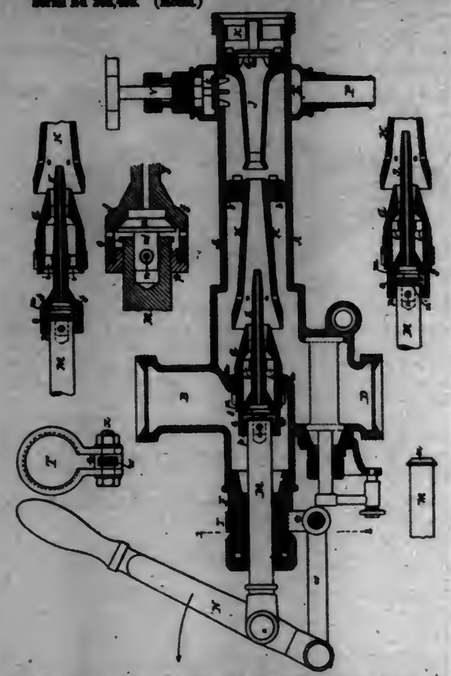


407,195. ROOFING-SHEET. CHARLES M. GARDNER, Wichita, Kans. Filed Apr. 10, 1888. Serial No. 270,603. (No model.)

Claim.—1. As an improved article of manufacture, a flexible water and fire proof fabric composed of a sheet of woven metallic wire having incorporated with it a flexible cement composed of asphaltum, coal-tar, sand, and animal hair, and a tarred sheet of paper, cotton cloth, or tarred felt arranged on the under side thereof, substantially as specified.

2. As an improved article of manufacture, a roofing-sheet composed of a sheet of woven metallic wire having a coating of flexible cement on the upper side of the wire, and a bottom covering of tarred paper, tarred cotton cloth, or tarred felt, substantially as specified.

407,196. FIRE-ESCAPE. JAMES M. GLENN, Cincinnati, Ohio. Filed June 4, 1888. Serial No. 276,003. (No model.)



Claim.—1. In a fire-escape apparatus, the combination, with a rail secured to a building, of a roller-frame engaged thereby, a frame provided with a reel carrying a ladder, and a drum carrying one or more endless ropes and secured to said roller-frame, substantially as and for the purpose specified.

2. In a fire-escape apparatus, the combination, with a rail secured to a building and a roller-frame engaged thereby, of an attaching-frame secured to said roller-frame and provided with engaging-dogs and carrying an endless rope, and a ladder-frame adapted to be hoisted from below by said rope and be automatically secured to said attaching-frame, substantially as and for the purpose specified.

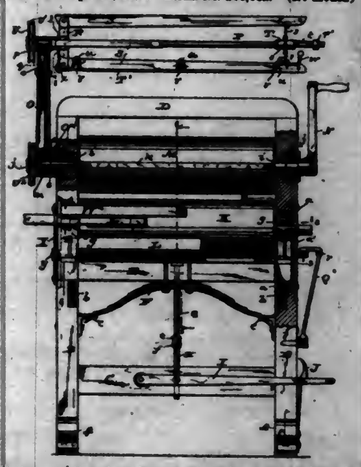
3. In a fire-escape apparatus, the combination, with the attaching-frame provided with the dogs *e*, of the ladder-frame having the tube M, provided with the collars *j k*, and carrying the sliding conical pieces *h i*, substantially in the manner and for the purpose specified.

407,197. INJECTOR. JOHN R. GOSHORN, Philadelphia, Pa., assignor to Henry Bolfield and T. Brown Bolfield, same place. Filed Dec. 3, 1888. Serial No. 292,402. (Model.)

Claim.—1. The combination of the forcing-jet tube of the injector, the operating stem or spindle, the valve closing the rear end of the forcing-jet tube and having a projecting lifting-jet tube, and a valve closing said lifting-jet tube, both valves having a slight longitudinal play in respect to the operating stem or spindle, substantially as specified.

2. The combination of the forcing-jet tube, the valve closing the same, and having a projecting lifting-jet tube, and a chamber closed at the rear by a detachable cap, the operating stem or spindle having a flange contained in the chamber of the valve and free to move longitudinally therein to a slight extent, and a supplementary valve closing the lifting-jet tube of the main valve, and also free to move longitudinally to a slight extent independently of the operating-spindle, substantially as specified.

3. The combination of the injector-cap, a split clamp embracing the same, the handle-hanger, and a bolt serving to tighten the clamp and also as a pivot for the handle-hanger, substantially as specified.



407,198. VAPOR-BURNER. GEORGE S. GRIMWOOD, Greenwich, County of Kent, assignor to the Lenigen Light Company, (Limited,) Westminster, England. Filed Apr. 9, 1888. Serial No. 269,866. (No model.) Patented in England Nov. 14, 1888, No. 16,686; in France Mar. 30, 1888, No. 197,104, and in Belgium Mar. 30, 1888, No. 85,619.

Claim.—1. In a vapor-burner, the combination of a closed oil-reservoir, a burner having a central air-opening in its bottom and supported on a level with the oil-reservoir, a hinged burner-cover having a flame-orifice at the top and containing a perforated inner conoidal casing also terminating at top in a flame-orifice, a steam-coil located in said cover and having at its lower end a steam-jet that projects upward in the center of the burner, a valve for controlling the steam-jet, and a pipe leading from the lower part of the oil-reservoir to the lower part of the burner and provided at its top with an air-inlet to the oil-reservoir, substantially as described.

2. In a vapor-burner, the combination of a closed oil-reservoir, a burner having in its bottom a central air-passage controlled by a valve, a pipe leading from the lower part of the oil-reservoir to the lower part of the burner and communicating therewith only at the lower part of said pipe, which is provided in its upper part with an air-inlet to the oil-reservoir, a hinged burner-cover having a flame-orifice in its top, an inner perforated conoidal casing supported by the cover and also having a flame-orifice in its top, a steam-coil supported in the cover and having at its lower end a steam-jet that projects upward in the center of the burner, a valve for controlling the steam-jet, and a pipe leading from the lower part of the oil-reservoir to the lower part of the burner and provided at its top with an air-inlet to the oil-reservoir, substantially as described.

3. In a vapor-burner, the combination of a closed oil-receptacle, a burner on a level with said reservoir, a pipe leading from the lower part of the reservoir to the lower part of the lamp and having an air-inlet to the reservoir, a hinged burner-cover having a flame-orifice, a perforated and open top inner casing, a steam-generating coil supported in the cover and having at its lower end a steam-jet that projects upward in the center of the burner, a water-tank having a pipe communicating with the steam-coil through the hinge-joint of the cover, and a pump connected to the water-tank, substantially as described.

407,199. LAUNDRY-MACHINE. AXEL R. GUSTAFSON, Hustletta, Wis. Filed Apr. 14, 1888. Serial No. 270,662. (No model.)

Claim.—1. In a laundry-machine, the combination of a suitable frame, a pair of rollers arranged within the frame, an arm pivotally connected to said frame, and a folding clothes-reel in turn connected to the arm, substantially as set forth.

2. In a laundry-machine, the combination of a suitable frame, a pair of rollers arranged within the frame, an arm connected to a journal-bearing of one of the rollers, a bracket connected to said frame on the side opposite the arm, a reel having its shaft journaled in said arm and bracket, and a belt-gear connecting one of the rollers with said reel-shaft, substantially as set forth.

3. In a laundry-machine, the combination of a suitable frame, a pair of rollers arranged within the frame, an arm connected to a journal-bearing of one of the rollers and provided at its free end with a bearing, a shaft arranged in the bearing, a head fast on the shaft, and a series of reel-arms connected to said head, substantially as set forth.

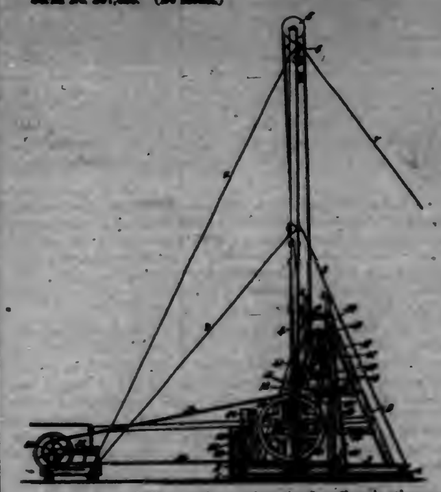
4. In a laundry-machine, the combination of a suitable frame, a pair of rollers arranged within the frame, an arm pivotally connected to a journal-bearing of one of the rollers, a dog for limiting the movement of the arm, a right-angle bearing pivotally adjustable on the free end of said arm, and a reel having its shaft journaled in said bearing, substantially as set forth.

5. In a laundry-machine, a reel that comprises a shaft, a head arranged on the shaft, a series of arms pivotally connected to the head, a sleeve loose on said shaft and provided with hooks to engage eyes on the reel-arms, and a spring-stop for the sleeve, substantially as set forth.

6. In a laundry-machine, a reel that comprises a shaft, a head arranged on the shaft, a series of arms pivotally connected to the head, a sleeve loose on said shaft and provided with hooks to engage eyes on the reel-arms, a spring-stop for the sleeve, and a clamping-rod connected to one of said reel-arms, substantially as set forth.

7. In a laundry-machine, the combination of a suitable frame, an arm pivotally connected to the frame, a folding clothes-reel having one end of its shaft journaled to the arm, another arm secured to said frame and provided with a bearing for the other end of the reel-shaft, a roller arranged on said reel-shaft, and a plate detachably connected to opposing arms of the reel and having a curved portion arranged to come adjacent to said roller, substantially as set forth.

8. In a laundry-machine, the combination of a suitable frame, a roller having fixed bearings in the frame, another roller having its bearings in a vertically-adjustable cross-piece, an elliptic spring clipped to the cross-piece, a support for the spring, a nut, adjustable on said support and impinged against said spring, and means, substantially as described, for adjusting said cross-piece, as set forth.



407,200. FIRE-ESCAPE. JAMES F. GUTHRIE, Somerville, Mass. Filed June 21, 1888. Serial No. 277,734. (No model.)

Claim.—A fire-escape consisting of a cage or car adapted to be moved up and down and guided by a tube or chambered guideway and having a weight secured to it by a rope or cord running over a pulley, which weight moves up and down in said tube or guideway, and a piston-head or plunger arranged to slide up and down in a cylinder or casing, for the purpose specified.

407,201. LOOM-SHUTTLE. FRANK J. HALL, Philadelphia, Pa. Filed Apr. 11, 1888. Serial No. 270,269. (No model.)

Claim.—A loom-shuttle having a body formed of wood treated with paraffine, substantially as and for the purpose set forth.

407,202. APPARATUS FOR DRILLING AND PUMPING OIL OR OTHER WELLS. MINNAIR HARDLE, Lima, Ohio. Filed Jan. 21, 1889. Serial No. 297,022. (No model.)

Claim.—1. A drilling and pumping rig for oil and other wells, consisting of a suitable foundation frame-work, a derrick composed of two shear-poles inclined toward each other and rising in substantially a vertical plane from the sides of the foundation, a bull-wheel shaft having a single bull-wheel, a band-wheel shaft combined with and forming part of the bull-wheel shaft, both journaled in uprights which are brought up to or under the derrick, a sand-reel having its axis parallel with the bull-wheel shaft and provided with a friction-pulley and brake-pulley, a secondary or auxiliary shaft geared with the bull-wheel shaft, means for operating the drilling and pumping devices, and clutch-connections between the band-wheel shaft and bull-wheel shaft and between the latter and the secondary shaft, substantially as specified.

2. In a drilling and pumping rig for oil and other wells, the combination, with a derrick composed of two inclining shear-poles, of a band-wheel shaft having a crank-arm, a reciprocating frame arranged and moving in vertical guideways near said shaft, said crank-arm being connected to a wrist-pin on the reciprocating frame by a pitman, and a horizontally-swinging bracket on said frame adapted to carry the temper-screw, substantially as described.

3. In a drilling and pumping rig for oil and other wells, the combination, with a derrick composed of two inclined shear-poles, of a band-wheel shaft having a crank-arm and a reciprocating frame moving in vertical ways near the band-wheel shaft and connected to said crank-arm by a pitman, said frame having connected therewith a pulley for the cable, said pulley being reciprocated by the reciprocation of the frame, substantially as described.

4. In a drilling and pumping rig, the combination, with a suitable foundation-frame having a vertical guideway, of a reciprocating frame moving in said guideway, a bracket-support hinged or pivotally mounted on said reciprocating frame and adapted to carry the temper-screw or pumping-rod, and means for actuating the frame from a crank on the band-wheel shaft, substantially as specified.

5. In a drilling and pumping rig having a suitable foundation-frame provided with a vertical guideway, the combination, with a reciprocating frame moving in said guideway, of a bracket-support hinged or pivotally mounted thereon and adapted to carry the temper-screw or pump-rod, a carrier connected with and operated by said frame and having a grooved pulley mounted on a stud bearing on said carrier, and a pitman connected by one end to a wrist-pin on the reciprocating frame and by the other end to a crank-arm on the band-wheel shaft, substantially as specified.

6. In a drilling and pumping rig having a foundation frame provided with a derrick composed of two poles rising vertically from opposite sides and approaching each other at top, where they are provided with one or more pulleys, the combination, with a bull-wheel shaft and a band-wheel shaft suited and clutch-connected, of a vertically-reciprocating frame moving in a guideway on the foundation, a bracket-support hinged or pivotally mounted on said frame and so constructed as to permit the attachment of the temper-screw or pump-rod, a carrier connected to and reciprocated by the said frame and provided with a grooved pulley to receive the cable, means for locking the bracket-support in any desired position, and a pitman con-

nected to a wrist-pin on the reciprocating frame and to a crank-arm on the band-wheel shaft, substantially as specified.

7. In a drilling and pumping rig having a foundation frame-work provided with a derrick composed of two shear-poles rising from its sides and approaching each other, the combination, with a bull-wheel shaft and band-wheel shaft united and clutch-connected and journaled in supports brought close to said derrick, of a reciprocating frame moving in a vertical guideway, a lever fulcrumed at one end at a distance from the guideway and linked at the other end to the reciprocating frame, a grooved pulley mounted on a stud carried by said lever, and a pitman operated by a crank on the band-wheel shaft and connected to a wrist-pin on the reciprocating frame, substantially as specified.

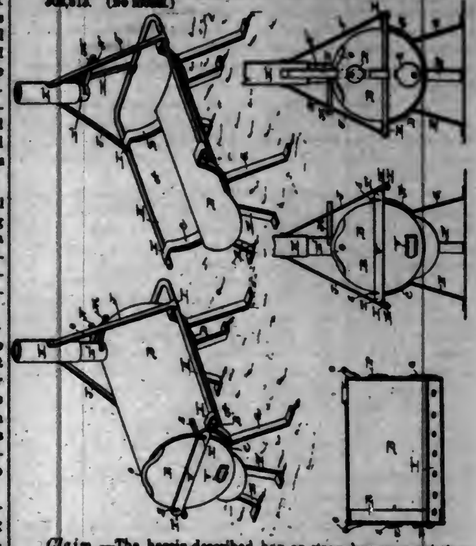
8. In a drilling and pumping rig, the combination, with a vertical guideway rising from a foundation frame-work, of a reciprocating frame moving in said guideway, a lever fulcrumed by one end at a distance from the guideway and linked at the other end to the reciprocating frame, a pulley journaled on said lever, and means for reciprocating said frame in the guideway for spudding, drilling, or pumping, and other purposes, substantially as specified.

9. In a drilling and pumping rig for oil and other wells, the combination, with a bull-wheel shaft, of a band-wheel shaft entering the same upon an axial line, a clutch splined to the one shaft to connect and disconnect the two, a band-wheel having its arms arranged near the outer edge of its rim and provided with a casting bolted to the inner face of said arms and carrying a crank-arm, and an upright in which the band-wheel shaft is supported, said upright having its outer face beveled off above and below the point of support to accommodate the rim of the band-wheel and give an increased bearing to the shaft, substantially as specified.

10. In a drilling and pumping rig for oil and other wells, the combination, with a bull-wheel shaft having at one end a casting lying partly within the shaft and provided with a flange bolted to its end, of a band-wheel shaft entering said casting axially and carrying a band-wheel, and a clutch splined on said band-wheel shaft between the latter and the band-wheel and engaging with a corresponding clutch-seat in the casting, substantially as described.

11. In a drilling and pumping rig for oil and other wells, the combination, with a vertical guideway rising from the foundation frame-work, of a reciprocating frame moving in said guideway, a supporting-bracket hinged or pivotally mounted on said frame and having two parallel arms separated by a block inserted a little behind the free or projecting ends of said arms, means for locking the said support in any desired position, and a pitman reciprocating the frame carrying the latter, substantially as specified.

12. In a drilling and pumping rig for oil and other wells, a band-wheel having a central casting bolted to its arms and carrying an integral crank-arm, substantially as specified.

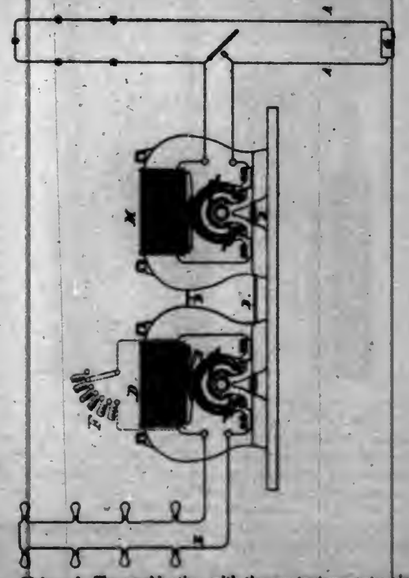


13. In a drilling and pumping rig for oil and other wells, the combination, with a foundation frame and a derrick formed of two shear-poles rising from opposite sides, of an upright guideway supported by inclined braces, a reciprocating frame moving in said guideway and carrying a hinged bracket-support having a locking-yoke, a lever fulcrumed at one end to one of the inclined braces, its other end linked to the reciprocating frame and provided with a grooved pulley journaled on a stud carried by said lever, a band-wheel shaft, and a pitman carried by a crank on the band-wheel shaft and connected to a wrist-pin on the reciprocating frame, substantially as specified.

14. A drilling and pumping rig for oil and other wells, consisting of a foundation-frame, a derrick formed of two shear-poles rising from its sides and inclining toward each other, a bull-wheel shaft and band-wheel shaft combined and journaled in supports brought up to or under the derrick, a secondary or auxiliary shaft arranged at right angles to and detachably geared with the band-wheel shaft, a reciprocating frame moving in a vertical guideway near the band-wheel, a bracket-support hinged or pivotally mounted on said frame, a pitman connecting the crank on the band-wheel shaft with said frame, and a lever fulcrumed at one end and connected at the other end to the reciprocating frame and provided with a pulley mounted on the said lever, substantially as specified.

15. In a drilling and pumping rig for oil and other wells, the combination, with a secondary or auxiliary shaft, of an extended band-wheel shaft carried through and projecting beyond the bull-wheel drum or shaft to receive the gearing connecting it with said auxiliary shaft, a clutch by which the revolution of the band-wheel shaft may be communicated to said auxiliary shaft, a reciprocating lever having a pulley to receive the cable operating the tool, and a pitman operated by the band-wheel shaft and reciprocating said lever, the cable or tool passing through an opening or slot in the maul, and the latter being connected to a cable operated by the secondary shaft, whereby the drill or spudding-tool and maul may be operated simultaneously, substantially as specified.

407,208. HAY OR STRAW BURNER.



William H. Harris and Gurdon W. Harris, Steele City, Nebr. Filed Mar. 9, 1888. Serial No. 302,612. (No model.)

Claim.—The herein-described hay or straw-burner, consisting of the cylindrical drum, the concave plate on which said drum is seated, the concave yokes supporting said concave-plate, the guard-rail connected to the yokes, the inclined arms rising from the yoke at one end, the pipe supported by said yoke, the pipe-section in said pipe having an arm, and the keeper on one of the inclined supports for engaging the arm on the sliding pipe-section, all of said parts being arranged substantially as shown, and for the purpose described.

407,204. SYSTEM OF ELECTRICAL DISTRIBUTION.

Daniel Higham, Philadelphia, Pa., assignor to the Higham Patent Right Company, Rockland, Me. Filed Aug. 17, 1888. Serial No. 283,091. (No model.)

Claim.—1. The combination, with the constant-current mains, of one or more local stations, each containing a motor in series in the said mains, a separate dynamo driven from the motor, and incandescent lamps or other translating devices in series in the local dynamo-circuit.

2. The combination of the constant-current mains of high tension with one or more local stations, each containing a motor in series with the said mains, a separate dynamo, and incandescent lamps or other translating devices in series in the local dynamo-circuit.

3. The combination of constant-current mains of high tension with one or more local stations, each containing a motor in series with the said mains, a separate dynamo driven from the motor through an electrically-insulated connection, and incandescent lamps or other translating devices in series in the local dynamo-circuit.

407,205. FLUID-COMPRESSOR.

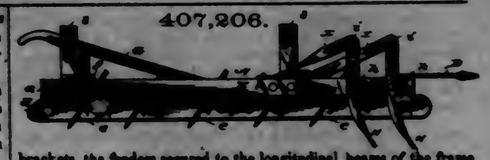
Benjamin Hill, South Norwalk, Conn. Filed Apr. 15, 1886. Serial No. 307,574. (No model.)

Claim.—1. In a fluid-compressing apparatus, the combination of a governor adapted to control the speed of the motor, a piston and cylinder, one side of the piston open to the pressure of the fluid and with a reactive resistance upon the piston in the opposite direction, mechanism between the said piston and the governor for imparting rotation to said governor, and a speed-controller between said mechanism and said piston, substantially as described, and whereby the movement of the said piston under varying pressure of the fluid correspondingly varies the speed of the governor.

2. In a fluid-compressing apparatus, the combination of a cylinder, a piston in said cylinder free for longitudinal movement, a resisting-spring upon one side of the piston, the other side of the piston open to the fluid-pressure, a shaft in connection with said piston and movable longitudinally therewith, a governing mechanism, substantially such as described, for imparting revolution to said governor, and a speed-controller in connection with said piston-shaft between the said governor and said mechanism, substantially as described.

3. In a fluid-compressing apparatus, the combination of a cylinder, a piston in said cylinder free for longitudinal movement, a resisting-spring upon one side of the piston, the other side of the piston open to fluid-pressure, a shaft in connection with the said piston and arranged to revolve, a disk adapted to receive revolution from the compressor-motor, the axis of said disk at substantially right angles to the axis of said piston-shaft, a friction-wheel on the said piston-shaft and arranged to work upon the surface of the said disk, whereby the said piston-shaft receives revolution from said disk, the said friction-wheel movable radially on the surface of said disk according to the movement of said piston, and a governor in connection with said piston-shaft, whereby the rotation of the piston-shaft is imparted to the said governor, substantially as described.

4. In a fluid-compressor, the combination of two cylinders, a piston in each of said cylinders, a resisting-spring against each of said pistons, the piston of one cylinder open to the inlet-pressure, the corresponding side of the piston of the other cylinder open to outlet-pressure, a shaft connecting said pistons, a governor mechanism, substantially such as described, to impart revolution to said governor, and a speed-controller in connection with said piston-shaft, substantially as described, which, under the longitudinal movement of the pistons, produced by either the inlet or outlet pressure, will correspondingly vary the revolution of the governor.



407,206. COMBINED HARROW AND CULTIVATOR.

John S. Rider, Oakland, Iowa. Filed Mar. 9, 1889. Serial No. 302,662. (No model.)

Claim.—1. The cultivator-frame composed of the two parallel beams, the arched brackets connecting the same and terminating in pintles, as shown, in combination with the harrow-sections hinged to the said brackets on opposite sides of the cultivator-frame, substantially as specified.

2. The combination, with the cultivator-frame, of the arched

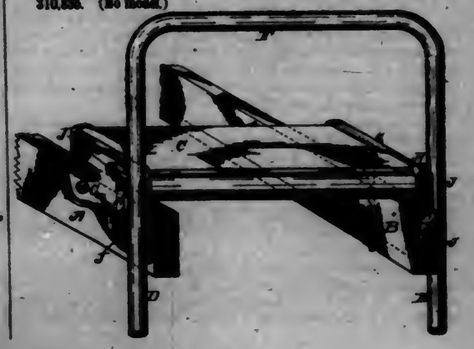
brackets, the fenders secured to the longitudinal beams of the frame on the inner sides thereof, and the outer harrow-sections removably hinged to the pintles of the said brackets, substantially as specified.

3. The combined harrow and cultivator described, consisting, essentially, of the two longitudinal beams, the arched brackets securing the same to form a passage for listed corn, the fenders secured to the inner sides of the longitudinal beams, the lateral harrow-sections hinged to the brackets, and the cultivator and harrow sections carrying, respectively, a pivoted plow provided with a break-pin, substantially as specified.

407,207. MILK DELIVERY AND SHIPPING CAN.

Charles E. Herman and Thomas H. McCramer, McCook, Nebr., assignors of one-half to William O. Russell, same place, and Andrew J. Pate, Denver, Colo. Filed May 13, 1889. Serial No. 310,698. (No model.)

Claim.—1. The combination, with a milk delivery and a shipping can, of a conical displacement and compression plug extending from the top to the bottom of the interior of the can, said plug having a sight-opening in its upper part, the upper edge of the opening being on the same plane with the upper edge of the chamber of the can, as set forth.



2. The combination, with a can having a conical top, of a hollow conical displacement and compression plug open at one end extending from the top to the bottom of the interior of the can, said plug having a sight-opening with its upper edge on the same plane with the converging inner edges of the top of the can, and a screw-threaded sleeve on its upper end having a packing thereon, and fitting a screw-threaded flange extending from the top of the can, as set forth.

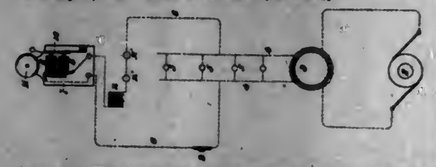
3. The combination, with a conical top, of a two-part conical plug extending from the top to the bottom of the can, the upper cone having a sight-opening at its upper edge, and open at each end and extending into the can from the top, and the lower or extension cone being secured within the lower end of the open cone and extending to the bottom of the can, as set forth.

4. The combination, with a can, of a two-part conical plug extending from the top to the bottom of the can, the upper cone being open and having a sight-opening in its side and a screw-threaded sleeve secured on its upper end working in a vertical flange of the can, and its lower end extending into the center of the can and provided with an internal screw-threaded sleeve, the lower or extension cone being closed and having a screw-cap on its upper end working within the sleeve on the lower end of the upper cone, said screw-cap having a stud thereon for engaging with a key for operating the cone, as set forth.

407,208. BED-FRAME.

Benjamin G. Hopkins, Hartford, Conn., assignor to Henry Roberts, same place. Filed May 18, 1889. Serial No. 310,836. (No model.)

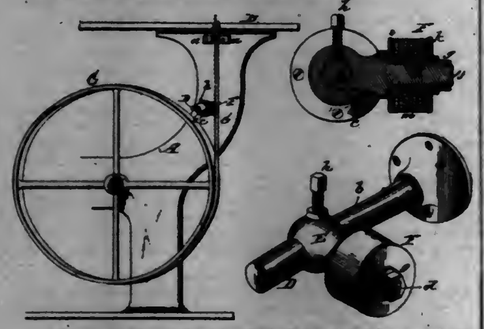
Claim.—A bed-frame consisting of the side pieces A and B, the end piece C, the posts D and E united by the reach F, the corner-pieces G, each of which is provided with a flange H, having the open recesses I, and the bolts J, passing through the posts parallel with the side pieces A and B and fixed in those open recesses, all substantially as described.



407,209. FIREMAN'S HAT. JAMES P. HOPKINS, Somerville, Mass. Filed Jan. 30, 1889. Serial No. 297,905. (No model.)

Claim.—1. A fireman's hat having an outer metallic crown, a hood or brim, and an inner felt crown having its edge secured between said outer metallic crown and hood or brim, and between which and said outer crown a space is formed, substantially as set forth.

2. As a new article of manufacture, a fireman's hat having an outer crown composed of corrugated sheet metal and intersecting metal ribs, and having a flange *g*, the hood or brim *c*, and the inner crown having its edge secured between the flange *g* and hood or brim *c*, as set forth, a space being formed between said crowns.

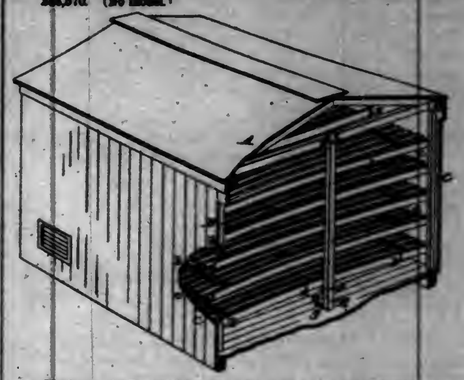


407,210. LIGHTING SYSTEM. JOSEPH H. HUNTER, Pittsburg, Pa. Filed May 11, 1889. Serial No. 310,439. (No model.)

Claim.—1. The combination of an electrical generator of alternating currents, a lamp-circuit, and an alarm or signal having a magnet or magnets connected in parallel with the lamp-circuit and having a vibratory armature, substantially as and for the purposes described.

2. The combination of an electrical generator of alternating currents, a lamp-circuit, an alarm or signal having a magnet or magnets connected in parallel with the lamp-circuit, and resistance devices arranged in circuit with said magnets, substantially as and for the purposes described.

407,211. GUARD FOR BAND-SAWS. ASA P. HYDE, Oxford, N. Y. Filed Jan. 19, 1889. Serial No. 296,864. (No model.)



Claim.—1. The combination, with the band-saw frame and saw, of the lateral arm provided with means for securing it to the frame, the stem projecting at right angles to said arm and having a head provided with an opening through which said arm is passed, said stem being adjustable on said arm, and a roller carried by said stem, substantially as shown and described.

2. The combination, with the band-saw frame and the saw, of the lateral arm provided with means for securing it to the frame, and grooved longitudinally, as shown, the stem projecting at right angles to said arm and having a head provided with an opening through which said arm is passed, a roller carried by the outer end of said stem, and a set-screw passed vertically through the head of the stem and working in the groove of the arm, substantially as shown and described.

3. A guard for band-saws, consisting of a stem, a clamp *i*, having a hub *l*, through which the said stem is passed, the clamp *k* on said stem, the plurality of rings on the stem between the said clamps, and the nut *g*, all substantially as and for the purpose specified.

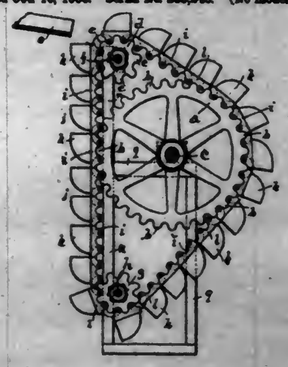
407,212. CAR. SIMEON T. JENKINS, Baltimore, Md., assignor to Jenkins, McGuire & Co., same place. Filed Oct. 19, 1888. Serial No. 288,570. (No model.)

Claim.—1. In combination with a car or other conveyance, a detachable and removable tray formed of elastic slats with intervening open spaces, and thereby adapted to support fruit, &c., to permit the passage of air between the slats and to take up the jar and concussion incident to the motion of the vehicle.

2. In combination with a car or other vehicle provided with suitable supports, a folding tray or trays consisting of a series of slats connected one with another, but having intervening open spaces for the passage of air, said trays resting upon but being readily removable from their supports.

3. In combination with a car or other conveyance having horizontal ledges or supports on its walls, a tray or trays composed of slats slightly longer than the space between the end supports of the tray, whereby said slats are caused to assume a curved or arched form when placed in position.

4. In combination with a car or other conveyance having horizontal strips or ledges *c* and vertical guides D, trays B, having slats *a*, longer than the space over which the trays extend, substantially as and for the purpose set forth.



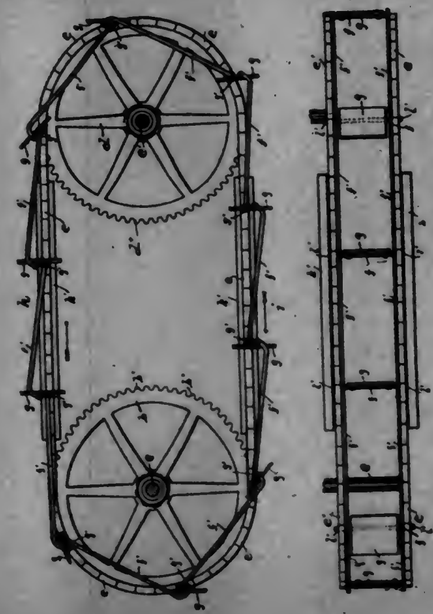
5. In combination with a car or other conveyance provided with ledges *c* and guides D, trays B, having the ends of their slats supported by said ledges and guides, and horizontal bars *d*, extending beneath the trays at their middle.

6. In combination with a car or like conveyance having horizontal supporting-ledges *c* and vertical guides D, trays B carried thereby, horizontal bars or timbers *d*, provided with hooks *e*, removable post E, and eyes or staples *f*, carried by said post and by the wall of the conveyance to receive the hooks *e*.

7. In combination with a car or like conveyance provided with supporting-ledges *c*, trays B, resting at their ends upon said ledges, bars *d*, extending beneath the trays at a point between the ends thereof, supporting-posts for said bars *d*, and springs or elastic supports for said posts.

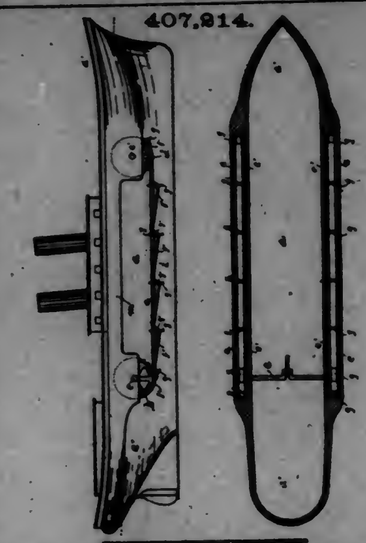
8. In combination with the trays B and end supports therefor, intermediate supporting-bars *d*, provided with T-heads, and supports E, having sockets of like form provided with spring-supports *f*, substantially as described and shown.

407,213. WATER-MOTOR. FERDINAND JOHNSON, New London, Pa. Filed Oct. 16, 1888. Serial No. 288,240. (No model.)



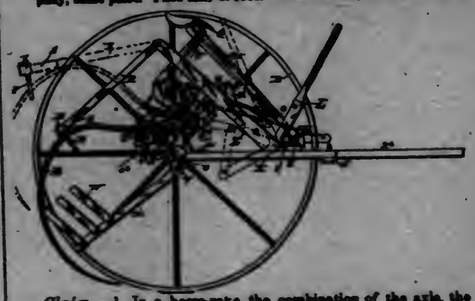
Claim.—1. In a water-motor, the combination, with the wheels *d*, provided on their peripheries with teeth or engaging devices, and the wheels *g*, located below the said wheels *d* and provided on their peripheries with teeth or engaging devices, and the central wheels *c*, suitably mounted and with one edge of their peripheries in alignment with one edge of the peripheries of the said wheels *d* and *g*, and provided with radially-projecting teeth, the endless chains *i*, passed over the peripheries of the said wheels and engaging with the teeth thereon and carrying a series of buckets *k*, and having the guides *m*, projecting laterally from the sides of its sections or links, of the vertical slides *n* on each side of the vertical run *j* of the chain, and provided with the grooves *p*, carrying the said side pieces *m*, substantially as set forth.

2. In a water-motor, the combination, with the frame *g*, the upper supporting-wheels *d*, and the lower supporting-wheels *g*, each provided on its periphery with radial teeth or engaging devices, of the central wheel *c*, provided on its periphery with suitable teeth, and suitably mounted in a position between and with one edge of its periphery in vertical alignment with one edge of the peripheries of the said wheels *d* and *g*, the endless chains *i*, carrying buckets *k*, passed over the said wheels *d*, *g*, and *c*, and engaging with the said teeth thereon; and the trough or flume *o*, substantially as and for the purpose set forth.



407,214. DEVICE FOR PROPELLING AND VENTILATING SHIPS. FERDINAND JOHNSON, New London, Pa. Filed Oct. 30, 1888. Serial No. 289,571. (No model.)

Claim.—1. In a device for propelling vessels, the combination, with the hull, the endless gear-chains mounted on sprockets and arranged with upper and lower horizontal runs between the said sprockets, the cross-rods *f*, with their ends passed through the chains and carrying the blades *g*, pivotally secured thereto, the brace-rods *f'*, with one end pivotally secured to the blades below their pivotal supports and with their opposite ends extended forward and pivoted to the chains, of the lugs *F'*, projecting laterally on opposite sides of the chains, and the horizontal guide-pieces *k* and *k'*, supported on opposite sides of the chains and provided with the grooves *l* to receive the lugs *F* and support the chains on the said horizontal runs thereof, substantially as set forth.



2. In a device for propelling and ventilating vessels, the combination, with the hull *a*, the endless chains *c* and *c'*, mounted on supporting-wheels and provided with an upper horizontal run *h* and a lower horizontal run *i* between the supporting-wheels, the blades *g*, supported in a perpendicular position between and carried by the said chain, of the casing *m*, inclosing the upper run *h* of the said chains, and having its forward end extended downward and sealed by the water, and the air-pipe *n*, opening into the forward end of the said casing and leading to the interior of the hull, substantially as and for the purpose set forth.

407,214.

407,215. HORSE-RAKE. JOHN A. JOHNSON and ELIAS G. STARKS, Madison, Wis., assignors to the Fuller & Johnson Manufacturing Company, same place. Filed May 5, 1888. Serial No. 272,992. (No model.)

Claim.—1. In a horse-rake, the combination of the axle, the castings *c'* secured thereupon, the rod secured to the castings, the inverted-U-shaped hollow lugs on the rod, eyebolts in said lugs, the rake-teeth extending through the lugs and the eyebolts, and nuts on the eyebolts bearing against the outer sides of the lugs, substantially as and for the purpose specified.

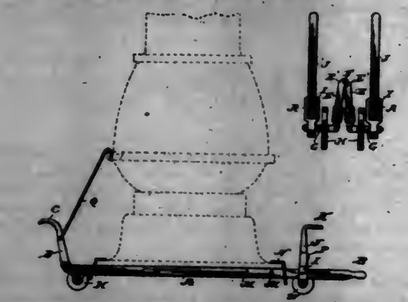
2. In a horse-rake having the ordinary teeth and levers for operating the same, the combination, with the axle, of a casting secured to each end having ears and a slide guard pivotally secured near its upper end to each of the ears, the extreme upper end of each guard being adapted to bear against the under side of the casting and prevent the opposite end of the guard from bearing upon the ground, substantially as and for the purpose set forth.

407,216. UMBRELLA-RUNNER. GERRATH JOSEPH and ELLIS I. O'NEILL, Philadelphia, Pa. Filed Sept. 20, 1888. Serial No. 286,045. (No model.)

Claim.—1. An umbrella-runner consisting of a divided or split band or sleeve and a clamp connected with the ends of said band or sleeve for contracting said ends, substantially in the manner and for the purpose described.

2. An umbrella-runner divided and having lips on its ends, in combination with a slide engaging with one lip and a lever pivoted to said slide having a cam or eccentric head, which latter engages with the other lip, substantially as described.

3. An umbrella-runner consisting of a divided band or sleeve, lips on the ends of the sleeve, and a clamping device carried by the lips for causing the contraction of the sleeve, substantially in the manner and for the purpose described.



4. An umbrella-runner consisting of a divided band or sleeve, a rod or plate connected to one end of the sleeve and passing through the other end thereof, and a cam or eccentric pivoted to the rod and operating against one end of the sleeve to cause the contraction of the sleeve, substantially in the manner and for the purpose described.

407,217. HYDRAULIC JACK. FRANK I. JOYCE, Dayton, Ohio. Filed Aug. 27, 1888. Serial No. 283,606. (No model.)

Claim.—The combination, in a hydraulic jack, of a base-frame provided with a hollow cylinder, a fluid-containing ram-tube sliding lengthwise in the cylinder, a ram-head fixed to the lower end of the ram-tube working along the cylinder and having a longitudinal chamber in communication with the fluid in the ram-tube, a valve in the lower portion of the ram-head, a hollow plunger-rod having a hollow packed plunger working in the ram-head, a valve carried by and located in the packed plunger, and a lateral tube communicating with the hollow plunger and extending from the latter at a point above both the plunger-valve and ram-head to a point nearly or adjacent to the extreme side of the fluid-containing ram-tube for enabling the jack to be used in a horizontal or inclined or perpendicular position, substantially as described.

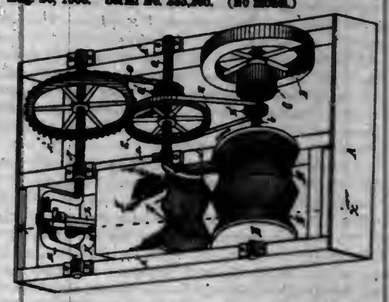
407,218. COMBINED TRUCK AND CARRIER. FRANKLIN P. KELLER, Savannah, assignor of one-half to Straits F. Champlin, Chicago, Ill. Filed July 17, 1888. Serial No. 280,161. (No model.)

Claim.—1. The parallel carrying-bars, in combination with links connecting said bars, a vertical rule-joint between said links, pivot-connections between said links and bars, and adjustable sliding sleeves fitting over said pivot-connections for rendering them rigid, substantially as described.

2. The parallel carrying-bars, in combination with links connecting said bars, a horizontal pivot-connection between said links, opposing abutting shoulders on the links above said pivot-connection, pivot-connections between said links and bars, and adjustable sleeves sliding on said bars and fitting over said pivot-connections, substantially as described.

3. The parallel carrying-bars, links connecting said bars, and a horizontal pivot-connection between said links, in combination with truck-wheels and a journal for said wheels on said links, substantially as described.

4. The parallel carrying-bars, links connecting said bars, and a horizontal pivot-connection between said links, in combination with journals bearing in said bars at one end and having a pivotal connection with the links at their opposite ends, truck-wheels loosely mounted on said journals, and adjustable sleeves sliding upon the links and fitting over said pivot-connections, substantially as described.



5. The parallel carrying-bars, a vertically-flexible but horizontally-rigid connection between said bars at one end, and wheels journaled on said connection, in combination with adjustable sliding boxes mounted on said bars toward their opposite ends, a vertically-flexible but horizontally-rigid connection between said boxes, and wheels journaled on said connection, substantially as described.

6. The parallel carrying-bars, a vertically-flexible but horizontally-rigid connection between said bars at one end thereof, and wheels journaled on said connection, in combination with adjustable sliding boxes mounted on said bars toward the opposite ends thereof, arms projecting from said boxes terminating in handles, a vertically-flexible but horizontally-rigid connection between said boxes, and wheels journaled on said connection, substantially as described.

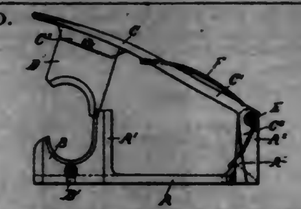
7. The parallel carrying-bars, a vertically-flexible but horizontally-rigid connection between said bars at one end, wheels journaled thereon, adjustable sliding boxes mounted on said bars toward the opposite ends thereof, a vertically-flexible but horizontally-rigid connection between said boxes, and wheels journaled on said connection, in combination with adjustable grappling-hooks mounted on said bars between said front and rear wheels, and a sliding connection between said hooks and bars, substantially as described.

8. The parallel carrying-bars, a vertically-flexible but horizontally-rigid connection between said bars at one end thereof, wheels journaled on said connection, adjustable sliding boxes mounted on said bars toward the opposite ends thereof, a vertically-flexible but horizontally-rigid connection between said boxes, and wheels journaled on said connections, in combination with adjustable grappling-hooks mounted on said bars and provided with slots corresponding in size and contour to and through which the bars project, substantially as described.

407,219. CLAY-GRINDING MACHINE. DAVID KENNEDY, Jr., Erie, Pa., assignor of one-half to Erastus B. Lipton, same place. Filed Aug. 20, 1888. Serial No. 283,305. (No model.)

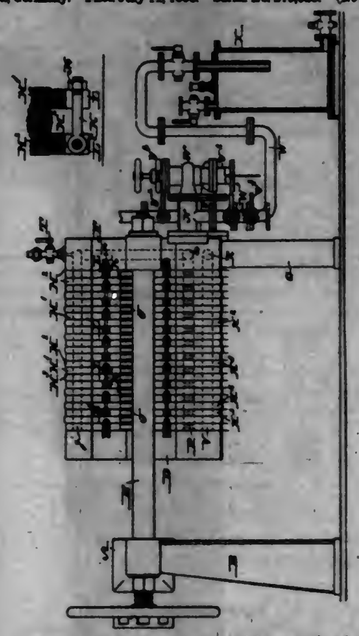
Claim.—1. The combination, in a clay-grinding machine, of a rotating corrugated grinding-cylinder and a corrugated grinding-jaw, with a reciprocating crushing-block operating on tracks above the grinding-jaw, substantially as and for the purpose set forth.

2. The combination, in a clay-grinding machine, of an annularly-grooved and longitudinally-corrugated grinding-cylinder, with an adjustable vertically-grooved and horizontally-corrugated grinding-jaw and a vertically-grooved and horizontally-corrugated reciprocating crushing-block, operating upon tracks above the grinding-jaw, substantially as and for the purpose set forth.



3. The combination, in a clay-grinding machine, of a grinding-cylinder having V-shaped radial grooves and longitudinal corrugations therein, with a grinding-jaw having transverse corrugations and vertical V-shaped grooves to correspond with the radial grooves in the grinding-cylinder, and a reciprocating crushing-block having transverse corrugations and vertical V-shaped grooves to correspond with the radial grooves in the grinding-cylinder, substantially as and for the purpose set forth.

4. The combination, in a clay-grinding machine, of the grooved and corrugated grinding-cylinder B, the hopper B', and the adjustable grinding-jaw G, having a grooved corrugated grinding-face *g*, with the reciprocating block I, having a grooved and corrugated crushing-face J, the pitman L, crank M, and shaft N for operating said reciprocating block I, substantially as and for the purpose set forth.



407,220. CIGAR-CUTTER. JOHN M. KIRK, Reading, Pa. Filed Oct. 23, 1888. Serial No. 288,935. (No model.)

Claim.—1. In a cigar-cutter, the combination, with the bed-plate A, having a concave cutter B secured to a high standard A', and standards A^2, with stops A^3 at the opposite end of said bed-plate, of a cutter-lever C, having bifurcated end C', with heel-pieces C^2 pivoted to the standards A^2, and a spring F, secured to the pivotal pin E between said standards A^2, said standard A' serving as a stop for the lever, and all arranged and adapted to operate substantially as set forth.

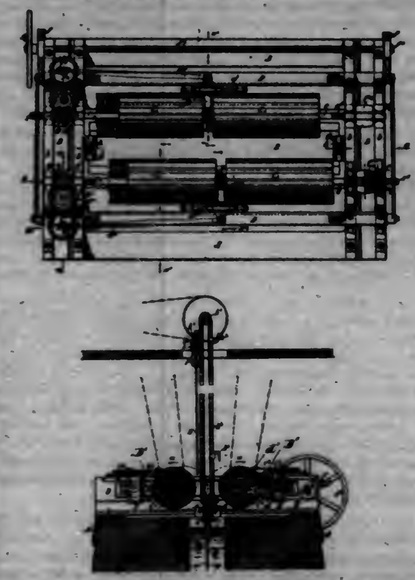
2. In a cigar-cutter, the combination, with the bed-plate A, having a concave cutter B adjustably secured to a correspondingly-shaped bracket A', one arm of which is extended upward, as described, of a cutter-lever pivoted to the bed-plate and a spring F adapted to raise it, the downward movement of said lever being stopped against the extended standard A', all substantially as set forth.

407,221. FILTER-PRESS. FRITZ KLEINHANS, Schöningen, Brunswick, Germany. Filed July 11, 1888. Serial No. 279,638. (No model.)

Claim.—1. In a filter-press, standards with a cross-head and side rods, the follower D, the cross-head F, with the diagonal passage Q, the filter-plates H^3 H^3, and cake-frames H', said plates and frames being between said follower and cross-head F and having the longitudinal passages P and R, communicating with said passage Q, and the said cake-frames H', having the passages *b*, leading from said passages P and R, and the supply-pipe N, leading into said passage Q, said parts being combined substantially as described.

2. In a filter-press, standards with side rods and cross-head, a follower guided on said side rods, the head F, with passage Q and inlet *a*, the filter-plates H^3 H^3, and cake-frames H', said plates and frames being between the follower and head F and having the longitudinal passages P and R communicating with the passage Q, and the said plates H^3 H^3, having the lower recesses *h*, and the ports *j* and channels *j'*, communicating with said recesses *h*, and the said cake-frames H', having the passages *b*, communicating with the passages P and R, and the supply-pipe N, leading into the passage Q, said parts being combined substantially as described.

3. In a filter-press, the combination of a follower, with the cake-frames H' and filter-plates H^3 H^3, the said frames and plates having longitudinal passages P and R and openings V, and said frames H', having the passages *b*, leading from said passages P and R, and the plates H^3 H^3, having the recesses *h* and communicating ports *l*, filtering plates and cloths between said frames H' and plates H^3 H^3, the head F, with passage Q, communicating with passages P and R, and the supply-pipe N, substantially as described.



4. The combination of standards with side rods and a cross-head, a follower guided on said side rods, the cross-head F, with passage Q, cake-frames H', and filter-frames H^3 H^3, having passages P and R, the cake-frames having the passages *b*, communicating with said passages P and R, and the plates having recesses *h* and *g*, vertical grooves connecting said recesses and ports *l*, filtering plates and cloths between said cake-frames and filter-plates, and supply-pipe N, leading to said passage Q, substantially as and for the purpose set forth.

5. In a filter-press, the combination of two cake-frames H', having bifurcated lugs L, with a filter-plate between the said frames, the bolt K, and nut M, substantially as described.

6. In a filter-press, the filter cake-frames H', having their inner faces inclined, the filter-plates H^3 H^3, with ports and recesses, substantially as described, the neck H^6, having ribs forming vertical passages communicating with the ports and recesses of said plates, the said plates being secured to said frames so that a plate is between adjacent frames and the plates H^3 H^3 alternate with each other, and each plate having its outer side covered with a perforated sheet or netting, said parts being combined substantially as and for the purpose set forth.

7. In a filter-press, the combination of a follower, with the cake-frames H' and filter-plates H^3 H^3, the said plates having the longitudinal passages P and R and openings V, the plates H^3, having the recesses *h* and communicating passage *l*, filtering material between each of said cake-frames and each of said filter-plates, the head F, with passage Q and passage K', the pipe N, communicating with the said passage Q, and the pipe U, communicating with the passage K' and having the valve U' and cock S, substantially as and for the purpose set forth.

407,222. APPARATUS FOR COATING METALS WITH ZINC OR OTHER METALS. FRIEDRICH W. KNYLER, Unter St. Veit, near Vienna, assignor of one-half to Adalmar Breden, Vienna, Austria-Hungary. Filed June 16, 1888. Serial No. 277,260. (No model.) Patented in Germany Dec. 23, 1884, No. 30,987; in France Dec. 23, 1884, No. 166,109; in Austria-Hungary Jan. 20, 1885, No. 40,949 and No. 3,771, July 8, 1886, No. 15,741 and No. 34,722, Dec. 8, 1886, No. 34,792 and No. 60,901, and Sept. 20, 1887, No. 14,366 and No. 36,793; in Belgium Oct. 16, 1888, No. 79,888, and in England Oct. 19, 1888, No. 12,465.

Claim.—1. In a machine of the class described, the combination, with the pan for containing the molten zinc and a support for the article to be zinked, of vertically-movable endless parallel chain carriers arranged above the pan and provided with hook-bearings for said support, and supporting and driving pulleys for said chain carrier, substantially as and for the purposes specified.

2. In a machine of the class described, the combination, with the pan for containing the molten zinc and a support for the article to be zinked, of vertically-movable endless parallel chain carriers arranged above the pan and having hook-bearings for said support of alternately-reversed position arranged above the pan, and supporting and driving pulleys for said carriers, substantially as and for the purpose specified.

3. In a machine of the class described, the combination, with the pan for holding the molten zinc, of a parallel endless chain carrier provided with hook-bearings *a*, a support for the article to be zinked provided with journals fitting into said hook-bearings, and brushes

arranged on opposite sides of the endless carriers, substantially as and for the purposes specified.

4. In a machine of the class described, the combination, with the pan for containing the molten zinc, of a parallel endless chain carrier provided with hook-bearings of alternately-reversed position, fixed bearings below the chain carrier within the reach of the hooks thereof, and a support for the article to be zinked provided with journals fitting into said hook-bearings, substantially as and for the purpose specified.

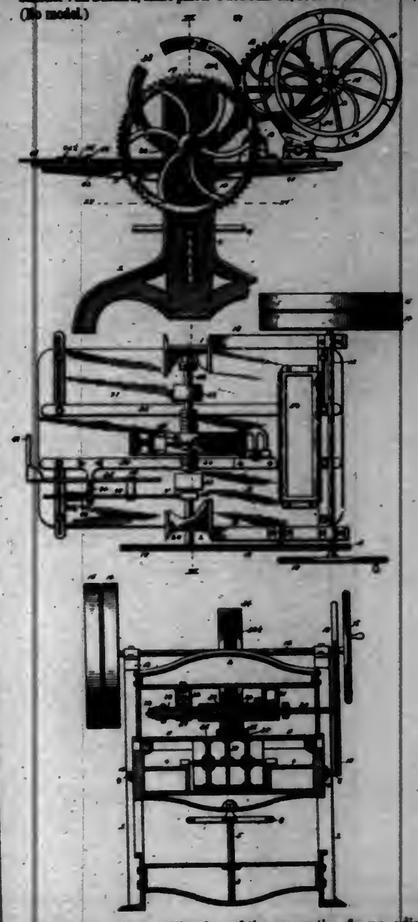
5. In a machine of the class described, the combination, with the pan for containing the molten zinc and the traveling carrier for the article to be zinked, of brush-shafts arranged on opposite sides of the carrier, mechanism for revolving the brushes in a direction at right angles to and toward said carrier, and motion-translating mechanism for translating the rotary motion of the brush-shafts into reciprocating motion connected with and operated directly from the brush-shafts, substantially as and for the purposes specified.

6. In a machine of the class described, the combination, with the pan for containing the molten zinc and a traveling carrier for the article to be zinked, of brush-shafts arranged on opposite sides of the carrier, mechanism for moving the same toward and from said carrier, a belt-pulley for and connected with each shaft by a spline or feather, and motion-translating mechanism for translating the rotary motion of the brush-shafts into reciprocating motion connected with and operated directly from the brush-shafts, substantially as and for the purposes specified.

7. In a machine of the class described, the mechanism for imparting lateral motion in opposite direction to the brush-shafts, which consists in the combination, with sliding bearings for said shafts and superposed rack-bars secured thereto, of an intermediate pinion for each pair of rack-bars, said pinions being mounted on the same cross-shaft, substantially as described.

8. In a machine of the class described, the combination, with the brush-shaft and a worm or endless screw connected therewith by a feather or spline, of a crank-shaft, intermediate gearing operated by the endless screw to rotate said crank-shaft, an actuating-arm connected with the brush-shaft, mechanism for imparting a reciprocating motion to the arm, abutments to hold said arm against independent reciprocation on the shaft, and a connecting-rod connecting said arm with the crank-shaft, substantially as and for the purposes specified.

9. In a machine of the class described, the combination, with the brush-shaft, a worm or endless screw connected therewith by a spline or feather, and sliding bearings for said shaft, of a connecting-bar rigidly secured to said bearings, an arm connected with the shaft and reciprocating on the connecting-bar, abutments to hold said arm against independent reciprocation on the brush-shaft, a crank-shaft, intermediate gearing operated by the endless screw to rotate the crank-shaft, and a connecting-rod connecting the crank-shaft with the reciprocating arm, substantially as and for the purposes specified.



10. In a machine of the class described, the combination, with the brush-shaft *c*, of a worm or endless screw connected therewith by a spline or feather, sliding bearings for said shaft, and a rack-bar and pinion for moving said bearings on their support, of a connecting-bar rigidly secured to the brush-shaft bearings, an arm connected with the shaft and reciprocating on the connecting-bar, abutments to hold said arm against independent reciprocation on the brush-shaft, a crank-shaft, intermediate gearing operated by the endless screw to rotate the crank-shaft, a connecting-rod connecting the crank-shaft with the reciprocating arm and bearings for said crank-shaft, and intermediate gearing rigidly secured to and moving with the brush-shaft bearings, substantially as and for the purposes specified.

11. In a machine of the class described, the combination, with the endless carrier, of a support for the article to be zinked, comprising a supporting-bar and holding-tongues, in combination with mechanism for closing the tongues, consisting of a cam operating on the arms of the tongue-jaws to move said arms in opposite directions and close the jaws, substantially as described.

12. In a machine of the class described, the combination, with the endless carrier, of a support for the article to be zinked, comprising a supporting-bar and a plurality of tongues suspended therefrom, in combination with a cam-shaft *i* and cams *i'* thereon lying between the arms of the tongue-jaws and operating to simultaneously move the arms of all the tongue-jaws in opposite directions to close the jaws when a partial rotation is imparted to the cam-shaft, substantially as described.

13. In a machine of the class described, the combination, with the pan for containing the zinc, and the endless carrier h^2 h^3, provided with hook-bearings at suitable distances apart, whose position is alternately reversed, and the curvilinear bearers i^3, provided with the projection or stop i^7, of the support for the articles to be zinked, provided with journals i^5, fitting into the hook-bearings of the carriers, substantially as and for the purposes specified.

407,223. WOOD EMBOSSING, FILLING, AND BACKING-OUT MACHINE. WILLIS W. KNOWLTON, Fort Scott, Kans., assignor of one-half to Samuel Van Buskirk, same place. Filed Jan. 12, 1889. Serial No. 296,216. (No model.)

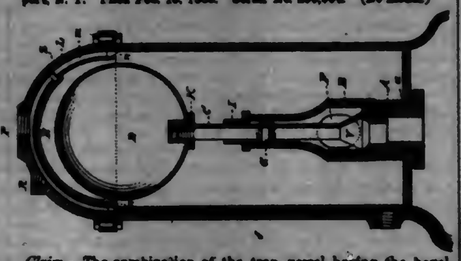
Claim.—1. The combination of the supporting-frame, adjustable table supported in the frame, a shaft provided with a cog-wheel, and an embossing-wheel provided with cogs on its inner surface which mesh with the cog-wheel secured to the shaft, and means for rotating said shaft, substantially as and for the purpose set forth.

2. The combination of the supporting-frame, adjustable table supported in the frame, a shaft provided with a cog-wheel, an embossing-wheel provided with cogs on its inner surface which mesh with the cog-wheel on the shaft, said embossing-wheel being provided with an opening 32, and suitable gearing for rotating said shaft and embossing-wheel, substantially as and for the purpose set forth.

3. The combination of an adjustable table, drive-shaft 12, shaft 20, intermediate gearing connecting said shafts, embossing-wheel located on the shaft 20, and a feeding device consisting of the rods 42 45, said rods being adjustably connected to each other, and a collar 40, secured to the shaft 20 and provided with a set-screw 41 for the purpose of operating said feeding device, substantially as described, and for the purpose set forth.

4. As a new article of manufacture, an embossing-wheel provided with cogs on its inner surface and an opening 32, substantially as and for the purpose set forth.

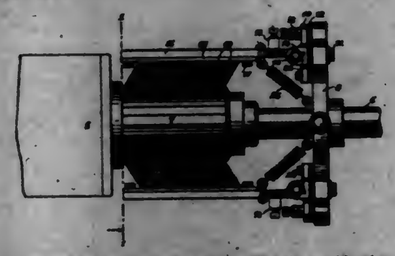
5. As a new article of manufacture, an embossing-wheel provided with cogs on its inner surface and having a depression 33 in said cogs, substantially as described, and for the purpose set forth.



6. The combination of a frame, shaft 20, mounted in said frame, said shaft being in sections, one of the sections being supported by a swivel-bearing 27, in order that said section may be disconnected from the fixed section when it is desired to remove the shaft from the machine, substantially as described, and for the purpose set forth.

7. The combination of the frame 1, table 11, shafts 12 20, embossing-wheel 34, suitable gearing connecting said shafts in order to rotate said embossing-wheel, and a filling device consisting of a box 50, roller 53, situated beneath the box, means for supporting said roller, and a tension-spring 57, connected with said roller, substantially as and for the purpose set forth.

8. The combination of a supporting-frame, sliding frame 4, friction-roller 35, journaled therein, and a stamping device 38 at the center of the friction-roller, substantially as and for the purpose set forth.



9. The combination of the frames 1 2, shafts 12 20, sliding sleeve 26, gearing-wheels 17 18 19, table 11, adjustable cutter 50, guide 62, supported in a frame 61, and a screw 63, substantially as and for the purpose set forth.

407,224. STEAM OR WATER TRAP. HIRAM F. LELAND, Lockport, N. Y. Filed Feb. 15, 1888. Serial No. 263,964. (No model.)

Claim.—The combination of the trap-vessel having the bevel-faced valve-seat, the tubular guide connected to said seat, the bevel-faced valve having an upwardly-extending stem provided with an annular stop, the spherical float applied to the upper end of said stem, and the hemispherical guard secured to the under side of the dome of the trap-vessel and having the lower deflected edges of flanges, substantially as set forth.

407,225. COMMUTATOR-BRUSH AND HOLDER. CHARLES P. LOCKE, Somerville, Mass., assignor to the Locke Electric Manufacturing Company, of New York. Filed Feb. 23, 1889. Serial No. 300,993. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with the commutator-cylinder, of a terminal-plate mounted on a support and insulated therefrom, and a brush-holder having a brush and hinged to said plate, for the purpose set forth.

2. In a dynamo-electric machine, the combination, with the commutator-cylinder, of the brush-holder yoke and a terminal-plate mounted thereon and insulated therefrom, a brush-holder carrying a brush and hinged to said plate, and a spring for forcing the holder in toward the commutator to hold the brush in engagement therewith, substantially as and for the purpose set forth.

3. In a dynamo-electric machine, the combination, with the commutator-cylinder, of a brush composed of the strips or lamiæ 19 19, broadened at their attaching ends 20 and tapering toward their contact ends 21, whereby the lamiæ may be pliant, at the same time stout enough to resist buckling up, substantially as set forth.

4. In a dynamo-electric machine, the combination, with the commutator-cylinder 7, of the brush-holder yoke 8, the terminal-plate 10, mounted thereon and insulated therefrom, the swinging brush-holder 16, carrying a brush and hinged to the said plate in electrical connection therewith, the spring 22, mounted on the said plate 10 and engaging the said brush-holder 16, the terminal-post 13, and a spring for forcing the holder in toward the said commutator, substantially as and for the purpose set forth.

5. In a dynamo-electric machine, the combination, with the commutator-cylinder 7, of the brush-holder yoke 8, the terminal-plate 10, mounted on and insulated from the yoke, the swinging brush-holder 16, carrying a brush and hinged to said plate 10, in electrical connection therewith, the spring 22, mounted on the plate 10 and engaging the holder 16, the terminal-post 13 and the spring 30, intermediate the holder 16, and yoke 8, for forcing the holder in toward the commutator, substantially as and for the purpose set forth.

6. In a dynamo-electric machine, the combination, with a swinging brush-holder, consisting in a bar, such as a bar 16, of a bed-plate, such as a bed-plate 18, secured to the bar and having the brush-lamiæ attached thereto, for the purpose described.

7. In a dynamo-electric machine, the combination, with a terminal-plate 10, suitably mounted and insulated and provided with perforated hinge-ears 14, of a brush-holder, such as 16, carrying a brush, and having hinge-pintles 15, for hinging with the ears 14, substantially as and for the purpose set forth.

407,226. GREASE-CUP. WILLIAM F. MATTES and JOHN F. LEWIS, Scranton, Pa., assignors to Wm. P. Hetzel, trustee, same place. Filed Oct. 10, 1888. Serial No. 287,742. (No model.)

Claim.—1. The combination, with the cup provided with a slot in the side of the upper part thereof and having a notch extending from the side of the slot, and the piston working in the cup, of the cross-head arranged to slide within the upper part of the cup, a spring interposed between the cross-head and the piston, and an arm projecting from the cross-head and extending through the said slot in the upper part of the cup, substantially as and for the purpose described.

2. The combination, with the cup having slots in the upper part thereof, and the piston, of the cross-head having arms that extend through said slots, and the spring placed between the piston and the cross-head, substantially as and for the purpose described.

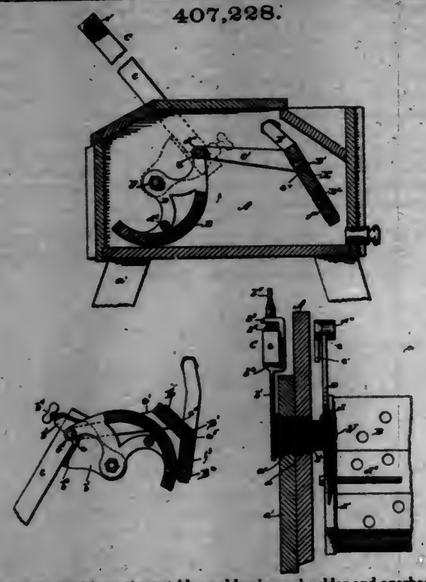
3. The combination, with the cup having slots in the upper part thereof, the armed cross-head, the piston, and the piston-rod passing through the said cross-head, of a projecting collar secured to the piston-rod above the cross-head, substantially as and for the purpose described.

4. The combination, with the cup having slots in the upper part thereof, the armed cross-head, the piston, and the spring, of the cap K, for strengthening the upper part of the cup and protecting the operating parts, substantially as set forth.

5. The combination, with the cup having a feed-hole in the bottom, of the piston having the groove G, packing L, and wire W.

6. The combination, with the cup having the cylindrical projection O^3, provided with slots O and with notches O^4, of the piston having the rod P^2, the cross-head having the depending rim *t*, the arms T^2, and the spring interposed between the cross-head and the piston, having its upper end fitting in the rim *t*, substantially as described.

407,227. LATCH. PHILIP MAY, Terre Haute, Ind. Filed Dec. 24, 1888. Serial No. 294,542. (No model.)



Claim.—The combination, in a gate-latch, with a box having front and rear plates, of a pair of catch-levers having outwardly-extending lugs on their front ends, said levers passing through said box, a screw entering the box and serving as a pivot for the levers, a stop formed on each lever projecting forwardly over the edges of the box, and a spring secured to one lever with its free end pressing against the opposite lever, substantially as described.

407,228. WASHING-MACHINE. GEORGE M. MILLER, York, Pa. Filed Oct. 24, 1888. Serial No. 288,612. (No model.)

Claim.—1. In a washing-machine such as described, and in combination with their box thereof, the pivot-pins inserted through openings in the sides of the box, removably connected to the presser-board on the inside and provided with laterally-projecting arms formed in-

407,228.

tegral therewith on the outside, and having a shoulder and overhanging portion carrying a thumb-screw, and the handle uniting said pivot carrying arms and secured thereto by the thumb-screws, as and for the purpose set forth.

2. In a washing-machine of the character described, and in combination with the box thereof provided with coincident openings for the insertion of the pivots, the flanged thimbles open at both ends inserted from the outside in said openings, the pivots bearing in said thimbles each removably connected to the presser-board on the inside and provided with a laterally-projecting arm on the outside, formed integral therewith and having a clamp, and the handle secured to said arms by the clamping devices thereon to retain the handle in position and hold the pivots and thimbles in place in the sides of the box, substantially as described.

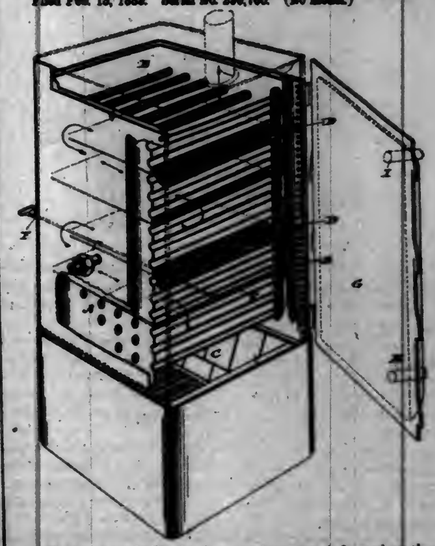
3. In a washing-machine such as described, the combination, with the box having coincident openings in its sides, of the pivots projected through said openings and provided with arms to which the handle is secured, and the brackets carrying an oscillating member of the washing mechanism, said brackets being detachably secured to the inner ends of the pivots and held from rotary movement by the corrugated or notched surfaces, permitting adjustment of the handle, substantially as set forth.

4. In a washing-machine such as described, and with the box thereof provided with bearings in opposite sides, the pivot-pins secured to and connected by the handle and projected through the bearings in the sides of the box, the inner ends of said pivot-pins being provided with a shoulder having radial shoulders or corrugations and a stud or pin, the brackets supporting the oscillating pressure-board provided with a series of shoulders or corrugations fitting those on the pivot-pins, and fastening devices for clamping said brackets onto the pivot-pins, as set forth, whereby the handle can be adjusted with relation to the pressure-board and held rigidly in position.

5. In a washing-machine, the combination, with the sides of the box and the legs, perforated as described, and the thimbles inserted through said openings and forming coincident bearings extending through one leg and the side of the box on opposite sides of the latter, of the curved presser-board secured to brackets attached to the opposite ends of said board and each provided with a boss perforated and having radial ribs or corrugations formed on its outer face, two pivot-pins inserted from the outside through the thimbles and each provided with a shoulder notched or corrugated on its inner face and a stud, the latter entering the perforation in the boss on one bracket and clamped thereto by a nut, an arm rigidly secured to each pivot-pin, and a handle provided with two side bars, each of the latter being clamped to one of the pivot arms, substantially as described.

6. In a washing-machine, and in combination with the box and a swinging pressure-board, a bearing formed in the side of the box, a pivot-pin inserted through said bearing, its inner end detachably and adjustably fastened to the swinging pressure-board, while the outer end is provided with an arm formed with an extended bearing, an overlying flange and a thumb-screw, and a handle-bar resting upon said extended bearing and held in position thereon by the thumb-screw, substantially as described.

7. In a washing-machine such as described, the combination, with the board B, suspended upon pivots to oscillate back and forth, of a swinging board B^2, also suspended from pivots, and the pressure-board B', pivotally attached to and connecting the swinging boards B B^2, substantially as described.



8. In a washing-machine such as described, and in combination with the box and the pressure-boards pivotally supported at or near opposite ends of said box, the pressure-board B', pivoted to the supports of one of said swinging boards at a point intermediate the board and its pivotal point of suspension, and arms attached to said board B' and loosely attached to the opposite swinging board B, substantially as and for the purpose set forth.

9. In a washing-machine, and in combination with the box thereof and the pressure-board B, pivotally supported therein near one end, the opposite pressure-board B^2, supported in brackets applied to the end thereof and furnished with pins or journals projected into bearings formed in the sides of the box, and the pressure-board B', provided with end plates, which are each furnished with a pivot engaging a socket in one of the supporting-brackets of board B^2, and an arm connected to the frame of the pressure-board B by a loose connection, substantially as described.

10. In a washing-machine, and in combination with the box, the pressure-board B, provided with brackets at the ends, which latter are detachably and adjustably secured to pivots projecting through openings in the side of the box, the end plate carrying board B', provided with arms detachably and loosely attached to the brackets of board B, said end plates being also loosely and detachably connected to the swinging brackets of the opposite pressure-board B^2, substantially as described.

11. In a washing-machine, and in combination with the box and the pressure-boards B B' B^2, arranged and co-operating substantially as described, the brackets D, detachably secured to pivots b and board B, the brackets F, provided with journals fitting bearings in the sides of the box and detachably secured to board B^2, and the end plates E, provided with pivots engaging brackets D and F and detachably secured to board B', substantially as described.

407,229. BOILER. WILLIAM MORRISON, Toronto, Ontario, Canada. Filed Feb. 13, 1888. Serial No. 263,760. (No model.)

Claim.—1. A boiler having a water-space A formed on three of its sides, the two opposite sides being connected together by tubes B, and the side on which no water-space is formed having a door G, arranged substantially as and for the purpose specified.

2. A boiler having a water-space A formed on three of its sides, the two opposite sides being connected together by tubes B, and the side on which no water-space is formed having a door G, in combination with a series of plates D, arranged between the tubes B, substantially as and for the purpose specified.

3. A boiler having a water-space A formed on three of its sides, the two opposite sides being connected together by tubes B, and the side on which no water-space is formed having a door G, in combination with a plate D and adjustable damper E, provided with a rod F and designed substantially as and for the purpose specified.

4. A boiler having a water-space formed on three of its sides, the two opposite sides being connected together by tubes B, in combination with a hinged door G, having a water-space formed in it, which latter water-space is connected to the water-space A by a pipe I, provided with a suitable coupling, substantially as and for the purpose specified.

407,230. TOOL-HOLDER. FRITZ MÜLLER, New York, N. Y., assignor to Alfred Deiga, same place. Filed Mar. 7, 1888. Serial No. 266,269. (No model.)

Claim.—A tool-holder composed of a handle A, provided with a split screw-nipple B, having a tapering end, a ferrule C, provided with an internal screw-thread and with a tapering mouth to engage the screw-nipple B, and of a cap E, fitting the outer end of the ferrule, substantially as described.

407,231. CAR-COUPLING. ADAM S. NEAL, Richmond, Tex. Filed Apr. 25, 1888. Serial No. 272,562. (No model.)

Claim.—1. In a car-coupler, the combination of the draw-heads A, provided with forwardly-projecting portions having curved faces B and notches b in the rear thereof, bails E, pivoted centrally on vertical pins passing through the center of the draw-heads, springs exerting a rearward pressure on the rear ends of the bails, and chains secured to the forward ends of the bails to move them in opposition to the pressure of their springs, substantially as shown, and for the purpose set forth.

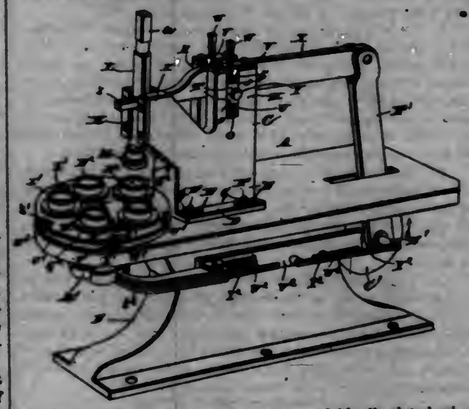
2. The combination, in a car-coupler, of the draw-heads A, provided with forwardly-projecting portions curved, as shown, notches b, located in the rear of said curved portions, inclined faces C and abutting faces D, bails E, pivoted centrally on vertical pins passing through the draw-heads forward of the notches b, springs g, exerting a rearward pressure on the rear ends of the bails, and chains to move the bails in opposition to the pressure of their springs, substantially as described.

3. In a car-coupler, the combination of the draw-heads the front ends of which are rounded on one side, notches b, formed in rear of the rounded faces, bails E, pivoted on vertical pins passing centrally through the draw-heads, springs exerting a rearward pressure on the rear ends of the bails, and spring-catches to engage the rear ends of the bails and suspend the operation of the coupler, substantially as described.

407,232. LAMP-EXTINGUISHER. WILLIAM NOTLEY, London, County of Middlesex, England. Filed Dec. 17, 1888. Serial No. 293,261. (No model.) Patented in England June 16, 1887, No. 8,099; in Germany Jan. 15, 1888, No. 44,468; in Belgium Jan. 16, 1888, No. 80,288, and in India July 4, 1888, No. 86.

Claim.—1. The combination, with the burner, of an extinguisher for the flame, an independent sliding weight encircling the extinguisher, and upwardly-inclined ways extending in the direction of the wick and supporting the weight, whereby, when the burner is upset, a portion of said weight will move toward the extinguisher for actuating the same and extinguishing the flame, substantially as described.

2. The combination, with the burner, of pivoted extinguisher-



407,232.

flaps, and an independent sliding weight mounted below the pivoted flaps upon upwardly-inclined ways extending in the direction of the wick, whereby, when the lamp is upset, some portion of the weight will be carried upward to actuate the extinguishing device, substantially as described.

3. The combination, with the burner of an oil-lamp, of an extinguisher consisting of two disks or flaps A, positively pivoted to a fixed portion of the burner, and a movable ring or plate C, the whole arranged to operate substantially as set forth.

407,233. MACHINE FOR STAMPING AND MOLDING SOAP. CARRIE P. OLDHAM, Knoxville, Tenn., assignor of one-half to Samuel H. McNutt and Edward S. Shepard, same place. Filed Feb. 20, 1888. Serial No. 265,726. (No model.)

Claim.—1. The combination of the revolvable die-plate having the ratchet-wheel and the notches X', the spring-pressed longitudinally-moving detent to engage said notches and provided with arms R^2, the reciprocating rod V^3, having the pawls (one or more) to engage and rotate the ratchet-wheel, the crank-wheel having the tappet-pin D', to engage the arm of the detent and release the same, and the pitman connecting the rod V^3 with the crank-wheel, substantially as described.

2. In a machine for stamping and molding soap, &c., the revolvable die-plate having the ratchet-wheel and the notches X', the spring-pressed detent to engage the notches, the rod V^3, having the pawl to engage the ratchet-wheel, the rocking bar X, the plunger attached thereto and having the die, the crank-wheel C, the rod F', connecting the latter to the rocking bar, the pitman W^3, connecting the crank-wheel to the rod V^3, and the tappet-pin on the crank-wheel to operate the detent, the pawl-actuating rod, and the plunger, as set forth.

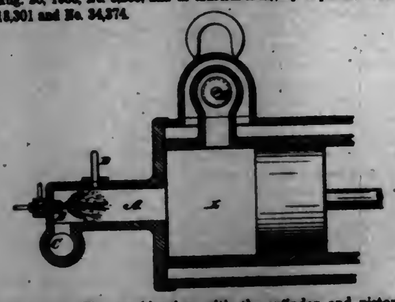
3. In a soap-molding machine, the combination of the pivoted die-plate having the notches X', the longitudinally-moving detent N^2, having the arm R^2 and the engaging-point S^2, the spring U^3, to move the detent in one direction and engage its point with the die-plate, and the revolving wheel C, having the tappet-pin D', to engage the detent-arm, for the purpose set forth, substantially as described.

4. In a machine for stamping soap, the combination of the revolvable die-plate, the pawl-and-ratchet mechanism to rotate the same intermittently, the plunger carrying the die, the lever mechanism for reciprocating the plunger, and the driving-shaft, to which both pawl-and-ratchet mechanism and the lever mechanism are respectively connected, and the expelling devices for the die-plate, comprising the plungers in the molds, and the cams arranged under the die-plate, said devices being operated by the cam-face, whereby as the die-plate turns said devices will ride up the cam-face to cause the expulsion of the stamped soap from the die.

5. The combination of the bed or table having the horizontal arm H' at one end and the vertical standard, the vertical shaft L', journaled in arm H', the die-plate secured to the upper end of said shaft, the ratchet-wheel secured to the lower end thereof, the cups or molds arranged on the die-plate in a concentric series, the plunger guided on the standard, the rocking lever connected to the plunger, the crank-wheel connected to and operating the lever, the reciprocating rod V^3, having the pawls engaging the ratchet-wheel, and the pitman connecting said rod to the crank-wheel, substantially as described.

6. In a soap-press, the combination of the plunger-rod, the standard C, having the slots or ways, the boxes T, adjustable in said slots or ways, the screws to raise and lower the boxes, and the beam or lever having its bearings in the adjustable boxes and connected with and adapted to operate the plunger-rod, substantially as described.

7. In a soap-press, the combination of the bed or table constituting the frame or support, the pivoted revolving die-plate having the series of concentrically-arranged cups or molds, the peripheral notches and the ratchet-wheel, the reciprocating rod V^3, the pawls pivoted thereto and engaging the ratchet-wheel, the crank-wheel having the tappet-pin D', the pitman connecting said wheel to rod V^3, the plunger-rod, the rocking lever connected thereto, the pitman F', connecting the crank-wheel to the rocking lever, the detent having the arm in the path of the pin D', and the spring to engage said detent with the notches of the die-plate in succession, substantially as described.



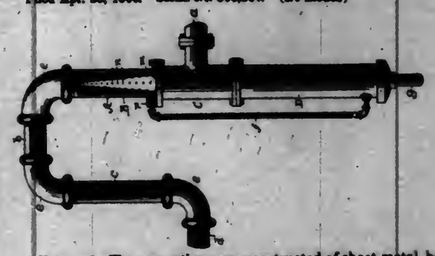
8. In combination with the revolvable die-plate having the cups or molds and the openings A^2, the vertically-adjustable cam-ring N', having the groove T', the plungers in the cups or molds, the depending pins B^2 on the plungers, and rollers D^2 on their lower ends traveling in the groove T' of the cam-ring, as set forth.

9. The die-plate having the cups or molds provided with flanges F^2, the circular plates G^2, provided with central countersunk openings H^2, which fit over the molds or cups and receive the flanges thereof, the slots I^2 in one of the ends of plates G^2 and enlarged circular openings K^2 in the other ends, the screws or bolts L^2, which extend through the slots I^2 and openings K^2 and enter the die-plate, and the washer M^2 on the bolts L^2 to cover the openings K^2 and enable the screws to clamp the plates G^2 to the die-plate, as set forth.

10. The revolvable die-plate and the removable interchangeable and adjustable molds or cups thereon, combined with the standard C, adjustable toward or from the die-plate and carrying the plunger for the cups or molds, whereby the standard with the plunger can be adjusted relative to the adjustment of the cups or molds, for the purpose set forth.

11. The revolvable die-plate, the cups or molds thereon, and the ratchet-wheel carried by the die-plate, combined with the standard C, the rocking lever X, pivoted to the standard, the plunger L, guided in the standard and connected to the rocking lever, the crank-wheel C', connected to and operating the rocking lever, the reciprocating rod V^3, having the pawl engaging the ratchet-wheel, and the pitman V^2, connecting the rod V^3 to the crank-wheel, as set forth.

407,234. MOTOR-ENGINE WORKED BY THE COMBUSTION OF SPRAY OF PETROLEUM. NICOLAUS A. OTTO, Cologne, Prussia, assignor to the Gas-Motoren-Fabrik-Deutz, Deutz-on-the-Rhine, Germany. Filed May 28, 1888. Serial No. 274,980. (No model.) Patented in England Apr. 17, 1888, No. 5,794; in Belgium Apr. 27, 1888, No. 81,563; in France June 2, 1888, No. 190,979; in Italy June 23, 1888, XLVI, 216; in Spain Aug. 20, 1888, No. 8,365, and in Austria-Hungary Sept. 16, 1888, No. 18,301 and No. 34,374.



Claim.—1. The combination, with the cylinder and piston of a petroleum motor-engine, which operates with combustible charges that are first introduced and compressed within the cylinder and subsequently fired, of a tubular extension projecting from the end of the cylinder of less sectional area than the latter, containing inlets for petroleum and air, and means for heating the tubular extension externally by an independent source of heat, said tubular extension being made to communicate directly and of its full sectional area with the cylinder, so that the mixture of petroleum and air as it enters the said tubular extension and becomes heated shall pass in a vaporized condition freely into the cylinder to be compressed therein, substantially as herein described.

2. The combination, with the cylinder and piston of a petroleum motor-engine, which operates with combustible charges that are compressed within the cylinder and subsequently fired, of a tubular extension projecting from the end of the cylinder of less sectional area than the latter, containing inlets for petroleum and air, and an externally-heated igniting-tube, and means for heating the tubular extension externally by an independent source of heat, said tubular extension being made to communicate directly and of its full sectional area with the cylinder, so that the mixture of petroleum and air as it enters the said tubular extension and becomes heated shall first pass freely into the cylinder, so as to be compressed by the instroke of the piston, and shall then be ignited within the tubular extension by the heated igniting-tube, substantially as herein described.

3. In a petroleum motor-engine, the combination, with the engine-cylinder, of a tubular extension thereon communicating at one end freely with the cylinder, and having at the other end an inlet for petroleum-spray and air, and heated externally by a suitable heating device, substantially as described.

407,235. SEPARATOR. LAWSON A. PALMER, Kansas City, Mo. Filed Apr. 23, 1888. Serial No. 308,267. (No model.)

Claim.—1. The separating-cone constructed of sheet metal, having apertures a punched inwardly through its body and provided with flange *m* at its base, in combination with an inclosing-chamber and connections, the flange *m* being clamped upon one end of said inclosing-chamber to hold the cone in position, substantially as and for the purpose set forth.

2. In a separator, the combination of an inclosing-chamber provided with a steam-supply connection with a boiler, a perforated separating device inclosed within said chamber, and the drain-pipe *f*, located on the exterior of the inclosing-chamber and connecting the space in the upper portion of the inclosing-chamber with the bottom thereof, substantially as set forth.

3. The steam-separator having a T-shaped pipe-connection and a perforated cone-pipe arranged in a pipe-section superposed upon the vertical arm of said T-shaped pipe-connection, substantially as set forth.

4. The steam-separator comprising the T-shaped pipe-connection, whose pipe-sections are of varying diameters, the receiving-chamber D, the cone-pipe chamber superposed upon the upper arm or section of the T-shaped pipe-connection and containing the perforated cone-pipe, the pipe or chamber D, connected to the lower end of the vertical arm or section of said T-pipe connection, and the drain-pipes, one connecting with the base of the cone-pipe chamber and with the bottom of the chamber D and the other connecting with the bottom of the latter chamber D and with the water chamber of the boiler, substantially as set forth.

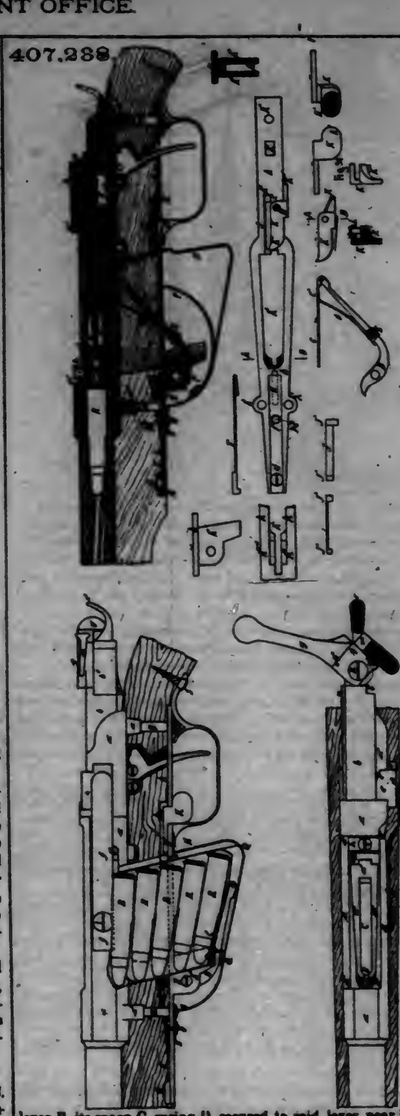
407,236. WEFT STOP MECHANISM FOR LOOMS. JAMES PATTERSON and TOM BROOK, Huddersfield, County of York, England. Filed Aug. 6, 1887. Serial No. 246,340. (No model.) Patented in England Nov. 17, 1886, No. 14,941, and in Belgium Dec. 18, 1886, No. 74,346.

Claim.—1. A cross-head C, having weft-feeding fingers secured thereto, and stop-arms C' C², the pointed pivotal set-screw supports E, on which the weft-fork is mounted, the bracket for said supports, the locking-nuts for the supports, the lifting-bar, and the connecting-rod and sliding guide-plate for actuating said bar and the lay, substantially as described.

2. In an automatic weft stop mechanism, the combination of a sliding cam or lifting-bar D, slide F, with projection G, connecting rod or link K, spiral spring O, and brackets L and M, substantially as described, for the purpose specified.

3. An automatic weft stop mechanism comprising, in combination, the weft-fork and its supports, the sliding lifting-bar D, the slide F, the projecting stop G, the knocking-off lever H, provided with a regulating set-screw, with which the said stop G is adapted to come in contact, the bracket to which said lever is pivoted, the breast-beam for supporting said bracket, the lever P and starting-shaft Q, the spring-actuated connecting-rod K, and the bearing on said breast-beam through which said rod slides, substantially as and for the purpose described.

407,237. GAS-MIXER. WALTER S. PAYNE, Fostoria, Ohio. Filed Apr. 13, 1888. Serial No. 270,408. (No model.)



Claim.—1. The combination of the valve-case, the jet or tube screwed thereto and having the flange F, the collar or sleeve loose on the jet-tube and having the exterior screw-threads, and the globe or mixer having the openings for the admission of air and having the threaded opening at its lower end adapted to receive the threaded sleeve, whereby said globe or mixer is connected to the valve-case and to the jet-tube, substantially as described.

2. The combination of the valve-case having the threaded opening in one side, the jet-tube or nipple B, adapted to enter the said threaded opening, having the polygonal projecting end and the flange F thereof, and having the exterior screw-thread, and the polygonal flange K at the base of said threaded portion, and the globe or mixer having the openings M and provided on the lower side with the threaded collar to receive the threaded sleeve, said collar having the seat at its upper end, against which the flange F of the jet-tube or nipple impinges, substantially as described.

3. The combination of the valve-case, the jet or tube secured thereto having the flange F and adapted to be engaged by a wrench, the collar or sleeve loose on the jet-tube and having the exterior screw-threads, and the globe or mixer having the threaded opening at its lower end adapted to receive the threaded sleeve, substantially as described.

407,238. MAGAZINE OR REPEATING FIRE-ARM. FRANZ J. PEYET, Vienna, Austria-Hungary, assignor of one-half to Julius Reichmüller, same place. Filed June 18, 1888. Serial No. 277,494. (No model.)

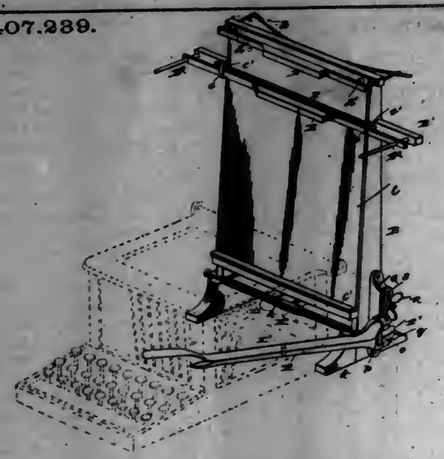
Claim.—1. In a magazine-gun, the combination of a receiver provided with the opening a^4 for the locking-key, the movable cylindrical breech-piece *b b'*, having the recess b^3 therein, the locking-key *c*, entering the opening a^3, and spring *f*, which presses the key *c* into the opening, thereby serving to maintain the breech-piece closed, substantially as shown and described.

2. In combination with the receiver of the gun having a recess to receive the same, the locking-key *c*, as made with its guiding-groove *d*, projection c^2, and taper c^3, the handle *g*, carried by the cylindrical breech-piece, and having the nose g^2 to engage the key *c* and move the same outward, and the flat spring *f* on the receiver for forcing inward the key to its locking position, substantially as and for the purpose set forth.

3. In combination with the locking-key *c*, seated in the receiver, and handle *g*, carried by the reciprocating breech-piece, the described breech-piece for opening and closing the breech and introducing the cartridge, consisting of the two parts *b* and *b'*, joined together, the one part *b* having in it the recess b^3 for the locking-key, and also having a fulcrum part *b'* for said handle, all substantially as set forth.

4. In a magazine-gun, the combination of the cartridge-lifting lever B, its spoon C, spring D, secured to said lever near its fulcrum and its free end bearing on the under side of the spoon, as set forth, the under plate A, provided with projections A^{11}, serving as a fulcrum-support and guide for said lever, the releaser K, fixed on the under plate at the rear of its opening A^6, and spring J J' J^3, carried by the said under plate and serving to retain the magazine in place, substantially as shown and described.

5. In a magazine-gun, in combination, the cartridge-lifting lever B, the spoon C thereon, and spring D, secured near the fulcrum of said lever, the spring F, bearing on the short arm of said lever, and the casing N for protecting these parts and provided with shoulders N^2 and having the opening Q, through which the empty magazine may fall, all substantially as shown and described.



407,239. COPY-HOLDER. HENRY H. POTTER, Kingwood, W. Va. Filed Apr. 16, 1889. Serial No. 307,626. (No model.)

Claim.—1. The table C, having the stops *d'*, in combination with the clip D and the spring *d*, for drawing said clip against said table or against the heads of said stops, as and for the purpose described.

2. The table C and a clutch for moving it upwardly step by step, in combination with the stationary line-marker E, beneath which the table moves, substantially as described.

3. The rack B, transverse bar B' thereon, and forwardly-project-

407,239.

ing and slightly-converging spring-pins B^3 at each end of said bar, in combination with the vertically-movable table C and the line-marker E, having holes engaging said pins, as and for the purpose set forth.

4. The vertically-movable table C, in combination with the line-marker E, the arms *e*, carried by said marker and having eyes *e'*, and the elliptical glass rod F, supported in said eyes, as and for the purpose described.

5. The rack B, having grooves *b*, in combination with the table C, having tongues *c*, engaging said grooves, and with a clutch and lever for raising said table step by step, as described.

6. The table C and the rod G, carried thereby, in combination with the rack B, upon which said table slides, the guides B^3, connected to said rack, the clutch H, pivoted between said guides and normally engaging said rod to support said table, and a clutch and lever for raising the table by a step-by-step motion, substantially as described.

7. The table C, rod G, carried thereby, the rack B, upon which said table slides, and the clutch H, pivoted in said rack and normally engaging said rod to support the table, in combination with the second clutch I, engaging said rod, the arm J, to which said second clutch is pivoted, and a handle connected to the lower end of said arm for raising it intermittently, as and for the purpose set forth.

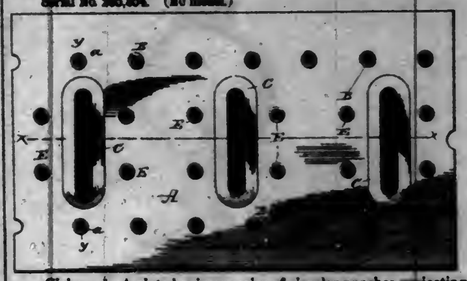
8. The table C, rod G, carried thereby, the rack B, upon which said table slides, the upright parallel guides B^3, connected to said rack, and the clutch H, pivoted between the upper ends of said guides and normally engaging said rod to support said table, in combination with the second clutch I, engaging said rod, the arm J, sliding between said guides, and to the upper end of which said second clutch is pivoted, the transverse shaft L, lever *k*, keyed thereon and pivoted at its free end to the lower end of said arm J, the handle O, keyed to said shaft, and a stop for limiting the movement of said handle, substantially as described.

9. The rod G and a table carried thereby, the rack B, and the clutch H, pivoted in said rack and normally engaging said rod, in combination with the second clutch I, engaging said rod G below the clutch H and carrying a pin *i* in its upper face, and an arm and lever for reciprocating said second clutch slightly to raise said rod and table or lifting it considerably to force the pin *i* against the clutch H and trip both clutches, as and for the purpose set forth.

10. The base A, lug Q thereon, having a pin *q*, thumb-screw R in said lug, and slotted stop S on said thumb-screw, in combination with the shaft L, journaled in said base, and a handle keyed to said shaft, said handle having an extension P', adapted to operate between said pin *q* and stop S, as and for the purpose described.

11. The base A and stops carried thereby, in combination with the shaft L, journaled in said base, the collar M on said shaft, carrying the arm N, and a handle removably secured to said arm, said handle having an extension P', adapted to operate between said stops, substantially as described.

12. The shaft L, the collar M thereon, the arm N, carried by said collar, and the handle O, removably secured to said arm, in combination with the supplemental handle P, centrally pivoted beneath said handle O, having a hole *p*, receiving the end of said shaft, and also having an extension P', for the purpose set forth, and with a spring *o*, carried by said handle O and normally pressing said supplemental handle P against said collar M, substantially as described.



407,240. PHOSPHATIC FERTILIZER. NATHANIEL R. POTTER, New York, N. Y., assignor to John Orrett, Kingston, Jamaica, West Indies. Filed Mar. 2, 1888. Serial No. 265,989. (No specimens.)

Claim.—A dry granular compound for fertilizers, composed of phosphatic rock or earth containing over ten per cent. of alumina or iron, sulphuric acid, and tank-water containing about twenty per cent. of animal matter, combined substantially in the proportions set forth.

407,241. PHOSPHATIC FERTILIZER. NATHANIEL R. POTTER, New York, N. Y., assignor to John Orrett, Kingston, Jamaica, West Indies. Filed Aug. 20, 1888. Serial No. 283,220. (Specimens.)

Claim.—The dry fertilizing composition herein described, composed of phosphatic guano or rock from the Cayman Islands, water containing about fifty per cent. of animal matter in excess of sulphuric acid, and sulphate of lime, combined substantially in the proportions set forth.

407,242. PUNCH. JOHN R. GUTHS, Toledo, Ohio. Filed Jan. 9, 1889. Serial No. 295,854. (No model.)

Claim.—1. A plate having a series of circular punches projecting from one face thereof near each longitudinal edge, and a series of elongated punches also projecting from said plate intermediate of the two series of circular punches, substantially as set forth.

2. A plate having a series of circular punches projecting from one face thereof near each longitudinal edge, a series of elongated punches located within the space between the two rows of punches, and series of circular punches located between and outside of the elongated punches, substantially as set forth.

407,248. STEM WINDING AND SETTING WATCH. HENRY RENFF, Houtzdale, Pa. Filed Nov. 21, 1888. Serial No. 291,611. (No model.)

Claim.—1. In a stem setting and winding watch, the combination, with the yoke, the winding and setting mechanism carried by the yoke, and the spring J, of the lever L, pivoted midway of its ends, the lower end being extended laterally and engaging with the said lever, the spring K, stronger than the spring J, pressing on the lower end of the lever L, and the stem to depress the upper end of the lever L, substantially as and for the purpose described.

2. In a stem setting and winding watch, the combination, with the yoke having a vertical arm and the winding and setting mechanism carried by the yoke, of the lever L, pivoted midway of its ends and having its lower end extended laterally and engaging with the said vertical arm, the spring K, and the stem, substantially as described.

3. In a stem setting and winding watch, the combination of the plates A and B, the pinion D, the block C, the yoke having a vertical arm, the winding and setting mechanism carried by the yoke, the spring J, bearing on one end of the yoke, the lever L, having its lower end extended through an opening in the plate A and engaging with the said vertical arm, the spring K, stronger than the spring J, bearing on the lever L, the stem E, and the sleeve *n* on the lower end of the said stem E, substantially as and for the purpose described.

407,244. CORN AND CANE HARVESTER. RICHARD B. ROGERS, Adrian, Mich. Filed May 12, 1888. Serial No. 273,602. (No model.)

Claim.—1. In a corn and cane harvester, the combination, with a main frame, a receiving-table secured on said frame, a stalk-cutter secured to and projecting in front of the receiving-table, an axle mounted in bearings on the frame, suitable wheels mounted on said axle, and a clutch connecting one of said wheels with the axle, of an upright hollow shaft mounted in suitable bearings and located to one side of and back of the cutter, and having a bevel-gear on its lower end engaging with a bevel-gear rigidly mounted on the axle, a telescopic extension mounted in the hollow shaft and provided with a double crank on its upper end, gathering-arms pivotally secured to said double crank, a suitable guide in which said arms rock, and a set-screw mounted in the upright hollow shaft and adapted to engage with the telescopic extension and secure it to the hollow shaft at any desired vertical adjustment, all constructed, arranged, and operating substantially as shown and described, whereby the forward ends of the gathering-arms will have an elliptical movement, passing alternately in front of and back over the cutter.

2. In a corn and cane harvester, the combination, with a main frame, a receiving-table secured on said frame, a stalk-cutter secured on and projecting in front of said receiving-table, an axle B, mounted in bearings on the frame, wheels C C, mounted on the axle, and a clutch D, connecting one of said wheels with said axle, of an upright hollow shaft H, mounted in suitable bearings and located to one side of and back of the cutter, and having a bevel-gear I on its lower end engaging with a bevel-gear I', rigidly mounted on the axle, a telescopic extension H', mounted in the hollow shaft and provided with a double crank on its upper end, a set-screw A, mounted in the hollow shaft and adapted to engage with the telescopic extension and secure it to said hollow shaft at the desired vertical adjustment, gathering-arms K K, pivotally secured to the double crank and working in a guide H^3, a short upright shaft L, mounted in a bearing in the receiving-table located back of and on the opposite side of the cutter from the shaft H, and having a double crank on its upper end and a bevel-gear L' on its lower end engaging with a bevel-gear L^2, rigidly mounted on the axle, and arms M M, pivotally secured to said double crank and working in a guide *d'*, all constructed, arranged, and operating substantially as shown and described.

3. In a corn and cane harvester, the combination, with a main frame, an elevated rectangular frame A, secured on suitable uprights, a receiving-table secured on said main frame to one side of and below the elevated frame, a cutter mounted on and projecting in front of the receiving-table, a bar 15, secured to suitable uprights on the outer side of the receiving-table, said bar being parallel with the inner side of the elevated frame and extending back of the receiving-table, and having inwardly and downwardly projecting fingers N formed on its extended portion, of a shaft O, mounted in bearings formed on the inner side of the elevated frame and extending back of said elevated frame parallel with the bar 15, and having two oppositely-disposed sets of curved fingers P P, secured to its extended portion, a ratchet *s'*, rigidly mounted on said shaft O, a foot-lever R, having a pawl *r*, adapted to engage with the ratchet and alternately hold the oppositely-disposed sets of fingers P P in position to co-operate with the fingers N to receive the stalks, all constructed, arranged, and operating substantially as shown and described.

4. In a corn and cane harvester, a main frame, a cutter comprising two blades secured to and projecting in front of the frame so as to leave a space between the blades, said blades having diagonal cutting-edges converging inwardly toward each other, and a transverse blade connecting the inner ends of the projecting blades and adjustably secured thereto, whereby its cutting-edge may be adjusted at different angles to the cutting-edges of said projecting blades, substantially as shown and described.

407,245. ABRADING-COVERING FOR BUFFERS. ANDREW W. ROGERS, Beverly, Mass., assignor to Sidney W. Winslow, trustee, same place. Filed Dec. 7, 1888. Serial No. 292,985. (No model.)

Claim.—1. In combination with the foot of a buffer, an abrading-covering for said foot, having a practically stiff margin extending beyond the margin of the said foot and a non-abrading edge, substantially as described.

2. In combination with the foot of a buffer, an abrading-covering for said foot, said covering having a continuous working-face, a practically stiff margin extending beyond the margin of the foot, and a non-abrading edge, substantially as described.

3. In combination with the yielding foot of a buffer, an abrading-covering loosely mounted on the flexible foot and extending beyond the margin of the foot, substantially as described.

4. A detachable abrading-covering for buffers, having its connection to hold it to the foot attached directly to the inner face of said covering, substantially as described.

5. An abrading-covering for the foot of a buffer, combined with connections attached to its inner face, between the margin and the center thereof, for connecting it to the foot, substantially as described.

6. An abrading-cover for buffers, having its flexible connections to hold it to the foot attached directly to the inner face of said covering, substantially as described.

7. In combination with the abrading-covering provided with connections on its inner face, a foot having notches or holes to receive the connections, substantially as described.

8. An abrading-covering for buffers, having a re-enforcement on its inner face and connections for holding it to the foot integral with said re-enforcement, substantially as described.

9. An abrading-covering for buffers, having an annular re-enforcing strip secured upon the inner face at the margin and immediately adjacent thereto, substantially as described.

10. An abrading-covering for buffers, having a marginal re-enforcement on its inner face, with connecting-tongues formed on the inner edge of said re-enforcement, combined with the foot having notches or holes, substantially as described.

11. An abrading-covering for buffers, combined with a buffer-foot and holding-connections between the cover and the foot, the said holding-connections being arranged circumferentially to draw obliquely to the surface of the cover and in line with the rotation of the foot, substantially as described.

407,246. BUFFER. ANDREW W. ROGERS, Beverly, Mass., assignor to Sidney W. Winslow, trustee, same place. Filed Dec. 7, 1888. Serial No. 292,984. (No model.)

Claim.—1. In combination with the foot of a buffer, an abrading-covering for said foot, having a practically stiff margin extending beyond the margin of the said foot and a non-abrading edge, substantially as described.

2. In combination with the foot of a buffer, an abrading-covering for said foot, said covering having a continuous working-face, a practically stiff margin extending beyond the margin of the foot, and a non-abrading edge, substantially as described.

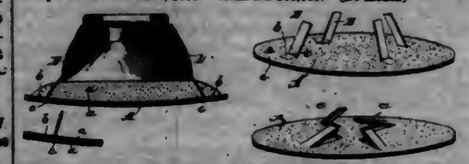
3. In combination with the yielding foot of a buffer, an abrading-covering loosely mounted on the flexible foot and extending beyond the margin of the foot, substantially as described.

4. A detachable abrading-covering for buffers, having its connection to hold it to the foot attached directly to the inner face of said covering, substantially as described.

5. An abrading-covering for the foot of a buffer, combined with connections attached to its inner face, between the margin and the center thereof, for connecting it to the foot, substantially as described.

6. An abrading-cover for buffers, having its flexible connections to hold it to the foot attached directly to the inner face of said covering, substantially as described.

7. In combination with the abrading-covering provided with connections on its inner face, a foot having notches or holes to receive the connections, substantially as described.



8. An abrading-covering for buffers, having a re-enforcement on its inner face and connections for holding it to the foot integral with said re-enforcement, substantially as described.

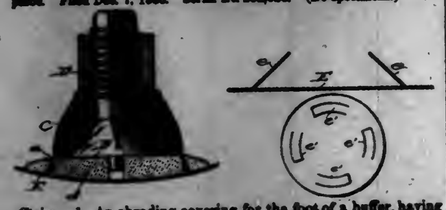
9. An abrading-covering for buffers, having an annular re-enforcing strip secured upon the inner face at the margin and immediately adjacent thereto, substantially as described.

10. An abrading-covering for buffers, having a marginal re-enforcement on its inner face, with connecting-tongues formed on the inner edge of said re-enforcement, combined with the foot having notches or holes, substantially as described.

11. An abrading-covering for buffers, combined with a buffer-foot and holding-connections between the cover and the foot, the said holding-connections being arranged circumferentially to draw obliquely to the surface of the cover and in line with the rotation of the foot, substantially as described.

407,247. ABRADING-COVERING FOR BUFFERS. ANDREW W. ROGERS, Beverly, Mass., assignor to Sidney W. Winslow, trustee, same place. Filed Dec. 7, 1888. Serial No. 292,985. (No model.)

Claim.—1. A reversible abrading-covering for buffers, consisting of a flexible disk of concave-convex form, and abrading material on both sides of said disk, combined with reversible connections attached to said cover for holding it to the foot of the buffer, substantially as described.



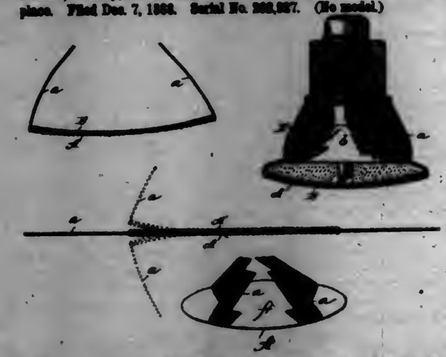
2. A reversible abrading-covering for buffers, composed of two disks of abrading material placed back to back and having slits in each disk, in combination with fastening devices adapted to the slits in the disk, substantially as described.

3. A reversible abrading-covering for buffers, composed of two disks of abrading-covering placed back to back and having slits in each disk, combined with the stiff strips B, having bent lower ends adapted to the slits in the disk, substantially as described.

4. The combination of a buffer-foot, a double-faced reversible cover supported removably on said foot, and holding connections between the cover and foot, substantially as described.

5. A reversible abrading-covering for buffers, consisting of a disk composed of two sheets placed back to back, with abrading material on the outer face of each, combined with the reversible connecting devices for holding it to the foot of the buffer, substantially as described.

407,248. ABRADING-COVERING FOR BUFFERS. ANDREW W. ROGERS, Beverly, Mass., assignor to Sidney W. Winslow, trustee, same place. Filed Dec. 7, 1888. Serial No. 292,926. (No specimens.)

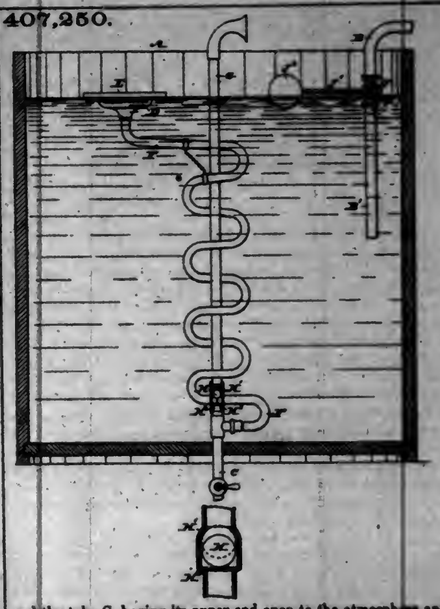


Claim.—1. An abrading-covering for the foot of a buffer, having projections by which it is attached, formed of tongues cut out from the material of the covering within the margin thereof, substantially as described.

2. A reversible abrading-covering having the abrading-surfaces with the projecting connections by which it is attached formed of tongues cut out of the material of the covering itself within the margin thereof, substantially as described.

3. An abrading-covering for the foot of a buffer, having projecting connections by which it is attached formed of tongues cut circumferentially out of the material of the covering itself, whereby the connection is less liable to be torn from the body of the covering, substantially as described.

407,249. ABRADING-COVERING FOR BUFFERS. ANDREW W. ROGERS, Beverly, Mass., assignor to Sidney W. Winslow, trustee, same place. Filed Dec. 7, 1888. Serial No. 292,927. (No model.)



Claim.—1. An abrading-covering for buffers, consisting of a disk having an abrading-surface and non-abrading edges and flexible non-abrading connecting-strips secured to the inner face with the free ends projecting outward, substantially as described.

2. An abrading-covering for buffers, consisting of a disk having an abrading-surface and non-abrading edge, a re-enforcement on its inner face at or near the edge, and flexible non-abrading connecting-strips secured to the inner face between the abrading-disk and the re-enforcement with the free ends extending outward, substantially as described.

407,250. APPARATUS FOR PURIFYING WATER. HENRY ROEMER, Philadelphia, Pa. Filed Jan. 28, 1887. Renewed June 15, 1889. Serial No. 314,240. (No model.)

Claim.—1. A tank for aerating water, having the supply-pipe B, the float E, with strainer D secured thereto, the discharge-pipe C, the flexible pipe F, connected to said strainer and to the discharge-pipe,

407,250.

and the tube G, having its upper end open to the atmosphere and its lower end connected with the discharge-pipe, all of said parts combined substantially as and for the purpose set forth.

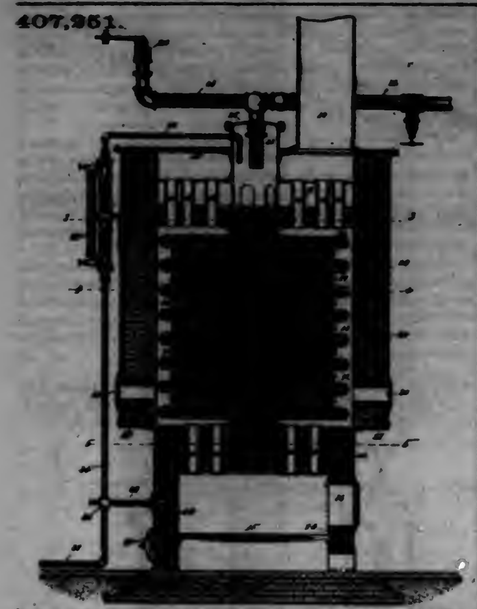
2. A tank having a supply-pipe and a discharge-pipe, the latter passing within the tank, an air-tube connected at its lower end to the discharge-pipe within the tube, and a strainer with a flexible tube, the latter connected to the discharge-pipe below the connection of the air-tube and within the tank, substantially as described.

3. The tank A, in combination with the supply-pipe B, the discharge-pipe C, the floating strainer D, the flexible pipe F, connecting said strainer with said discharge-pipe, and the tube G, open at its upper end to the atmosphere, and at its lower end connected to the discharge-pipe above the connection of the pipe F, and provided with the automatic valve H, all substantially as described.

4. The tank A, with automatic supply-pipe B, having its lower end below the water-level, the floating strainer D, with flexible pipe F, the discharge-pipe C, with cock, and the air-tube G, leading into said discharge-pipe and provided with perforated automatic valve H, all substantially as and for the purpose set forth.

407,251. STEAM-BOILER. PHILIP ROEHM, St. Louis, Mo., assignor of one-half to Erskine L. Babcock, Cuyahoga Falls, Ohio. Filed Feb. 4, 1889. Serial No. 298,662. (No model.)

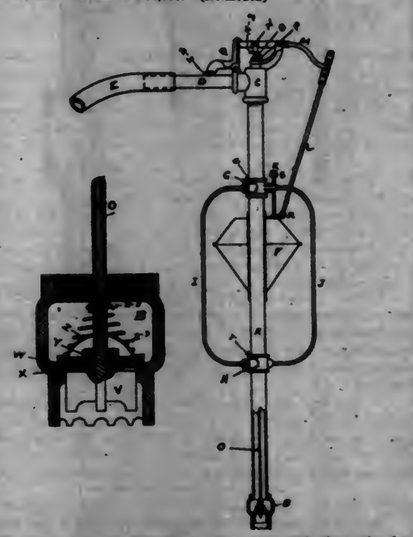
Claim.—1. The combination, in a boiler, of a main part or trunk, one or more series of radial pipes 11 extending therefrom, a drum between the source of heat and said pipes communicating with said main part to act as a shield for said radial pipes, and fire-tubes 13 passing therethrough.



2. The combination, in a boiler, of a main part or trunk, a drum communicating with said main part adjacent to the source of heat, a second drum communicating with said main part remote from said source of heat, and several series of pipes, as 11, extending from said main part and located in the space between the two drums, for the purpose described.

3. The combination, to form a boiler, of the main part 10, the drum 12, communicating therewith, having fire-tubes 13 passing through the same, the upper drum 17, also communicating with said main part 10 and having fire-tubes 18 passing through it, and several series of radial pipes 11, extending from said main part 10 between said drums.

4. The combination, to form a boiler, of the main part 10, vertically arranged, the water-drum 12, communicating with the same, having fire-tubes 13 extending therethrough, the water-leg 14, opening into said drum, the grate 15 adjacent to the aforesaid drum and water-leg, the radial pipes 11, extending from said main part 10, a second drum 17 above said pipes communicating with the main part 10, having fire-tubes 18 passing therethrough, a top 20, smoke-stack 19, and steam-connections, as set forth.



5. The combination, in a boiler, of a main part, a horizontally-disposed drum communicating therewith adjacent to the source of

407,251.

heat, a water-leg 14, opening into said drum, a casing for said boiler, and a flange 27, extending from said drum for supporting said casing.

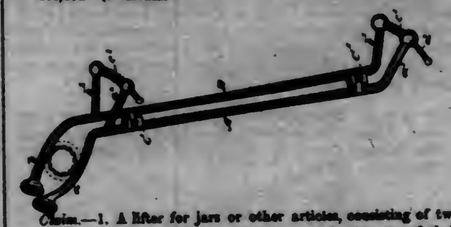
407,252. CAN-FILLER. EDWARD C. SAMA, Columbus, Ga. Filed Oct. 20, 1888. Serial No. 288,089. (No model.)

Claim.—1. In a can-filler, the combination, with the main pipe, the valve in the lower end thereof, and its valve-stem, of the vertically-sliding float on the main pipe, a suitably-fulcrumed valve-lever pivoted to the upper end of the valve-stem, a latch arranged to engage one end of this lever, the connecting-rod between its other end and the float, and the guides for the pipe adapted to enter opposite corners of the can, and thus support said pipe in an upright position, all substantially as described.

2. In combination with the main pipe of a can-filler, the guide-rods I J and their upper and lower collars G H, which collars are movable on said main pipe, substantially as described.

3. The combination of the main pipe, its valve and valve-stem, the vertically-sliding float on the main pipe, the guides for the pipe adapted to enter opposite corners of the can, and thus support said pipe in an upright position, the step on the float connected to these guides, the lever pivoted to the upper end of the valve-rod, the latch engaging the same, and the rod connecting the lever with the float, substantially as described.

4. In combination with the main pipe of a can-filler, the hose for supplying it, the valve and valve-stem in the main pipe, the sliding float on the main pipe, the valve-lever pivoted to the valve-stem, the spring-latch engaging the valve-lever, the connecting-rod between the valve-lever and the float, and the guide-rods connected adjustably to the main pipe and adapted to enter corners of the can to support the same in an upright position, substantially as and for the purpose described.

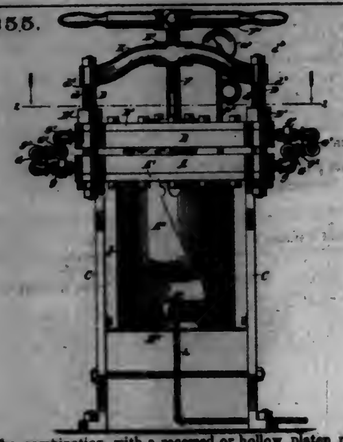


5. The combination of the valve and the valve-stem, having at its lower end a spring holding valve in position and allowing for unequal expansion without opening the valve, substantially as described.

407,253. FUNNEL. CHARLES F. SAUTTER, Brooklyn, N. Y. Filed Oct. 27, 1888. Serial No. 289,249. (No model.)

Claim.—As a new article of manufacture, a funnel having a spout adapted to enter the mouth of a bottle and its bell open at the top and provided with a continuous spiral groove terminating at its lower end in the spout for holding a hollow conical filtering fabric from contact with the internal surface of the bell, all in such manner that the filtrate which passes outwardly through the filter from the interior thereof enters the groove and forms a stream that increases in volume as it descends to exert a suction on the unfiltered liquid in the conical filter to promote the filtering action, substantially as described.

407,254. LIFTER FOR JARS, BOTTLES, OR OTHER ARTICLES. CHARLES F. SAUTTER, Brooklyn, N. Y. Filed Dec. 13, 1888. Serial No. 293,444. (No model.)



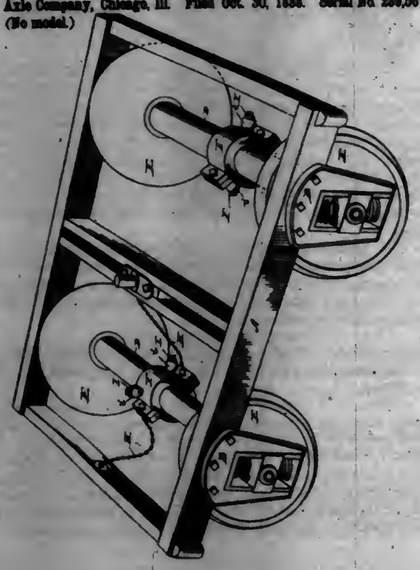
Claim.—1. A lifter for jars or other articles, consisting of two rods A B, arranged parallel to each other and having one of their extremities bent substantially at right angles to their bodies to form two jaws *a b*, and their other extremities bent substantially at right angles to their bodies in an opposite direction to the jaws to form two handles *a' b'*, a hinge-joint connecting the parallel rods adjacent to the jaws, a hinge-joint connecting the parallel rods adjacent to the handles, and a spring acting to bodily turn the parallel rods on their two hinge-joints in a direction toward each other, substantially as described.

2. A lifter for jars, bottles, or other articles, composed of two jointed spring-actuated rods, each rod being provided with two handles extending at right angles from its body, and with a jaw which extends at an angle from its body in an opposite direction to the handles, substantially as described.

407,255. APPARATUS FOR VULCANIZING RUBBER. LOUIS E. SEXTRUM, Chicago, Ill. Filed Sept. 3, 1888. Serial No. 284,603. (No model.)

Claim.—1. A press for the purpose set forth, comprising a stationary platen the lower wall of which is provided with a depending water-receptacle in communication with the hollow interior of the platen, a second hollow movable platen or follower the interior of which is in communication with the platen first mentioned, stationary guides for the movable platen, and mechanism operating independently of the steam-pressure within the platen for forcing the movable platen toward the stationary platen, substantially as described.

407,255.



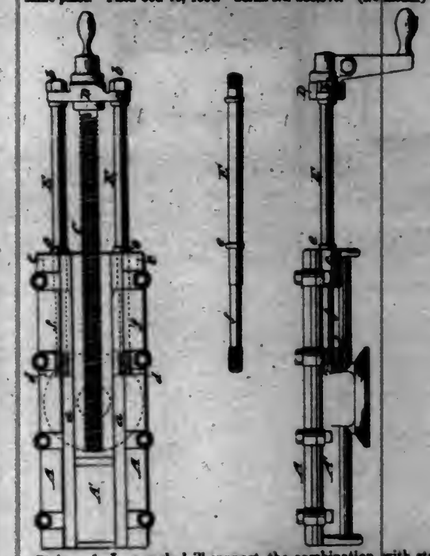
2. The combination, with a recessed or hollow platen provided with a depending water-receptacle in communication with the recess thereof and forming a steam-generator, of a superposed movable platen having steam connection with the first platen, mechanism independent of the steam-pressure for moving said platen, supporting legs or standards attached to the lower platen, and a burner sustained upon said legs or standards beneath the water-receptacle of the lower platen, substantially as described.

3. The combination, with a platen and movable follower, of screw-threaded posts secured to the platen, a yoke connected with said posts, a screw-threaded shaft engaging said yoke and acting upon the follower or upper platen, and nuts placed upon said posts above the follower, said posts, yoke, screw-shaft, and follower being connected with each other by means affording lost motion between the follower and posts, substantially as described.

4. The combination, with the recessed platen and recessed follower and a steam-generator communicating with the recesses of said platen and follower, of top and side walls located over the said follower and forming with the top of the latter a drying-oven, substantially as described.

5. The combination, with the hollow platen A and follower or platen B, of the posts D D, nuts D' D' thereon, a horizontal plate K, located above the follower, tubular posts *k' k'*, surrounding the posts D D, and walls *k k*, located between the said follower and the plate K, said plate and walls forming with the follower a drying-oven, substantially as described.

407,256. SELF-LUBRICATING CAR-AXLE. FREDERICK J. SEYMOUR, Findlay, Ohio, assignor to the Automatic Lubricating Tubular Axle Company, Chicago, Ill. Filed Oct. 30, 1888. Serial No. 289,567. (No model.)



Claim.—1. In a compound car-axle, the combination of a central axle-body adapted to form the journals, and two hollow sleeves exterior to the central axle, to which the wheels are rigidly secured, said sleeves terminating at the outer sides of the wheels and adapted for independent rotation, and said axle provided with a central flange, against which said sleeve-sections abut at their inner ends, substantially as described.

2. The combination, in a car-axle, of an inner axle-body extended to form the journals, of two exterior sleeve-sections, to which the respective wheels are rigidly secured, said axle having a central flange or collar, and said sleeves having on their inner ends flanges abutting against said collar and being adapted for independent rotation, and a divided clamp adapted to prevent endwise movement of the wheels on the axle, substantially as described.

3. A compound car-axle, comprising in construction an inner axle-body and exterior sleeve-sections, to which the wheels are secured, said inner axle having a central flange or collar, and said sleeve-sections having flanges abutting the central collar, and a central clamp adapted to secure the sleeve-sections in place and provided with a lubricator, substantially as described.

407,257. ROCK-DRILL SUPPORT. HENRY C. SERGEANT, New York, N. Y., assignor to the Ingersoll-Sergeant Rock Drill Company, same place. Filed Oct. 19, 1888. Serial No. 288,576. (No model.)

Claim.—1. In a rock-drill support, the combination, with standards, of bearings upon the support receiving said standards, certain of said bearings being inward of the others, so that spaces will be left between them, the standards having a screw-threaded engagement with the inner of said bearings, substantially as and for the purpose herein described.

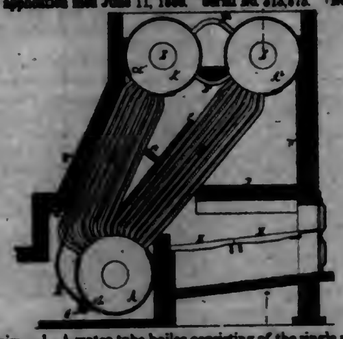
2. In a rock-drill support, the combination, with standards, of bearings on the support receiving said standards, certain of said bearings being inward of the others, so that spaces will be left between them, the portions of the standards between said bearings being reduced in diameter, substantially as and for the purpose herein described.

407,258. DIRECT-ACTING ENGINE. HENRY C. SERGEANT, New York, N. Y., assignor to the Ingersoll-Sergeant Rock Drill Company, same place. Filed Oct. 19, 1888. Serial No. 288,582. (No model.)

Claim.—1. The combination, with an oscillating valve provided with tappets and a passage whereby steam is received at one of its ends and two passages by which steam is discharged at the other of its ends, of a cylinder in which said valve is partly arranged, a cap removably secured to the cylinder and provided with an arc-shaped seat for the valve, passages within the said cap for conveying steam or other fluid to and from the cylinder and adapted to be brought alternately into communication with the passages in the valve, and stops for the tappets of the valve upon said cap, substantially as specified.

2. The combination, with a cylinder, of a cylindric valve arranged in said cylinder so as to be oscillated therein, and provided with a passage whereby steam is received at one end of the valve and two passages by which steam is ejected at the other end of the valve, oppositely-arranged tappets upon the valve, a piston within the cylinder having oppositely-extending inclined surfaces inward of its heads and a straight portion intermediate of the inclined surfaces of less diameter than the said heads, and a cap removably secured to said cylinder and provided with passages for conveying steam behind the heads of the piston and with a seat for the valve, substantially as specified.

3. The combination, with a cylinder, of a cylindric oscillating valve arranged with its axis transverse to the axis of the cylinder and adapted to receive steam or other fluid at one end and eject it from the other end, a cap removably secured to said cylinder and provided with steam-passages adapted to communicate with the said valve, said valve having bearings at its ends, whereby leakage is prevented from the supply to the exhaust, oppositely-arranged tappets on the valve, and a piston within the cylinder provided with inclined surfaces adapted to contact with said tappets during the movements of the piston, substantially as specified.



407,259. PLOW. CLARENCE C. SMALLEY, Manitowoc, Wis. Filed Mar. 30, 1889. Serial No. 305,267. (No model.)

Claim.—1. The combination, with the landside and mold-board and the transverse brace connecting the same, of the handles pivotally connected at their forward ends with the said brace, and the braces G, pivotally connected at their forward ends with the plow-beam and at their rear ends slotted and adjustably connected with the handles near the rear ends of the latter, substantially as and for the purpose specified.

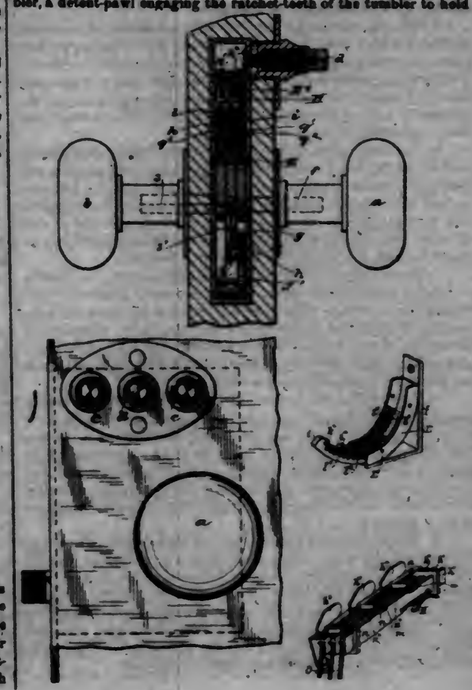
2. In a plow, the combination, with the landside and mold-board and transverse brace, of the handles pivoted to the brace at their forward ends, the cross-piece E, connecting the handles near their rear ends, the braces G, pivotally connected at their forward ends to the plow-beam and slotted at their rear ends, and the transverse bolt F, passed through the piece E and through the slots of the braces G, and provided with the nut *g*, substantially as shown and described.

407,260. STEAM-BOILER. ALLAN STIRLING, New York, N. Y., assignor to the International Boiler Company, (Limited,) same place. Original application filed Feb. 24, 1889, Serial No. 301,437. Divided and this application filed June 11, 1889. Serial No. 313,573. (No model.)

Claim.—1. A water-tube boiler consisting of the single mud-drum A, the two elevated steam and water drums A' A', the water-tubes B', connecting the water-spaces of the steam and water drums, the steam-tubes B², connecting the steam-spaces of said steam and water drums, and two sets of water-tubes B B, directly connected, respectively, at their upper ends with the steam and water drums and both sets connected at their lower ends with the single mud-drum, substantially as described.

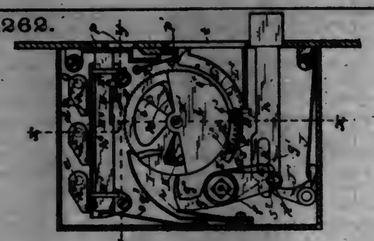
2. A water-tube boiler consisting of a furnace structure, a single mud-drum A, the two elevated steam and water drums A' A', having their steam and water spaces respectively placed in communication, two sets of water-tubes B B, directly connected, respectively, at their upper ends with the steam and water drums and both sets connected at their lower ends with the single mud-drum, the fire-brick arch D, extending over the fire-place from the wall of the furnace structure to the front set of water-tubes, and the fire-brick partition C, inclined between the two sets of water-tubes and located between the single mud-drum and the two steam and water drums, substantially as described.

407,261. HAT BRUSH AND PAD. MARTIN J. SUMMERLIN, Watkins, N. Y. Filed Aug. 22, 1888. Serial No. 283,549. (No model.)



Claim.—1. In an elastic pad or brush, the combination of a flexible back and a flexible brushing-face secured together, and an interposed stiffening-sheet extending entirely across the width of the brush and through the main portion of its length, whereby the main portion of the brush will remain stiff, and the rest of the brush may be curved or flexed, as and for the purpose set forth.

2. The combination, in an elastic brush, of the pliable back and brushing-face secured together, a transverse spring interposed between the same, and metallic clamps *c c*, clasping the side edges of the brush and the ends of the said transverse spring, whereby the spring will be firmly held in place and all the parts securely bound together, substantially as described.



3. In a brush, the combination of the brushing-face and back-piece, the interposed transverse spring covered with impervious material, the interposed stiffening-sheet extending entirely across the brush and to within a short distance from the ends of the brush, and the metallic clamps clasped over the edges of the brush, so as to hold all the parts securely together.

407,262. COMBINATION-LOCK. JAMES F. THOMPSON, Chicago, Ill. Filed Feb. 27, 1888. Serial No. 265,260. (Model.)

Claim.—1. The combination, with the bolt and knob-spindle, of a notched tumbler mounted on a pivot parallel with the axis of the knob-spindle and provided with ratchet-teeth, an arm or projection upon the said knob-spindle adapted to engage the notch in the tumbler, a detent-pawl engaging the ratchet-teeth of the tumbler to hold

407,262.

the same from backward movement, and an actuating-pawl acting upon said tumbler to move the latter, substantially as described.

2. The combination, with the bolt and knob-spindle, of a plurality of tumblers controlling the movement of the bolt, said tumblers being provided with ratchet-teeth, slides moving in planes parallel with the tumblers, actuating-pawls mounted upon said slides, push-pins, and bell-crank levers connecting said push-pins with the said slides, substantially as described.

3. The combination, with the bolt and knob-spindle, of a tumbler provided with ratchet-teeth, a detent-pawl engaging the teeth of the tumbler to hold the same from backward movement, an actuating-pawl acting upon said tumbler to move the same, and a part actuated by the knob-spindle when the latter is turned backward, constructed to engage and move the said detent-pawl for releasing the tumbler, substantially as described.

4. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, an arm or projection upon the said knob-spindle adapted to engage the notch of the tumbler, a detent-pawl engaging the tumbler, and an actuating-pawl acting on the tumbler to move the same, said arm or projection upon the knob-spindle being constructed to engage and move the detent-pawl when the spindle is turned backwardly, substantially as described.

5. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, a detent-pawl engaging the said ratchet-teeth, an actuating-pawl acting upon said tumbler to move the same, and a stop adjustably mounted on the lock-frame and adapted to engage the said tumbler, substantially as described.

6. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, a detent-pawl, an actuating-pawl acting upon said tumbler to move the same, a curved strip provided with a projection forming a stop for the tumbler, a curved guide supporting said strip, and means for adjustably securing said strip to the said guide, substantially as described.

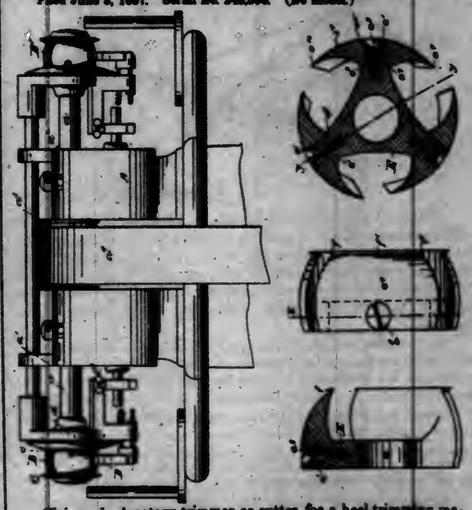
7. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, a detent-pawl engaging the said teeth, an actuating-pawl also engaging the ratchet-teeth for moving the tumbler, a part actuated by the spindle constructed to engage and move the detent-pawl, and a locking-detent adapted to engage the tumbler for holding the same in position to allow the actuation of the bolt, substantially as described.

8. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, an actuating-pawl engaging and moving the tumbler, a part actuated by the spindle engaging and moving said detent-pawl, a spring locking-detent engaging the tumbler to hold the same from movement, and an exposed movable part or slide upon the lock-frame constructed to thrust the locking-detent into engagement with the tumbler, substantially as described.

9. The combination, with the bolt and knob-spindle, of a plurality of notched tumblers provided with ratchet-teeth, adjustable stops limiting the movement of the tumblers, detent-pawls for holding the tumblers from backward movement, actuating-pawls engaging and moving the tumblers, slide-bars carrying said actuating-pawls, push-pins, and bell-crank levers transmitting motion from said push-pins to the slide-bars, substantially as described.

10. The combination, with the bolt and knob-spindle, of a tumbler provided with ratchet-teeth, a detent-pawl engaging the teeth of the tumbler to hold the same from backward movement, an actuating-pawl acting upon said tumbler to move the same, a part actuated by the knob-spindle in the backward movement of the latter constructed to engage said detent-pawl for releasing the tumbler, and a spring applied to resist such backward movement of the knob-spindle, substantially as described.

11. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, an arm or projection upon the said knob-spindle adapted to engage the notch of the tumbler, a detent-pawl engaging the tumbler, an actuating-pawl acting upon the tumbler to move the same, said arm or projection upon the spindle being constructed to engage and move the detent-pawl when the spindle is turned backwardly, and a spring applied to resist the backward turning of the spindle, substantially as described.



12. The combination, with the bolt and knob-spindle, of a plurality of tumblers controlling the movement of the bolt, said tumblers being provided with ratchet-teeth, slide-bars moving in planes parallel with the tumblers, actuating-pawls mounted upon said slide-bars, push-pins, and bell-crank levers, one or more of said slide-bars being provided with pins engaging the bell-crank levers, and a lateral arm or arms attached to one or more of said slide-bars to sustain the pins belonging thereto, substantially as described.

13. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, a detent-pawl engaging said ratchet-teeth, an actuating-pawl also engaging said ratchet-teeth, a slide-bar carrying said pawl, and a stationary part or arm located in position to engage the actuating-pawl and throw the same away from the tumbler in the backward movement of the said slide-bar and pawl, substantially as described.

14. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, a detent-pawl, a bodily-movable actuating-pawl, an exposed removable plate secured to the lock-frame, and a stop adjustably mounted on said removable plate and adapted to engage the tumbler, substantially as described.

15. The combination, with the bolt and knob-spindle, of a notched tumbler provided with ratchet-teeth, a detent-pawl, an actuating-pawl, an exposed removable plate attached to the lock-frame, a curved strip provided with a projection forming a stop for the tumbler, and a curved guide supporting the said strip, said curved guide being attached to said removable plate, substantially as described.

407,263. SOLE AND HEEL TRIMMER. CHARLES H. TRASK, Lynn, Mass., assignor to the Duplex Shoe Trimmer Company, Portland, Me. Filed June 3, 1887. Serial No. 240,208. (No model.)

Claim.—1. A rotary trimmer or cutter for a heel-trimming machine, having a blade or knife support and reversible shell blades or knives carried thereby, which are provided with two cutting-edges, each of which is adapted to be used in turn either for right cutting or for left cutting, substantially as described.

2. The combination of a block or support E for a rotary sole-edge trimmer or cutter with the shell blades or knives c^4, shaped substantially as specified, each of which has a cutting-edge c^9 and a cutting-edge c^{10}, attached to the said block or support in a manner, substantially as described, to permit them to be swung or moved thereon to bring each cutting-edge of the said knives or blades into operative position either for right or left trimming, substantially as described.

3. The combination of the block E, having the posts or studs d and the shaft-hole e, the blades c^4, having the cutting-edges c^9 c^{10}, and the locking-screws c^5, substantially as described.

4. The combination of the block E, having the shaft-hole e, the post f, and the shoulders c^6 c^7, the posts and shoulders being arranged in relation to the center of the block as specified, with the shell blades or knives c^4, having the cutting-edges c^9 c^{10}, and the fastening-screws c^5, substantially as described.

5. A rotary trimmer for a sole or heel edge trimming machine, having reversible blades provided with two cutting-edges concentrically secured to a holding-block, whereby the blades when occupying one position thereon present one trimming-edge, while the other trimming-edge is within the circle described by the operative trimming-edge, whereby upon the turning of the blades upon their supports the inoperative cutting-edge is brought into operative position and the first-named cutting-edge moved to a position within the circle which it formerly described, as and for the purposes specified.

6. A rotary trimmer for a heel and sole edge trimming machine, having a block E and a series of reversible blades c^4 secured thereto, one or more of which has the rand-trimmer f integral with it or them, substantially as described.

7. The shell blade or knife c^4, having the hole c^8, the shoulders c^6 c^7, and the cutting-edges c^9 c^{10}, substantially as described.

8. A shell blade or knife having the hole c^8, the shoulders c^6 c^7, and cutting-edges c^9 c^{10}, the extension f' upon one edge having the cutting-edge f, as and for the purposes described.

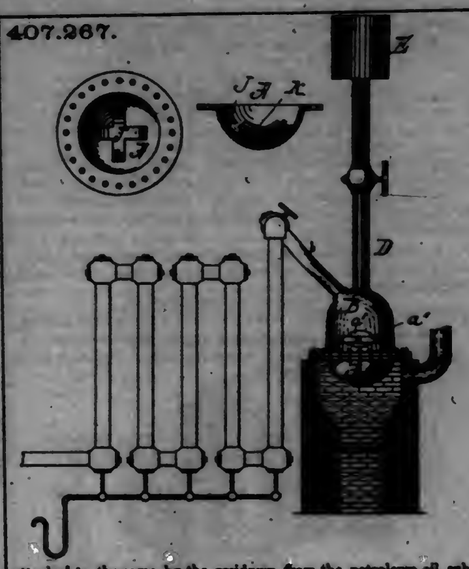
9. The combination, in a heel-trimming machine, of a shaft a, a right trimmer B, comprising a block or support E, and the reversible blades c^4, arranged to extend outwardly therefrom and supported at one end of the shaft a, the left trimmer B', comprising the block E and reversible blades c^4, which extend outwardly from it, and is supported upon the opposite end of the shaft a, a rand-guide C, top-lift rest and guide c, and a heel-rest D for each cutter, as and for the purposes described.

407,264. COMPOSITION FOR WATERPROOFING TEXTILE MATERIALS. JACOB WEST, New York, N. Y., assignor of one-half to Sigmund S. Hirschler, same place. Filed June 28, 1888. Serial No. 277,886. (No specimens.)

Claim.—A waterproofing composition consisting of glue, sugar of lead, alum, chloride of zinc, and water, as described.

407,265. COMPOSITION FOR WATERPROOFING TEXTILE MATERIALS. JACOB WEST, New York, N. Y., assignor of one-half to Sigmund S. Hirschler, same place. Filed June 28, 1888. Serial No. 278,000. (No specimens.)

Claim.—A waterproofing composition consisting of glue, sugar of lead, alum, and water, substantially as herein described.



407,266. WHEEL FOR VEHICLES. DARIUS S. WEST, Great Falls, Mont. Filed Apr. 10, 1889. Serial No. 306,694. (No model.)

Claim.—In a wheel for vehicles, the combination of the countersunk felloes, curved spokes having enlarged heads at their outer ends and bent at their inner ends to form right-angled elbows, the hub comprising a central threaded sleeve or thimble, a central disk having recesses alternating with one another on both sides, and two side disks having recesses on their inner sides registering, respectively, with the recesses on opposite sides of the outer disks or side disks, keys for locking said disks together, and the nut working upon the threaded end of the hub-thimble and adapted to force the several disks together laterally, substantially in the manner and for the purpose herein shown and set forth.

407,267. APPARATUS FOR GENERATING GAS FROM PETROLEUM-OIL. ARCHIE WEYER, Tallapoosa, Ga. Filed Jan. 12, 1889. Serial No. 296,602. (No model.)

Claim.—In an apparatus for generating gas from petroleum-oil, a retort having a false bottom J, said false bottom having a hook attached to its edge to be used in withdrawing said bottom from the retort, and the bricks K, carried by said false bottom adapted to be

407,267.

attached to the same by the residuum from the petroleum-oil, substantially as and for the purpose set forth.

407,268. LATCH. EDWIN R. WESTMACOTT, Westwich, County of Kent, England. Filed Dec. 17, 1888. Serial No. 293,286. (No model.) Patented in England July 5, 1884, No. 9,766.

Claim.—1. In a latch, the combination, with a latch-bolt having a projection thereon, of a block having a catch or pawl adapted to engage such projection on the bolt, and also having a projection q, a latch-spindle extending to the opposite side of the door, its weighted arm, and a striking-plate r, having a slot s and cam-surfaces t and u, substantially as and for the purposes described.

2. In a latch, the combination, with a latch-bolt having a projection k on its upper end and provided with a bore having an opening therein, a sliding block j, having a catch or pawl i, adapted to engage said projection k, and also having a projection q and a spindle k', fitting in the opening of the bolt and extending to the opposite side of the door, a bore through which said spindle passes, provided with teeth to engage the teeth of the rack f, the short spindle and its weighted arm, and a striking-plate r, having a slot s and cam-surfaces t u, all substantially as and for the purposes set forth.

407,269. STOP FOR PEDALS. SAMUEL T. WHITE, Brooklyn, N. Y. Filed Mar. 22, 1889. Serial No. 304,312. (No model.)

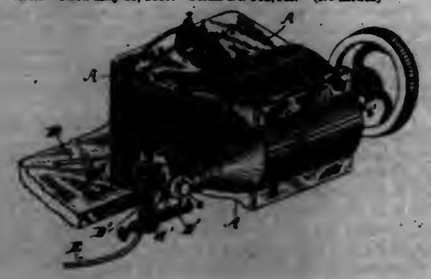
Claim.—1. The combination, with a pedal, of a stop for said pedal, and a releasing-pedal for said stop, substantially as described.

2. The combination, with a pedal, of a stop for said pedal, and a releasing-pedal connected to the stop by a bell-crank lever and link, substantially as described.

3. The combination, with a pedal, of a stop for said pedal, a pivot or joint about which said stop moves, and a releasing-pedal for said stop, substantially as described.

407,270. BUFFER. SIDNEY W. WINSLOW and FREEMAN H. WINSLOW, Beverly, Mass., administrators of Freeman Winslow, deceased, assignors to Sidney W. Winslow, trustee, same place. Filed Dec. 7, 1888. Serial No. 292,982. (No model.)

Claim.—1. An abrading-covering for boot or shoe buffers, the same consisting of a disk composed of a sheet of thin flexible material having an abrading-surface and a non-abrading edge, combined with connections for holding it to the foot, and the foot attached by said connections to the covering between the center and margin thereof, substantially as and for the purpose set forth.



2. As an article of manufacture, an abrading-covering for boot or shoe buffers, consisting of a disk composed of a sheet of thin flexible material having an abrading-surface and a non-abrading edge, attaching-connections, and countersinks between the center and margin of said covering adapted to receive the attaching-connections to hold it to the foot, substantially as described.

3. An abrading-covering for boot or shoe buffers, consisting of a disk composed of a sheet of thin flexible material molded with countersinks at intervals on its working-surface between the center and the margin, combined with a foot and connecting devices inserted through the countersinks in said covering and through the foot, substantially as described.

407,271. PLASTIC COMPOUND. ARTHUR T. WOODWARD, New York, N. Y. Filed Apr. 26, 1889. Serial No. 308,966. (No specimens.)

Claim.—The plastic compound herein described, composed of pulverized silica—such as flint, glass, or sand—and a mineral or vegetable resin or pitch mixed therewith, combined with sulphur, arsenic, and manganese, substantially as described, for the purpose specified.

407,272. ELECTRIC MOTOR. LEONIDAS G. WOOLLEY, Grand Rapids, Mich. Filed May 23, 1889. Serial No. 312,443. (No model.)

Claim.—1. In an electric motor, the field-magnet having its core constructed wider than the pole-pieces, whereby the centers of the armature and said core may be brought closer together and the distance through which the magnetic force must travel thus reduced, while the proper quantity of metal in said core is maintained, substantially as set forth.

2. An electric motor or dynamo in which the core of the field-magnet is wider than the pole-pieces, and in which that portion leading from said core to said pole-pieces tapers gradually, whereby the lines of magnetic force are concentrated instead of being broken or dispersed, substantially as set forth.

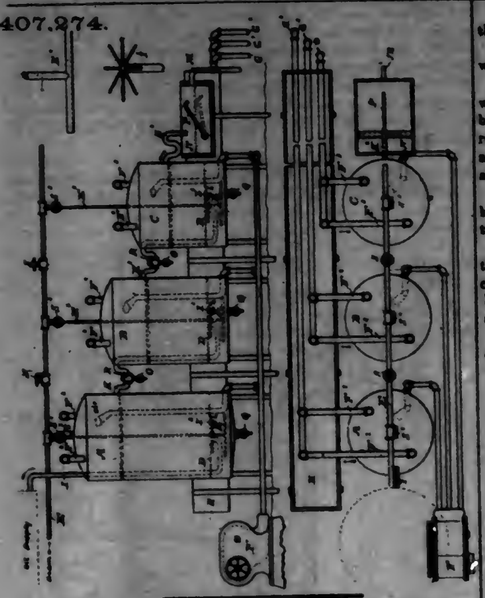
3. The combination, in a motor or dynamo, of a single cap composed of diamagnetic metal, and bearing-supports for the armature-shaft, secured to the ends of said cap, substantially as shown and described.

4. In a motor or dynamo, a single cap constructed cup-shaped, as described, in combination with the bearing-supports secured thereto, substantially as set forth.

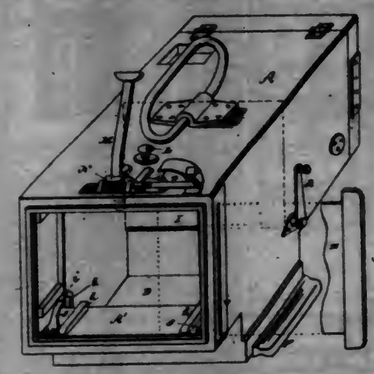
5. In a motor or dynamo, the combination, with the armature and its shaft, of a bearing-support having extended wings which also support the brush-holders, substantially as set forth.

6. An electric motor or dynamo in which the core of the field-magnet and the pole-pieces are cast in a single piece, said core being wider than said pole-pieces, and arranged to include the neutral part of the machine.

407,273. CULTIVATOR. ROBERT ALLSTATTER, Hamilton, Ohio, assignor to the Long & Allstatter Company, same place. Filed Mar. 25, 1889. Serial No. 304,762. (No model.)



Claim.—The combination, substantially as set forth, of a beam, a toothed shank pivoted thereto, so as to be capable of oscillating motion and a reciprocating motion with reference thereto, a latch-ment serving to hold the shank into normal position with reference to the beam and adapted to engage and disengage by the reciprocating motion of the shank upon the beam, and a spring acting between the beam and shank and arranged to resist the disengagement of the latchment and to resist the swinging back of the tooth-shank when the latchment is disengaged.



407,274. PROCESS OF PURIFYING AND DEVOLATILIZING PETROLEUM DISTILLATES. HENRY R. ASTON, Brooklyn, N. Y. Filed June 5, 1885. Renewed Sept. 26, 1888. Serial No. 286,708. (No model.)

Claim.—The process of obtaining purified and graded oils and naphthas from petroleum distillate, consisting in repeatedly subjecting the distillate to the action of heated water in closed tanks at increasing temperatures by passing the distillate upwardly through the heated water in said tanks, separately removing the volatilized products of each tank as the process advances, and condensing and discharging said products separated from each other and from the distillate, substantially as set forth.

407,274.

407,275. PHOTOGRAPHIC CAMERA. RUFUS B. RAMSEY, Newark, N. J. Filed Apr. 11, 1887. Serial No. 234,462. (No model.)

Claim.—1. A magazine-camera for photographic purposes in which are combined the following elements: a chamber in the rear end of the camera-body for storing the sensitized plates or their holders, upper and lower stops adapted to finally support the forward plate-holder, spring-supports arranged in proximity to the lower stops and adapted to sustain the front plate-holder, a spring adapted to force forward the series of plates, and a well to receive the plates successively after exposure, essentially as and for the purposes herein described.

2. In a magazine photographic camera, the combination of the chamber A' in rear of the camera-body, having an upper stop *e* and lower side stops *i*, the spring-supports *J J*, the guards or guides *k*, and the well or chamber D, substantially as specified.

3. In a magazine photographic camera, the combination, with the magazine or chamber A', of the rails or guides *h h* and the spring-supports *J J*, substantially as specified.

4. The trigger or button L, in combination with the spring-supports *J J* and the stops *e i*, essentially as described, and for the purpose set forth.

5. In a magazine photographic camera, the spring M, adapted to slide in and out of the chamber containing the plates to be exposed, also to set out in a backward direction relieved of tension, and to project or be adjusted forward subject to tension, substantially as specified.

6. The combination of the plate-holders S', provided with lower side trunnions *e e*, the spring-supports *J J*, and the stops *e i*, essentially as specified.

7. The spring M, in combination with the spring-supports *J J* and the stops *e i*, substantially as described.

8. The plate-holder S', adapted to receive the plate and provided with a covering-lip *f*, substantially as specified.

9. In a magazine photographic camera provided with a lower well or chamber for reception of the plates after exposure, the combination, with said well or chamber and with an apertured board in rear of the lenses of the camera, of a rocking supplementary shutter adapted to close in its different adjustments the aperture in said board and the well at its top, substantially as and for the purposes specified.

10. The removable plate-holding box G, having a slide H, in combination with the well D, its slide F, the chamber A', and slide E, essentially as described, and for use as herein set forth.

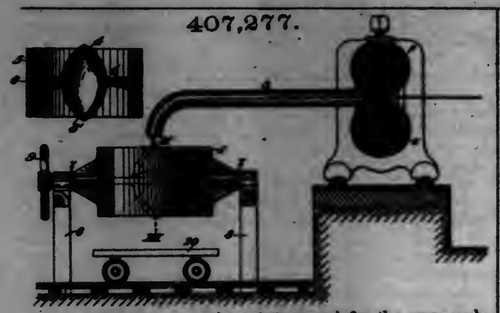
11. In a magazine photographic camera, the combination, with the chamber A', of the spring M, adapted to slide in and out of said chamber, the slotted rocker N, carrying said spring, and the pivoted handle O, for operation together, substantially as and for the purposes specified.

407,276. ROLL FOR JORDAN PULP-ENGINES. EDWIN W. BARTON, Lawrence, Mass. Filed June 26, 1882. Serial No. 278,169. (No model.)

Claim.—1. The tapering ungrooved roll *b*, having the annular projections *b' b'*, grooved transversely for the reception of the blades *c c*, in combination with the hoops or rings *d, d*, surrounding the said annular projections and adapted to serve as means for holding the said blades secured to the roll *b*, substantially in a manner and for the purpose specified.

2. In combination with the blades *c c*, having the bayonet-shaped notches *c'* and ledges *c''*, as described, the ungrooved roll *b*, having annular projections *b'*, transversely grooved for the reception of said blades, and the annular hoops *d*, surrounding said projections *b'* and adapted to receive between their inner surfaces and the grooved portions of the projections *b'* the ledges *c''* of the notched bars *c*, substantially as and for the purpose set forth.

3. The roll *b*, having the annular projections *b'* and end projections *b'' b''*, transversely grooved and having the respective hoops or rings *d c c*, in combination with the blades *c*, having the bayonet-notches *c'* and ledges *c''*, substantially as and for the purpose set forth.

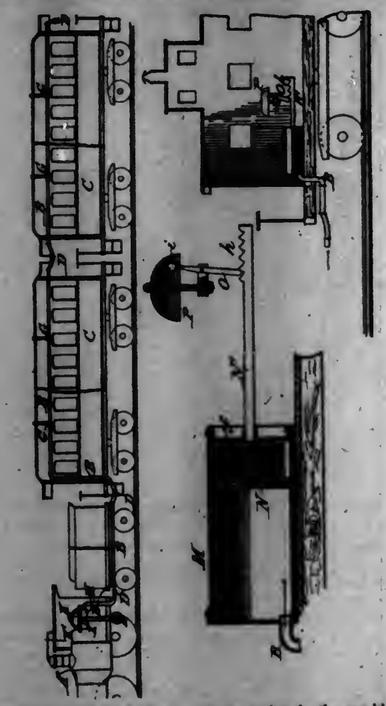


4. The ungrooved roll *b*, having the annular and transversely-grooved projections *b'*, and the hoops or rings *d*, surrounding the same, in combination with the blades *c*, having the notches *c'* and ledges *c''*, and the filling-pieces *f f*, all arranged and combined substantially as and for the purpose set forth.

407,277. METAL-COILING APPARATUS. FRANK. BRAMEIS, Pittsburg, Pa., assignor to Henry Roberts, same place. Filed Apr. 11, 1889. Serial No. 306,573. (No model.)

Claim.—1. In apparatus for coiling metal rods, the combination, with the roll, of a tapering or conical turret, and a guide leading from the rolls and having a stationary delivery end at the end of the turret, substantially as and for the purposes described.

2. The combination of the rolls 2, the conical turret 4, and a guide 3, leading from the rolls and having its delivery end flared and directed

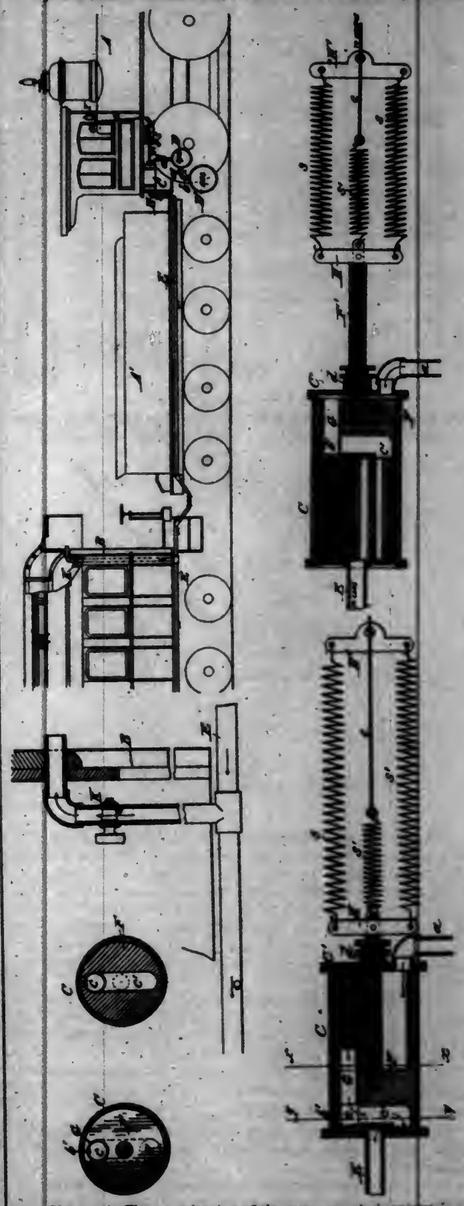


407,277.

to the apex of the turret, substantially as and for the purposes described.

2. The double coiling-box provided with opposite compartments having turrets, said box being mounted on pivots so as to be capable of being overturned, substantially as and for the purposes described.

407,278. RAILWAY-CAR SIGNAL. MILTON R. CAMPANY, Hamilton, Mich. Filed Aug. 16, 1888. Serial No. 282,911. (No model.)

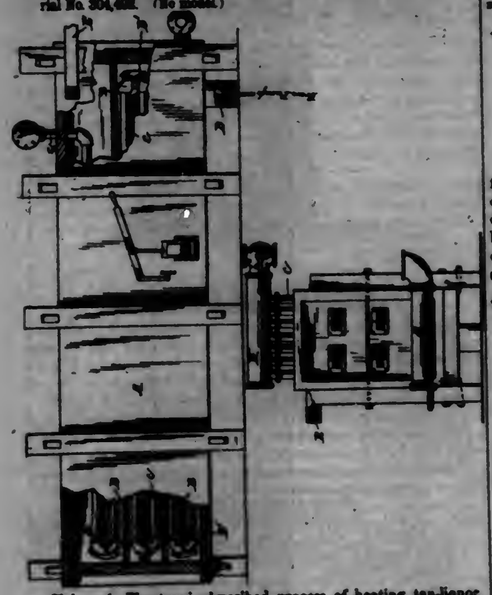


Claim.—1. As an improvement in train-signals, the combination of an air-pipe extending through the train, a compressed-air receptacle upon the locomotive with which said pipe is connected, a cylinder placed in the rear car of the train, also connected with said pipe, a piston in said cylinder actuated in one direction by a spring and in the opposite direction by compressed air, and a bell or gong arranged to ring by the movement of said piston, all the parts arranged to ring the bell upon the escape of air from the pipe through a suitable valve or upon the breaking of a pipe-coupling, substantially as set forth.

2. As an improvement in train-signals, the combination of an air-pipe extending through the train and provided with suitable escape-valves, a compressed-air receptacle attached to the locomotive and with which said pipe is connected, a rotary motor also connected with the air-pipes and mounted upon the locomotive, and a bell and bell-ringing devices put in motion by the motor upon the escape of air from the pipe to convey signals from any car in the train to the engine, as specified.

3. As an improvement in train-signals, the combination of a rotary motor mounted upon the locomotive, a bell and bell-ringing devices put in motion by said motor, an air-pipe extending through the train and connected with said motor, a cylinder placed in a car of the train and also connected with said air-pipe, a piston in said cylinder actuated in one direction by a spring and in the opposite direction by compressed air, and a bell or gong arranged to ring by the movement of said piston, all arranged to give signals upon the locomotive and also upon the train upon the escape of air from the pipe through a suitable valve or upon the breaking of a pipe-coupling, substantially as set forth.

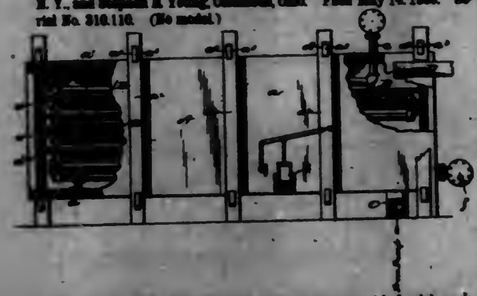
407,279. TRAIN-SIGNALING APPARATUS. MILTON R. CAMPANY, Hamilton, Mich. Filed Dec. 20, 1888. Serial No. 294,145. (No model.)



Claim.—1. The combination of the compressed-air reservoir employed to supply the brakes of a train, an air-chamber connected with said reservoir by a pipe containing a check-valve for maintaining an equable pressure in said chamber, a cylinder and a piston moving therein, the piston provided with an automatically-operating valve having a longitudinal sliding movement, an independent train-pipe connecting with the chamber and cylinder and provided with escape-valves, and devices, substantially as herein shown and described, for connecting the piston with the gong or whistle, as set forth.

2. As an improvement in train-signaling apparatus, the cylinder connected at one end to an air-chamber and at the other to a train-pipe, said cylinder containing a movable piston capable of being moved in one direction by compressed air and provided with an automatically-moving valve in combination with the piston-rod, its cross-head and the springs connecting said cross-head to the opposite ends of a swinging lever adapted to return said piston to its normal position when the air-pressure within the cylinder is equalized, as set forth.

3. As an improvement in train-signaling apparatus, the combination of the cylinder, the perforated piston, the hollow cylindrical valve moving in said perforation, the piston-rod, the spring *d'*, attached to said rod, the cord *e*, attached to the spring, and the whistle I, all arranged, as shown and described, to operate the whistle by a yielding pull upon its lever, as set forth.



407,280. PROCESS OF HEATING TAN-LIQUOR. OLIVER F. CARLEY, Westfield, Pa., assignor of two-thirds to Dewitt C. Conklin, Olean, N. Y., and Stephen H. Young, Columbus, Ohio. Filed Mar. 23, 1889. Serial No. 304,462. (No model.)

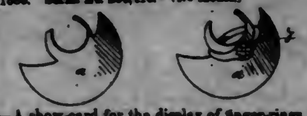
Claim.—1. The herein-described process of heating tan-liquor, which consists in passing it in a sinuous flow over the surface of steam-pipes in a direction opposite to that of the movement of the steam within the pipes, whereby the advancing liquor is subjected to a gradually-increasing temperature, substantially as described.

2. The herein-described process of heating tan-liquor, which consists in pumping it upward through a series of sinuous passages, through which steam is circulating in pipes in a direction contrary to that of the direction of the liquor, substantially as described.

407,281. APPARATUS FOR HEATING TAN-LIQUOR. OLIVER F. CARLEY, Westfield, Pa., assignor of two-thirds to Dewitt C. Conklin, Olean, N. Y., and Stephen H. Young, Columbus, Ohio. Filed May 14, 1888. Serial No. 310,110. (No model.)

Claim.—1. A tank for heating tan-liquor, provided with a zigzag passage for the liquor and a zigzag steam-heating coil within the liquor-passage, substantially as and for the purposes set forth.

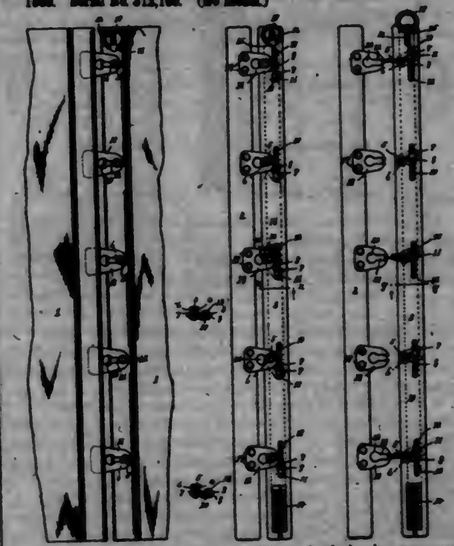
2. In combination with the tank A, having partitions B to afford a zigzag passage throughout it, the zigzag steam pipes or coils E, the inlet F, the connections *e*, the pump C, for forcing the liquor through the tank, and steam or water outlet *f*, all as set forth.



3. In combination with the tank A, made as described and having zigzag passages for the tan-liquor and steam, a gate G, for letting off the liquor when desired.

4. In a tank for heating tan-liquor, the coil pieces *d'* and rods *e'* for holding them in position, whereby, when occasion requires, the said pieces, or either of them, can be removed and access had to the entire inner part of the tank, substantially as set forth.

5. In an apparatus for heating tan-liquor, the combination of the following elements, viz: a knockdown tank having zigzag passages for the liquor, zigzag heating-pipes in said passages, means for forcing the liquor through the tank, doors by which each coil can be inspected, removable end pieces by which the entire interior of the tank can be inspected, and a gate to draw off the liquor as occasion demands.

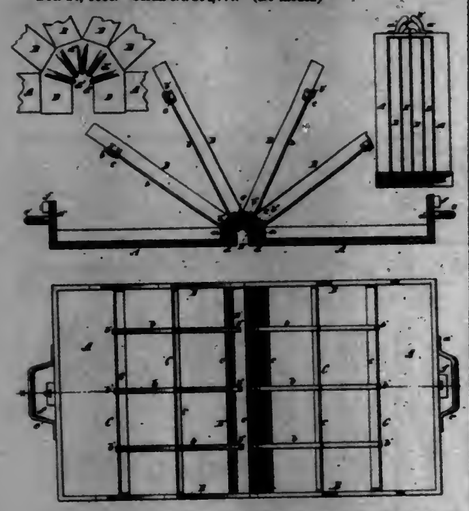


6. In an apparatus substantially as described, the combination of the steam pipe or coil having a projecting lug *e'* at each bend or joint, as set forth, with the partitions B, whereby the coil or pipe is supported in the manner and for the purposes explained.

407,282. SHOW-CARD. JOHN W. DAVIES, Worcester, Mass. Filed Feb. 1, 1889. Serial No. 298,410. (No model.)

Claim.—A show-card for the display of finger-rings, constructed from flexible sheet material in a single blank in the shape of a semi-disk, and with the yoke or arms projecting in the same plane, but divergently from the straight or diametric edge, the whole, when bent or slightly curved, being adapted to receive a ring over the yoke or arms, and to support it in an elevated and conspicuous position, substantially as shown and described.

407,283. CORSET-CLASP. ALBERT H. DEAN, Bridgeport, Conn., assignor of one-half to Leonard K. Hayden, same place. Filed May 25, 1888. Serial No. 312,169. (No model.)



Claim.—1. A corset-clasp comprising a bank having eyes, each of which is provided with a slot at its outer edge leading to the central opening, and a second bank having rotary clasping-studs, said studs being cut away upon one side, so that when in position they will remain in engagement with the eyes, and when partially rotated they will pass through said slots, so that the banks may be disengaged without movement toward each other.

2. A corset-clasp comprising a pair of banks, one of which is provided with rotary studs cut away upon one side, the other being provided with eyes having openings to receive the heads of the studs, slots extending therefrom toward the outer edge thereof, which receive the shanks of the studs, and reduced slots leading to the outer edge, of suitable size to allow the studs to pass through when the lesser diameter is presented thereto, but to hold the banks in the clasped position when the greater diameter of the studs is presented thereto.

3. A corset-clasp comprising a pair of busks, one of which is provided with rotary studs cut away upon one side, the other busk being provided with eyes having openings 20, of suitable size to receive the heads of the studs, slots 21, of suitable size to receive the greater diameter of the studs, and slots 22, leading to the outer edge, of suitable size to allow the studs to pass through when the lesser diameters are presented.

4. A corset-clasp comprising a pair of busks, one of which is provided with rotary studs 4, cut away upon one side, and slots 12, plates attached to the inner ends of said studs and provided with slots 9, said slots lying obliquely to slots 12, and a slide having studs 11 passing through slots 9 and 12, so that when said slide is moved either upward or downward the greater or lesser diameters of studs 4 are placed in operative position, the other busk being provided with eyes adapted to be engaged by the greater diameter of stud 4 in the usual manner, and having slots 22 at the outer edges thereof, which allow studs 4 to pass out when the smaller diameters are placed in operative position, but which hold said stud in the clasped position when the greater diameter is in operative position.

407,284. PORTFOLIO. ALBERT EDWARDS, Brooklyn, N. Y. Filed Dec. 27, 1888. Serial No. 294,777. (No model.)

Claim.—1. A portfolio composed of a case, a flexible back attached thereto, and hinged leaves connected with the flexible back, said flexible back consisting of a series of keystone-shaped pieces flexibly connected with each other at the upper points of their beveled sides or edges, in contact with each other at the upper points of their beveled sides or edges when the portfolio is closed, and capable of binding together by the contact of their beveled sides or edges with each other when the portfolio is open, said hinged leaves consisting of upright pieces and connections working in unison with the series of keystone-shaped pieces, all substantially as described.

2. In a portfolio, a hinge consisting of a series of keystone-shaped pieces flexibly connected with each other at the upper points of their beveled sides or edges, in contact with each other at said upper points of their beveled sides or edges when the portfolio is closed, and capable of binding together by the contact of their beveled sides or edges with each other when the portfolio is open, substantially as set forth.

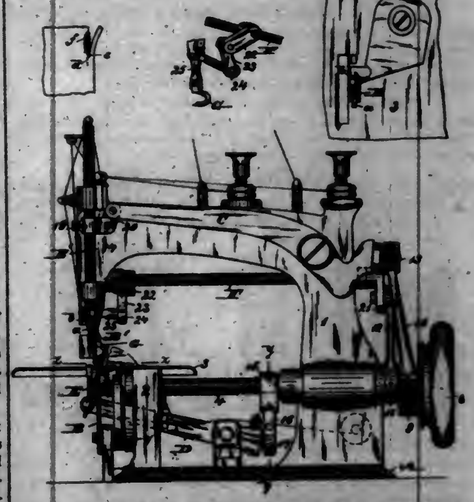
3. In a portfolio, the combination of a case, a series of keystone-shaped pieces flexibly connected with each other at the upper points of their beveled sides or edges joined to said case, said keystone-shaped pieces being in contact with each other at the upper points of their beveled sides or edges when the portfolio is closed, and capable of binding together by the contact of their beveled sides or edges when the portfolio is open, with hinged leaves composed of upright pieces, and connections working in unison with the keystone-shaped pieces, substantially as set forth.

4. In a portfolio, the combination of a case A *a*, a flexible back connected therewith, consisting of a series of keystone-shaped pieces flexibly connected with each other at the upper points of their beveled sides or edges and working upon each other, as described, with upright pieces B B B, and connections working in unison with the keystone-shaped pieces, all substantially as set forth.

5. In a portfolio, substantially as described, the combination of a series of keystone-shaped pieces flexibly connected with each other at the upper points of their beveled sides or edges and working upon each other, as described, substantially as and for the purposes set forth.

6. In a portfolio, the combination of a case A *a* with pieces B B B, of wood or suitable material, attached thereto, said pieces B B B having their sides or edges beveled in the form of keystones and being flexibly held together by a fastening *c c c*, of canvas, leather, tape, cord, or suitable material, upon their upper faces, with upright pieces B B B *b b b* and connections *c c c*, attached to the beveled pieces B B B at or near the respective ends of said beveled pieces and upon the upper faces thereof, all substantially as described.

7. In a portfolio, substantially as described, the combination of pieces B B B, of wood or suitable material, having their sides or edges beveled in the form of keystones, and being flexibly held together at the upper points of their beveled sides or edges by a fastening *c c c*, of canvas, leather, tape, cord, or suitable material, and working upon each other, as described, substantially as and for the purposes set forth.



407,285. COMBINED SQUARE, LEVEL, PROTRACTOR, &c. CHRISTIAN HENNINGER, Albany, N. Y., assignor, by mesne assignments, of one-half to Cortland S. Babcock, same place. Filed Dec. 16, 1887. Serial No. 258,073. (No model.)

Claim.—1. The square A, having each of its angular limbs made with surfaces *a a'*, which are parallel with each other, and having in the same from their inner surfaces the grooves *c c*, parallel with the side surfaces a^2 a^2 of said limbs, for operation with a protractor and T-square at will, substantially as and for the purposes set forth.

2. The combination, with a square constructed as described, of a protractor which is attachable at will with said square, and a level which is pivoted at one of its ends to the protractor at the point of the center of curve of the same, and provided with an index, substantially as and for the purposes set forth.

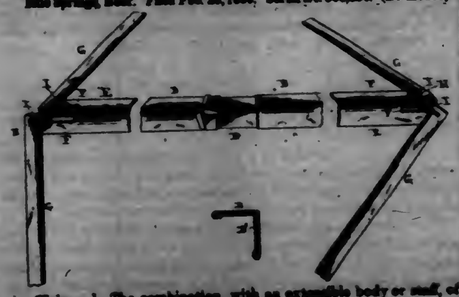
407,286. COMBINED SEAMING, TRIMMING, AND OVERSEAMING MACHINE. HENRY H. FRYER, Philadelphia, Pa., assignor of one-half to Thomas A. Pearce, same place. Filed Oct. 27, 1888. Serial No. 289,285. (No model.)

Claim.—1. The combination, with a needle and looper and their operating mechanism, of an additional needle and looper and a spreader adapted to take the loop from said looper and spread it for the additional needle, with operating mechanism for said needle, looper, and spreader, a vertically-moving trimming device operating between the path of the needles and in advance of said additional needle, substantially as and for the purpose set forth.

2. The combination, with a needle and looper and their operating mechanism, of an additional needle and looper and a spreader or carrier for the loop from said additional needle to its looper, with operating mechanism for said needle, looper, and spreader, forming combined devices for seaming and overseaming, the first-mentioned needle and looper being in advance of said additional needle and looper, substantially as described.

3. In a combined seaming, trimming, and overseaming machine, the parallel shafts 4 and F and operating mechanism, two needles *a b* and bars carrying the same, the looper 5 for the needle *a*, the looper E for the needle *b*, the spreader G, passing to and from the looper 5 and needle *b*, with operating mechanism, and a trimming-knife intermediate of the two needles, said parts being combined substantially as described.

4. A combined seaming, trimming, and overseaming machine having a cloth-feeding device, two vertically-operating needle-bars, one of which has a seaming and the other an overseaming needle, a vertically-operating trimmer on the side of the path of the work of the needle and behind the seaming but before the overseaming needle, a looper-needle working through the cloth-plate and connected with and operated by mechanism connected with the driving-shaft, and a pivoted spreader above the cloth-plate and operated by mechanism connected with the driving-shaft, the said spreader being adapted to receive the loop from the looper-needle and spread it for the overseaming-needle, said parts being combined substantially as described.



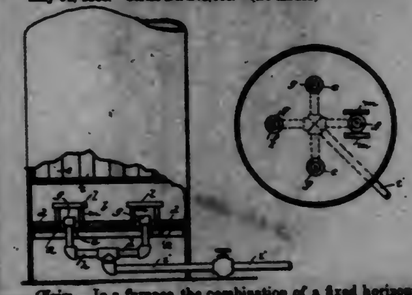
407,287. SMOKE AND GAS CONSUMING FURNACE. ALBERT PICKETT, Rochester, N. Y., assignor of one-half to Theodore W. Hulett, same place. Filed Feb. 11, 1889. Serial No. 299,689. (No model.)

Claim.—1. In a furnace, the combination of a magazine extending across the furnace-space, doors opening into the fire-chamber provided with chutes which tally with discharge-openings in the magazine, and cut-off valves covering the passage between the magazine and chutes, as shown and described, and for the purpose specified.

2. In a furnace, the combination of a magazine extending across the furnace-space, doors opening into the fire-chamber provided with chutes which tally with discharge-openings in the magazine, cut-off valves covering the passage between the magazine and chutes, and separate screw conveyers having their ends resting, respectively, under the chutes, said conveyers forming part of the main grate of the furnace, as herein shown and described.

3. In a furnace, the combination of the grate-bars *i i*, the separate screw conveyers *h h*, standing on a level with said grate-bars and operated independently, and the troughs *l l*, in which the conveyers rest, provided with slots *m m* in their bottom for the discharge of ashes below the conveyers, as herein shown and described.

407,288. GAGE FOR MARKING SPOUTING. LOREN S. FLETCHER, Blue Springs, Nebr. Filed Feb. 23, 1889. Serial No. 300,866. (No model.)



Claim.—1. The combination, with an extensible body or staff, of a plate having two plane faces at an angle to each other, and a gage-piece attached to each of the faces and each adjustable to any angle in the plane of the face, substantially as described.

2. The combination, with the extensible body, of the angle-plate perforated near its end, a perforated gage-piece secured to each face of the angle-plate and movable in the plane of that face, and a clamp for securing each gage in adjusted position, substantially as described.

3. The combination of the extensible staff, an angle-plate at each end of said staff having two faces in different planes, and an adjustable gage-piece connected to each of the faces of each angle-plate, all substantially as described.

407,289. GAS-FURNACE. ROBERT S. FRAZE, Gloucester, Pa. Filed May 31, 1888. Serial No. 275,602. (No model.)

Claim.—In a furnace, the combination of a fixed horizontal partition *a*, located in the combustion-chamber and having a refractory lining *d* and a series of openings which extend through said lining and the partition, the vertical inlet-pipes *h* of less diameter than the openings *c* through which they are passed to provide intermediate air-spaces for air to pass through said openings into the combustion-chamber, the fixed caps on the upper extremities of said inlet-pipes and having the contracted central discharge-openings, the horizontal deflecting-plates *l*, one arranged above each of the caps at right angles to the path of the gas issuing from the discharge-opening thereof, and the spaced tiles *m*, resting on the lining *d* beneath the ends of the deflecting-plate and leaving wide spaces between themselves for the free escape of the gas impinging against said deflecting-plates, substantially as described.

407,290. BALING-PRESS. JOHN H. GARDNER, Dalton, Ga., assignor to J. R. Sanders and Sam Waddell, both of Union City, Tenn. Filed Feb. 23, 1889. Serial No. 300,896. (No model.)

Claim.—1. In a baling-press, the baling-chamber and the door C attached thereto, adapted when open to swing clear of the feed-aperture and having on its front edge the piece *c*, combined with the weighted locking-ball, substantially as shown and described.

2. In combination with the baling-chamber slotted as *a*, the weighted locking-ball D, the door C, having a piece *c* on its front edge, the pivoted arm G, and the platen having the studs moving in said slots *a*, substantially as and for the purposes set forth.

3. In a baling-press, the pitman F, carrying platen E and having notches *d' d²* in its end, combined with the piece K, having studs *k* at its respective ends, and the sweep L, having arm *l*, each having a pin or stud at or near its end to engage, respectively, with said notches *d' d²*, substantially as and for the purposes set forth.

4. The combination of casing A, slotted at *a'*, the door C, the weighted ball, and the arm G with the platen E, studs *c*, and pitman F, operated as set forth.

407,291. GAS-BURNER. CORNELIUS J. HAMILTON, Philadelphia, Pa., assignor to James H. Wilson, same place. Filed July 26, 1888. Serial No. 281,267. (No model.)

Claim.—1. In a gas-lamp, the combination of a central supply-pipe with a series of distributing-pipes leading to an annular gas-chamber having outlets at the top thereof, the perforated conical cap 5 on said gas-chamber, the deflector C, secured to said cap, the air-distributer 7, surrounding said gas-distributing pipes, the inverted cup 8, surrounding said air-distributer and forming a chamber having openings leading into the lower part thereof, and the perforated cap 6,

407,291.

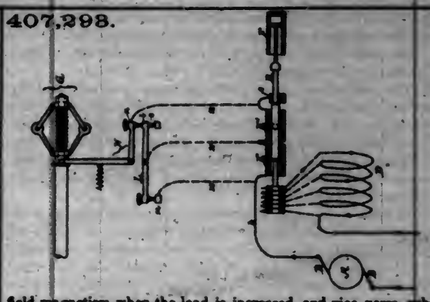
surrounding the gas-chamber and above the air-distributer 7, substantially as and for the purpose set forth.

2. In a gas-lamp, gas-supply pipes, a gas-chamber communicating therewith having outlets, a perforated cap above the same, a perforated cap and an air-distributer surrounding the gas-supply pipes and gas-chamber, and an imperforate shell or guard surrounding said air-distributer, substantially as and for the purpose described.

3. In a gas-lamp, the combination of a central supply-pipe having a radiating series of distributing-pipes therefrom leading to an upper annular gas-chamber, the latter having openings at its top, the perforated cap 5 above said gas-chamber, the deflector C, secured to said cap, an air-distributer surrounding the distributing-pipes, and a perforated cap surrounding the gas-chamber below the top outlets thereof, the inverted cup 8, surrounding the air-distributer, and an air-chamber connected with the central supply-pipe and having pipes or tubes leading into the space between the cup 8 and the air-distributer 7, substantially as and for the purpose described.

4. In a gas-lamp, the combination of the collar A, the hollow plug 1, the air-chamber 10 on said collar, gas-supply pipes 2, leading from said hollow plug, annular gas-chamber 3 above said gas-supply pipe 2 and having outlets 4, a perforate air-distributer surrounding said gas-supply pipes, the imperforate shell 8, surrounding said air-distributer and forming the air-chamber B, the air-pipes 9, leading into the base of said chamber B from said air-chamber 10, a perforated cap surrounding said annular gas-chamber, air-space 12 within said gas-chamber, the perforated cap 5 above said gas-chamber 3 and air-space 12, and the conical deflector C, surrounding the said perforated cap 5, substantially as described.

407,292. NIPPLE-HOLDER. HARVEY D. HARNER, Council Bluffs, Iowa, assignor of one-half to Edward W. Hart, same place. Filed Apr. 29, 1889. Serial No. 309,053. (No model.)

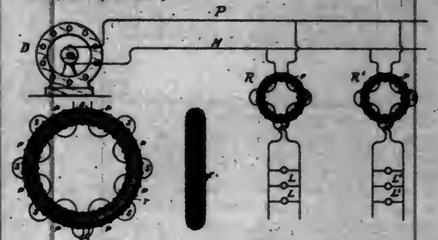


Claim.—In a nipple-holder, the tubes A and B and the threaded rod C, in combination with the swivel D and spear-headed rod E, all constructed and arranged substantially as and for the purpose described.

407,293. REGULATION OF ELECTRIC MOTORS. DANIEL HIGHAM, Philadelphia, Pa., assignor to the Higham Electric Motor Company, same place. Filed Oct. 3, 1887. Renewed Dec. 22, 1888. Serial No. 294,445. (No model.)

Claim.—1. The combination of the armature of an electric motor and a field-magnet having all its coils in series with the armature-coils with a centrifugal governor driven by the armature-shaft and electro-magnetic devices controlled by the governor to increase the

407,293.



field magnetism when the load is increased, and vice versa, substantially as described.

2. The combination of the armature and field-magnet of an electric motor with solenoid-coils, a core therefor and contacts controlled thereby, and centrifugal devices driven by the armature to automatically cut out one or the other of the solenoid-coils to vary the field magnetism, substantially as described.

3. The combination of the armature and field-magnet coils of an electric motor, and contact-rings connected to sections of the field-magnet coils with a pair of solenoid-coils, a common core controlling the contact for the said rings, and devices for automatically throwing one or other of the solenoid-coils out of action under the control of the armature-shaft, all substantially as set forth.

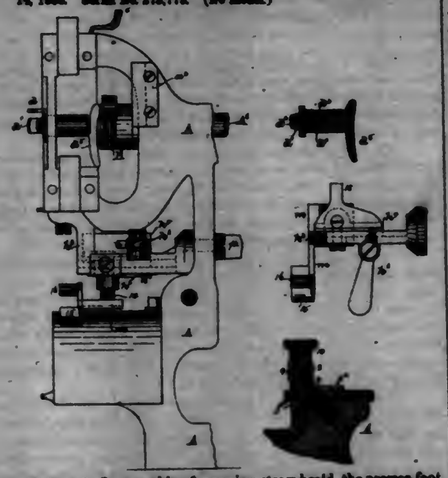
4. The combination of the armature and field-magnet coils of an electric motor, a pair of solenoid-coils, and a common core therefor with contact-rings, and a contact-rod controlled by said core, a centrifugal governor driven by the armature of the motor, and contacts acted on by the said governor to cut out one or other of the solenoid-coils, all substantially as set forth.

407,294. METHOD OF ELECTRICAL DISTRIBUTION BY SECONDARY GENERATORS. RANKIN KENNEDY, Glasgow, County of Lanark, Scotland, assignor, by mesne assignments, to the Westinghouse Electric Company, Pittsburg, Pa. Filed Nov. 13, 1888. Serial No. 290,717. (No model.)

Claim.—The method of distributing and regulating alternating electric currents by secondary generators, which consists in producing in two or more derived circuits constituting the primaries of two or more secondary generators a counter electro-motive force which, when any secondary is open, is practically equal to the applied electro-motive force in its primary, and in controlling said electro-motive force by the current flowing in the corresponding secondary, when the secondary is closed, in such manner that the current in the primary shall vary with and be approximately inversely proportional to the resistance in the secondary, substantially as described.

407,295. GLOVE-FASTENER. EDWIN J. KRAFFERT, Gloversville, N. Y., assignor to the International Fastening Company, Portland, Me. Filed Mar. 5, 1888. Serial No. 301,854. (No model.)

Claim.—1. A member of a fastener, consisting of a cap, a stud-embracing fastening-eyelet, a suitable filling, and a downwardly-projecting clinching-eyelet held by its flange within said cap, in combination with a recessed anvil-plate, substantially as described.



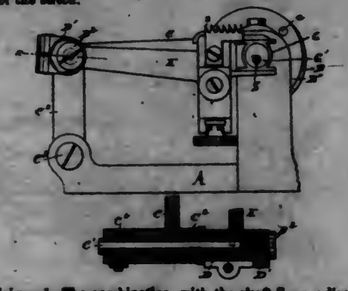
2. The button-hole member of a fastener, consisting of a cap E, a stud-embracing fastening-eyelet F, and a downwardly-projecting clinching-eyelet G, held by its flange within the said cap, in combination with a recessed anvil-plate washer H, whereby the final clinching of the parts to the leather or fabric is invisibly accomplished beneath the said leather or fabric, substantially as described.

407,296. CAR-COUPLING. SYLVE LAU, La Crosse, Wis., assignor of one-half to Moses Anderson, same place. Filed Apr. 3, 1888. Serial No. 269,894. (No model.)

Claim.—An improved car-coupling, consisting of a draw-head having the lower slotted jaw, the coupling-pin and link, the transverse bolt, and the tumbler thereon, said tumbler having the arm *e*, which receives the impact of the coupling-link, the arm *f*, which passes through the coupling-link and behind the coupling-pin, and an arm *g*, projecting at right angles to the arm *e*, said arm *g* being broader at its front end than at its rear and supporting the link after the parts are coupled, substantially as herein described.

407,297. STRAW-BRAID-SEWING MACHINE. MOSES MARSH, Amherst, Mass., assignor to the Hills Company, same place. Filed May 14, 1888. Serial No. 273,779. (No model.)

Claim.—1. In a machine for sewing straw braid, the presser-foot, the bed-plate, an edge-guide G, adjustable just above the bed-plate to guide the edge of the body of the article, and the guide A^3, located above and independent of the presser-foot, combined with the braid-gage *m*, unattached to and independent of the presser-foot, and having a rod 14 extended into the said guide A^3 loosely, and with a lever to lift the said rod 14 and its attached braid-gage, substantially as described.

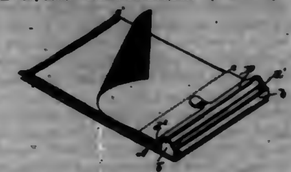


2. The presser-foot, the lever 20, to lift it and not lift the braid-gage, the bed-plate, the adjustable edge-guide G, and the braid-gage *m*, having the vertical rod 14, and the guide A^3, detached from the presser-foot and guiding the said rod, combined with a second lever *p*, to engage the said rod 14 and lift the said braid-gage, substantially as described.

3. The bed-plate and the presser-foot, combined with an independent detached braid-gage *m*, having a vertical rod 14 and a lip 15, and with the longitudinally-adjustable carriage having a sleeve or guide A^3 for the said rod 14, and the support for the said carriage entirely above the said bed-plate and independent of the said presser-foot, substantially as described.

4. The bed-plate and the presser-foot, combined with an independent detached braid-gage *m*, having a vertical rod 14 and a lip 15, and with the longitudinally-adjustable carriage having a sleeve or guide A^3 for the said rod 14, and the support for the said carriage entirely above the said bed-plate and independent of the said presser-foot and with a lever to adjust the said carriage horizontally and with it the said braid-gage, substantially as described.

407,298. FEEDING DEVICE FOR SEWING-MACHINES. MOSES MARSH, Amherst, Mass., assignor to the Hills Company, same place. Filed Sept. 14, 1888. Serial No. 285,206. (No model.)



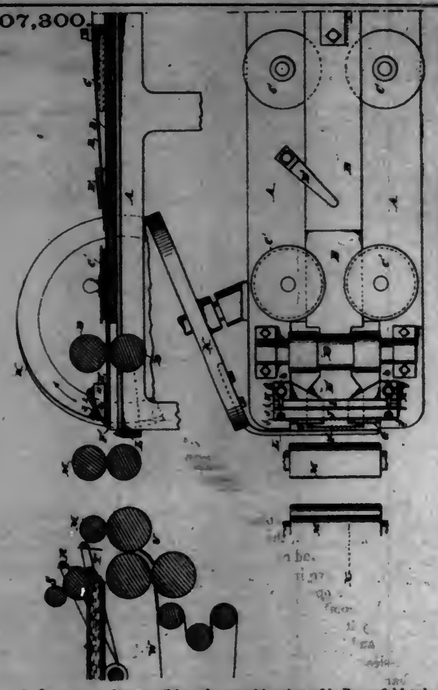
Brief.—By means of an adjustable eccentric-sleeve interposed between the hub of the feed-bar and its supporting-stud, the feed is controlled so that it will start from the same point whatever be the length of the stitch.

Claim.—1. The combination, with the shaft S, an adjustable eccentric actuated by it, the rocker, the stud, and connections between the said eccentric and rocker to vibrate the latter, of the feed-bar and the eccentric-sleeve interposed between the said stud and the hub of the feed-bar, to operate substantially as described.

2. The combination, with the shaft S, an adjustable eccentric actuated by it, the rocker, the stud, and connections between the said eccentric and rocker to vibrate the latter, of the feed-bar and the eccentric-sleeve interposed between the said stud and the hub of the feed-bar, and with the screw D^2 to fasten the said eccentric-sleeve in adjusted position, substantially as described.

407,299. SALE-SLIP. THOMAS J. A. MACDONALD, Detroit, Mich. Filed June 19, 1888. Serial No. 277,542. (No model.)

Claim.—A paper-clip consisting of a plate B, having an upturned heel-plate *b* and side pieces *b'*, and a jaw D, consisting of a strip of sheet metal bent lengthwise at a right angle and journaled between the side pieces *b'*, the construction being such that the paper is jammed between the edge *d*, the plate B, and the heel-plate *b*, substantially as described.



407,300. PAPER-BAG MACHINE. FRANK M. MCGUILL, Philadelphia, Pa., assignor to Frank H. Leach, same place. Filed Sept. 14, 1888. Serial No. 285,462. (No model.)

Claim.—1. In a paper-bag-tube machine, the combination of a lower cutter and an upper cutter for the outer folds of the paper tube and two intermediate side or bellows-fold cutters, the lower, upper, and side cutters being arranged stationary in different planes and slightly separated for the passage of the paper, the edges of one of said outer cutters projecting beyond the edges of said intermediate side or bellows-fold cutters, with a movable beater or cutter transversely movable across the cutting-edges of the stationary cutters.

2. In a paper-bag-tube machine, the combination of a lower cutter and an upper cutter for the outer folds of the paper tube and two intermediate side or bellows-fold cutters, the lower, upper, and side cutters being arranged stationary in different planes and slightly separated for the passage of the paper, having their cutting edges projecting beyond each other and the edges of one of said outer cutters projecting beyond the edges of said intermediate side or bellows-fold cutters, with a movable beater or cutter transversely movable across the cutting-edges of the stationary cutters.

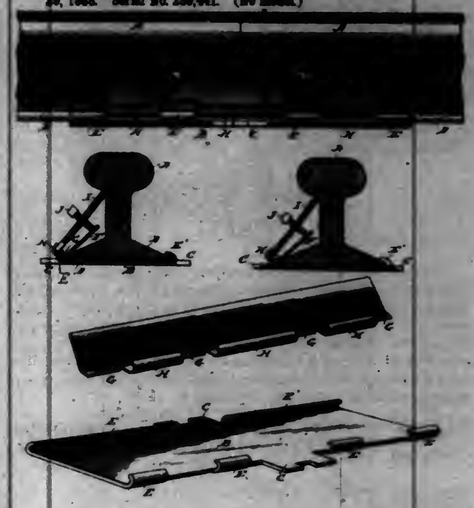
3. In a bag-tube machine, the combination of forming devices for folding the paper into a tube having bellows side folds with cutters for transversely severing the top and bottom layers of the tube, two side cutters projecting into the bellows folds, and a transversely-moving beater or cutter to force the layers of paper forming the bellows fold against the cutters to sever them at each side of the tube.

407,300.

4. In a paper-bag machine, the combination of bellows-fold-tube-making mechanism with a stationary cutter for each of the outer layers of the tube and two side cutters for the bellows-fold layers, and in which said cutters have their cutting-edges projecting beyond each other, substantially as set out, the edges of one of said cutters for the outer layers projecting beyond the edges of the side cutters for the bellows side folds and a transversely-movable cutter or beater adapted to move past the cutting-edges of the first-mentioned cutters to sever the tube.

5. In a paper-bag machine, the combination of bellows-fold-tube-making mechanism with a stationary cutter for each of the outer layers of the tube, and two side cutters for the bellows-fold layers, in which said cutters have their cutting-edges projecting beyond each other, substantially as set out, the edges of one of said cutters for the outer layers projecting beyond the edges of the side cutters for the bellows side folds, a transversely-movable cutter or beater adapted to move past the cutting-edges of the first-mentioned cutters to sever the tube, and pasting and folding devices to apply paste and fold over the bottom of the tube.

6. In a paper-bag machine, the combination of bellows-fold-tube-forming devices with stationary transverse cutters for the top and bottom layers of the tube and two lateral or side cutters adapted to extend into the bellows folds of the tube and arranged between the other cutters, means to adjust said side or bellows-fold cutters, and a transversely-movable beater or cutter to sever the tube.



7. In a paper-bag machine, the combination of bellows-fold-tube-forming devices with stationary transverse cutters for the top and bottom layers of the tube made relatively adjustable longitudinally to separate or reduce the space between their cutting-edges, and two lateral or side cutters adapted to extend into the bellows folds of the tube and arranged between the other cutters, means to adjust said side or bellows-fold cutters, and a transversely-movable beater or cutter to sever the tube.

8. The combination of the lower outer cutter F, upper outer cutter I, intermediate side cutters G G, arranged with their cutting-edges projecting beyond each other, as set out, with the edges of one of said outer cutters projecting beyond the edge of said intermediate side cutters, and a rotary beater L, adapted to be moved past said cutters F, I, and G to sever the tube.

9. In a paper-bag machine, bellows-fold-tube forming and guiding devices, in combination with independent cutters, substantially as set out, for severing transversely the top, bottom, and bellows-fold layers of the tube, the edges of one of the cutters for the outer layers projecting beyond the edges of the cutter for the bellows fold.

10. In a paper-bag machine, bellows-fold-tube forming and guiding devices, in combination with independent cutters, substantially as set out, for severing transversely the top, bottom, and bellows-fold layers of the tube at different places in the length of the tube to expose all three layers from one side of the tube, the edges of one of the cutters for the outer layers projecting beyond the edges of the cutter for the bellows fold.

407,301. RAIL-JOINT. MILTON C. HILES, Chicago, Ill. Filed Oct. 29, 1888. Serial No. 289,441. (No model.)

Claim.—1. In a rail-joint, the rails, the chair, and a clamping-plate connected with said chair at the side edge thereof and fulcrumed upon the rail-flange, in combination with the brace-plate confined between said clamping-plate and the under side of the rail-top, and means for operating said plate, substantially as described.

2. In a rail-joint, the rails, the chair, and a clamping-plate connected with said chair at the side edge thereof and fulcrumed upon the rail-flange, in combination with the brace-plate confined between said clamping-plate and the under side of the rail-top, and bolts working through said brace-plate for bearing upon and depressing the inner free edge of said clamping-plate, substantially as described.

3. In a rail-joint, the rails, the chair provided with upturned side edges, constituting hooks, under one of which one edge of the rail-flange is inserted, in combination with a clamping-plate fulcrumed on the rails, the outer edge of which engages the other upturned edge of the chair, and means for operating said clamping-plate, whereby, when the inner free end thereof is depressed, the hook of the chair on the opposite side of the rail will be caused to bind tightly against the flange thereof, substantially as described.

4. In a rail-joint, the chair, the upturned side edges thereof, under which the flange of the rail is inserted, a clamping-plate fulcruming upon the rail-flange at the opposite side, and a connection between said plate and the chair, in combination with the brace-plate confined between the outer edge of said clamping-plate and the under side of the rail-top, and bolts working through said brace-plate for depressing the inner free edge of the clamping-plate, substantially as described.

5. In a rail-joint, the rail, the chair upturned along one side edge, under which the flange of the rail is inserted, and a series of hooks on the opposite side edge thereof, in combination with a clamping-plate fulcrumed upon the flange of the rail, the outer edge of which engages the hooks on the chair, and a series of upturned portions alternating with the hooks on the chair, a brace-plate confined between said upturned portions and the under side of the rail-flange, and bolts working through said brace-plate bearing upon and depressing the inner free end of the clamping-plate, substantially as described.

407,302. RAIL-JOINT. MILTON C. HILES, Chicago, Ill. Filed Mar. 11, 1889. Serial No. 302,867. (No model.)

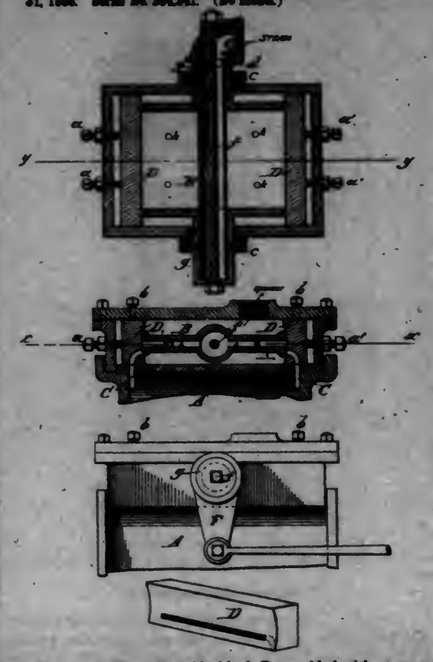
Claim.—1. In a rail-joint, the combination, with the rail and a base-plate provided with a shoulder against which one of the flanges of the rail impinges, of a toggle confined between said plate and the rail, so as to clamp the same together, substantially as described.

2. In a rail-joint, the combination, with the rail and a base-plate provided with a shoulder against which the flange of the rail impinges, of a clamping and a brace plate constituting a toggle, the opposite edges of which respectively engage the base-plate and the rail, and means for operating said toggle, substantially as described.

407,302.

3. In a rail-joint, the combination, with the rail of a base-plate provided with a shoulder against which one of the flanges of the rail impinges, of a clamping and brace plate constituting a toggle engaging the base-plate and rail, respectively, and a tightening-bolt working through said rail for operating the toggle, substantially as described.

4. In a rail-joint, the combination, with the rail and a base-plate provided with a shoulder against which the rail-flange abuts at one side, of a clamping-plate pivoted upon the rail-flange and engaging the base-plate at the opposite side of the rail, a brace-plate confined between the top of the rail and said clamping-plate, and a tightening-bolt working through the rail-flange and engaging the clamping-plate near the point of engagement therewith of the brace-plate, substantially as described.



5. In a rail-joint, the combination, with the rail and a base-plate provided with a shoulder at one side, against which the flange of the rail abuts, of a clamping-plate pivoted upon the rail-flange and engaging the base-plate at the opposite side of the rail, a brace-plate confined between said clamping-plate and the top of the rail, a tightening-bolt working through the rail-flange and said plates, the nut of which bears against the upper edge of the clamping-plate, a locking-plate provided with a depending lip from the upper edge thereof, engaging the upper edge of the clamping-plate, and ears thereon projecting beneath said nuts, substantially as described.

407,303. LETTER-BOX. REED M. NOBLE, Washington, D. C., assignor of one-half to William A. Raburg, same place. Filed Feb. 18, 1889. Serial No. 300,314. (No model.)

Claim.—In a receptacle for valuables, the combination of a top provided with an opening, a hinged door for closing said opening, said door being provided with a rabbet in its free end to engage a rabbet upon the side of the opening, a cam upon the under side of the door, and a guard-plate pivoted below the door with its light end in loose frictional engagement with said cam, the lower end of said plate having a length sufficient to come in contact with the front wall of the receptacle when the door is depressed, in the manner and for the purpose substantially as described.

407,304. BALANCED VALVE. WARREN T. REAMER, Fairmount, Nebr., assignor to the Round Valve Company, Chicago, Ill. Filed Aug. 31, 1888. Serial No. 284,341. (No model.)

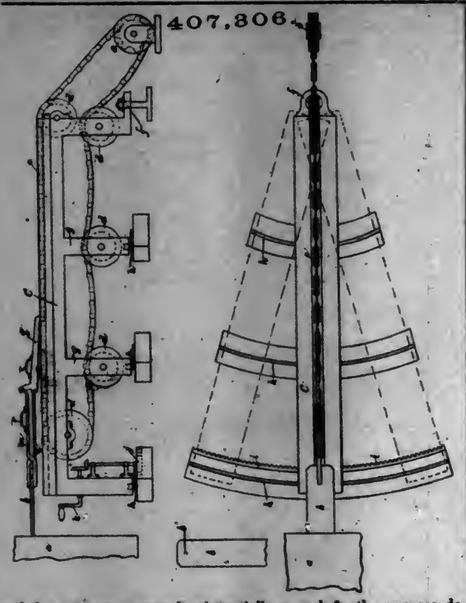
Claim.—1. The adjustable block D, provided with steam-ports, as shown, and adapted for adjustment to the valve and to be secured in place by the set-screws, substantially as shown and described, and for the purpose set forth.

2. In a balanced oscillating valve, the combination of the chambered valve extending nearly the whole length of the cylinder with the adjustable port-blocks provided with passages connecting with the cylinder-ports, substantially as shown and described.

3. As an improvement in balanced oscillating valves for steam-engines, the valve B, chambered throughout its length, the walls of said chamber being connected and stiffened by the studs or connections *h*, and the ends of the valves expanded to form a wearing-surface, in combination with adjustable port-blocks forming the valve-seats, and the means for imparting an oscillatory movement to said valve, substantially as shown and described.

407,305. PROCESS OF DECORATING BASE METALS, GLASS, &c., WITH PRECIOUS METALS. FRANZ ROSSMLER, Furth Amboy, N. J. Filed Oct. 22, 1888. Serial No. 288,638. (No specimens.)

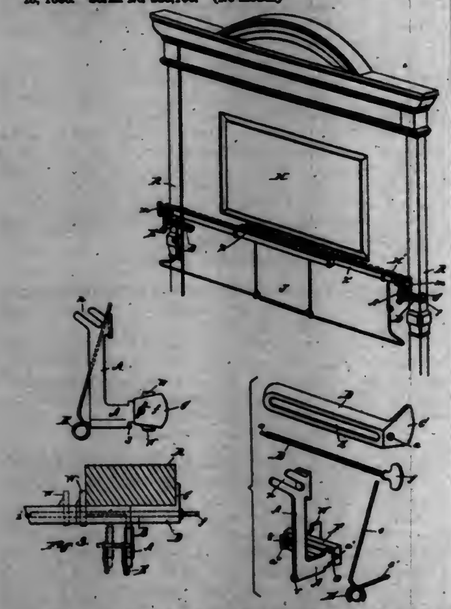
Claim.—The process of decorating articles of base metal, glass, terra-cotta, and the like, consisting in first applying varnish to the surface of such article, next drying the varnish, next applying a solution of the sulphuret of a precious metal and balsam of sulphur, and subsequently firing, substantially as specified.



407,306. APPARATUS FOR SKELPING OR TUBE-WELDING. JAMES A. SIMPSON, McKeesport, Pa. Filed Oct. 2, 1888. Serial No. 286,967. (No model.)

Claim.—1. A skelping or tube-welding table pivoted at one end, so as to be capable of horizontal oscillation, and provided with an endless traveling chain, combined with skelping-tongs having a hook to engage said chain, substantially as and for the purposes described.

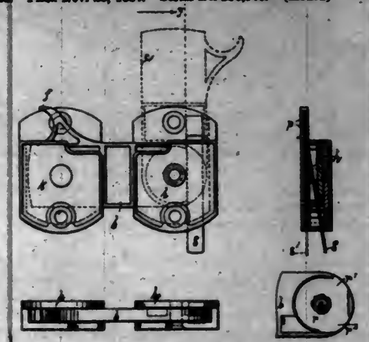
2. A skelping or tube-welding table pivoted at one end, so as to be capable of horizontal oscillation, and provided with an endless traveling chain, combined with skelping-tongs consisting of arms united by a slide-joint, said joint having inclined faces, and a hook to engage the chain, substantially as and for the purposes described.



3. A skelping or tube-welding table pivoted at one end, so as to be capable of horizontal oscillation, and provided with an endless traveling chain, combined with skelping-tongs consisting of arms united by a slide-joint, one of the arms being provided with a holding-lug, and a hook to engage the chain, and to which hook the arms

407,306.

of the tongs are secured, substantially as and for the purpose described.

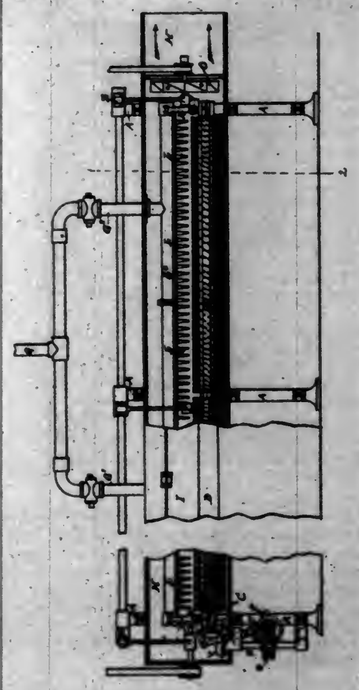


407,307. COMBINED BRACKET AND CLAMP FOR PILLOW-SHAM HOLDERS. GEORGE S. TOMPKINS and CHARLES WHITTINGHAM, Detroit, Mich.; said Whittingham assignor to said Tompkins. Filed Oct 15, 1888. Serial No. 288,168. (No model.)

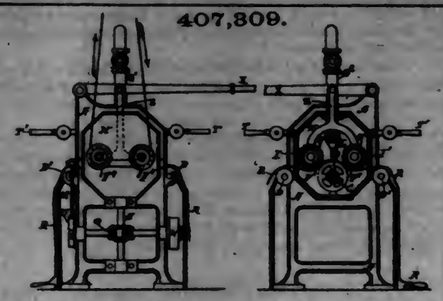
Claim.—1. In combination with the L-shaped bracket having the base and jaw formed integral therewith, and screw-threaded holes in the base thereof, the base-plate D, having the central opening with fixed jaw at one end thereof and holes in each end of the base, the screw-threaded bolt engaging with the base F, having its ends journaled in the holes of the base-plate D, as and for the purposes specified.

2. In combination with the bracket A, having the forked upper end with base and jaw W formed integral therewith, the base-plate D, having the oblong opening and holes in each end and jaw C at one end, the screw-threaded bolt having threaded engagement with the base of the bracket, its ends being journaled in the base-plate D and carrying a button on one end, substantially as set forth.

407,308. SHUTTER-FASTENER. AVERY VAN WIE, Indianapolis, Ind. Filed Nov. 29, 1887. Serial No. 256,379. (Model.)



Claim.—In a shutter-fastener, a housing A, adapted at *p* to receive the fixed end of spring *s*, a bar *v*, pivoted at *a* within said housing, said bar being provided with recesses or grooves *r' r²*, within which spring *s* is adapted to engage, the above-named spring, and a keeper *k*, all combined to operate substantially as and for the purpose specified.



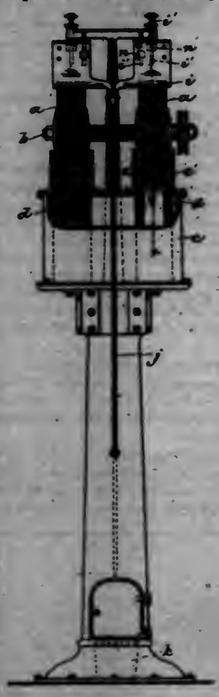
407,309. MACHINE FOR CLEANING AND PURIFYING CARPETS OR OTHER FABRICS. THOMAS WARDLE and ARTHUR S. WARDLE, Nottingham, County of Nottingham, England, assignors to George Wigley, same place. Filed Feb. 11, 1888. Serial No. 263,736. (No model.) Patented in England June 8, 1886, No. 7,962.

Claim.—1. The combination, with the frame, the shaft journaled therein, the casing, and the perforated drum in said casing and carried by said shaft, of the supply-pipes, the nozzles thereon, the fan at one end of the casing, the brushes, and means, substantially as described, for revolving said drum and brushes, substantially as and for the purpose specified.

2. The combination, with the frame, the shaft journaled therein, the casing, and the perforated drum in said casing and carried by

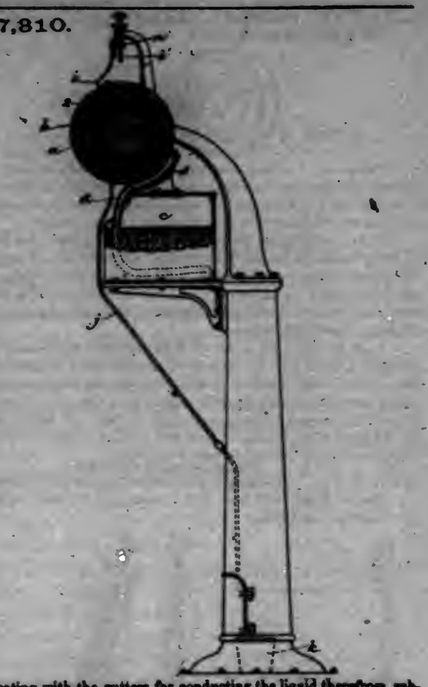
407,309.

said shaft, of the supply-pipes, the nozzles carried thereby, the fan at one end of the casing, the brushes, the levers K K, the axles Y Y, rod M, eccentric U, worm P, driving-pulley N, worm-wheel Q, shaft S, and bevel-wheels V V, all arranged and operating substantially as and for the purpose specified.



407,310. LEATHER-CLEANING MACHINE. HAROLD A. WEBSTER, Haverhill, assignor of one-half to Lewis P. Tunney, Boston, Mass. Filed Jan. 12, 1888. Serial No. 260,136. (No model.)

Claim.—1. In a leather brushing or cleaning machine, the combination of the tank or reservoir having the bed or support mounted thereon, the feeder having one end in the tank and the other end supported on the bed, and the brush adapted to revolve against the feeder, substantially as described.



2. In a leather brushing or cleaning machine, the combination of the tank, the guide or bed on said tank, the brush adjacent to said guide, and the wick having one end in the tank and the other end resting on the guide and in contact with the brush, substantially as and for the purpose described.

3. In a leather brushing or cleaning machine, the combination of the tank or reservoir, the brush arranged above said reservoir, the wick having one end in the reservoir and the other end in contact with the brush, and the scrapers arranged above and in contact with the brush, substantially as and for the purpose described.

4. In a leather brushing or cleaning machine, the combination of a tank or reservoir, brushes arranged above said reservoir, wicks leading from the reservoir to said brushes, scrapers having gutters for removing the surplus liquid from the brushes, and a pipe or tube com-

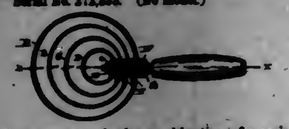
407,310.

municating with the gutters for conducting the liquid therefrom, substantially as and for the purpose described.

407,311. SULPHUR FABRIC. HENRY P. WEBER, Newark, N. J., assignor to Jacob Klotzbach and John B. Stolzenau, same place. Filed Mar. 5, 1888. Serial No. 266,012. (Specimens.)

Claim.—As a new article of manufacture, a fabric consisting of paper or textile material impregnated with granular or crystalline sulphur, substantially as set forth.

407,312. TOP-FLAT CLEANER FOR CARDING-MACHINES. CHAS. H. WHITTEN, Lawrence, assignor to the Potter Machine Works, Newton, Mass. Filed Sept. 26, 1888. Serial No. 286,468. (No model.)

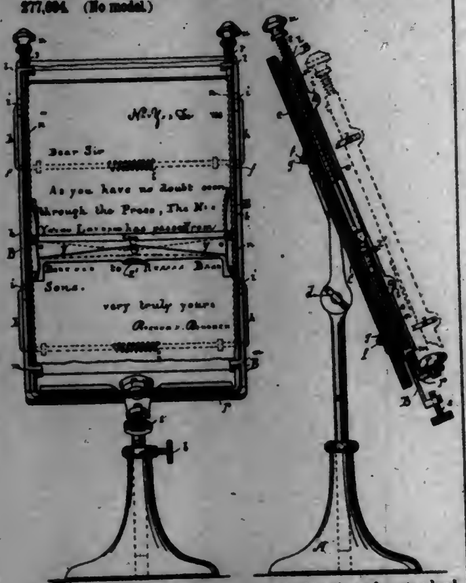


Brief.—The cleaner consists of a series of cloth-covered rolls within the chain of flats and journaled in slotted arms upon a shaft. The cleaner is rotated by the engagement with successive ribs of the flats and picks up the dirt between each two of the same.

Claim.—1. The improved top-flat cleaner herein described, the same consisting of a central shaft adapted to revolve in but removable from supports at opposite sides of a carding-engine and within the series of top-flat frames, this shaft being provided with enlargements or extensions having a series of brushes or cleaners A in slotted revoluble connection therewith, the brushes being arranged circumferentially around the shaft and having a cross-section sufficient to permit them to enter and clean the trough B, formed by parts of adjacent flats, all substantially as set forth.

2. The improved cleaning device for carding-machines herein shown, consisting of the central shaft C, extension-pieces D, connected to said shaft, top-flat cleaners A, revolubly mounted in radial slots in said extension-pieces, and the circular brushes E G, mounted upon the shaft C, the whole forming a single device adapted to clean the top-flats and their grinding-faces and sprockets simultaneously and during the operation of the carding-machine.

407,813. CURRY-COMB. JAMES DU SHANE, South Bend, Ind. Filed May 4, 1888. Serial No. 272,833. (No model.)



Claim.—1. In a curry-comb, the combination of a series of rings or loops, serrated on one edge and arranged within each other, with a handle and a bolt attached to and securing the handle to said rings or loops on one side of the same, substantially as specified.

2. In a curry-comb, the combination of the rings or loops formed of strap metal and serrated on one edge, placed within and eccentrically to each other, with the washers placed between said rings at the point where they approximate, the handle secured to the rings at such point, and the bolt entering the handle and rings, substantially as and for the purpose described.

3. As an improved article of manufacture, a curry-comb composed of a series of rings serrated on one edge, and washers placed between said rings at the points where they are secured to the handle, with a handle having a flattened head and a lug depending therefrom, and the bolt passing through said rings, washers, and lug for securing the rings to the handle, all constructed and arranged substantially in the manner and for the purpose described.

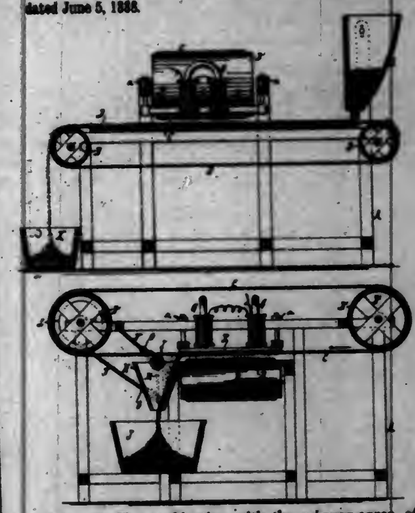
407,814. AUTOMATIC COPY-HOLDER AND LINE-INDICATOR. JOHN V. BERRY, New York, N. Y. Filed June 20, 1888. Serial No. 277,604. (No model.)

Claim.—1. In a copy-holder, the combination of a standard, bed-plate, and movable platen-frame, with suitable connections arranged to hold the copy, and also to admit of the ready insertion and removal thereof, substantially as described.

2. In a copy-holder, a frame with its sides notched and movable ratchets so arranged that a space or slot is left between them to receive the ends of a line-ruler, substantially as described.

3. In a copy-holder with a movable frame arranged to rest upon a platen and with the inner edges of its sides notched, the combination of ratchets, pawls, and line-ruler, substantially as described.

4. In a copy-holder with a frame having its inner side edges notched, the combination of ratchets on each side, pawls, and levers to throw the pawls out of connection, substantially as described.



5. In a copy-holder with a frame, the combination of reciprocating ratchets, a cross-bar connecting them, a button or key by which one movement is made, and springs to produce the return movement, substantially as described.

6. In a copy-holder with a frame, the combination of reciprocating ratchets, a cross-bar connecting them, a button or key by which one movement is actuated, and a set-screw attached to the frame to regulate the extent of motion, substantially as described.

7. In a copy-holder, parallel ratchets on each side, one reciprocating and one permanent, in combination with a line-ruler provided with pawls, divided or bifurcated, so that one fork of each engages one ratchet, springs to lift the reciprocating ratchets so arranged that the forks of the pawls in contact with them carry down a line-ruler, while those engaging with the permanent ratchets prevent the line-ruler from returning, substantially as described.

REISSUES.

11,012. MAGNETIC SEPARATOR. GURDON COMLING, Glens Falls, N. Y. Filed June 3, 1889. Serial No. 313,080. Original No. 383,963, dated June 5, 1888.

Claim.—1. The combination, with the primary apron, of a secondary apron to operate transversely to the primary apron, a magnetized plate secured in proximity to said secondary apron, so as to draw the iron particles to said secondary apron, and suitable driving mechanism for actuating the aprons, substantially as set forth.

2. The combination, with a primary apron and a secondary apron made to operate transversely to the primary apron, of a magnetized plate secured in proximity to said secondary apron, so as to draw the iron particles to said secondary apron, suitable driving mechanism for actuating the aprons, and a scraper or brush made to act on said secondary apron, substantially as set forth.

3. The combination, with a primary apron, of a secondary apron made to operate transversely to the primary apron, a magnetized plate secured in proximity to said secondary apron, so as to draw the iron particles to said secondary apron, and means for adjusting the magnetized plate in relation to the secondary apron, substantially as set forth.

4. The combination, with the feed-apron D and the transverse apron C, of a magnetic plate F, situated between the layers of the apron C in close proximity to one of the layers and extending lengthwise in the direction of the motion of said layer, substantially as shown and described.

5. The combination, with the apron C, of a magnetic plate F, situated between the layers of said apron in close proximity to one of its layers and extending lengthwise in the direction of the motion of said layer, substantially as shown and described.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE CORDREY.

Decided July 8, 1889.

1. AMENDMENTS TOUCHING THE MERITS UNDER RULE 68.
When an amendment touching the merits is presented nearly two years after the case is in condition for appeal to the Examiners-in-Chief, and no showing or attempt at any showing whatever is made why the amendment was not presented earlier, a petition that the case be reopened and that applicant be heard upon the amendment must be denied.

2. ALTERATIONS OF DRAWINGS.
When a figure is added to an original drawing on file in the Office, without direction or permission of the Office, it must be erased or canceled, even though it has been added in good faith.

ON petition.

STEAM WASHING-MACHINE.

Application of Thomas P. Cordrey filed October 7, 1886, No. 215,546.

Mr. E. E. Masson for the applicant.

MITCHELL, *Commissioner:*

This application was finally rejected August 27, 1887. Since that time it has been in condition for appeal to the Examiners-in-Chief. The applicant now asks that the case be reopened and that he may be heard upon an amended claim. He also presents a new specification and supplemental oath, and has recently, and in aid of his present petition, added a figure to the original drawing filed October 7, 1886.

Rule 68 provides that if amendments touching the merits are presented after an application is in condition for appeal they may be admitted upon a duly verified showing of good and sufficient reasons why they were not earlier presented. In this case nearly two years have elapsed since the final rejection by the examiner, and no showing, verified or unverified, is made or attempted to be made why the amendment now offered was not presented earlier.

In the case of *ex parte Thurmond* (C. D., 1886, 90) Rule 68 was expounded. In that decision Commissioner Montgomery said:

> An applicant's claims are rejected. Applicant himself is absent or sick or unable to confer with his attorney. There are urgent reasons for expedition. The attorney, in perfect good faith and after careful examination, asks a reconsideration and second action. The second action is had and the claims are again rejected. At once thereafter the attorney confers with his client in relation to an appeal, and ascertains that he has mistaken or failed to understand an important part of the invention, or something of that character. He then comes back to the Office and asks, notwithstanding the two rejections, that he be permitted to amend so as to fairly exhibit his true invention as applicant intended, and so that the references cited may be fairly avoided. Upon making a showing of these facts or some similar facts, or of something equally meritorious and blameless, he would undoubtedly be allowed to amend, notwithstanding the two rejections. No such case, however, is exhibited here.

In the case under consideration there is not only no sufficient showing, but no attempt is made at any showing whatever. The petition must therefore be denied.

I have already adverted to the fact that the drawing contains a new figure. This figure is placed upon the single sheet which was originally filed nearly three years ago. So far as the face of the drawing discloses it purports to be one of the figures of the original drawing.

In the present case the figure was placed upon the drawing in entire good faith, with reference to the intended presentation of an amendment which should disclose to the Office the fact that the change in the drawing had been made; nevertheless the figure was added to the original drawing-sheet by the attorney without the direction or permission of the Office, and if it should be permitted to remain would indicate that it was a part of the drawing as originally filed. I am informed by the attorney that this figure was added in the Attorney's Room, and that, in his opinion, such a course is neither unusual nor improper. The Rules of Practice make provision for the correction of drawings so as to make them conform to the specification as originally filed, or to the model, if a model has been required, when such correction is made either by direction or permission of the Office. It is impossible that any other right of correction should be recognized, and the figure added to the drawing in this case will be erased or canceled. The fact that it was added in the exercise of a supposed right, and with the intention to apprise the Office of what had been done, has no tendency to prevent the great and irreparable mischief which might result, and in many instances would result, if alterations of drawings were permitted in the Attorney's Room.

As has been already said, the petition must be denied, not, however, because of the addition of a figure to the drawing, since, as I have said above, such addition seems to have been made in good faith, but because of failure to make any suitable showing in accordance with the requirement of the rule.

MEAD *v.* BROWN.

Decided July 6, 1889.

1. MOTION TO DISSOLVE INTERFERENCE UPON THE GROUND OF ESTOPPEL BY OATH OF APPLICANT TO A PRELIMINARY STATEMENT AND BY THE TESTIMONY OF HIS WITNESSES IN A PREVIOUS INTERFERENCE WHEREIN HE WAS ONE OF TWO JOINT APPLICANTS.
An applicant in a pending interference who claims to have been the sole inventor is not estopped by reason of his oath in a preliminary statement in a previous interference, wherein he was one of two joint applicants, nor by the testimony of his

witnesses in that interference, from correcting an error, if an error can be shown to exist, as to the date when his invention went into public use, when the former statement of applicant and testimony of his witnesses were made with reference to an interference proceeding in which the question of two years' prior public use was not directly in issue.

2. In such a case there is no irregularity in declaring the pending interference, and a motion to dissolve such interference upon the ground that the party claimed to be estopped has no legal standing in the Office will be denied.

APPEAL on motion.

SEEDING-MACHINES.

Application of Edwin D. Mead filed June 28, 1886, No. 206,486. Application of Hiram L. Brown filed June 18, 1886, No. 205,573.

Messrs. Dodge & Son for Mead.
Mr. Philip T. Dodge for Brown.

MITCHELL, *Commissioner:*

On the 10th day of August, 1885, George H. Preston filed an application for improvements in seeding-machines. On the 16th of March, 1886, a joint application was filed by Hiram L. Brown and Richard B. Sheldon. While the Brown and Sheldon case was pending a patent issued to Preston, dated April 6, 1886, No. 339,578. An interference was then declared between the patent to Preston and the joint application of Brown and Sheldon. This interference was decided against Preston, the Office holding that Brown alone was the original and first inventor, but that inasmuch as Brown was a joint applicant with Sheldon no award could be made in favor of Brown alone. Prior, however, to this decision Brown had filed a sole application, as had also Edwin D. Mead, who is the other contestant in the present proceeding, Mead being the junior applicant. Thereupon the present interference was declared between the sole application of Brown and the application of Mead.

On the 11th day of December, 1888, Mead filed a motion to dissolve this interference between himself and Brown, averring that the preliminary statement sworn to by Brown and filed in the previous interference by himself and his joint applicant, Sheldon, and the testimony taken in pursuance of that statement, show conclusively, if true, that the invention in dispute had been for more than two years in public use and on sale prior to the filing of the pending application of Brown; that, whether true or false, Brown is bound by his sworn statement and by those of witnesses called in his behalf in the former interference, and is estopped from denying them in whole or in part; that this Office is bound to take notice of its own records, and cannot issue a patent to a party who has himself sworn to alleged facts constituting a statutory bar; that Brown is therefore without standing in the case, and that the facts thus recited show that there has been such irregularity in declaring the interference as will preclude proper determination of priority, since a party without legal standing cannot contest an interference; that the matter in issue is not patentable to Brown, because, according to his sworn statement, it has been in public use and on sale for more than two years prior to his application, such sale or use constituting a statutory bar against his making or receiving any such claim, from which it appears that the interference is antagonistic to grounds set forth in Rule 122 and in Rule 126. The Examiner of Interferences denied this motion, and from this decision appeal is taken to the Commissioner. It will be observed that this is not a motion to suspend the interference that proceedings may be meanwhile instituted to determine whether a statutory bar exists to the grant of a patent. Both Mead and Brown are before the Office seeking a patent for the same invention, and it is manifest that the result of a public-use proceeding, if fatal to the claims of Brown, would be equally fatal to the application of the junior party, Mead. It is probably for this reason that the motion sets forth that the facts recited show that there has been irregularity in declaring the interference, the proposition of Mead seeming to be that Brown is bound in this proceeding by his sworn statement in the former interference, and that, too, whether such statement be true or false, so that he cannot take a patent whatever may have been the actual fact, but is conclusively estopped from being heard to say or prove that the subject-matter now in issue was not in public use for more than two years prior to his application now pending. On the other hand, it is claimed by Brown, first, that as matter of law he is not barred in the pending proceeding from showing that there was an error in his preliminary statement in the case wherein he was one of two joint applicants, and, second, that as matter of fact the date of sale given in his statement in the present case is consistent with the language in the statement in the former case and with the testimony adduced by him under the former issue.

The first question to be considered is whether, in his present controversy with Mead, Brown is conclusively estopped from showing, if he can, that there was an erroneous allegation in the preliminary statement filed by himself and Sheldon in the former interference with Preston. If this question is answered in the affirmative it will then become material to inquire whether or not the former preliminary statement sets up facts amounting to a statutory bar as against the pending application of Brown. If decided in the negative, however, no further discussion will be necessary. Of course, if Brown is not estopped from obtaining a patent, he is not estopped from contesting priority with another party claiming the same invention.

The former statement of Brown was made with reference to an interference proceeding in which the question of two years' prior public use was not directly in issue. In my opinion, it would be going a great way, and, so far as I know, beyond what any Commissioner has ever held, to take the ground that an inventor is forever precluded from showing what the actual fact may be because he has in a former proceeding not involving the same issue made a sworn statement upon the same subject. Even in the same proceeding the rules provide for the amendment of a preliminary statement when it is essential to justice, and it is scarcely conceivable that a more rigorous rule should be applied to a case in which a stranger to the former proceeding asserts the estoppel. If it should be held that no consideration of justice, truth, or fact could avail to authorize the senior party to prove the actual date when the invention went into public use, then, if the fact should be otherwise than is asserted by the junior applicant, the latter might take a valid patent, while the earlier applicant would have been denied a patent because of the statutory bar of two years' prior public use. A method of administration which involves such a result must be a mistaken one, and I am compelled to the conclusion that under his present application, at some stage of the proceedings arising upon it, Brown is at liberty to show, if he can and if the Office requires it, that his invention was not in public use for more than two years prior to his sole application. Such being the law, it follows that this is not a case in which an interference has been irregularly declared between one party who is entitled to a patent and another party who is forever estopped from obtaining a patent.

The conclusion thus reached in one aspect of the case makes it unnecessary to inquire whether the preliminary statement of Brown and Sheldon and the testimony under it, if unexplained, establish two years' prior public use. It appears, however, that the Brown and Sheldon statement averred that the machines had been in public use and on sale since on or about the 14th day of May, 1885. The testimony taken under this statement was to the effect that on that date one machine was shipped, a car-load being shipped on the 15th of July following, the latter date being within two years. It is now claimed, however, on behalf of Brown that this first machine was shipped by the Empire Drill Company, of Shortsville, N. Y., to its general manager at Baltimore, Md., where it was used only for experimental purposes, not having been sold, and that it is still the property of and in the possession of said Empire Drill Company. Under these circumstances it is claimed that the acts referred to in the original preliminary statement as taking place about May 14, 1885, did not constitute in law public use or sale, and that Brown is entitled in the pending proceeding to have the error corrected.

Whether or not there was such an error, and whether or not the facts are as now claimed, can only be ascertained by a proper investigation at the proper time. The motion before me, however, does not ask that the interference proceedings may be suspended that the actual facts may be ascertained, but that the interference may be dissolved because Brown is claimed to be estopped from showing the actual facts.

In the case of *Kohler* v. *Kohler* and *Chambers* (43 O. G., 247) an analogous question arose—to wit, whether an applicant is estopped by reason of his oath filed with a joint application from asserting his rights as sole inventor. Commissioner Hall said:

> The question then recurs whether Kohler, by reason of having joined in the oath filed with the application of Kohler and Chambers, stating that they were original and first inventors, is estopped or in any manner denied the right to take out a patent for the invention as the sole inventor thereof. Attention has been called to some authorities upon this point, and it seems to be uniformly conceded that no such principle of estoppel applies, and that there is no reason why an applicant should be denied a patent on account of having made an error or mistake as to the matter of his joint inventorship.
>
> The interference will undoubtedly develop the truth and the facts, and if it shall appear that there was a joint invention and no sole invention, Kohler will be denied the patent.

It seems to me that the same principle is involved in the pending case, and that the party who claims to have been the sole inventor is no more estopped to correct an error, if an error can be shown to exist, as to the date when his invention went into public use than he would be to deny and correct his sworn statement that the invention was originally made jointly with another.

I deem it proper to repeat that this is not a motion to suspend the interference to enable proof to be taken upon the ground that the first preliminary statement constitutes *prima facie* proof of prior public use, but a motion to dissolve the interference upon the ground that Brown has no right to have any such proceedings instituted in his behalf, but is finally and conclusively estopped from obtaining a patent or appearing as a contestant in an interference proceeding.

What action would be taken upon a motion to institute public-use proceedings need not be indicated, but the decision of the Examiner of Interferences denying the pending motion is sustained.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

RUDE *et al. v.* WESTCOTT *et al.*

Decided March 18, 1889.

1. ASSIGNMENT.

A provision in an assignment of a patent, that the net profits arising from sales, royalties, settlements, or other sources are to be divided between the parties to the assignment, so as to give the patentee one-fourth thereof, does not in any respect modify or limit the absolute transfer of title.

2. SAME.

Nor does a clause appointing the assignees attorneys of the patentee, with authority to use his name whenever they deem proper in the management of the business connected with the ownership of the patent, restrict in any way the interest or power of the assignees. Such a clause is simply unnecessary.

3. MEASURE OF DAMAGES—ROYALTIES.

In order that a royalty may be accepted as a measure of damages against an infringer who is a stranger to the license establishing it, it must be paid or secured before the infringement complained of; it must be paid by such a number of persons as to indicate a general acquiescence in its reasonableness by those who have occasion to use the invention, and it must be uniform at the places where the licenses are issued.

4. SAME—PROOF OF DAMAGES.

Where complainants have failed to establish a royalty as measure of damages, and no evidence of the value of the invention to defendants is adduced, except the conjectural estimates of witnesses who had no practical knowledge of the subject, a decree for anything more than nominal damages cannot be sustained.

APPEAL from the Circuit Court of the United States for the District of Indiana.

STATEMENT OF THE CASE.

The original complainants, John M. Westcott and Charles W. West, allege in their bill that they are the owners, by assignment from the patentee, of two patents to Hiram Moore for improvements in seeding-machines, one issued November 20, 1860, and extended for 7 years from November 20, 1874, and the other issued March 28, 1861, for 17 years; that since the assignment the defendants have made, used, and sold seeding-machines in the district of Indiana, and in various other places in the United States, without the consent or license of the complainants and in infringement of their patents; and that the defendants are still engaged in such unlawful acts. The complainants therefore pray that the defendants may upon their best knowledge and information answer as to the matters alleged, and be compelled to account for and pay to the complainants the profits acquired by them and the damages sustained by the complainants, and be enjoined from making, using, and vending the said machines, or any part thereof, or any seeding-machine made in accordance therewith, or similar to those heretofore made, used, and sold by them. The bill was filed in March, 1876. An answer was filed in June following, in which the defendants admit that they have been and are engaged in the manufacture and sale of seeding-machines, but deny that they infringe either of the patents or any of the rights of the complainants under them, or that the complainants have been thereby deprived of any profits. They also deny that Hiram Moore was the first and original inventor of the alleged improvements described and claimed in the patents, and designate several patents previously issued which, as they allege, embody the substantial and material parts of the invention claimed.

In March, 1881, an amendment to the answer was allowed, in which the defendants deny that the complainants have such title to the patents as to enable them to maintain the suit against the defendants, setting up that on the 10th of November, 1874, the complainant Westcott, by an instrument in writing, assigned to Isaac Kinsey and Aaron Morris an undivided part of his interest in the patents, which instrument is recorded in the Patent Office of the United States, and that on the 4th of February, 1879, the said Isaac Kinsey assigned one-twelfth interest in the patents to one Lowell L. Lawrence and the Wayne Agricultural Company, which assignment is also on record in the Patent Office.

A replication to the answer having been filed, proofs were taken, and among other things the assignment by Moore, the patentee, to the complainants, and the assignment by Westcott to Kinsey and Morris, mentioned in the bill and answers, were produced. They are as follows, omitting such parts as are not material to the questions presented:

ASSIGNMENT OF MOORE TO WESTCOTT AND WEST, AND CONTRACT BETWEEN THEM.

This agreement, made this sixth day of October, anno Domini

one thousand eight hundred and seventy-four, by and between Hiram Moore, residing near Ripon, in the county of Fond du Lac, and State of Wisconsin, party hereto of the first part; Charles W. West, of Cincinnati, in the county of Hamilton, and State of Ohio, party hereto of the second part, and John M. Westcott, of Milton, in the county of Wayne, and State of Indiana, party hereto of the third part, witnesseth:

That whereas sundry Letters Patent of the United States heretofore have been granted to said Moore, which said Letters Patent are respectively numbered, entitled, and dated as follows, to wit: No. 30,685, dated November 20th, 1860, and entitled, "improvement in seed-drills," and No. 31,819, dated March 26th, 1861, and entitled "improvement in seed-drills;" and whereas the said Moore is justly indebted unto the said Charles W. West in the full sum of ten thousand dollars, for money advanced to aid him, the said Moore, in perfecting his inventions, and is desirous of securing the repayment of the same; and whereas the said Westcott is desirous of acquiring an interest in the inventions and Letters Patent aforesaid, and in any reissue, renewal, or extension thereof: Now, therefore,

Know all men by these presents, that, for and in consideration of the premises, and of the sum of five dollars in lawful money, to me in hand, by the said Westcott and West, before the execution hereof, paid, and of other valuable considerations, me thereunto moving, I, the said Hiram Moore, do hereby assign, sell, and set over unto the said Charles W. West and John M. Westcott the entire right, title, and interest in and to the Letters Patent aforesaid, and in and to the inventions and improvements represented, shown, or described therein, including any renewal, reissue, or extension thereof, the same to be held and enjoyed by the said West and Westcott, and their legal representatives, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made, to the full end of any term or terms for which the Letters Patent aforesaid, or either of them, have been, or hereafter may be, granted, reissued, renewed, or extended.

I hereby further agree to sign such lawful papers, and do such lawful acts as may, by the counsel learned in law, of the said West and Westcott, be deemed necessary or expedient in order to obtain an extension or reissue of the patents aforesaid, or to assert, maintain, or defend the rights secured by said Letters Patent. It is expressly understood, however, that the costs and charges of the proceedings aforesaid shall be defrayed by said West and Westcott, as hereinafter provided.

In consideration of the premises, I hereby further make, constitute, and appoint the said Charles W. West and John M. Westcott my true and lawful attorneys in law and in fact, with power irrevocable, giving and granting to them full and exclusive and unreserved power and authority, for me and in my name, place, and stead, to assume and take upon themselves the entire and exclusive management and control of the aforesaid Letters Patent, and of each and every one of them, and to dispose of all the rights, title, and interest which I have under the same, and under each and every of them, for such price or prices, upon such terms, and to such persons, and for such place or places, as they, my said attorneys, shall deem proper, and in my name, place, and stead, and as my own proper act and deed, to sign, seal, deliver, and acknowledge all such deeds and instruments of writing as shall be necessary or proper for the granting or licensing to others the said rights under the said Letters Patent, and to each and every of them, and to ask, demand, sue for, and receive the price of fees, or any part or parts thereof, paid or payable for such grants or licenses, and in my name to execute and deliver receipts and acquittances therefor, and in my name to bring to account and reckoning, and to ask, demand, sue for, and recover and receive of and from all and any person whomsoever, who may have been, or may be, manufacturing or selling said drills containing the improvements aforesaid, or by any or either of them, such reasonable price or fee for such use of said improvements, or either of them, as my said attorneys shall deem proper and reasonable, * * * and generally to do and perform, and execute in my name as aforesaid, all and whatever other acts, matters, and things that they may deem expedient and requisite, or may be advised to do in and about the premises, as fully and effectually, to all intents and purposes, as if I myself were present and did the same, I, the said Hiram Moore, hereby ratifying, allowing, and confirming, and agreeing from time to time, and all times hereafter, to ratify, allow, and confirm as good and valid all and whatsoever the acts, matters, and things which my said attorneys, or their substitute, shall lawfully do, or cause to be done, in and about the premises, by virtue of these presents.

* * *

The said John M. Westcott, for his part, agrees, at his own cost and charges, to procure the extension of said Letters Patent, November 20, 1860, now pending, if practicable, including the expenses already incurred as well as those which hereafter may be incurred in said behalf, which sum is to be paid absolutely whether said extension is granted or not, and in no event is any part of said sum to be reclaimed from, or refunded or repaid by, said Moore, or to be deducted from the sum or sums collected under said patents.

It is hereby covenanted and agreed, by and between the parties hereto, as follows: That from the sum or sums collected under the Letters Patent aforesaid, from sales, royalties, or settlements, or from any other source, shall first be deducted the costs, charges, and expenses of collecting the same, including all litigation expenses save those of the extension application, and then the net profits or receipts shall be divided among the parties hereto as follows: To Hiram Moore, or his legal representatives, one-fourth part; to C. W. West, or his legal representatives, one-fourth part; to John M. Westcott, or his legal representatives, one-half part. In case of loss or failure to realize any profit under said patents, all litigation expenses aforesaid are to be paid by said Westcott, it being expressly understood by the parties hereto that under no circumstances are said Moore or West to incur any obligation, or be under any liabilities for said expenses. It is further agreed that John M. Westcott is to make no charge for his own time spent in this behalf, nor is said West to make any charges for his services.

It is also expressly understood that said Moore's interest is to continue during and throughout the extended time of the patent of November 20, 1860. Should such extension be granted, the parties hereto hereby agree in good faith to perform the covenants between them made.

In testimony whereof, the parties hereto have affixed their hands and seals, the day and year first above written.

HIRAM MOORE. [L. S.]
C. W. WEST. [L. S.]
J. M. WESTCOTT. [L. S.]

In presence of—
WM. D. BALDWIN,
MARY T. PALMER.

ASSIGNMENT OF WESTCOTT TO MORRIS AND KINSEY, AND CONTRACT BETWEEN THEM.

Whereas, heretofore, to wit, October 6th, 1874, Hiram Moore, of Fond du Lac County, Wisconsin, Charles W. West, of Cincinnati, Ohio, and John M. Westcott, of Milton, Indiana, entered into a contract and article of agreement in relation to certain improvements in grain-drills, for which Letters Patent have been issued to said Moore, No. 30,685, dated November 20th, 1860, and No. 31,819, dated March 26th, 1861, in which agreement, amongst other things, the said Moore assigns and conveys to said West one-fourth, and to said Westcott one-half, and retains for himself one-fourth of said interest, contained in said Letters Patent, for said improvements in said grain or feed-drills;

In said assignment, said Westcott, on his part, agrees, at his own cost and charges, to procure the extension of said Letters Patent of November 20th, 1860, including expenses already incurred, as well as those that may hereafter occur in said behalf, to be paid whether such extension be granted or not, and in no event is said sum, or any part thereof, to be reclaimed from or refunded by said Moore, and that from sums collected under said Letters Patents, from sales, royalties, or settlements, or from any other source, shall first be deducted the costs, charges, and expenses of collecting the same, including all litigation expenses, save those of the extension application, and then the net profits, or receipts, shall be divided among said parties; to said Moore one-fourth, said West one-fourth, and said Westcott one-half part. In case of loss or failure to realise any profits under said patent, all litigation expenses aforesaid are to be paid by said Westcott, said Moore or West to be under no liabilities for said expenses. Said Westcott is to make no charge for his own time spent in this behalf, nor is said West to make any charge for his services; said Moore's interest is to continue during and throughout the extended term of the patent of November 20th, 1860, should such extension be granted;

And whereas, in consideration of the foregoing, Isaac Kinsey and Aaron Morris, of Milton, in Wayne county, Indiana, are desirous of obtaining an interest in said Letters Patent, they thereby agree to and with said John M. Westcott, of the same place, to severally take an equal interest with him in the same;

Therefore, this article of agreement witnesseth: That said John M. Westcott hereby agrees to and with said Isaac Kinsey and Aaron Morris, and does hereby set over and assign to each of them one-third part of his one-half interest, retaining one-third part himself in said Letters Patent; and said Kinsey and Morris, fully understanding the original agreement mentioned, do hereby agree to and with said Westcott, to be at one-third expense each with said Westcott, jointly, as set forth in said agreement, and shall be equally entitled and receive one-third profit or proceeds, if any, in said one-half interest, and in all things pertaining hereto to be governed by this and the original contract and agreement.

In witness whereof, we have hereunto set our hands and affixed our seals this 10th day of November, 1874.

J. M. WESTCOTT. [L. S.]
ISAAC KINSEY. [L. S.]
AARON MORRIS. [L. S.]

In May, 1881, the case was brought to a hearing on the pleadings and proofs, and the court held that the patents to Moore were valid; that he was the original and first inventor of the improvements specified in them, and that the title to them was vested in the complainants; that the defendants had infringed the first and second claims of the patent of 1860, and the sixth claim of the patent of 1861, and that complainants were entitled to recover the profits and gains which had accrued to the defendants from the manufacture, use, and sale of the improvements specified in those claims; and ordered a reference to one of the masters of the court to ascertain, state, and report an account of the gains and profits which the defendants or either of them had received by infringing the said claims, as well as the damages the complainants had sustained thereby.

The master thereupon proceeded to comply with the order, and on the 6th of December, 1883, made his report to the court. That report is not contained in the record, but from references to it, and quotations from it in the opinion of the court in considering exceptions taken to it, it appears that he reported that the complainants waived all claim for profits, and relied upon the proofs produced as establishing a fixed license-fee or royalty as the measure of damages. After stating

the testimony of the witnesses who had been examined on the point, he said that it was very difficult to determine from this evidence whether it made proof of such an established royalty or license-fee as furnished a criterion upon which to estimate complainants' damages.

The proof on the subject of damages was thus stated in his report:

It is proved that the Wayne Agricultural Company paid the royalty of $1 for one-horse machines and $2 for two-horse machines for four years—a sum which, in the absence of evidence to the contrary, may be regarded as reasonable. Mast & Co. paid between $2,000 and $3,000 in cash and conceded privileges, which Westcott estimates to have been worth as much more for infringement. It is true Westcott threatened suit, and when money is paid under threat of suit merely as the price of peace, it furnishes no evidence of the amount or value of the real claim in dispute; but the settlement made shows that Westcott was paid something substantial for the infringement, and that the fear of litigation was a small element of the settlement itself. Westcott says that he arrived at the amount by his estimate of the number of the machines made by Mast & Co. and other considerations which are explained in Mast's deposition. Mast says no estimate was made of the number of machines.

Westcott says he gave licenses like the one attached to his deposition to Mast & Co., and to English & Over. Mast was examined but not interrogated on that point. Mr. English, the active man in the firm of English & Over, says he does not recollect whether they took a license or not.

Notwithstanding the difficulty expressed by him, the master reported that the defendants had made and sold 800 infringing one-horse machines, and that complainants' damages on that account were $800; and that defendants had made and sold 800 infringing two-horse machines, and that complainants' damages on that account were $1,600, making $2,400 damages in full. The court, after a full consideration of the exceptions, came to the conclusion that without further evidence the complainants were entitled to only nominal damages, and entered an order that the case be recommitted to the master, with directions to admit further evidence as to damages, and to report the same, with his conclusions of law.

On the 23d of April, 1885, the master made a second report, in which among other things he stated that the additional evidence taken by him did not strengthen the proofs previously made in support of the claim that the complainants had established a license-fee, or royalty, which furnished a criterion by which to estimate the damages. He found that between 1870 and May, 1881, the defendants had made and put on the market about two thousand drills which infringed "the elements of the combination covered by the first claim," one-half of which were one-horse and one-half two-horse drills. He then considered the value of the claim or combination to defendants, who had used it in violation of complainants' rights, and stated that the evidence on this subject was conflicting; that some of the manufacturers considered it of so much value that during the life of the patent they had paid a stipulated license for its use, and that afterward they said it was worth very little if anything, and that it might be true that its value had been impaired and destroyed by new devices and improvements; and that the value of the combination as estimated by the witnesses varied from nothing to $6 per drill. He therefore reported that complainants were entitled to damages for 1,000 one-horse drills at 75 cents each, and 1,000 two-horse drills at $1.50 each, making in all $2,250; but how he arrived at the conclusion that 75 cents on each drill of one class, and $1.50 on each drill of the other class, were the actual damages sustained, nowhere appears.

Exceptions were taken to the report on various grounds, and among others: That the findings were based on speculation, and were only guesses, both as to the number of infringing drills and as to the value of the claim infringed; and that it failed to state any definite facts or evidence as a basis or ground for the findings. In July, 1885, the court decreed that the complainants were entitled to recover $1,800 for the damages sustained, and that so far as the master's report was inconsistent with that decree, the exceptions to it were sustained, but in other respects the exceptions were overruled. From this decision the appeal is taken.

Pending the suit Charles W. West, one of the complainants, and George W. Rude and John R. Rude, two of the defendants, died, and the bill was revived by the substitution of the executors of West in his place, and the administrators of George W. Rude in his place, and the executor of John R. Rude in his place.

Mr. Arthur Stem and *Mr. L. Hill* for the appellants.
Mr. E. E. Wood and *Mr. Edward Boyd* for the appellees.

Mr. Justice FIELD, having stated the facts of the case, delivered the opinion of the Court.

The defendants below, appellants here, seek a reversal of the decree of the circuit court upon several grounds, and, among others, these: first, that the complainants have not established a title in themselves to the patents; and, second, that they have not proved any damages for the infringement of the claims of the patentee. The first of these grounds rests upon the supposed effect of the assignment executed by the patentee to the complainants on the 6th of October, 1874. The instrument in its words of transfer is amply full and expressive to convey to them his entire interest in and title to not only the patents then issued, but also any renewals or extensions thereof. His language is:

I, the said Hiram Moore, do hereby assign, sell, and set over unto the said Charles W. West and John M. Westcott the entire right, title, and interest in and to the Letters Patent aforesaid, and in and to the invention and improvements represented, shown, or described therein, including any renewal, reissue, or extension thereof, the same to be held and enjoyed by the said West and Westcott, and their legal representatives, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made, to the full end of any term or terms for which the Letters Patent aforesaid, or either of them, have been, or hereafter may be, granted, reissued, renewed, or extended.

Nothing could add to the force of this language. The concluding provision, that the net profits arising from sales, royalties, or settlements, or other source, are to be divided between the parties to the assignment so as to give the patentee one-fourth thereof, does not, in any respect, modify or limit the absolute transfer of title. It is a provision by which the consideration for the transfer is to be paid to the grantor out of the net profits made; it reserves to him no control over the patents or their use or disposal, or any power to interfere with the management of the business growing out of their ownership. The clause appointing the assignees attorneys of the grantor, with authority to use his name whenever they deem proper in such management, does not restrict in any way the power of the assignees after the transfer of the property. It was inserted, perhaps, from over-caution, but it was unnecessary. The assignees were under no obligation to consult him in the management of the property. Their own interests were a sufficient guarantee of a judicious exercise of their power of disposition.

The assignment of Westcott to Kinsey and Morris does speak of an interest possessed by him in the patent; but it explains what that interest is, viz., one-half part of the net profits from the patents, arising from sales, royalties, or settlements, or other sources, and it refers to the original assignment of the patentee to West and Westcott.

It follows that the contention of the defendants, that the complainants have not established their title to the patents, is not sustained. The complainants do not hold the property as trustees for the benefit of the patentee; they are only trustees for him of one-fourth of the profits which may be received by them. (*Tilghman* v. *Proctor*, 125 U. S., 136, 143.)

The second ground of the appellants is, we think, well taken. The master reported in his first report that the complainants waived all claim for profits arising from the manufacture, use, and sale of the patented machines, and relied upon the proofs as establishing such a fixed royalty or license-fee as would furnish a criterion by which to estimate complainants' damages; and, proceeding upon that view, he found

from two instances, and perhaps a third instance, in which a specified sum had been paid for the use of the machines, or for the privilege of making and selling them, that the complainants had suffered damages on each one-horse machine used by the defendants of $1 and on each two-horse machine used by them of $2. One of the instances relied upon was that of the Wayne Agricultural Company, which had paid the sums named for the use of the machines for 4 years. It is not clear when the payment was made, but it would seem that it was made in part under a threat of suit, and in part as the result of an arbitration after litigation on the subject had been commenced, and to avoid future litigation. It is clear that a payment of any sum in settlement of a claim for an alleged infringement cannot be taken as a standard to measure the value of the improvements patented, in determining the damages sustained by the owners of the patent in other cases of infringement. Many considerations other than the value of the improvements patented may induce the payment in such cases. The avoidance of the risk and expense of litigation will always be a potential motive for a settlement. The second instance relied upon is that of a corporation by the name of P. P. Mast & Co., which had obtained a license to manufacture grain-drills and seeders at Springfield, Ohio, and to sell the same within the United States, upon an agreement to pay $1 for every one-horse drill or seeder and $2 for every two-horse drill, provided that if the fee were paid upon the days designated for semi-annual returns, or within 10 days thereafter, a reduction of 50 per cent. should be made from the fee. The corporation soon afterward changed its feeding device, and thus did not infringe, and it settled for a portion of the fees; but it does not appear what they were. It is plain, without regard to the settlement had, that an agreement of this kind, where the charge may be fixed at the pleasure of the owner of the patent, cannot be received as evidence of the value of the improvements patented so as to bind others having no such agreement. The third instance is that of an alleged license to English & Over. The complainant Westcott testifies that they continued to pay as long as they were in partnership, but how much, or how long that partnership continued, does not appear. And Mr. Over, a member of that firm, does not recollect that it ever took a license. Westcott also testifies that no other persons or corporations than those mentioned ever took any licenses from them under the patents sued upon.

It is undoubtedly true that where there has been such a number of sales by a patentee of licenses to make, use, and sell his patents, as to establish a regular price for a license, that price may be taken as a measure of damages against infringers. That rule was established in *Seymour* v. *McCormick*, (16 How., 480,) and affirmed in *Corporation of New York* v. *Ransom*, (23 How., 487;) *Packet Co.* v. *Sickles*, (19 Wall., 611, 617;) *Birdsall* v. *Coolidge*, (93 U. S., 64;) and *Root* v. *Railway Co.*, (105 U. S., 189, 197.) Sales of licenses, made at periods years apart, will not establish any rule on the subject and determine the value of the patent. Like sales of ordinary goods, they must be common, that is, of frequent occurrence, to establish such a market price for the article that it may be assumed to express, with reference to all similar articles, their salable value at the place designated. In order that a royalty may be accepted as a measure of damage against an infringer, who is a stranger to the license establishing it, it must be paid or secured before the infringement complained of; it must be paid by such a number of persons as to indicate a general acquiescence in its reasonableness by those who have occasion to use the invention; and it must be uniform at the places where the licenses are issued. Tested by these conditions, the sums paid in the instances mentioned, upon which the master relied, cannot be regarded as evidence of the value to the defendants of the invention patented. The court below so treated them, and held that without further evidence the complainants would be entitled only to nominal damages, and remanded the case to the master to take further evidence. He did so, but in his second report he stated that the additional evidence did not strengthen the proofs previously made in support of the claim that complainants had established a license fee or royalty which furnished a criterion by which to estimate the damages. He therefore proceeded to estimate the value of the claim or combination patented, to the defendants, who had used it in violation of the complainants' rights, and for that purpose took the opinions of different persons on the subject. Of the witnesses produced by the complainants, it does not appear that any ever manufactured or used the patented machines. One of the principal witnesses stated that he had never read the patent, had never seen a drill made like that described, had no experience in the matter of licenses, and that he placed his estimate of the value of the claim patented at what he considered would be a fair recompense to the inventor. The estimates of all the witnesses of the complainants were merely conjectural; that is, were made without having knowledge of any saving secured either in the cost of the machine or in the labor required for its use, they simply stating that they considered that the amounts named by them would be a reasonable and fair royalty or license-fee for the patented drill. Naturally estimates founded upon supposed but not known benefits were widely apart, varying from $3 to $6 for a two-horse drill and half those sums for a single-horse drill. On the other hand, witnesses produced by the defendants, who had examined, and some of whom had used, the patented drills, stated that they did not consider them of any more utility than other seeding-drills in use, and that they did not bring any greater price in the market. The master does not appear to have given weight to the judgment of any of the witnesses, but concluded, though by what process of reasoning is not perceived, that 75 cents on each one-horse drill and double that sum on each two-horse drill would be the proper amount to allow, and as he had found, though upon testimony equally loose and insufficient, that there were 1,000 one-horse drills and an equal number of two-horse drills, he reported that the complainants were entitled to $2,250 as damages. The court was not satisfied with his conclusion, and, without stating the ground of its action, ordered the amount to be reduced to $1,800 as damages which the plaintiff should recover, besides costs, and $150 fee for the master, sustaining the exceptions to the report so far as it was inconsistent with that decree, and in other respects overruling them.

The action of the court is subject to the same objection as the report of the master. The ruling that a royalty was established, as made in the first report, had been repudiated by it, and no evidence of the value of the invention to the defendants was adduced except the conjectural estimates stated; and they furnished no satisfactory basis for any damages, much less data, which authorized the specific finding made as to the damages for each drill used. Opinions not founded on knowledge were of no value. Conclusions from such opinions were at best mere guesses. By the decision rendered a settled rule of law was violated, that actual, not speculative, damages must be shown, and by clear and definite proof, to warrant a recovery for the infringement of a patent. As was said long ago by this Court:

> Actual damages must be calculated, not imagined; and an arithmetical calculation cannot be made without certain data on which to make it. (*New York* v. *Ransom*, 23 How., 487, 488.)

There was no question in this case of damages arising from lost sales, or injurious competition, for no machines had been manufactured and put on the market by the patentee, or by the complainants, his assignees.

No legal ground being shown for the recovery of specific damages for the alleged infringement of the patents, the decree must be reversed, and the cause remanded, with directions to enter a decree for the complainants for nominal damages; and it is so ordered.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 350 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Issue of July 23, 1889.

DESIGNS.

19,213.—STICK-HANDLE FOR CANES, &c.—*Stephen M. Creteau*, Providence, R. I. Application filed June 15, 1889. Serial No. 314,496. Term of patent 7 years.

19,214 to 19,218, inclusive.—CURTAIN.—*Riley Hartley*, Philadelphia, Pa., assignor to *Barnes & Beyer*, same place. Applications filed June 24, 1889. Serial Nos. 315,422 to 315,426, inclusive. Term of patents 3½ years.

19,219.—HEATING-STOVE.—*Werter C. Higgins*, Norwich, Conn. Application filed June 26, 1889. Serial No. 315,643. Term of patent 7 years.

19,220.—FASTENER FOR PAPER.—*George W. McGill*, New York, N. Y. Application filed June 26, 1889. Serial No. 315,642. Term of patent 14 years.

19,221.—STRENGTH OR POWER TESTING MACHINE CASE.—*Alfred W. Reeves*, Brooklyn, N. Y. Application filed June 14, 1889. Serial No. 314,302. Term of patent 7 years.

19,222.—PAPER-WEIGHT.—*William H. Ryer*, Salt Lake City, Utah Ter., assignor to *Miller, Metcalf & Parkin*, Pittsburg, Pa. Application filed June 27, 1889. Serial No. 315,880. Term of patent 14 years.

19,223.—BACK FOR BRUSHES, &c.—*Henry Berry*, Shelton, Conn. Application filed June 25, 1889. Serial No. 315,531. Term of patent 7 years.

19,224.—WEDDING-CARD.—*George F. Brown*, Brooklyn, N. Y. Application filed May 11, 1889. Serial No. 310,470. Term of patent 7 years.

19,225 to 19,229, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edouard C. Sampson*, New York, N. Y. Applications filed July 27, 1889. Serial Nos. 315,813 and 315,816 to 315,818, inclusive. Term of patents 3½ years.

19,230.—POCKET-FLASK.—*Charles H. Read*, Pittsburg, Pa. Application filed June 22, 1889. Serial No. 315,277. Term of patent 3½ years.

19,231.—BABY-CARRIAGE BODY.—*Daniel P. Jefferies* and *James G. Rodgers*, Springfield, Ohio, assignors to *The Tricycle Manufacturing Company*, same place. Application filed December 3, 1888. Serial No. 292,554. Term of patent 14 years.

19,232.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Application filed June 27, 1889. Serial No. 315,814. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,836.—COUGH-MEDICINE.—*Thomas Candy*, Columbus, Ohio. Application filed June 7, 1889. Used since May 15, 1889.
"The representation of an hour-glass."

16,837.—MEDICAL COMPOUNDS FOR EXTERNAL APPLICATION FOR PRODUCING EPIDERMICAL HEAT.—*M. E. Casin & Co.*, New York, N. Y. Application filed May 31, 1889. Used since May 28, 1889.
"The words 'BOTTLED SUNSHINE' and the representation of a bottle with the sun in it."

16,838.—COTTON GOODS.—*Samuel A. Croser & Son*, Upland, Pa. Application filed May 10, 1889. Used since January 8, 1889.
"The words 'SUN CHECKS.'"

16,839.—BOOTS AND SHOES.—*Eva Dalsimer*, Philadelphia, Pa. Application filed June 8, 1889. Used since January 3, 1887.
"The words 'DALSIMER LAST' appearing on a picture of the sole of a human foot, surrounded by the outline of a shoe, associated with the legend ''TIS A FEAT TO FIT FEET.'"

16,840.—BOOTS OR SHOES WITH RUBBER SOLES.—*Thomas N. Ferguson*, Readville, Mass. Application filed April 1, 1889. Used since January 1, 1889.
"The representation of a shoe-sole with the word 'KOO-CHOOK' diagonally across it."

16,841.—GINGER-ALE.—*Frank L. Hazelton*, Boston, Mass. Application filed June 14, 1889. Used since December 1, 1888.
"The words 'COLD BLAST.'"

16,842.—FLOUR.—*The Estate of George V. Hecker*, New York, N. Y. Application filed May 16, 1888. Used since March 22, 1888.
"The representation of a lamb upon an island, bearing a flag, and the letters 'AA' in connection therewith."

16,843.—LAGER-BEER.—*Ferd. Heim Brewing Company*, Kansas City, Mo. Application filed May 31, 1889. Used since March, 1888.
"A crescent with a section-sign and the figures '11' placed within its circle."

16,844.—GUITARS AND MANDOLINS.—*J. W. Jenkins & Son*, Kansas City, Mo. Application filed February 25, 1889. Used since August 22, 1885.
"The word 'HARWOOD.'"

16,845.—CRACKERS, BISCUITS, WAFERS, CAKES, AND KINDRED ARTICLES.—*F. A. Kennedy Company*, Cambridge, Mass. Application filed February 27, 1889. Used since February 18, 1889.
"The representation of a series of stars arranged in the form of a circle."

16,846.—COFFEE.—*Alejandro M. Martinez*, Havana, Cuba. Application filed May 29, 1889. Used since April 6, 1889.
"The representation of coffee-plants and a man having a basket under his left arm and his right hand extended gathering the berries from the plants."

16,847.—[Withdrawn.]

16,848.—MEDICINAL PREPARATION OF A PROPHYLACTIC CHARACTER. *William Radam*, Austin, Tex. Application filed May 17, 1889. Used since September 1, 1887.
"The words 'MICROBE DESTROYER' associated with the representation of a shield with the figures of a man carrying a raised club and a skeleton thereon."

16,849.—MEDICINAL PREPARATION OF A PROPHYLACTIC CHARACTER. *William Radam*, Austin, Tex. Application filed May 17, 1889. Used since September 1, 1887.
"The words 'BACTERIA KILLER' associated with the representation of a shield with the figures of a man carrying a raised club and a skeleton thereon."

16,850.—BEER OF ALL DESCRIPTIONS.—*Bass, Ratcliffe & Gretton, (Limited,)* Burton-on-Trent, county of Stafford, England. Application filed March 20, 1889. Used since 1855.
"A rhomboidal or diamond-shaped figure."

16,851.—BEER OF ALL DESCRIPTIONS.—*Bass, Ratclif & Gretton, (Limited,)* Burton-on-Trent, county of Stafford, England. Application filed March 20, 1889. Used since 1855.
"A triangular figure."

16,852.—DRESS-GOODS AND UMBRELLA-COVERINGS.—*William F. Read*, Philadelphia, Pa. Application filed May 16, 1889. Used since November 15, 1888.
"The word 'LANSDOWNE.'"

16,853.—EMBROCATION PREPARATIONS OR EXTRACTS OF SARSAPARILLA, STOMACHIC TINCTURES, BITTERS, LOZENGES, AND PASTILS.—*Friedrich Adolph Richter*, Nuremberg and Rudolstadt, Germany; Vienna, Austria-Hungary; Rotterdam, Holland, and New York, N. Y. Application filed May 25, 1889. Used since March 1, 1869.
"The representation of an anchor."

16,854.—PAPER-CUTTING MACHINES.—*Shniedewend & Lee Company*, Chicago, Ill. Application filed May 9, 1889. Used since March 1, 1888.
"The word 'ADVANCE.'"

16,855.—PAPER-CUTTING MACHINES.—*Shniedewend & Lee Company*, Chicago, Ill. Application filed May 9, 1889. Used since December 1, 1887.
"The word 'CHALLENGE.'"

16,856.—PRINTING-PRESSES.—*Shniedewend & Lee Company*, Chicago, Ill. Application filed May 9, 1889. Used since November 1, 1884.
"The word 'CHALLENGE.'"

16,857.—GLOVES.—*Sterling Fast Black Glove Co.*, Boston, Mass. Application filed May 15, 1889. Used since April 1, 1889.
"The representation of a mousquetaire or fabric glove bearing the words 'FAST BLACK FABRIC GLOVES' and 'STERLING.'"

16,858.—NEWSPAPER.—*Daniel Stern*, Chicago, Ill. Application filed June 13, 1889. Used since 1881.
"The words 'AMERICAN ARTISAN.'"

16,859.—TOILET-PAPER.—*George W. Thompson*, New York, N. Y. Application filed March 28, 1889. Used since January 1, 1873.
"A rectangular figure made up of top, bottom, and side panels, with a circular sight within the panels, and the words 'GLEN MILLS.'"

16,860.—CORDIAL, LIVER-PILLS, BLOOD-SPECIFIC, AND OINTMENT.—*The "Topaz" Cinchona Cordial Company*, Atlanta, Ga. Application filed May 8, 1889. Used since March 1, 1889.
"The portrait or picture of the Beautiful Countess of Cinchon."

16,861.—KEROSENE-OIL.—*Wilson Grocery Company*, Peoria, Ill. Application filed April 1, 1889. Used since January 1, 1887.
"The words 'BREAK OF DAY.'"

16,862.—CONFECTIONERY.—*George Ziegler Company*, Milwaukee, Wis. Application filed May 24, 1889. Used since 1882.
"The word 'PEERLESS.'"

16,863.—PEAR-TREES.—*The Idaho Pear Co.*, Lewiston, Idaho Ter. Application filed February 15, 1889. Used since November 1, 1886.
"The representation of a tag and the words 'IDAHO PEAR' upon it."

16,864.—WORM REMEDY.—*Annis C. McIntosh*, Cambridgeport, Mass. Application filed June 3, 1889. Used since August 1, 1884.
"The words 'DR. CHAMPLIN'S.'"

16,865.—CHEWING-TOBACCO, PARTICULARLY PLUG.—*Perkins & Ernst*, Covington, Ky. Application filed June 10, 1889. Used since May 10, 1889.
"The representation of a lead-pencil."

16,866.—PINS, BRACELETS, CHAINS, CHARMS, SLEEVE AND SHIRT BUTTONS, AND LIKE ARTICLES.—*Plainville Stock Company*, Plainville and Wrentham, Mass. Application filed June 17, 1889. Used since 1884.
"The letters 'P. S. Co.'"

LABELS.

5,973.—Title: "THE 'LUSTER' FURNITURE POLISH."—*Julius S. Mack*, Kansas City, Mo. Application filed June 25, 1889.

5,974.—Title: "BRAND B" (FOR SHEATHING PAPER.)—*Margaret E. Manahan*, New York, N. Y. Application filed June 13, 1889.

5,975.—Title: "CHEMICAL AND VEGETABLE PARLOR ILLUMINATOR" (FOR BURNING FLUID.)—*William K. Wales*, Baltimore, Md. Application filed June 12, 1889.

5,976.—Title: "HOLDEN'S COUGH SYRUP."—*Isaac D. Holden*, Stockton, Cal. Application filed March 16, 1889.

5,977.—Title: "CARTER'S LIQUID GLUE."—*Carter, Dinsmore & Co.*, Boston, Mass., and New York, N. Y. Application filed September 1, 1887.

5,978.—Title: "CARTER'S LIQUID GLUE."—*Carter, Dinsmore & Co.*, Boston, Mass., and New York, N. Y. Application filed September 1, 1887.

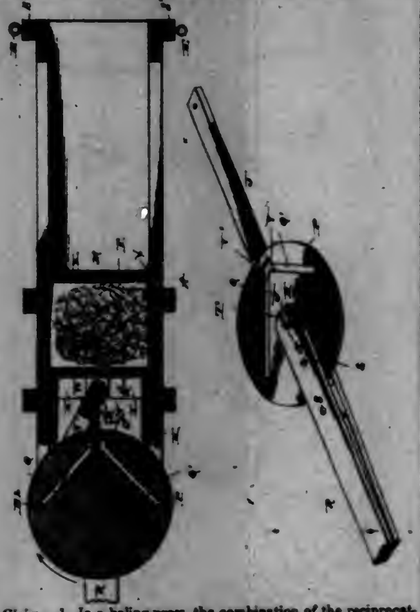
5,979.—Title: "DR. W. C. DETWEILER'S MARVELOUS SPECIFICS."—*William C. Detweiler*, Easton, Pa. Application filed June 27, 1889.

5,980.—Title: "JAPANESE BRAND," (FOR MOTH PAPER.)—*Margaret E. Manahan*, New York, N. Y. Application filed June 27, 1889.

DISCLAIMER.

308,661.—*Sidney H. Short*, Columbus, Ohio. IMPROVEMENT IN INSULATING-SUPPORTS FOR ELECTRIC CONDUCTORS. Patent dated February 26, 1889. Disclaimer filed July 15, 1889, by the patentee.

Enters his disclaimer to the second and third claims, which are in the following words:



"2. In combination with the shank and its clip, the conducting-wire formed with an offset fitted to the clip, substantially as described.

"3. The conducting-wire formed with an offset, and the clip fitted thereto and provided with a hole in its upper end for connection with the shank, substantially as described."

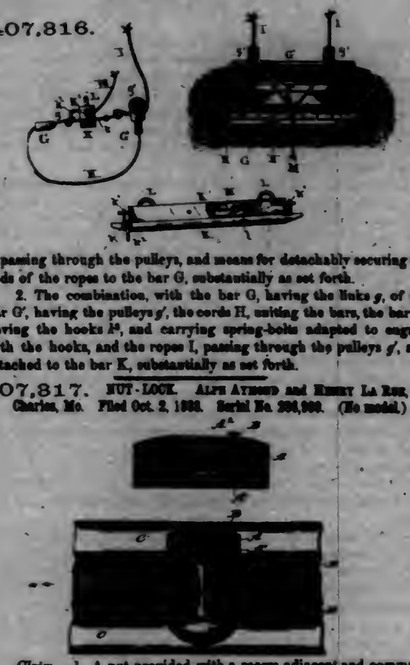
PATENTS

GRANTED JULY 23, 1889.

407,315. BALING-PRESS. ZACHARIAH J. ANDERSON, Fort Worth, Tex. Filed Feb. 13, 1889. Serial No. 299,709. (No model.)

Claim.—1. In a baling-press, the combination of the reciprocating follower, a retracting-spring connecting said follower with the end of the press-frame, a pitman connected pivotally to the said follower and having a friction-roller at its front end, and a horizontal operating-disk having slots formed therein at right angles to each other, and notches or extensions at their meeting ends, substantially as set forth.

2. The herein-described operating mechanism for baling-presses, comprising the disk-plate having slots formed therein at right angles to each other, and notches formed at the meeting ends of the said slots, and forming practically continuations thereof, in combination with a pitman connected pivotally to a reciprocating follower and having a friction-roller operating in the said slots and notches, substantially as set forth.



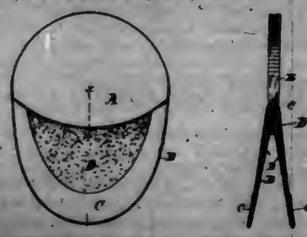
3. In a baling-press, the combination of the press-box, the reciprocating follower, the pitman pivoted to the latter, a vertical bolt at the front end of the press-frame, a horizontal operating-disk mounted loosely on said bolt and having slots formed at right angles to each other, and notches forming continuations of said slots, the bifurcated sweep or operating-lever attached to said cam-plate between a pair of tubular posts or washers upon the bolt, the retracting-spring connecting the follower with the vertical bolt or with one of the posts surrounding the same, and a friction-roller journaled to the end of the pitman and working in the slot and notches in the cam-plate, substantially as set forth.

407,316. HAY-SLING. JAMES G. ARMER, Brookfield, Mo. Filed Nov. 30, 1888. Serial No. 292,177. (No model.)

Claim.—1. A sling for a hay-stacker, consisting of the bars G G', united by the cords H, the pulleys *f*, attached to the bar G', the ropes I, passing through the pulleys, and means for detachably securing the ends of the ropes to the bar G, substantially as set forth.

2. The combination, with the bar G, having the links *g*, of the bar G', having the pulleys *g'*, the cords H, uniting the bars, the bar K, having the hooks k^2, and carrying spring-bolts adapted to engage with the hooks, and the ropes I, passing through the pulleys *g'*, and attached to the bar K, substantially as set forth.

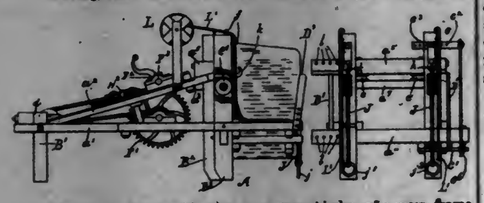
407,316.



407,317. NUT-LOCK. ALPH ATHERTON and HERBERT LA REE, St. Charles, Mo. Filed Oct. 2, 1888. Serial No. 286,902. (No model.)

Claim.—1. A nut provided with a recess adjacent and communicating with its central or main bore and with a pin fitted in the recess and projecting from the outer face of the nut, said pin being provided with threads substantially coincident with the threads of the nut, substantially as specified.

2. A nut provided with a cylindrical recess adjacent and communicating with its central or main bore and with a cylindrical pin fitted in the said recess and projecting from the outer face of the nut, said cylindrical pin being provided with threads coincident with the threads of the nut, substantially as specified.



407,318. ARMPIT-SHIELD. EMILY BAIN, New York, N. Y. Filed Nov. 12, 1888. Serial No. 290,560. (No model.)

Claim.—The combination, in a dress-shield, of a water-proof base-piece B, the edge piece C, composed of water-proof material and attached to said base, so as to form a water-tight pocket, and the re-

movable absorbent D, whereby the absorbent material is exposed on one side to take up the perspiration from the person of the wearer and protected on its other side and at its edges so that the absorbed moisture cannot be expressed therefrom, substantially as described.

407,319. MACHINE FOR BINDING STRAW. HAMILTON BAKER, Pittsburg, Ohio. Filed Feb. 7, 1889. Serial No. 299,046. (No model.)

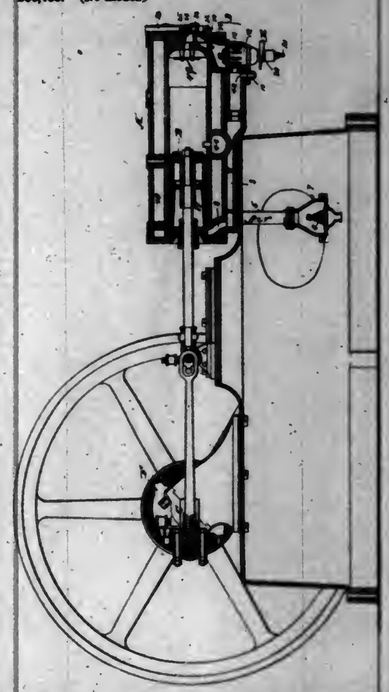
Claim.—1. The combination, in a straw-binder, of a main frame and a binding-table, a windlass supported on said main frame, a movable pulley connected, as described, to said windlass, a binding-rope passing over said movable pulley, with its extremities resting on said binding-table, rings in said binding-rope adapted to engage with stationary hooks on said binding-table, and means, substantially as described, for revolving said windlass, substantially as and for the purpose set forth.

2. The combination of a main frame having a lower longitudinal piece and the upper supporting-pieces at an angle thereto, a movable pulley supported on said upper supporting-pieces, a windlass on the lower longitudinal supporting-pieces connected to the said movable pulley by a rope passing over a fixed pulley on the said main frame, a binding-table having projecting arms adapted to support the ends of a binding-rope which passes over said movable pulley, rings in said binding-rope, and stationary hooks in said binding-table, substantially as and for the purpose set forth.

3. The combination of a main frame having the projecting arms which form the bottom of the binding-table, said projecting arms each consisting of two parallel longitudinal pieces having connecting-bars therein, a supporting-post to which said arms are connected, supporting-pulleys in each of said posts, a binding-rope passing over said pulleys, a movable pulley over which said rope passes, stationary hooks on said posts adapted to be engaged by the rings in the ends of said binding-rope, and means, substantially as described, for drawing said movable pulley against the loop formed in the said binding-rope to cause the same to draw equally from each end, substantially as described.

4. The combination, with a main frame, of the supporting-arms forming a binding-table, the supporting-posts having the stationary hooks therein, and a binding-rope passing through said posts, and a movable pulley around which said rope passes, rings in the ends of said binding-rope adapted to engage said hooks, cord-spools on said main frame, and a notched cord-holder device on each of said supporting-arms, an adjustable butt-board at one end of said binding-table, and means, substantially as described, for drawing said movable pulley against the loop in said binding-rope, substantially as specified.

5. In a straw-binder, the combination, with a main frame, of the supporting-posts B^2 B^3, the supporting-arms secured thereto, stationary hooks on said posts, supporting-pulleys in said posts immediately below said hooks, a binding-rope passing at each end over said supporting-pulley and provided with rings or loops to engage said hooks, a movable pulley in the loop or bight of said binding-rope, and means, substantially as described, for operating said movable pulley to tighten said binding-rope, substantially as specified.



6. The combination, with a main frame, of the front supporting-posts located in different planes to form a binding-table of different capacities at each end, supporting-arms on said posts, stationary hooks and supporting-pulleys supported adjacent to each other by the said posts, a binding-rope passing over said pulleys and provided with rings or loops adapted to engage said hooks, a movable pulley over which said rope passes between the said posts, means, as described, for operating said movable pulley, cord-spools supported on the said frame, and cord-holding pieces on the said supporting-arms, substantially as specified.

7. The combination, with a main frame having a windlass supported thereon and provided with an upper deck portion, and a movable pulley supported on said deck portion and attached to said windlass, of a binding-table having stationary hooks, guiding and supporting pulleys, and a binding-rope passing around said movable pulley and over said guiding and supporting pulleys and adapted at each end to engage the respective hooks, substantially as set forth.

8. The combination of a main frame, a windlass, and a movable pulley supported on said frame, said movable pulley being attached to said windlass, a crank-shaft having a pinion adapted to engage a spur-gear on said windlass, a pawl to limit the motion of said windlass, a binding-table and binding-rope, as described, and stationary hooks adapted to engage the free ends of said binding-rope, which passes over suitable guiding and supporting pulleys and around said movable pulleys, substantially as and for the purpose set forth.

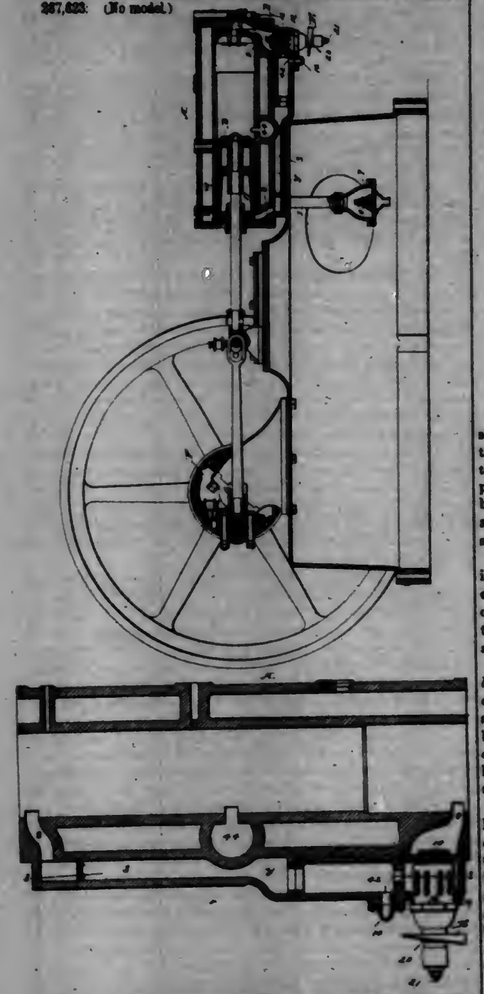
9. The combination, with a main frame, of the front supporting-posts, supporting-arms secured thereto, a binding-rope adapted at each end to engage stationary hooks on said posts, a movable pulley at the rear of said posts around which said rope passes, a windlass for operating said movable pulley, and means, substantially as described, for adjusting one of said supporting-posts and its supporting-arm, substantially as specified.

407,320. GAS-ENGINE. CYRUS W. BALDWIN, Yonkers, N. Y., assignor to William R. Hale, Chicago, Ill. Filed July 28, 1888. Serial No. 280,705. (No model.)

Claim.—1. The combination, with the working-cylinder, inlet-port, and air-pump of a gas-engine, of two chambers communicating with the air-pump and with an air-inlet port, one chamber communicating near its rear end with a gas-supply pipe and both communicating at their rear ends with the passage leading to the cylinder, substantially as set forth.

2. The combination, with the cylinder of a gas-engine having an inlet-port at the rear and air-port at the front, of two chambers communicating with said air-port at the front ends and each communicating independently with the said inlet-port at the rear end, and one of said chambers communicating also with the gas-inlet pipe, substantially as set forth.

3. The combination, with the cylinder, piston, and ports of a gas-engine, of a casing containing two chambers communicating with each other at the front ends, and with an air-inlet port at the front and independently at the rear ends with the charge inlet-port of the cylinder, and a gas-pipe provided with a check-valve communicating with one of said chambers, substantially as set forth.



4. The combination, with the cylinder, piston, and ports of a gas-engine, of a casing provided with a partition partially dividing the casing, an air-inlet port, a gas-inlet port communicating with the casing at one side of the partition, and a communication between the rear ends of the chambers on each side of the casing and the inlet-port of the cylinder, substantially as set forth.

5. The combination, with the pump of a gas-engine, of a casing communicating with the pump and with an air-inlet port at one end partially divided into two communicating chambers, a gas-pipe leading to one of the chambers, and a communication between each chamber, and a passage leading to the working-cylinder of the engine, substantially as set forth.

6. The combination, with the cylinder, piston, and ports of a gas-engine, of a casing provided with two chambers side by side, each communicating with the other at one end and at the other with a passage leading to the cylinder, and a gas-pipe connecting with one of the chambers near the end adjacent to said passage, substantially as set forth.

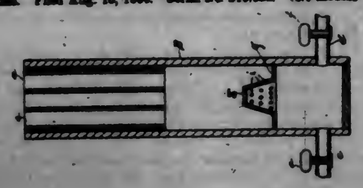
7. The combination of the cylinder, casing, passage leading to the cylinder, valve controlling said passage, and partition dividing said casing longitudinally into two chambers communicating at the forward end and each having a communication with the said passage at the rear end, substantially as set forth.

407,321. GAS-ENGINE. CYRUS W. BALDWIN, Yonkers, N. Y., assignor to William R. Hale, Chicago, Ill. Filed Oct. 9, 1888. Serial No. 287,623. (No model.)

Claim.—1. The within-described improvement in supplying the cylinder of a gas-engine with charges of explosive mixture, the same consisting in drawing air into two chambers, each independent of the gas-chamber, and gas also into one of them, and in then forcing the contents from said chambers and mixing the same together only after they reach the explosion-chamber, substantially as described.

2. The mode of supplying the cylinder of a gas-engine with charges of explosive mixture, consisting in supplying one chamber with a mixture of air and gas having an excess of gas, supplying another chamber with air, forcing the contents from both chambers and bringing them together in the explosion-chamber of the engine, substantially as described.

407,322. STAND-PIPE AND FIRE-ESCAPE. FRANK W. BARNES, Chicago, Ill. Filed Mar. 7, 1889. Serial No. 302,925. (No model.)



Claim.—1. The combination, with the stand-pipe permanently secured to the balconies of a building, of the sectional ladder secured to the stand-pipe, the different sections extending each from one balcony to another, and each section being on the opposite side of the stand-pipe from the section preceding the same, the floors of said balconies being provided with man-holes, the man-hole of each balcony being at the top of the ladder-section extending down from the same, substantially as and for the purpose specified.

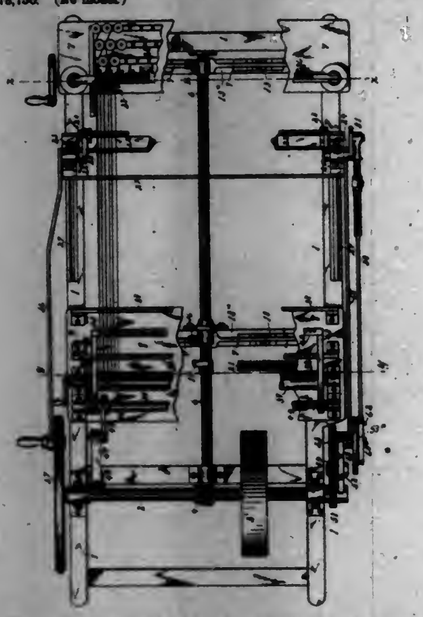
2. A fire-escape consisting of balconies and sections of ladders, in combination with a stand-pipe placed vertically and secured to the different balconies, the sections of the ladder being placed successively on opposite sides of the stand-pipe, and a man-hole in each balcony at the top of the ladder extending down from the same, substantially as and for the purpose specified.

3. The combination, with the vertical stand-pipe *a*, of balconies *b c d*, to which the stand-pipe is secured, ladder-sections *i k l*, and openings *e f g* in the balconies, respectively, one side of each ladder-section being secured to the stand-pipe and the other being secured between the balconies, as described, said sections being arranged successively on different sides of the stand-pipe, and the openings or man-holes *e f g*, corresponding in position to the different ladder-sections, substantially as and for the purpose specified.

4. The combination, with the balconies provided each with a man-hole, of a ladder consisting of different sections or stories, the successive sections or stories of said ladder being placed vertically between the balconies, and each section or story of the ladder having an opening in the balcony at the top of the same, and the floor of the balcony at the foot of each section serving as a landing, said ladder-sections and said man-holes being respectively at the same distance from the building, whereby one descending from one balcony to another is prevented from falling down through the successive openings, substantially as and for the purpose specified.

407,328. GAS-BURNING DEVICE. JOHN F. BARKER, Springfield, Mass. Filed Aug. 13, 1888. Serial No. 282,538. (No model.)

Claim.—1. In a gas-burning device, the combination, with an inclosed chamber, of one or more inlet-pipes for the introduction of gas and atmospheric air under pressure, and a burner-head leading from said chamber consisting of a pipe and a group of tubes arranged side by side therein, substantially as and for the purpose set forth.



2. In a device for burning combined gases or gas and atmospheric air, the combination, with the delivery-pipe, of tubes, as *a a a*, arranged within the pipe and perforated partition *g*, said pipe being provided with a chamber intervening between the partition and the tube, substantially as described.

3. In a gas-burning device, the combination, with an inclosed chamber, of one or more inlet-pipes for the introduction of gas and atmospheric air under pressure, and a burner-head consisting of a pipe leading from said chamber, and a group of tubes arranged side by side within said pipe, with open interstices between them for the escape of gas, substantially as described

4. In a gas-burning device, the combination, with an inclosed chamber, of one or more inlet-pipes for the introduction of combined gases or gas and atmospheric air, and a pipe leading therefrom with a number of convergent tubes therein for the concentration within a limited space of the heat of burning gas-jets issuing from said pipe, substantially as described.

407,324. MACHINE FOR POLISHING THE EYES OF NEEDLES.

PHILO M. BURNS, Bridgeport, Conn. Filed July 2, 1888. Serial No. 278,730. (No model.)

Claim.—1. In a machine of the class described, the combination, with a reciprocating carriage, an oscillating needle-clamp carried thereby, and connecting-rods 30 and 55, of a main shaft having an arm 52, gears 51, 53, and 54, and cam 58, to which rod 30 is connected.

2. The combination, with the carriage, connecting-rod 55, the clamp journaled on the carriage, and connecting-rod 30, pivoted to the clamp, of tables by which the threads are carried, and mechanism, cams, and levers, as shown, whereby the tables are raised and lowered during the polishing of each row of eyes.

3. The combination, with the carriage, connecting-rod 55, the clamp journaled upon the carriage, and connecting-rod 30, pivoted to the clamp, of tables by which the threads are carried, and mechanism—for example, cams and levers, as shown, and arm 18—whereby the tables are raised and lowered during the polishing of each row of eyes, and a lateral movement is imparted to the table as it rises, as and for the purpose set forth.

4. The carriage, the clamp carried thereby, the main shaft having an arm 52, and connecting-rod 55, whereby the carriage is reciprocated, in combination with a fixed gear 51, within which the shaft rotates, an intermediate gear upon the arm engaging gear 51, a shaft journaled in the arm and carrying a cam having a groove 61, a gear 53, engaging the intermediate gear, and a rod 30, connected to the clamp and having a pin engaging the groove, said gears being so proportioned relatively to each other that gear 53 will lose a tooth at each revolution of the shaft and will complete a revolution when the shaft has made as many revolutions as there are teeth in gear 51.

5. The combination, with the reciprocating carriage, the clamp, and shaft 6, of levers 9, by which the tables are supported, and cams 16, engaging the inner ends of said levers, whereby the tables are raised and lowered during each rotation of shaft 6.

6. In combination, the tables, levers 9, having slots 10 and pivotally secured to the tables, blocks engaging said slots and journaled in suitable brackets, and rotating cams engaging the inner ends of the levers, whereby the tables are raised and lowered.

7. In combination, the tables, levers 9, whose outer ends are pivotally secured thereto, one lever of each pair carrying a roller at its inner end, the other being branched to receive the roller, and rotating cams adapted to engage said rollers, whereby the tables are raised and lowered.

8. The combination, with the tables, shaft 6, and cams 16, of levers 9, pivotally connected to the tables and having slots 10, blocks engaging said slots and having pins at opposite ends, and suitable brackets wherein said pins are journaled, substantially as and for the purpose set forth.

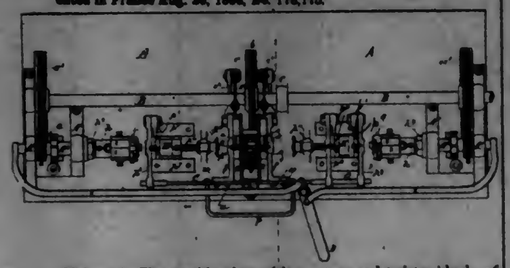
9. In a machine of the class described, frame-work table 8, having arm 18 and eyes 19, and supported by angle-pieces engaging said eyes and eyes upon the frame-work, in combination with a rotating cam engaging said arm to impart a lateral movement to the table, and a spring whereby it is returned to its normal position when the cam has passed the arm.

10. In combination, table 8, having an arm 18, angle-pieces by which the table is supported, shaft 6, having a cam 17, engaging said arm, whereby the table is moved laterally, and a spring whereby the table is returned to its normal position after the cam has passed the arm.

11. Table 8, having eyes 19 and arm 18, and vertically-movable angle-pieces engaging said eyes, in combination with levers 9, whose outer ends are pivoted to the angle-pieces, a rotating cam 16, engaging said levers to raise and lower the table, and a rotating cam 17, engaging arm 18 to impart a lateral movement to the table.

12. Table 8, having thread-bars 38 and a thread-shaft 39, in combination with a rock-shaft having arms 43 and cross-bars, spring-plungers in said cross-bars which engage the threads between bars 38, arm 45, and a strap and weight whereby the spring-plungers are kept in engagement with the thread.

13. Thread-bars 38 and thread-shafts 39, in combination with the rock-shaft, arms 43, cross-bars secured to said arms, spring-actuated plungers carried by said bars and adapted to engage the threads between bars 38, means, as a strap and weight, for retaining the plungers in engagement with the threads, and spring-pawls engaging shaft 39 to prevent backward movement, and the rock-shaft to hold the plungers out of engagement with the threads.



14. In combination, the reciprocating carriage, the needle-clamp journaled thereon, the main shaft, a crank-arm carried thereby, a shaft 53^a, journaled in said arm, a cam rigidly secured to said shaft, intermediate gearing actuated by the main shaft, whereby shaft 53^a and the cam are caused to rotate once during a predetermined number of revolutions of the main shaft, and a connecting-rod pivoted to the needle-clamp and engaging the cam, whereby the plane of the needle-clamp is shifted independently of the movements of the carriage.

15. In combination, the reciprocating carriage, the needle-clamp journaled thereon, the main shaft having a crank-arm, shaft 53^a, journaled in said arm, a grooved cam secured to said shaft, intermediate gearing actuated by the main shaft, whereby said cam is caused to rotate once during a predetermined number of revolutions of the main shaft, and a connecting-rod pivoted to the needle-clamp and to arm 53^a, and having a pin engaging the cam-groove, whereby the plane of the needle-clamp is shifted independently of the movements of the carriage.

16. In combination, the carriage supported by single rollers on opposite sides, the needle-clamp journaled thereon, the main shaft having a crank-arm, a shaft 53^a, journaled in said crank-arm, a grooved cam secured to said shaft, intermediate gearing actuated by the main shaft, whereby rotary motion is imparted to the cam, connecting-rod 55, pivoted to shaft 53^a and rigidly secured to the carriage, connecting-rod 30, pivoted to the needle-clamp and having a slotted connection to shaft 53^a, and a pin engaging the cam-groove, whereby the carriage is reciprocated and tilted forward and backward at each reciprocation and the plane of the needle-clamp is shifted independently of the movements of the carriage.

17. The carriage having a roller 28 at each end, and the needle-clamp carried thereby, in combination with the main shaft having an arm and a hand-wheel, and connecting-rods 55 and 56, one end of said rods being pivoted, respectively, to said arm and said hand-wheel, the other ends being rigidly secured to the carriage, so that each revolution of the shaft will reciprocate the carriage and cause it to tilt forward and backward upon rollers 28.

407,325. NEEDLE-MAKING MACHINE. JEAN BENAIEST, Rixheim, France. Filed June 11, 1888. Serial No. 276,751. (No model.) Patented in France Aug. 26, 1886, No. 173,173.

Claim.—1. The combination, with a rotary end twister-block, of a finger adapted to be moved athwart the line of the heddle and adjustable to and from said block.

2. The combination of two live-spindles whose axes are in line, said spindles being movable in the line of their axes to and from each other, with twister-blocks on said spindles and an eye-forming mechanism between said spindles.

3. The combination, with the spindles A^3 A^4, of levers *l l*, and springs controlling said levers, rods *t t*, and hand-lever D, substantially as and for the purpose set forth.

4. The combination, with the spindle A^3, of the elbowed plate *h*, the fingers *j* and *j'* on said plate *h*, the blocks *r*, having curved surfaces, as set forth, and set-screws *r'*, for adjustment of said blocks, substantially as described.

5. The combination, with the end twister-blocks, of the movable puppets E and the pins *i* on said puppet.

6. The combination, with the end twister-block having the slit finger *j*, of the movable puppet having the pins *i* and *i'*, substantially as and for the purpose set forth.

7. The combination, with the pins *i i* and twister-blocks, of springs tending to drive said pins *i i*, respectively, toward said twister-blocks, for the purpose set forth.

8. A puppet comprising the base-plate *p*, the hinged frame *p'*, the rigid frame p^1, the spring p^2, the plate p^3, sliding in said frame *p'*, the pin *i* on said plate p^3, and the lever p^4, for the purpose set forth.

9. The combination, with the pins *k*, of the guards *e* to said pins, the levers f e^2, and links f' e^3, for operating said guards and pins.

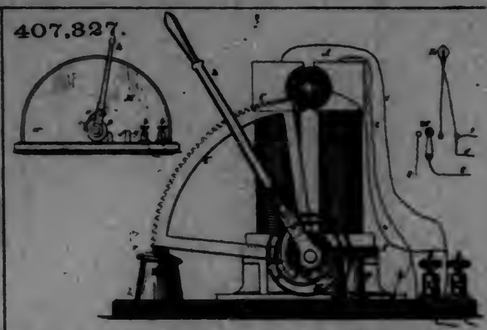
407,326. MILLSTONE-DRESS. JOSEPH BOESELEN, Cincinnati, Ohio. Filed Apr. 22, 1889. Serial No. 308,058. (No model.)

Claim.—A millstone-dress consisting of a series of straight tangential second furrows C, running against the draft and having inclined leading edges *c*, vertical trailing edges *c'*, and enlarged discharging ends, a series of tangentially-curved skirt furrows E, running with the draft and having vertical leading edges *e*, inclined trailing edges *e'*, and contracted outer ends, a concentric distributing-groove D between these sets of furrows, the inner wall of said groove being vertical and its outer wall inclined, and an unfurrowed annular portion F at the rim of the stone, which solid annulus prevents the ground material from being discharged directly from said skirt furrows, all as herein described.

407,327. ELECTRIC GENERATOR. CHARLES R. BURLL, Newark, N. J. Filed Feb. 18, 1889. Serial No. 300,302. (No model.)

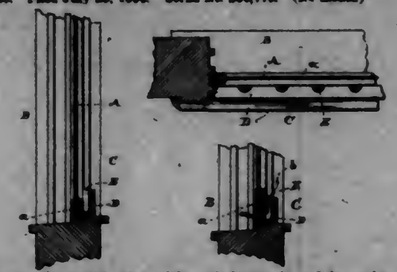
Claim.—1. An electrical generator comprising an exterior circuit and a condensing-circuit, gears for actuating the same, and electrical connections with said gears, the said gears being adapted to first complete the condensing-circuit and then break said circuit, whereby said generator is caused to discharge into the said exterior circuit.

2. An electrical generator comprising a spring-actuated armature and a condensing-circuit, a spring and gears for actuating said generator, and electrical connections with said gears, the said gears being adapted to first complete the condensing-circuit and afterward break said circuit, whereby the generator is caused to discharge into the exterior circuit.



3. The combination, with a generator, of a spring-actuated armature and a winding-up handle or device that is provided with an automatic releasing contact or device, whereby the wound-up armature-actuating mechanism is tripped at a predetermined point in the process of winding.

4. The combination, with a dynamo or magneto electric machine that is provided with a firing-circuit and a condensing-circuit that is completed by the movable parts of the apparatus, as described, of a spring-actuated armature that is provided with an automatic releasing device that in its normal operation trips the armature-actuating mechanism at a predetermined point in the winding, the whole arranged and operating substantially as described.



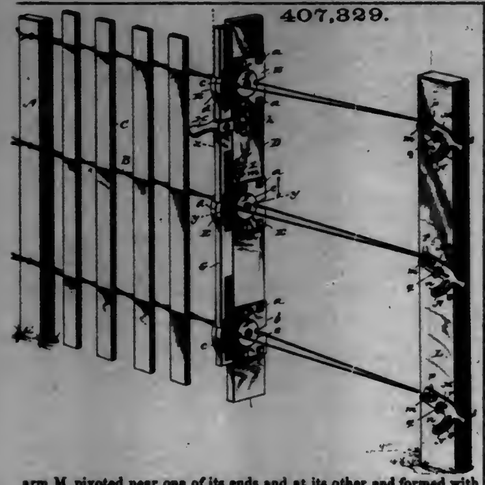
5. An electric generator that comprises an exterior circuit, a condensing-circuit, a spring-actuated armature, gears for actuating said armature, electrical connections with said gears, and a winding handle or device that is provided with a releasing-contact, whereby the wound-up mechanism can be released in the process of winding and the condensing-circuit opened at the desired moment by the moving parts of the apparatus.

6. In an electrical generator the combination, with a spring-actuated armature that is automatically released at a predetermined point in the winding, of a condensing-circuit that is opened at the desired moment in the process of accumulation by the moving parts of the apparatus.

407,327.

407,328. WINDOW-VENTILATOR. THEODORE BURT, Cleveland, Ohio. Filed July 23, 1888. Serial No. 280,770. (No model.)

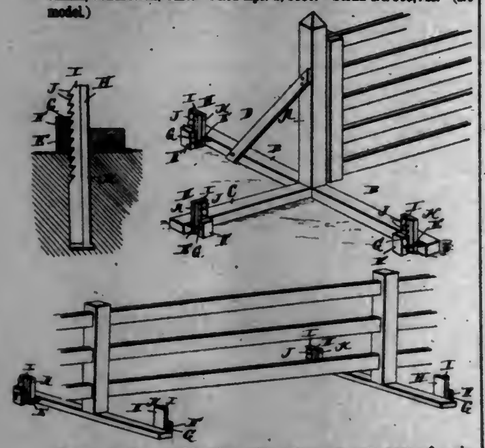
Claim.—In combination with a window-sash and its casing, the bar D, fitted between the sides of said casing in contact with the lower rail of the open sash and having a series of channels or grooves in one side extending nearly to the bottom, as shown, forming controllable openings by means of and in relation with said rail, constructed and arranged substantially as and for the purpose set forth.



407,329. FENCE-MAKING MACHINE. CHARLES W. BURR, Selden, Ohio. Filed May 2, 1889. Serial No. 309,267. (No model.)

Claim.—1. In a fence-making machine, the combination with the board D and the twisters, of the rack-bar, its handle provided with the projection, as described, the stop-blocks on the board, and the spring carried by one of said blocks, substantially as shown and described, and for the purpose specified.

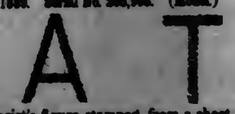
2. In a fence-making machine, the combination, with the tension-



407,329.

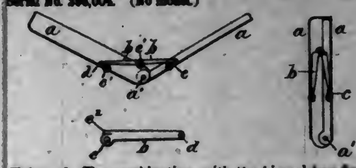
arm M, pivoted near one of its ends and at its other end formed with curved arm slotted as described, of the pin working in said slot, and the rollers on the arm M, between which the wires pass, substantially as shown and described, and for the purpose specified.

407,330. BRACE FOR FENCE OR GATE POSTS. GEORGE W. CLARK, Johnstown, Ohio. Filed Apr. 2, 1889. Serial No. 305,740. (No model.)



Claim.—1. The combination, with a fence or gate post, of a pivoted stirrup, a block mounted pivotally in said stirrup and having teeth or ratchets on its inner face, and an anchor-bar confined in said stirrup and having teeth or ratchets engaging those of the pivoted block, substantially as set forth.

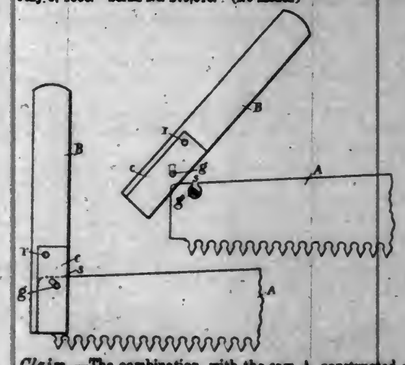
2. The combination, with a fence or gate post, of a pivoted stirrup, a toothed block mounted pivotally on said stirrup, and a vertical anchor-bar having wings or flanges at its lower end and provided with downwardly-beveled teeth or ratchets engaging those of the pivot-block, substantially as set forth.



3. The combination of a vertical post mounted upon a suitable sill, stirrups pivoted to the arms of said sill, toothed blocks mounted pivotally upon said stirrups, and the vertical anchor-bars having wings or flanges at their lower ends and provided with downwardly-beveled teeth engaging those of the pivoted blocks, substantially as herein described, and for the purpose set forth.

407,331. FLORIST'S FIGURE. ANDREW T. CORREY, Boston, Mass. Filed Jan. 10, 1889. Serial No. 295,969. (Model.)

Claim.—A florist's figure stamped from a sheet of material, appropriately colored, and having an adhesive coating covered with a flock made of fragments of flowers more or less comminuted, substantially as described.

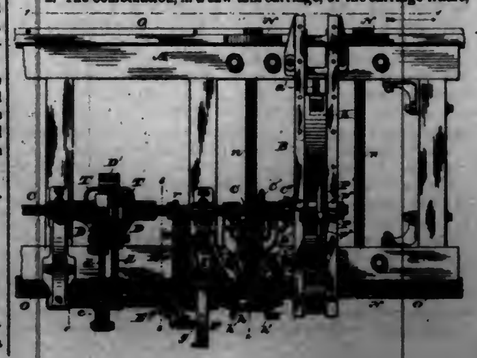


407,332. BAG-HINGE STAY. CHARLES R. CLEVELAND, Newark, N. J., assignor to William H. Peck, same place. Filed Jan. 29, 1889. Serial No. 298,004. (No model.)

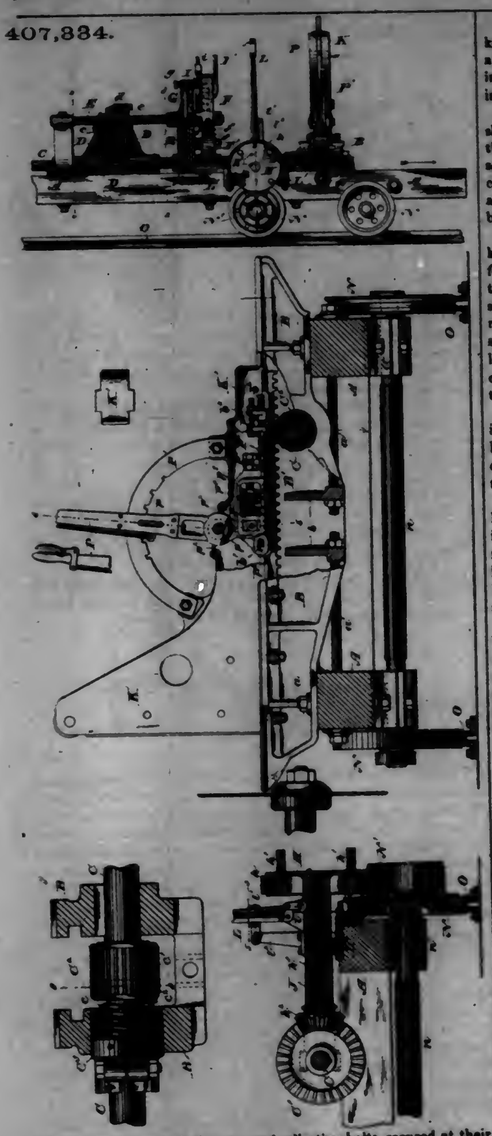
Claim.—1. The combination, with the hinged bag-frames *a a*, of the toggle-arms *b*, jointed to one another and to the bag-frames at equal distances from their hinge, each of the arms being provided upon its upper side with a shoulder *s*, to prevent their bending toward the hinge, and the toggle-arms being bent away from the hinge to close the bag and falling by their own weight into an operative position when the bag is opened, as and for the purpose set forth.

2. The combination, with the bag-frames, of the toggle-arms for the bag-frame brace, each pivoted at one end to one of the frames of the bag and at the opposite end to the other toggle-arm, and each being stamped from sheet metal and formed with pivot-holes *d* and *e*, and the stud *d'*, bent laterally to form both stud and shoulder adjacent to the hole *e*, as and for the purpose set forth.

407,333. SAW-HANDLE. JOHN A. COREY, Rockville, R. I. Filed July 5, 1888. Serial No. 279,010. (No model.)



Claim.—The combination, with the saw A, constructed with a notch *s* in its back, of the handle B, constructed with a recess and provided with a plate *c*, and the pin *g*, having a flattened middle portion, substantially as and for the purpose herein set forth.



407,334. SAW-MILL SET-WORKS. ALBERT CUNNINGHAM and ERNST J. MULLER, Milwaukee, Wis. Filed Mar. 23, 1887. Serial No. 232,073. (No model.)

Claim.—1. The combination, in a saw-mill carriage, of the carriage-frame, a head-block movable endwise thereon, and adjusting-bolts secured in the side rails of said carriage and connected with and acting horizontally in opposite directions upon said head-block, substantially as and for the purposes set forth.

2. The combination, in a saw-mill carriage, of the carriage-frame,

407,334.

a head-block mounted thereon, and adjusting-bolts secured at their inner ends to said head-block and passing horizontally outward and secured in or to the side rails of said carriage-frame, substantially as and for the purposes set forth.

3. The combination, in a saw-mill carriage, of a head-block, a rack movable longitudinally therein, a knee movable transversely to the carriage and capable of longitudinal movement with reference to said rack, and a lever pivoted to said knee and having a horizontally-adjustable connection with said rack, substantially as and for the purposes set forth.

4. The combination, in a saw-mill carriage, of a head-block, a knee movable transversely to the carriage and provided with a rack, a block or frame having a vertically-movable pivot-block and adjustably attached to said rack, and a lever pivoted to the knee and fulcrumed to said vertically-movable block, substantially as and for the purposes set forth.

5. The combination, in a saw-mill carriage, of a head-block, a knee movable transversely to the carriage and provided with a movable rack, and a lever pivoted to said knee and having a horizontally-yielding connection with said rack, substantially as and for the purposes set forth.

6. The combination, in a saw-mill carriage, of a head-block, a knee movable therein transversely to the carriage and provided with a rack, a frame or block adjustably attached to said rack and carrying a yielding block, and a lever pivoted to said knee and fulcrumed in said yielding block, substantially as and for the purposes set forth.

7. The combination, in a saw-mill carriage, of a longitudinally-slotted head-block, a knee arranged to slide therein transversely to the carriage, a rack movable longitudinally on ways in the base of said knee, a yoke or frame adjustably attached to said rack and recessed to receive a vertically-sliding and horizontally-yielding block, and a lever pivoted to said knee and connected with said yielding block, substantially as and for the purposes set forth.

8. The combination, in a saw-mill carriage, of a head-block, a knee movable transversely to the carriage in the ways provided therefor in said head-block, a rack movable lengthwise in ways formed in the base of said standard, a yoke or frame connected at one end by a slotted ear and at the other end by an adjusting bolt or bolts to said rack, a vertically-sliding block inserted in a recess in said frame, a spring acting against one side of said block, an adjusting-bolt for regulating the tension of said spring, and a lever pivoted to said knee and connected with said vertically-sliding block, substantially as and for the purposes set forth.

9. The combination of a shaft, a split pinion, one section of which is fixed and the other section loosely mounted upon said shaft, a collar fixed upon said shaft and bearing in a fixed box, and a spring connecting said collar and the loose section of said pinion, substantially as and for the purposes set forth.

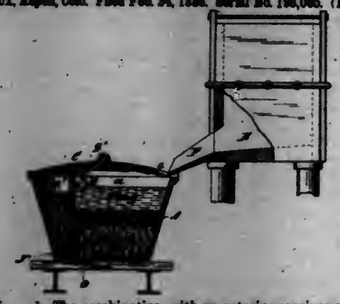
10. The combination, in a saw-mill carriage, of a head-block, a knee movable transversely to the carriage in ways formed therefor in said head-block, a set-shaft, a split pinion, one section of which is fixed and the other section loosely mounted upon said set-shaft, a collar fixed upon said set-shaft and bearing in a box formed in said head-block, and a spring connecting said collar with the loose section of said pinion, substantially as and for the purposes set forth.

11. The combination, in a saw-mill carriage, of a head-block, a knee movable thereon transversely to the carriage, a set-shaft, a split pinion, one section of which is fixed and the other section loosely mounted upon said set-shaft, a collar adjustably secured on said set-shaft and having a bearing in said head-block, and a spring connecting said collar with the loose section of said pinion, substantially as and for the purposes set forth.

12. The combination, in a saw-mill carriage, with the set-shaft and knees, of a transverse shaft mounted in a yoke hinged upon said set-shaft, a gear fixed upon said transverse shaft and working with a gear on the set-shaft, a friction driving-wheel secured to a carriage axle or wheel, a driven friction-wheel fixed upon the outer end of said transverse shaft over said friction driving-wheel, a fixed brake strap or shoe working with the upper face of said driven friction-wheel, and a lever connected with said yoke and arranged to carry the driven friction-wheel into engagement with the driving friction-wheel or brake, substantially as and for the purposes set forth.

13. The combination, in a saw-mill carriage, with the set-shaft and knees, of a transverse shaft geared therewith and bearing in a yoke hinged upon said set-shaft, a paper friction driving-wheel attached to a carriage wheel or axle, which is capable of vertical movement in its adjacent box, a driven friction-wheel mounted upon said transverse shaft vertically, or nearly so, over said friction driving-wheel, whereby the force exerted to produce engagement of said driving and driven friction-wheels acts to increase the traction of said carriage-wheel, and a lever connected with and arranged to move said driven friction-wheel vertically, substantially as and for the purposes set forth.

14. The combination, in a saw-mill carriage, with the set-shaft, a ratchet-wheel fixed thereon, vibrating pawl-carriers provided with pawls working with said ratchet-wheel, and a setting-lever arranged to operate said pawl-carriers, of a quadrant provided with a graduated arc or strap made detachable therefrom to permit of the substitution in its place of arcs or straps having different graduations, a stop fixed relatively to said arc, and a stop movable longitudinally of said arc or strap and arranged to engage the setting-lever at different points in said arc corresponding to its graduation, substantially as and for the purposes set forth.



15. The combination, in a saw-mill carriage, with a set-shaft and knees, of a rock-shaft carrying pawl-actuating arms and a setting-arm, vibrating pawl-carriers connected with the arms on said rock-shaft, a ratchet-wheel on said set-shaft operated by the pawls in said carriers, a longitudinally-adjustable setting-arc provided with a fixed stop, and an adjustable stop movable lengthwise of said arc, said stops being arranged to engage said setting-arm and limit the angular movement thereof, substantially as and for the purposes set forth.

16. The combination, in a saw-mill carriage, with the set-shaft, ratchet-wheel, and vibrating pawl-carrier, of a rigid setting-arm, stops arranged to limit the throw of said setting-arm, and a yielding or elastic actuating-lever, substantially as and for the purposes set forth.

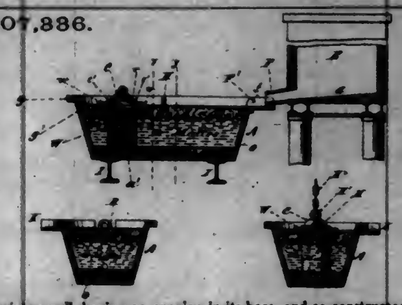
17. The combination, in a saw-mill carriage, with the knees and set-shaft, of a ratchet-wheel fixed upon said set-shaft, a rock-shaft provided with arms and an actuating-lever, vibrating pawl-carriers journaled on said set-shaft, one on each side of said ratchet-wheel and each provided with pins projecting transversely over the face of said ratchet-wheel, one or more pawls and a link journaled upon said pins in each pawl-carrier, said link acting in a direct line with said pawls and connecting said pawl-carrier with an arm on said rock-shaft, and a cap-plate secured to and connecting the inner ends of the pins of each pawl-carrier, substantially as and for the purposes set forth.

18. The combination, in a saw-mill carriage, with the knees and set-shaft, of a ratchet-wheel fixed upon said set-shaft, a rock-shaft provided with a cross-head and an actuating-lever, vibrating pawl-carriers journaled on said set-shaft, one on each side of said ratchet-wheel and each provided with pins overhanging the face of said ratchet-wheel, one or more pawls and a link journaled upon said pins in each carrier, said link acting in a direct line with said pawls and connecting said pawl-carrier with the cross-head on said rock-shaft, and an angle-plate secured to and connecting the inner ends of the pins of each carrier and covering the pawl-bearings therein, substantially as and for the purposes set forth.

407,835. APPARATUS FOR SEPARATING LEAD OR BULLION IN SMELTING FROM SLAGS, MATTES, OR SPEISS. WALTER B. DEVEREUX, Aspen, Colo. Filed Feb. 24, 1886. Serial No. 193,065. (No model.)

Claim.—1. The combination, with an exterior receiver or collecting-well, into which the molten products of the smelting-furnace are tapped, of a movable partition for the separation of the heavy from the light molten products.

2. The combination, with an exterior receiver or collecting-well into which the molten products of the smelting-furnace are tapped, of interior devices within said receiver, so constructed and arranged that they may be raised, lowered, removed, and replaced or moved to any point in the receiver for separating the lead and base bullion and the slags from the intermediate portions of the smelted mass.



3. The combination, with an exterior receiver or collecting-well into which the molten products of the smelting-furnace are tapped, of a diaphragm in the interior of said receiver so constructed and arranged that it can be raised, lowered, removed, and replaced or moved to any point therein, whereby the same is divided into two compartments, an opening in the bottom of or under said diaphragm connecting said compartments, whereby the heavier material discharged from the furnace into the one compartment flows into and rises in the other compartment in proportion as the static pressure in the first compartment increases, and a discharge-spout at the receiving side of the well, whereby the lighter material is discharged.

4. The combination, with an exterior receiver or collecting-well into which the molten products of the smelting-furnace is tapped, of a diaphragm in the interior of said receiver, so constructed and arranged that it can be raised, lowered, removed, and replaced or moved to any point therein, whereby the receiver is divided into two compartments, means, substantially as described, for holding said diaphragm in position, an opening in the bottom of or under said diaphragm connecting said compartments, whereby the heavier material discharged from the furnace into the one compartment flows into and rises in the other compartment in proportion as the static pressure in the first compartment increases, and a discharge-spout at the receiving side of the well, whereby the lighter material is discharged as it accumulates.

407,836. APPARATUS FOR SEPARATING SLAGS, MATTES, AND SPEISS AND LEAD OR BASE BULLION IN LEAD-SMELTING. WALTER B. DEVEREUX, Aspen, Colo. Filed Jan. 12, 1888. Serial No. 260,803. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with a portable receiving or collecting well into which the contents of the smelting-furnace are tapped, of a lead-well placed in said

407,836.

receiving-well, having an opening in its base, and so constructed and arranged as to be readily removed therefrom, and an opening in the side walls of said receiving-well at a higher level than the opening in said lead-well and at a level lower than the slag-spout of said receiver, for the purposes specified.

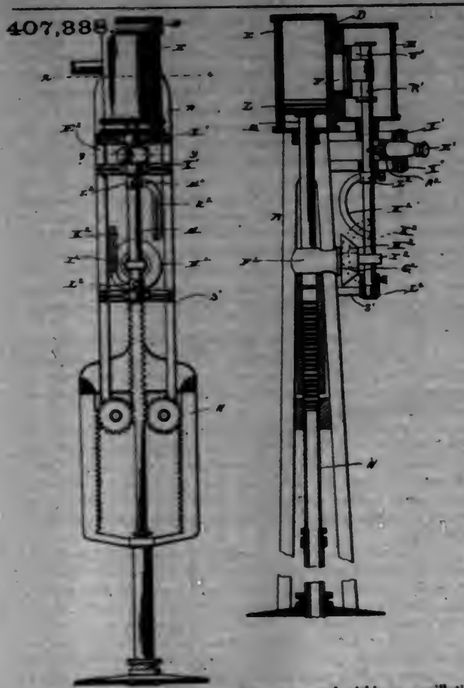
2. The combination, substantially as hereinbefore set forth, with a portable receiving or collecting well into which the contents of the smelting-furnace are tapped, of a lead-well placed in said receiving-well, having an opening in its base, so constructed and arranged that it may be removed therefrom at pleasure, an opening for tapping in the side walls of said receiving-well at a higher level than the opening in said lead-well and at a level lower than the slag-spout of said receiver, and means for closing and opening, substantially as described.

407,837. METHOD OF SEPARATING LEAD AND BASE BULLION FROM SLAG, &c. WALTER B. DEVEREUX, Glenwood Springs, Colo. Filed Apr. 4, 1889. Serial No. 305,958. (No model.)

Claim.—The hereinbefore-described method of separating lead and base bullion from slags, mattes, and speiss in the smelting of ores of precious metals, consisting in smelting the ores in a furnace having no crucible proper and in discharging the smelted mass into a receiver or collecting-well provided interiorly with devices, substantially as described, whereby the same is divided into two compartments, in one of which the lead and base bullion rise through the static pressure of the smelted mass in the other compartment, in tapping off the matte through an opening provided for that purpose in the side walls or bottom of the receiver, and allowing the slags to flow off automatically from the top of the receiver through a suitable aperture.

407,838. STEAM-ENGINE. JOHN G. DOWNIE, Beaver Falls, Pa. Filed Feb. 28, 1889. Serial No. 301,462. (No model.)

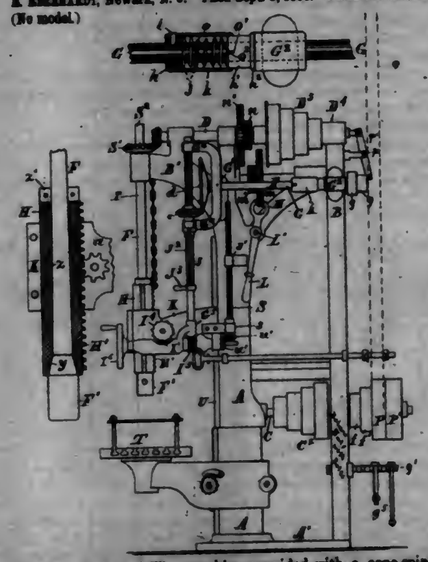
Claim.—1. The combination, in a steam-pump engine, of the rock-shaft carrying the oscillating cut-off valve, the arm Z', projecting from the rock-shaft, the oscillating arm Y', and the spring-pressed plunger guided by the said oscillating arm and flexibly jointed thereto, substantially as described.



2. The combination, in a steam-pump engine, of the rock-shaft carrying the cut-off valve, the arm Z', projecting from said rock-shaft, the oscillating cylindrical arm Y', the plunger arranged in the said oscillating arm and pivotally connected to arm Z', the spring bearing on said plunger, and means, substantially as set forth, to regulate the tension of the spring, substantially as described

3. The combination, in a steam-pump engine, of the rock-shaft R', having the arm Z' and the segment-arm T', the oscillating cut-off valve having the recess with which arm T' engages, said recess exceeding the width of the said arm to give the latter lost motion, the oscillating arm Y', the spring-pressed plunger guided in said arm and connected to arm Z', and stops to limit the play of the valve, substantially as described.

4. The combination, with an oscillating steam-valve, of mechanism for completing the stroke of such valve independently of the motion communicated to it from the piston-rod of the engine, and stops arranged interiorly in the steam-chest to limit the motion of the valve, substantially as set forth.



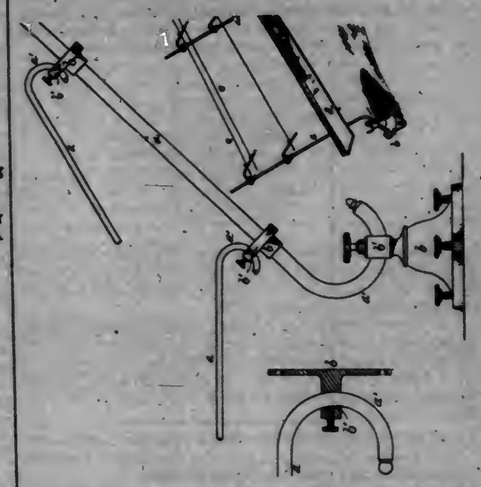
5. The combination of a cylinder or steam-chest, an oscillating valve arranged within the latter, curved arms attached to the valve-stem and adapted to be engaged by a roller journaled to the piston-rod, and an arm extending radially from the valve-stem and connected

407,838.

pivotally with a spring-pressed slide arranged within an oscillating casing, substantially as set forth.

407,839. DRILLING-MACHINE. ULRICH EBERHARDT and HENRY R. EBERHARDT, Newark, N. J. Filed Sept. 5, 1888. Serial No. 284,634. (No model.)

Claim.—1. In a drilling-machine provided with a cone-spindle having a back gear secured thereon and a cone and back gear turning loosely thereon, the combination, with the spindle and the cone, of a clutch for locking the cone and spindle together, a back-gear shaft movable longitudinally, with gears to mesh into those upon the cone and cone-spindle, a lever connected with the back-gear shaft to move it longitudinally and with the clutch to shift it in and out of gear, and a shifting-handle operating independently upon the back-gear shaft to shift it longitudinally and to indirectly actuate the cone-clutch, as and for the purpose set forth.



2. In a drilling-machine, the combination, with the feeding-shaft J, provided with the friction-wheel *e*, of the friction-disk *d*, the shaft G, movable longitudinally toward the wheel *e*, bearings for the shaft G, the spring *j*, applied to the shaft, and a collar adapted to press the shaft under the tension of the spring toward the wheel *e*, as and for the purpose set forth.

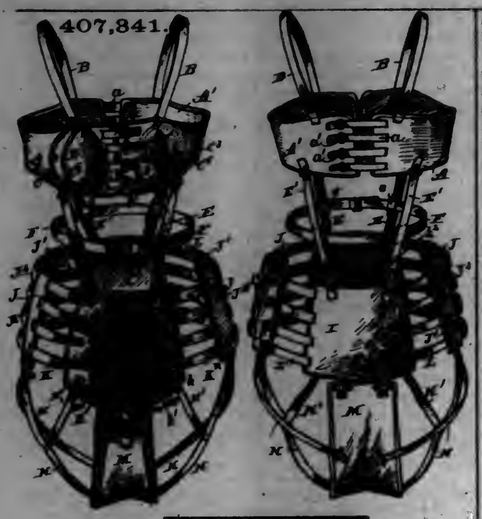
3. In a drilling-machine, the combination, with the feeding-shaft J, provided with the friction-wheel *e*, of the friction-disk *d*, the shaft G, movable longitudinally toward the wheel *e*, bearings for the shaft G, the spring *j*, applied to the shaft, and a collar adapted to press the shaft, under the tension of the spring, toward the wheel *e*, the collar *b'*, movable longitudinally upon the shaft G and fitted against the bearing G^2, the collar *h*, secured to the shaft by a screw *i*, the holes *o* in the shaft to adjust the collar, and the spring *j*, inserted between the collars *h* and *h'*, as and for the purpose set forth.

4. In a drilling-machine, the combination, with the main spindle, the bracket K, supporting the same movably upon the column A, and a feed-wheel rotated upon the bracket for actuating the feed, of a feed-screw coupled to the bracket, and a clutch for connecting such feed-screw to the rotary feed-wheel upon the bracket, as and for the purpose set forth.

5. In a drilling-machine, the combination, with the spindle F, provided with a long bearing adjacent to the head F', of the socket *y*, of abrupt taper, formed in the bearing adjacent to the spindle-head, and the less taper in the remainder of the bearing fitted to the spindle above the socket *y*, as and for the purpose set forth.

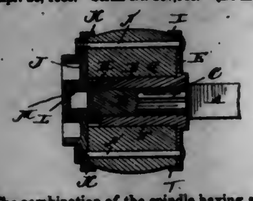
407,840. DISPLAY-RACK. ROBERT FARIS, Decatur, Ill. Filed Dec. 7, 1888. Serial No. 292,881. (No model.)

Claim.—An adjustable support comprising an arm having a bent end of approximately uniform curvature, and a base or bracket having an approximately straight bore or eye slightly greater in diameter than the diameter of the bend, whereby the bend may be adjusted and held in the eye, as set forth.



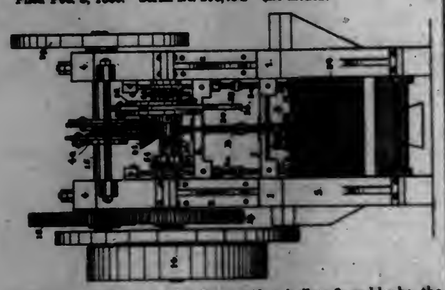
407,841. ABDOMINAL SUPPORTER. IDA M. FRASH, Osage City, Kans. Filed Aug. 22, 1888. Serial No. 283,436. (No model.)

Claim.—1. In a bandage, the combination of the front and rear parts H I, the hip-pads J J, the elastic bands J^3, connecting the hip-pads, and the straps and buckles K L, connecting the hip-pads to the front and rear pads H I, substantially as herein shown and described.



2. The combination, with a breast-bandage, of an abdominal and back pad, straps for connecting the said pads, the keeper-straps E, for connecting the bandage and pads aforesaid, and a belt engaged in the keepers of the straps E, substantially as described.

407,841.



407,842. HUB. EDWARD P. GAINES and WALKER P. ORR, Bradshaw, Tenn.; said Gaines assignor to said Orr and William P. Harwell, same place. Filed Apr. 20, 1889. Serial No. 307,963. (No model.)

Claim.—1. The combination of the spindle having a longitudinal groove, the sleeve mounted on the spindle and fitting in the bore of the hub, the plate J on the end of the hub, having a tube L, and the cap M fitting on said tube, as set forth.

2. The combination of the spindle, the sleeve mounted thereon, the nut on the end of the spindle turning up against the end of the sleeve, the hub fitting on the sleeve, the plates E J at the ends of the hub, the plate J having a central tube L, the cap on said tube, and the long bolts passing through the said plates E J and the hub, as set forth.

407,843. MACHINE FOR FORMING BULLETS. LEON P. GARDIN, San Francisco, Cal., assignor of one-half to John Lafferty, same place. Filed Feb. 6, 1888. Serial No. 263,754. (No model.)

Claim.—1. In a machine for pressing bullets from blanks, the combination of the following parts or elements: a hinged mold having horizontal reciprocating movement between a vertically-acting presser-rod and blank-feeding devices, means by which said mold in its forward run or toward the blank-feeding device is opened to discharge the finished bullet, and then closed to receive a blank at the end of such run, and is held closed on the return to place beneath the presser-rod during the pressing operation, a vertically-acting presser-pin placed for operation beneath the presser-rod and mounted in a swinging centering-plate having lateral movement to set the pin in line and to throw it clear of the mold-aperture while the blank is being fed, and a vertically-acting presser-rod adapted to apply pressure upon the head of the pin, constructed for operation as set forth.

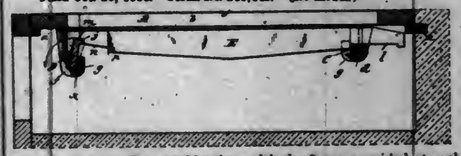
2. In a machine for pressing bullets from blanks, the combination, with the horizontally-reciprocating mold divided longitudinally and opening laterally to discharge the finished bullet, of the laterally-sliding blocks K K, the vertically-movable wedges L L, and mechanism whereby said wedges are operated, as described, to lock the blocks and hold the mold-sections together on the downward movement of the presser-rod while the blank is being pressed, substantially as set forth.

3. In combination with the horizontally-reciprocating mold and vertically-acting presser-rod, the presser-pin adapted to enter the mold-aperture upon the blank held therein, the pivoted plate carrying the end of said pin, and the slotted incline upon which the head of the pin is arranged to travel, as a means of moving said swinging plate laterally to carry the pin into and out of line with the mold-aperture and of moving it also in a vertical direction, substantially as set forth.

4. In combination with the horizontally-reciprocating mold-sections A A, separable on a longitudinal line for lateral movement, the stationary bed-plate having grooves G G, with parallel and divergent portions, and the switch-tongues g^x, and studs a^3 on the mold-sections, substantially as set forth.

5. In a machine for pressing bullets from blanks, the combination of the divided mold-sections A, movable laterally to open and discharge the finished bullet, and the vertically-movable bottom section C, suitably shaped to form the end of the bullet and adapted to close the bottom of the mold-cavity during the operation of the presser, but to withdraw and clear the mold before the sections open, substantially as set forth.

6. In combination with the horizontally-reciprocating mold-sections A A, separable laterally, as described, the vertically-movable bottom piece C, mounted on the upright bar C^x, and the horizontally-sliding plate 33, having the inclined slot C^y, in which the end of the bar 33 is fitted, substantially as described, for operation as set forth.

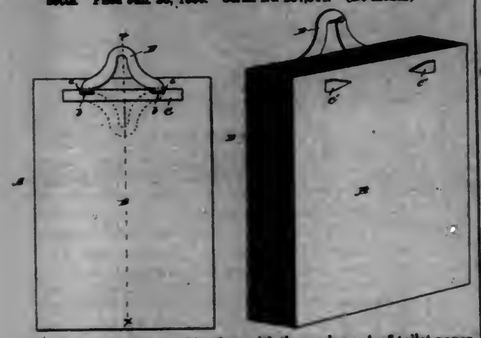


7. In a machine for pressing bullets from blanks, the combination, with a sliding mold having movement between a blank-feeding device and a pressing mechanism, of the blank-feeding tube, sliding gates adapted to operate alternately, the pivoted tongue or finger, and the lug on the lower slide-gate, projecting in the path of the mold in position to be struck and moved by it at the end of the travel, substantially as described.

8. In a machine for pressing bullets from blanks, the combination, with the rod by which pressure is applied to the confined blank, of the rotating shaft 15, cams 60 64, segment-gears 63, link 61, and cam 66, applied for operation as set forth.

9. In a machine for pressing bullets from blanks, the combination, with the rod by which pressure is applied to the confined blank, of the rotating shaft 15, cams 60 64 66, segment-gears 63, and links 61 68, applied for operation as set forth.

10. In combination with the divided mold consisting of the laterally-opening sections A A and the removable bottom section C, from which the sections A A are separated during their reciprocating movement, as described, the stop-pins a^4 a^5, applied for operation as set forth, to support the blank in the mold.



407,844. FURNACE-GRATE. EUGENE H. GATES, Fitchburg, Mass. Filed Oct. 29, 1888. Serial No. 289,445. (No model.)

Claim.—1. The combination, with the frame provided at each side with the downwardly-extending hook-shaped lugs *d f* and the cross-bars C D, supported thereby, and the latter having a width greater than its thickness and having a rolling bearing in the lugs *f*, of the grate-bars, each provided at its one end with a notch *m*, engaging the edge of the bar D, and by its other end portion resting for a slide on the bar C, and means, substantially as described, for rocking said bar D, whereby said grate-bars will be moved endwise and whereby one end of each thereof will be downwardly swung with its contact with the bar C as the center of oscillation, substantially as described.

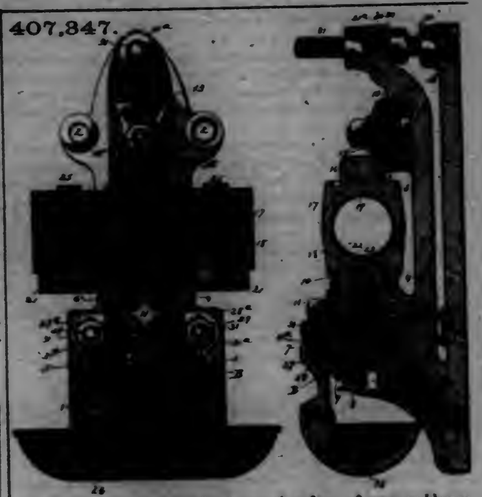
2. The combination, with the frame provided at each side with the downwardly-extending hook-shaped lugs *d f*, and the cross-bars C D, supported thereby, and the latter having a width greater than its thickness and having a rolling bearing in the lugs *f*, and provided with the rib *j*, of the grate-bars, each provided at its one end with the notch *m*, recess *n*, and engaging the bar D, and by its other end portion resting for a slide on the bar C, and means, substantially as described, for rocking said bar D, whereby said grate-bars will be moved endwise and whereby one end of each thereof will be downwardly swung, substantially as described.

407,845. TOILET-PAPER HOLDER. WARREN R. GIBSON, Springfield, Mass., assignor to the Morgan Envelope Company, of Massachusetts. Filed Jan. 23, 1889. Serial No. 297,311. (No model.)

Claim.—1. The combination, with the package A of toilet-paper, of the stiff backing B, the metal strip C, having the projecting prongs or arms C C, and the hinged bail D, all arranged substantially as described.

2. The package A of toilet-paper, the stiff backing B, the metal strip C, having the projecting prongs C C extending forward through both backing and package A, and having the parts *c c*, to which the bail is hinged, struck up above the face of said strip, in combination with the hinged bail D, having eyes *b b*, adapted, when turned down, to lie flat against the backing, substantially as described.

407,846. MACHINE FOR CRUSHING SEEDS. JAMES A. J. GIBSON, Crawford, Ala. Filed Dec. 26, 1888. Serial No. 294,695. (No model.)



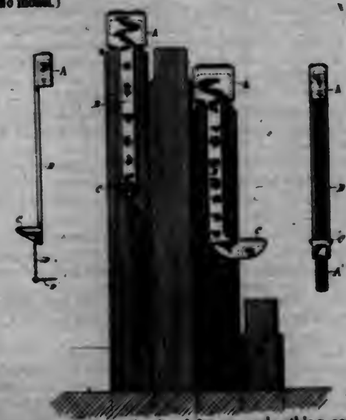
Claim.—In a machine for crushing cotton-seed, the herein-described frame structure, comprising a horizontal rectangular frame, legs depending from the ends of the same, inclined braces secured to the inner sides of the legs and extending upwardly above the horizontal rectangular frame, and crossed braces connecting said inclined braces, said frame structure serving to support the crushing-rolls, which are mounted upon the rectangular horizontal frame, and a hopper which is mounted between the upward extensions of the inclined braces, substantially as set forth.

407,847. SHAFT-HANGER. THEODORE R. GOLDEN, Columbus, Ga. Filed Feb. 21, 1889. Serial No. 300,669. (No model.)

Claim.—1. In a shaft-hanger, the combination, with a bracket

407,847.

and a yoke adjustable toward and away therefrom, of upper and lower bearings mounted on the yoke and adjustable in a direction at right angles to the direction of movement of the yoke, and a box carried by said bearings.



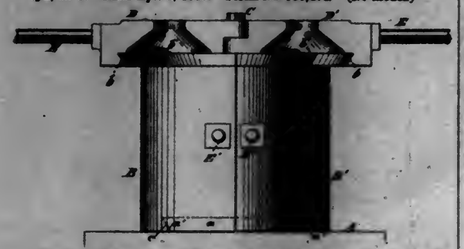
2. In a shaft-hanger, the combination, with a bracket, a yoke adjustable laterally toward and away from the bracket, and lock-nuts for locking the yoke, of upper and lower bearings carried by the yoke and adjustable at right angles to the direction of movement of the yoke, devices for locking the bearings in position, and a box located between and supported by said bearings.

3. In a shaft-hanger, the combination, with a bracket having a slotted shelf, a yoke movable toward and away from said bracket, bearings carried by said yoke and movable in a direction at right angles to the direction of movement of the yoke, screws for locking said bearings in position, and a box located between and supported by said bearings, substantially as set forth.

4. In a shaft-hanger, the combination, with a bracket, of a yoke secured thereto and movable toward and away therefrom, bearings secured to the yoke and adjustable in a direction at right angles to the direction of movement of the yoke, and a sectional box secured between the bearings, substantially as set forth.

5. In a shaft-hanger, the combination, with a fixed plate having a shelf and screw-threaded bolts, a yoke supported on the shelf, and nuts on each side of the yoke by which the latter is moved inward or outward, of a screw-step in the yoke, means for locking it, an adjustable bearing, means for locking it, and a sectional shaft-box supported between the screw-step and adjustable bearing, substantially as set forth.

407,848. DRIVING-HEAD FOR SEWER-SHEATHING. NELSON R. GREEN, Minneapolis, Minn. Filed Mar. 11, 1889. Serial No. 302,815. (No model.)



Claim.—1. A driving-head for sewer-sheathing, consisting of a band adapted to incase the sheathing provided with an outturned jaw

adapted to receive the stroke of the driving-hammer, substantially as described.

2. A driving-head for sewer-sheathing, consisting of a cap-band adapted to fit over the end of the sheathing, one or more dependent arms secured to said cap-band, and an outturned jaw on said arm or arms adapted to receive the stroke of the driving-hammer, substantially as described.

3. The combination, with a driving-head for sewer-sheathing, piles, and similar timbers, of a securing-pin connected to the head by a flexible connection adapted to be driven into the timber for securing the head in its working position with freedom for a limited movement thereon, substantially as described.

407,849. MOLD FOR GLASSWARE. MICHAEL H. HAGERTY, Brooklyn, N. Y. Filed Apr. 8, 1889. Serial No. 306,471. (No model.)

Claim.—In the herein-described mold for blown glassware, the combination, with the base A, of the rod or standard C, the sides B B' of the mold proper hinged to said rod, and the independent cap or blow-over D D', also hinged to said rod and arranged above the body of the mold proper and co-operating therewith substantially in the manner as and for the purpose specified.

407,850. PARALLEL-RULER. JOHN J. HAMILTON, St. Louis, Mo. Filed Mar. 22, 1889. Serial No. 304,267. (No model.)

Claim.—1. A parallel-ruler having one or each of its pivoted connecting-links provided with a graduated scale adapted to swing adjacent to a fixed line on the ruler, substantially as set forth.

2. A parallel-ruler having one of its pivoted connecting-links provided with a scale the graduating lines of which are not parallel and are at different distances apart, and a fixed line on the ruler past which the said lines of the scale are moved, substantially as and for the purpose set forth.

3. A parallel-ruler having the two rulers connected by links pivoted near the outer ends of the rulers, and one or both provided along their inner edges with a scale G, substantially as set forth.

4. The combination of the ruler having a beveled edge, the V-shaped straight-edge bar or ruler adapted to lie over the beveled edge of the ruler, and the connecting-links between the ruler and bar, substantially as set forth.

5. A parallel-ruler consisting of a ruler 1, having a ruling-edge, the connecting-links, and another ruler or bar having a straight-edge 8, and the last said ruler or bar being held by the said links above the surface to be ruled with its edge 8 close thereto, but not in contact therewith, substantially as set forth.

407,851. COMPOUND FOR PRODUCING FLASH-LIGHT. ALEXANDER HEMSLEY, Philadelphia, Pa. Filed May 4, 1888. Serial No. 272,783. (No specimens.)

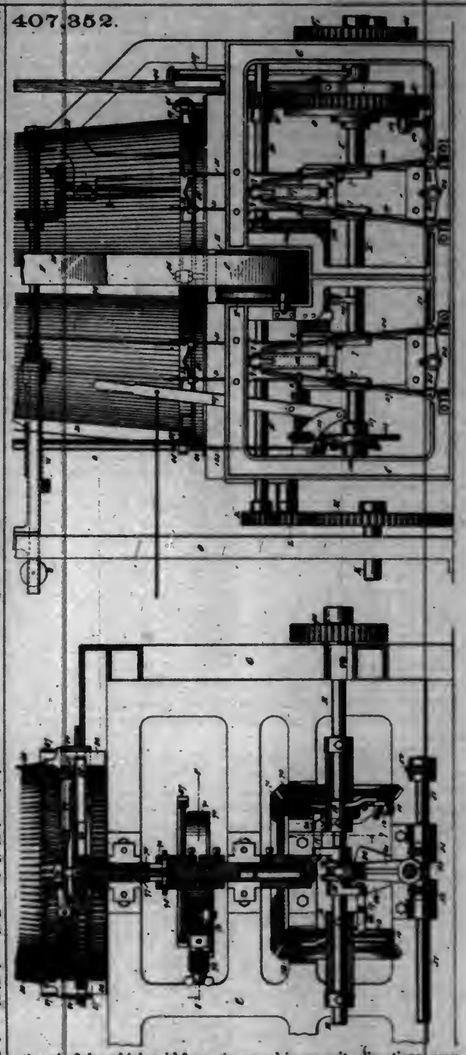
Claim.—1. A compound for producing a momentarily intense flash-light, composed of magnesium, one or more oxygen-yielding salts of the metals or alkaline earths, and phosphorus, substantially as and for the purposes set forth.

2. A compound for producing a flash-light for photographic purposes, composed of powdered or granulated metallic magnesium, one or more nitrates, and amorphous phosphorus, substantially as described.

407,852. EMBROIDERING-MACHINE. JOSEPH IRISH, Bridgeport, Conn., assignor of two-thirds to James McVicker, New York, N. Y. Filed Dec. 15, 1888. Serial No. 293,662. (No model.)

Claim.—1. The combination, with a tambour-frame, of a rotative actuating-shaft by which said frame is moved in opposite directions and movable stops for arresting said shaft in various positions, whereby the length of the stitches is determined, substantially as described.

2. The combination, with a tambour-frame, of a rotative actuating-shaft by which said frame is moved in opposite directions, movable stops for arresting said shaft in various positions, whereby the length of the stitches is determined, and a pattern mechanism for controlling said stops, substantially as described.



3. The combination, with a tambour-frame, of a rotative actuating-shaft by which said frame is moved in opposite directions, movable stops for arresting said frame in various positions, whereby the length of the stitches is determined, and a yielding connection between said shaft and its driver, substantially as described.

4. The combination, with the tambour-frame and its two-part actuating-shaft, of a yielding connection between the parts of said shaft, means for rotating the shaft in opposite directions, and movable stops for limiting the movement of the shaft, substantially as described.

5. The combination, with the tambour-frame and its two-part actuating-shaft, of a yielding connection between the parts of said shaft, means for rotating the shaft in opposite directions, movable stops for limiting the movement of the shaft, and a pattern mechanism for controlling said stops, substantially as described.

6. The combination, with the tambour-frame and its two-part actuating-shaft, of a yielding connection between the parts of said shaft, reversing-gearing for rotating the shaft in opposite directions, movable stops for limiting the movement of the shaft, and clutches for coupling the reversing-gearing, substantially as described.

7. The combination, with the tambour-frame and its two-part

407,852.

actuating-shaft, of a yielding connection between the parts of said shaft, reversing-gearing for rotating the shaft in opposite directions, movable stops for limiting the movement of the shaft, clutches for coupling the reversing-gearing, and a pattern mechanism for controlling the action of the clutches, substantially as described.

8. The combination, with the tambour-frame and its two-part actuating-shaft, of a yielding connection between the parts of said shaft, reversing-gearing for rotating the shaft in opposite directions, movable stops for limiting the movement of the shaft, clutches for coupling the reversing-gearing, and pattern mechanisms for controlling the clutches and stops, substantially as described.

9. The combination, with the movable tambour-frame and its driving-shaft, of a yielding connection for imparting movement to the frame from said shaft and movable stops for limiting the movement of said frame, substantially as described.

10. The combination, with the movable tambour-frame and its driving-shaft, of a yielding connection for imparting movement to the frame from said shaft, movable stops for limiting the movement of said frame, and a pattern mechanism for controlling said movable stops, substantially as described.

11. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gearing and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, and movable stops for limiting the movement of the tambour-frame in both directions, substantially as described.

12. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gearing and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, movable stops for limiting the movement of the tambour-frame in both directions, and a pattern mechanism for controlling said stops, substantially as described.

13. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gearing and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, movable stops for limiting the movement of the tambour-frame in both directions, and a pattern mechanism for controlling said reversing-gearing to move the frame in either direction, substantially as described.

14. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gearing and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, movable stops for limiting the movement of the tambour-frame in both directions, and pattern mechanisms for controlling said reversing-gearing and said stops, substantially as described.

15. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, clutches for connecting and disconnecting said reversing-gears, and movable stops for limiting the movement of the tambour-frame in both directions, substantially as described.

16. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, clutches for connecting and disconnecting said reversing-gears, movable stops for limiting the movement of the tambour-frame in both directions, and a pattern mechanism for controlling said clutches and stops, substantially as described.

17. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, clutches for connecting and disconnecting said reversing-gears, movable stops for limiting the movement of the tambour-frame in both directions, and a pattern mechanism for controlling said clutches to move the frame in either direction, substantially as described.

18. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and a yielding connection, for imparting movement from said shaft to the tambour-frame in opposite directions, clutches for connecting and disconnecting said reversing-gears, movable stops for limiting the movement of the tambour-frame in both directions, and pattern mechanisms for controlling said clutches and said stops, substantially as described.

19. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanisms, each including reversing-gearing and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, and movable stops for limiting the movement of the tambour-frame in each direction, substantially as described.

20. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanisms, each including reversing-gears and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, clutches for connecting and disconnecting said reversing-gears, and movable stops for limiting the movement of the tambour-frame in each direction, substantially as described.

21. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gearing and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, and movable stops for limiting the movement of the tambour-frame in each direction, and a pattern mechanism for controlling said stops, substantially as described.

22. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, clutches for connecting and disconnecting said reversing-gears, and movable stops for limiting the movement of the tambour-frame in each direction, and a pattern mechanism for controlling said stops, substantially as described.

23. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, movable stops for limiting the movement of the tambour-frame in each direction, and a pattern mechanism for controlling said reversing-gearing to move the frame in either direction, substantially as described.

24. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, clutches for connecting and disconnecting said reversing-gears, movable stops for limiting the movement of the tambour-frame in each direction, and a pattern mechanism for controlling said clutches to move the frame in either direction, substantially as described.

25. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gearing and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, movable stops for limiting the movement of the tambour-frame in each direction, and pattern mechanisms for controlling said stops and said reversing-gearing to move the frame in either direction, substantially as described.

26. The combination, with the movable tambour-frame, of a driving-shaft R, connecting mechanism, including reversing-gears and yielding connections, for imparting movement from said shaft to the tambour-frame in opposite directions and in directions crosswise of each other, clutches for connecting and disconnecting said reversing-gears, movable stops for limiting the movement of the tambour-frame in each direction, and pattern mechanisms for controlling said stops and said clutches to move the frame in either direction, substantially as described.

27. The combination, with the tambour-frame and a driving-shaft for moving the same, of a bevel-wheel loose on said shaft and geared with the tambour-frame-actuating shaft, a clutch for coupling said wheel to the shaft, and a pattern mechanism for controlling the movements of said clutch, substantially as described.

28. The combination, with the tambour-frame and a driving-shaft for moving the same, of companion bevel-wheels loose on said shaft and geared with the tambour-frame-actuating shaft, clutches for coupling said wheels to the shaft; and a pattern mechanism for controlling the movements of said clutches, substantially as described.

29. The combination, with the tambour-frame and a driving-shaft for moving the same, of two pairs of companion bevel-wheels loose on said shaft, each pair geared with one of the tambour-frame-actuating shafts, clutches for coupling said wheels to the shaft, and a pattern mechanism for controlling the movements of said clutches, substantially as described.

30. The combination, with the tambour-frame and a driving-shaft for moving the same, of a bevel-wheel loose on said shaft and geared with the tambour-frame-actuating shaft, a clutch for coupling said wheel to the shaft, a yielding connection between the driving-shaft and tambour-frame, and movable stops for arresting said frame, substantially as described.

31. The combination, with the tambour-frame and a driving-shaft for moving the same, of companion bevel-wheels loose on said shaft and geared with the tambour-frame-actuating shaft, clutches for coupling said wheels to the shaft, a yielding connection between the driving-shaft and tambour-frame, and movable stops for arresting said frame, substantially as described.

32. The combination, with the tambour-frame and a driving-shaft for moving the same, of two pairs of companion bevel-wheels loose

on said shaft, each pair geared with one of the tambour-frame-actuating shafts, clutches for coupling said wheels to the shaft, a yielding connection between the driving-shaft and tambour-frame, and movable stops for arresting said frame, substantially as described.

33. The combination, with the tambour-frame and a driving-shaft for moving the same, of a bevel-wheel loose on said shaft and geared with the tambour-frame-actuating shaft, a clutch for coupling said wheel to the shaft, a yielding connection between the driving-shaft and tambour-frame, movable stops for arresting said frame, and pattern mechanisms for controlling the movements of the stops and clutch, substantially as described.

34. The combination, with the tambour-frame and a driving-shaft for moving the same, of companion bevel-wheels loose on said shaft and geared with the tambour-frame-actuating shaft, clutches for coupling said wheels to the shaft, a yielding connection between the driving-shaft and tambour-frame, movable stops for arresting said frame, and pattern mechanisms for controlling the movements of the stops and clutches, substantially as described.

35. The combination, with the tambour-frame and a driving-shaft for moving the same, of two pairs of companion bevel-wheels loose on said shaft, each pair geared with one of the tambour-frame-actuating shafts, clutches for coupling said wheels to the shafts, a yielding connection between the driving-shaft and tambour-frame, movable stops for arresting the frame, and pattern mechanisms for controlling the movements of the stops and clutches, substantially as described.

36. The combination, with the tambour-frame, of the screw-shafts and nuts *f g* for imparting up and down movements to the frame, and the rods *b*, each having a universal joint at both its ends for transmitting the movement derived from the shafts and nuts to the frame, substantially as described.

37. The combination, with the balancing-levers *p*, carrying the pulleys *l*, of the tambour-frame supported upon said pulleys, the screw-rods *f* and nuts *g*, and the rods *b*, connected to said levers and to said nuts or screw-shafts by universal joints, substantially as described.

38. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, and a series of movable stops 86, for arresting the arm and frame without arresting the driving mechanism, substantially as described.

39. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same in opposite directions, according to the direction in which said gear is revolved, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, and a series of movable stops 86, for arresting the arm and frame as they are moved in either direction without arresting the driving mechanism, substantially as described.

40. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, and a series of movable stops 86, for arresting the arm and frame without arresting the driving mechanism, and a pattern mechanism for controlling said stops, substantially as described.

41. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same in opposite directions, according to the direction in which said gear is revolved, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, and a series of movable stops 86, for arresting the arm and frame as they are moved in either direction without arresting the driving mechanism, and a pattern mechanism for controlling said stops, substantially as described.

42. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, and a series of movable stops 86, for arresting the arm and frame without arresting the driving mechanism, and a reciprocating frame 89, acting upon said stops to restore them to their normal position, substantially as described.

43. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, a series of movable stops 86, for arresting the arm and frame without arresting the driving mechanism, and means for imparting a slight backward movement to said arm after it has been arrested to release the stop, substantially as described.

44. The combination, with the tambour-frame of an embroidery-machine, a gear 60 or 69 for moving the same, and a yielding connection through which said gear is driven, of an arm 83, moving with said gear and frame, a series of movable stops 86, for arresting the arm and frame without arresting the driving mechanism, the series of recesses 2, corresponding to the stops, and the reciprocating bar 90, carried by the arm 83 and arranged to enter one of said recesses after the arm is arrested and move the arm slightly backward to release the stop, substantially as described.

45. The combination, with the tambour-frame of an embroidery-machine, a driving-shaft therefor, and a yielding connection through which the movement of said shaft is transmitted to the frame, of an arm 83, moving with said frame, and a series of movable stops for arresting said arm and frame without arresting the driving mechanism, substantially as described.

46. The combination, with the tambour-frame of an embroidery-machine, a driving-shaft therefor, and a yielding connection through which the movement of said shaft is transmitted to the frame, of an arm 83, moving with said frame, and a series of movable stops for arresting said arm and frame without arresting the driving mechanism, and a reciprocating frame 89, acting upon said stops to restore them to their normal position, substantially as described.

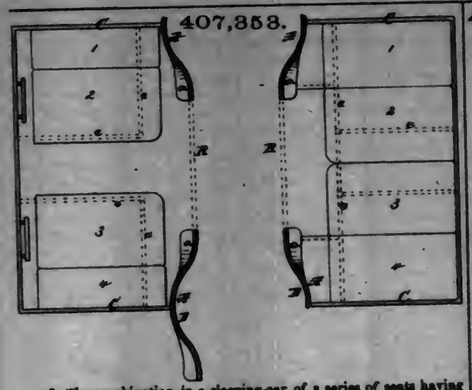
47. The combination, with the tambour-frame of an embroidery-machine, a driving-shaft therefor, and a yielding connection through which the movement of said shaft is transmitted to the frame, of an arm 83, moving with said frame, and a series of movable stops for arresting said arm and frame without arresting the driving mechanism, and means for imparting a slight backward movement to said arm after it has been arrested to release the stop, substantially as described.

48. The combination, in an embroidery-machine, of a driving-shaft R, a loose gear 63 or 64, means for imparting its movement to the tambour-frame, a clutch for connecting and disconnecting said gear to and from the shaft, a movable rod 27 or 28, connected to operate said clutch to clutch the gear, and a reciprocating head 56, arranged to engage with said rod or not, according to the position of the rod, substantially as described.

49. The combination, in an embroidery-machine, of a driving-shaft R, a loose gear 63 or 64, means for imparting its movement to the tambour-frame, a clutch for connecting and disconnecting said gear to and from the shaft, a movable rod 27 or 28, connected to operate said clutch to clutch the gear, and a reciprocating head 56, arranged to engage with said rod or not, according to the position of the rod, and a pattern mechanism for controlling the position of said rod, substantially as described.

50. The combination, in an embroidery-machine, of a driving-shaft R, a loose gear 63 or 64, means for imparting its movement to the tambour-frame, a clutch for connecting and disconnecting said gear to and from the shaft, a movable rod 27 or 28, connected to operate said clutch to clutch the gear, and a reciprocating head 56, arranged to engage with said rod or not, according to the position of the rod, and a cam 78, for operating said clutch to unclutch the gear, substantially as described.

51. The combination, in an embroidery-machine, of a driving-shaft R, loose reversing-gears 63 64, means for imparting their movement to the tambour-frame in reverse directions, clutches for connecting and disconnecting said gears to and from their shaft, movable rods 27 28, connected to operate said respective clutches to clutch the gears, and a reciprocating head 56, arranged to engage with one of said rods or not, according to the position of the rods, substantially as described.



52. The combination, in an embroidery-machine, of a driving-shaft R, loose reversing-gears 63 64, means for imparting their movement to the tambour-frame in reverse directions, clutches for connecting and disconnecting said gears to and from their shaft, movable rods 27 28, connected to operate said respective clutches to clutch the gears, and a reciprocating head 56, arranged to engage with one of said rods or not, according to the position of the rods, and a pattern mechanism for controlling the position of said rods, substantially as described.

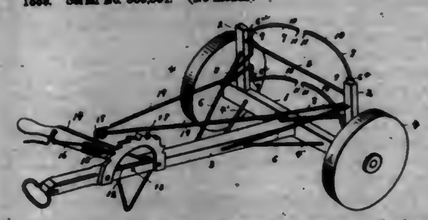
53. The combination, in an embroidery-machine, of a driving-shaft R, loose reversing-gears 63 64, means for imparting their movement to the tambour-frame in reverse directions, clutches for connecting and disconnecting said gears to and from their shaft, movable rods 27 28, connected to operate said respective clutches to clutch the gears, and a reciprocating head 56, arranged to engage with one of said rods or not, according to the position of the rods, and a cam 78, for operating said clutches to unclutch the gears, substantially as described.

54. The combination, with a tambour-frame, of a rotative actuating-shaft by which said frame is moved in opposite directions, movable stops for arresting said frame in various positions, whereby the length of the stitches is determined, a pattern mechanism for controlling said stops, and a yielding connection between said shaft and its driver, substantially as described.

407,353. SLEEPING-CAR. LOUIS KELLER, New York, N. Y. Filed Jan. 21, 1889. Serial No. 296,960. (No model.)

Claim.—1. The combination, with a car-seat, of an end frame curved in its horizontal section, with a concave side toward the center of the car, as specified.

2. The combination, in a sleeping-car, of a series of seats having the end frames thereof curved in horizontal section, as specified and set forth.



3. The combination, in a sleeping-car, of a car-seat curved in its horizontal section and an upper berth and lower berth of less width than the seat-frame, as specified and set forth.

4. The combination, in a sleeping-car, of a seat-frame and an upper berth and lower berth of less width than the seat-frame, as specified.

5. The combination, in a sleeping-car, of a seat-frame and curtain arranged to hang a distance from the side of the upper and lower berths, which are of less width than the seat-frame, substantially as specified.

6. The combination, in a sleeping-car, of a fixed curtain covering the adjacent ends of two berths and a curtain at the center of the length of the section extending from one fixed curtain to another, substantially as specified.

407,354. TRUCK. JOHN W. KIRK, Kincaid, Kans. Filed May 4, 1889. Serial No. 309,551. (No model.)

Claim.—1. In a truck, opposite standards provided with pivoted grippers and intermediate cranks, in combination with a locking-lever connected with the cranks, substantially as specified.

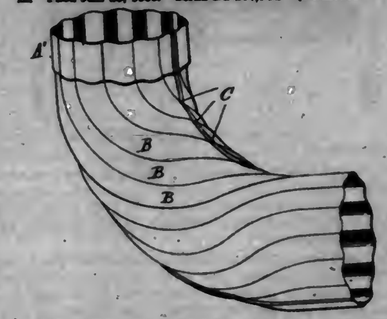
2. In a truck, opposite standards having vertically-opposite eyes, in combination with a gripper mounted in each of the pair of eyes, and consisting of a central cranked portion, oppositely-bent bearing portions, and opposite terminal gripping-arms, and with an operating-lever pivotally mounted in the frame of the truck and connected with the cranks of the grippers, and provided with a spring-bolt and a locking rack-bar arranged at the side of the lever, substantially as specified.

3. The beam or axle 1, having the tongue 3, wheels 4, and opposite posts 2, the latter provided with eyes 6, in combination with the grippers 7, comprising the central cranked portion 8, the bearings 9, mounted in the eyes and terminating in the gripping-arms 10, having spurs 11, and the lever 14, pivoted as at 13 and carrying the spring-bolt 15 and its operating-rod 16, and the curved rack-bar 17, and the eye 18, and rods 19, connecting the eye and cranks, substantially as specified.

4. In a truck, the grippers mounted on the axle thereof, and comprising the central crank portion 8, the bearings 9, and the gripping-arms 10, combined with the lever 14, its locking device and connecting-rods, as set forth.

407,355. FLAT-IRON HEATER. JASPER D. KNOX, Oxford, Ind. Filed Sept. 26, 1888. Serial No. 286,448. (No model.)

Claim.—1. A flat-iron heater of the class described, consisting of a closed shell having an imperforate bottom and a series of doors in its side, an imperforate draft-tube B, arranged centrally within said shell, opening through the bottom, and terminating a short distance below the top thereof, and a separate perforated concentric tube C surrounding said tube B, whereby the heat is radiated and distributed



407,355.

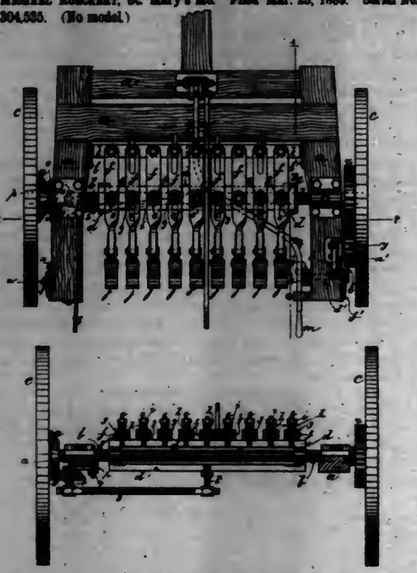
uniformly from the tube B against the vertical faces of the bottoms of the flat-irons arranged contiguous to said tube B, as and for the purpose described.

2. A flat-iron heater of the class described, consisting of a shell or drum having an imperforate top and bottom and two series of openings F i in its sides, one of the series of openings being closed by doors and the other by valve-plates, substantially as described, a central imperforate draft-tube B, opening through the bottom of the shell and terminating a short distance below the top thereof, and a larger perforated tube C, surrounding said tube B and arranged out of contact therewith, to radiate and distribute the heat uniformly against the flat-irons placed within the shell or drum, as and for the purpose described.

407,356. SHEET-METAL ELBOW. ADDIS O. KITTREDGE, State Hill, N. Y., assignor to James A. Miller and Robert B. Miller, Chicago, Ill. Filed Jan. 26, 1889. Serial No. 297,544. (No model.)

Claim.—A sheet-metal elbow longitudinally divided by seams and formed with spiral corrugations oblique to said seams, as and for the purpose set forth.

407,357. DOOR-HANGER TRACK. JOHN G. LANE, Poughkeepsie, N. Y. Filed May 1, 1888. Serial No. 272,408. (No model.)



Claim.—In combination with the rail A and brackets B, a coupling-clip the ends of which are bent at right angles to each other and provided with holes, one of which receives the rivet which holds the rail to the bracket, and the other lies between the legs of the bracket and is provided with a bolt to connect it to the adjacent section, substantially as described.

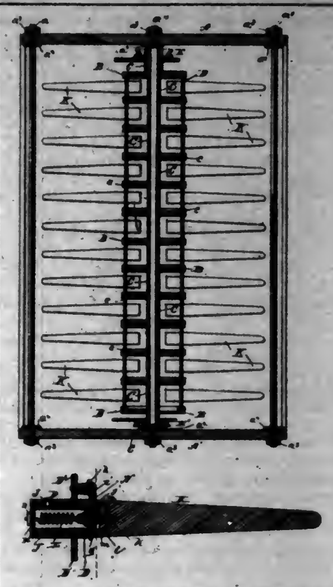
407,358. CIGAR-PERFORATOR. LOUIS LATTAN and HERMAN TRIPP, Chicago, Ill. Filed Feb. 15, 1889. Serial No. 300,017. (No model.)

Claim.—The cigar-perforator described, consisting of a base-plate A, having a central opening, stationary tubes B and G, located concentrically to each other in the central part of the base, the tube B having a vertical slot, the tube G being open at both ends and carrying at its upper end upwardly-projecting perforators, a reciprocating tube F, located between tubes B and G, carrying at its upper end a seat K for a cigar, and a coiled spring located beneath the tube F, all combined and operating as set forth.

407,359. GRAIN-DRILL. CHARLES F. LAWRENCE, Lithium, and MICHAEL RUECKERT, St. Mary's Mo. Filed Mar. 23, 1888. Serial No. 304,535. (No model.)

Claim.—1. In a grain-drill, the combination of a sleeve adapted to slide longitudinally on the carriage-axle and coupled by pins to the drill-teeth bars, a bevel-wheel on the axle engaging in a bevel wheel or pinion pivoted axially to a lever fulcrumed to the frame, said bevel wheel or pinion having a crank-pin coupled by a rod to the sleeve, with means for operating the said lever, substantially as shown, and for the purpose described.

2. In a drill, the combination, with a series of drill-teeth, each having a bar-support which is pivoted on the frame and provided with a slot between the tooth and end of the bar, of a longitudinally-movable pin-support having pins which engage in the slots of the teeth-bars, and gearing for actuating the pin-support from the wheel, substantially as and for the purposes described.



3. In a grain-drill, the combination of drill-teeth having bars pivoted on the frame at their rear ends and slotted opposite the axle, and a shifting-sleeve arranged on the axle and provided with pins which engage in the slots of the teeth-bars, substantially as and for the purposes described.

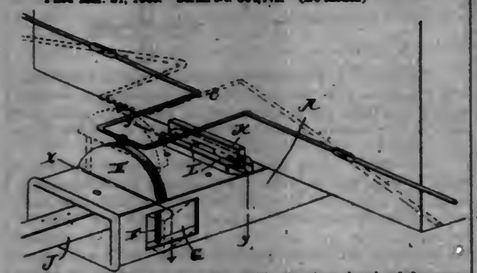
4. In a grain-drill, the combination, with a series of drill-teeth, each tooth having a bar-support slotted at or near its mid-length, of an adjustable frame-bar on which the bar-supports are pivoted at one end, and a transversely-movable pin-support provided with pins which engage in the mid-length slots of the support-bars, substantially as and for the purposes described.

5. In a grain-drill, the combination, with a series of adjustable drill-teeth, of a lever for adjusting the same, said lever provided with a projecting pin, a rock-lever pivoted on the frame and having one arm arranged in the path of the pin on the first-named lever and its other arm connected by a link with a movable gear arranged to engage with the feed mechanism, and a spring to retract the rock-lever, substantially as and for the purposes described.

6. In a grain-drill, the combination, with a series of drill-teeth, each tooth having a bar-support slotted at or near its mid-length, of an adjustable frame-bar on which the bar-supports are pivoted at one end, a transversely-movable pin-support provided with pins which engage in the mid-length slots of the support-bars, and springs for holding said support-bars down, substantially as and for the purposes described.

407,360. COTTON-HARVESTER. SAMUEL D. T. MANNING, Portsmouth, Va. Filed May 21, 1888. Serial No. 274,623. (No model.)

Claim.—1. In a cotton-harvester, a socket for the picking-spindles, composed of a cylindrical bearing D and a curved plate D', the cylindrical bearing D being the socket proper and formed partly on each side of the plate D' and apertured longitudinally to receive a hollow cylindrical butt J, rotatively fitted therein, substantially as set forth.

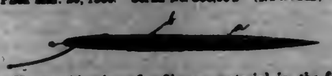


2. In a cotton-harvester, a socket for the picking-spindles, composed of a cylindrical bearing D and a curved plate D', the cylindrical bearing D being the socket proper and formed partly on each side of the plate D' and apertured longitudinally, a cylindrical butt J, rotatively fitted therein, the said butt having a flange formed on its anterior end with radial projections *f* on its face and an annular groove *g* on its periphery, plate M, secured to the opposite end of said butt, cap *j*, having a flange formed at its base with conical projections *m* on one side of the flange and radial grooves on the opposite side, shouldered eye-pin *k*, transverse pin *l*, spiral spring L, and guide-roller A, the said roller being mounted on the plate D' of the socket, all substantially as set forth.

3. In a cotton-harvester, a spindle-socket composed of a cylindrical bearing D, formed upon a curved plate D', apertured disks B, having annular grooves c formed on their sides near their peripheries, longitudinally-apertured sleeves C, vertical rod *a''*, square in cross-section, the disks B and sleeves C, mounted on said rod and closely fitted thereto, so as to prevent circular movement thereon, the sleeves located between the disks, one sleeve located between the top disk and the plate A and one between the bottom disk and the plate A' of the receptacle, the sockets disposed between the disks in the grooves c and supported by said disks, all substantially as set forth.

4. In a cotton-harvester, a spindle-socket composed of a cylindrical bearing D, formed upon a curved plate D', apertured disks B, having annular grooves c formed on their sides near their peripheries, longitudinally-apertured sleeves C, vertical rod *a''*, secured to the plates A and A' of the receptacle, said rod being square in cross-section, the disks and sleeves mounted on said rod and closely fitted thereto, the sleeves located between the disks, one sleeve located between the top disk and the plate A and one between the bottom disk and the plate A' of the receptacle, the sockets disposed between the disks in the grooves c, chain-wheels E and E', rotatively mounted, respectively, on the top and bottom sleeves, arms *c*, formed on opposite sides of said wheels and apertured near their extremities, vertical rods *d* and *d'*, secured in said apertures and bearing against two opposite columns of sockets, vertical operating-shaft F, journaled in the plates A and A' of the receptacle, chain-wheels H and H', mounted on said shaft and secured thereto, and driving-chains I and I', transmitting motion from the chain-wheels H and H' to the chain-wheels E and E', all substantially as set forth.

5. In a cotton-harvester, a spindle-socket composed of a cylindrical bearing D, formed upon a curved plate D', the bearing D apertured longitudinally, hollow cylindrical butt J, rotatively fitted therein, having a flange formed on its anterior end, with an annular groove *g* on its periphery, guide-roller A, mounted on the plate D', apertured disks B, having annular grooves c near their peripheries, longitudinally-apertured sleeves C, vertical rod *a''*, square in cross-section, secured to the plates A and A' of the receptacle, the sleeves and disks mounted on said rod and closely fitted thereto, the sleeves located between the disks, one sleeve located between the top disk and the plate A and one between the bottom disk and the plate A' of the receptacle, the sockets disposed between the disks in the grooves c, chain-wheels E and E', rotatively mounted, respectively, on the top and bottom sleeves, arms *c*, formed on opposite sides of said wheels and apertured near their extremities, vertical rods *d* and *d'*, secured in said apertures and bearing against two opposite columns of sockets, vertical operating-shaft F, journaled in the plates A and A' of the receptacle, chain-wheels H and H', mounted on said shaft and secured thereto, and driving-chains I and I', transmitting motion from the chain-wheels H and H' to the chain-wheels E and E', all substantially as set forth.



407,361. CAR-COUPLING. CHARLES B. MARVIN, Hartland, Mich. Filed Mar. 21, 1888. Serial No. 304,172. (No model.)

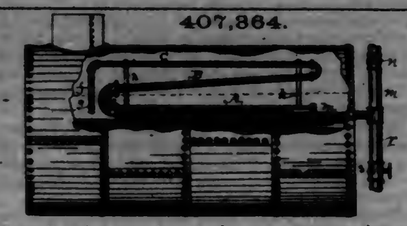
Claim.—1. The combination, with the draw-head, of the coupling-jaws pivoted therein and adapted to engage the coupling-link, the locking-plate mounted in the rear end of the draw-head and adapted to hold the front ends of the coupling-jaws separated, and the fork mounted in the front end of the draw-head and adapted to hold the coupling-jaws in engagement with the coupling-link, as set forth.

2. The combination, with the draw-head, of the coupling-jaws pivoted therein and adapted to engage the coupling-link, the locking-plate mounted in the rear end of the draw-head and having depending beveled arms acting on the rear ends of the coupling-jaws, the fork in the front end of the draw-head adapted to act on the front ends of the coupling-jaws, and the oscillating lever pivoted on the end of the car and connected to the fork, as set forth.

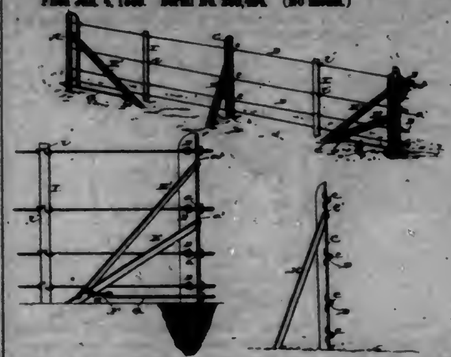
407,362. COMBINATION TOOTH-PICK. DORR T. MASON, Phœnix, N. Y. Filed Mar. 20, 1888. Serial No. 268,004. (No model.)

Claim.—The combination of a fibrous material in the form of thread or floss with a tooth-pick, in the manner set forth, whereby I use the pick as a carrier and holder for the floss.

407,368. COMBINED MEMORANDUM-BOOK, CALENDAR, &c. GEORGE R. MATTHEWS, Buffalo, N. Y. Filed June 12, 1888. Serial No. 276,867. (No model.)



Claim.—As a new article of manufacture, a memorandum-book, calendar, or the like having its covers provided with openings at the upper parts of their front edges and provided with a continuous cord passed through said openings, said cord being of such length as to pass in doubled form around the book and to retain the same in open suspended condition, as described.



407,364. FEED-WATER PURIFIER. FRED V. MEUTHEN, Des Moines, Iowa. Filed Sept. 24, 1888. Serial No. 286,373. (No model.)

Claim.—1. A feed-water perifier for steam-boilers, composed of two or more straight tubes, and provided with an extension at one end that will project vertically, and that has one or more openings or slots that will admit water to enter at different points of elevation, for the purposes stated.

2. The boiler-water perifier comprising straight tubes A B C, elbows D, and an extension *f*, having one or more openings or slots, and a support A, arranged and combined and applied and operated substantially as set forth.

407,365. FENCE-POST. SAMUEL J. MILLER, Cambridge City, Ind. Filed Jan. 4, 1888. Serial No. 255,694. (No model.)

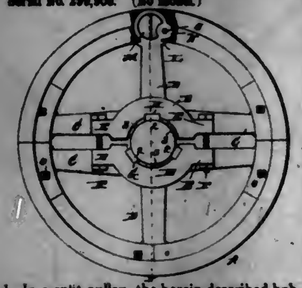
Claim.—1. In a fence, the combination of the end posts, each having upper and lower perforations, two inclined braces E E', the lower having an opening at its lower end with its upper end engaging the lower perforation of the post, the upper brace having its lower end engaging the opening in the lower brace, and its upper end engaging the upper perforation of the posts, the clevises pivoted to the lower braces, and the tension-rods connected to the clevises and end posts, substantially in the manner and for the purpose described.

2. In a fence, the end posts, in combination with the two inclined braces E E', arranged one above the other, and both having their upper ends connected to the end posts at different points, the brace E' bearing at its lower end on the brace E, and the latter brace resting on the ground, and the tension-rods connected to the brace E, and also to the end posts, substantially as described.

3. The combination, in a fence-post, of the post A, having the perforations *a'* *a²*, respectively at its center and its upper end, the brace E, having a beveled lower end, which rests on the surface of the ground, and provided with a perforation in its upper side near its lower end, the projection on the upper end of the post fitting in the perforation *a'*, the brace E', having a projection on its lower end fitting in the perforation in the lower end of the brace E, and provided with a projection on its upper end which fits in the perforation *a²*, and the tension-rod secured to the lower end of the brace E, passing at its outer end through the lower end of the post, and having a nut on its end to draw the said rod outwardly, substantially as and for the purpose specified.

407,366. HINGE. FRANK W. MIX, New Britain, Conn. Filed Jan. 11, 1887. Serial No. 224,062. (Model.)

Claim.—1. A hinge consisting, essentially, of two leaves, one of which is provided with integrally-formed pintles and curved at its inner end, substantially as shown, and the other provided with a shoulder adapted to engage the concave face of the curved portion of the leaf and with loops for embracing the pintles, substantially as set forth.



2. A hinge consisting, essentially, of two leaves, one of which is

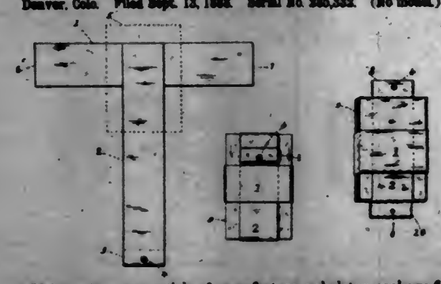
slotted on its side edge at its inner end and provided at said inner end with a pintle, the latter being formed by rolling or bending said inner end, as described, the other leaf having projecting straps, which latter are bent over into the form of loops to receive the ends of the pintle, the outer ends or sections of said straps resting and having extended bearing against a face of the leaf, substantially as set forth.

3. The combination of two leaves of a hinge, one leaf being provided on one side with a shoulder for limiting the movements of the leaves in one direction, and on the opposite side with an abutment for limiting the movement of the leaves in the opposite direction, substantially as set forth.

4. The combination, with a hinge that has a pintle formed of the material of one leaf, and connected by the loops to the other leaf, of an abutment or angle-plate secured to the surface of one leaf between its loops to have bearing-contact with the opposed leaf to prevent a complete folding of these leaves together, substantially as set forth.

407,867. PULLEY. PETER MCNAUGHTON, Kalamazoo, Mich., assignor to Charles H. Bird and Brastus W. Crane, same place. Filed Feb 14, 1889. Serial No. 299,806. (No model.)

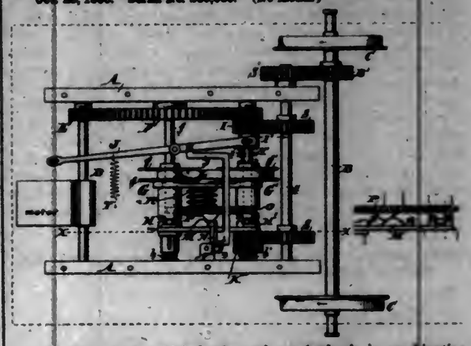
Claim.—1. In a split pulley, the herein-described hub, consisting of two semi-cylindrical castings the inner face of each of which is provided on one side of a central transverse annular groove with a single recess and on the other side of such groove with two seats or recesses, breaking joints with each other and adapted to receive bearing-blocks to be interposed between the hub and shaft, substantially as and for the purpose herein set forth.



2. In a split pulley, the hub composed of two sections provided interiorly on opposite sides of a central transverse line with projecting bearings so arranged as to break joints with each other and adapted to bear against the shaft, substantially as set forth.

3. In a split pulley, the hub composed of two sections provided on their inner faces with central transverse grooves, and having on opposite sides of said grooves projecting bearings so arranged as to break joints with each other, substantially as herein set forth.

4. In a split pulley, the combination, with the semi-hubs having outwardly-extending arms or spokes provided at their outer ends with rings, as herein described, of the rim or flange the material of which completely fills the said rings at the outer ends of the spokes, substantially as and for the purpose set forth.



5. In a split pulley, the combination, with the semi-hubs having outwardly-extending arms or spokes provided at their outer ends with rings and circular perforated offsets adjoining said rings, of the rim the material of which completely fills the said rings, and the transverse fastening-bolts passing through the perforated offsets, substantially as herein set forth.

407,868. ADJUSTABLE PACKAGE-BINDER. THOMAS F. NELSON, Denver, Colo. Filed Sept. 13, 1888. Serial No. 285,332. (No model.)

Claim.—As a new article of manufacture, a skeleton package for tickets, cards, &c., consisting of a long narrow strip 2, having an eyelet or similar device at one extremity and a similarly-shaped strip 1, united at its middle to the opposite end of the strip 2, so as to form a T-shaped skeleton holder, substantially as described.

407,869. CAR-STARTER. JOHN H. PALMER, Philadelphia, Pa. Filed Oct. 25, 1888. Serial No. 289,089. (No model.)

Claim.—1. A vehicle having axles and wheels, in combination with a motor to propel the vehicle and speed-increasing power-transmitting mechanism, substantially as set out, between the motor-shaft and axle for automatically accelerating the speed of the axle with a given rotation or speed of the motor.

2. A vehicle having axles and wheels, in combination with a motor to propel the vehicle and speed-increasing power-transmitting mechanism, substantially as set out, between the motor-shaft and axle for automatically accelerating the speed of the axle with a given rotation or speed of the motor, fixed speed-transmitting gear between the motor-shaft and axle for imparting a definite rotation of the axle to a given speed of the motor-shaft, and clutch mechanism for putting either the accelerating transmitting mechanism or fixed speed-transmitting gear into connection between the motor-shaft and axle.

3. A self-propelling vehicle, in combination with a motor to propel it, a variable or accelerating power-transmitting mechanism between the motor-shaft and axle, clutch mechanism for connecting or disconnecting said accelerating power-transmitting mechanism into or out of action, gearing between the motor-shaft and axle for imparting a fixed speed to the axle with a given speed of the motor-shaft, and means for connecting or disconnecting said gearing.

4. A self-propelling vehicle, in combination with a motor to propel it, a variable or accelerating power-transmitting mechanism between the motor-shaft and axle, clutch mechanism for connecting or disconnecting said accelerating power-transmitting mechanism into or out of action, gearing between the motor-shaft and axle for imparting a fixed speed to the axle with a given speed of the motor-shaft, means for connecting or disconnecting said gearing, and connecting mechanism between the clutch mechanism and the means for connecting or disconnecting the fixed speed-gearing, whereby said accelerating power-transmitting mechanism and fixed speed-gearing are alternately put in or out of action.

5. A self-propelling vehicle, in combination with a motor to propel it, a shaft rotated by the motor, a second shaft connected with the axle by a power-transmitting device, and a speed-accelerating power-transmitting mechanism between the two shafts.

6. A self-propelling vehicle, in combination with a motor to propel it, a shaft rotated by the motor, a second shaft connected with the axle by a power-transmitting device, and a speed-accelerating power-transmitting mechanism between the two shafts, consisting of two drums and a connecting band, chain, or rope, substantially as set out.

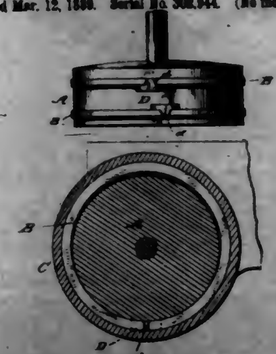
7. A self-propelling vehicle, in combination with a motor to propel it, a shaft rotated by the motor, a second shaft connected with the axle by a power-transmitting device, a speed-accelerating power-transmitting mechanism between the two shafts, consisting of two drums, a connecting band, chain, or rope, substantially as set out, and mechanism to unwind said connecting-band back into operative position after said drums have been operated.

8. A self-propelling vehicle, in combination with a motor to propel it, a shaft rotated by the motor, a second shaft connected with the axle by a power-transmitting device, a speed-accelerating power-transmitting mechanism between the two shafts, consisting of two drums, a connecting band, chain, or rope, substantially as set out, and mechanism to unwind said connecting-band back into operative position after said drums have been operated, consisting of gear-wheels O and P and spring R.

9. In a car-starter for a motor-car, the combination of a main power gear-wheel operated by the motor, a transmitting gear-wheel adapted to gear with said main power gear-wheel, mechanism, substantially as described, operated by the power gear-wheel to accelerate the rotation of said transmitting gear-wheel, a shifter to connect said transmitting gear-wheel and power-wheel when the former has been accelerated to a proper gearing speed, and gearing between said transmitting gear-wheel and the car-axle.

10. In a car-starter for a motor-car, the combination of a main power gear-wheel operated by the motor, a transmitting gear-wheel adapted to gear with said main power gear-wheel, mechanism, substantially as described, operated by the power gear-wheel to accelerate the rotation of said transmitting gear-wheel, a shifter, and automatic devices to shift said shifter and to connect said transmitting gear-wheel and power-wheel when the former has been accelerated to a proper gearing speed, and gearing between said transmitting gear-wheel and the car-axle.

11. In a car-starter for a motor-car, the combination of a main power gear-wheel operated by the motor, a transmitting gear-wheel adapted to gear with said main power gear-wheel, mechanism, substantially as described, operated by the power gear-wheel to accelerate the rotation of said transmitting gear-wheel, a shifter to connect said transmitting gear-wheel and power-wheel when the former has been accelerated to a proper gearing speed, a clutch actuated by the shifter to bring said accelerating mechanism into operation, and gearing between said transmitting gear-wheel and the car-axle.



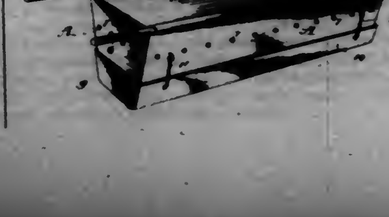
12. In a car-starter for a motor-car, the combination of a main power gear-wheel operated by the motor, a transmitting gear-wheel adapted to gear with said main power gear-wheel, mechanism, substantially as described, operated by the power gear-wheel to accelerate the rotation of said transmitting gear-wheel, a shifter to connect said transmitting gear-wheel and power-wheel when the former has been accelerated to a proper gearing speed, a clutch actuated by the shifter to bring said accelerating mechanism into operation, means, substantially as described, to disconnect said clutch when the proper acceleration is obtained, and gearing between said transmitting gear-wheel and the car-axle.

13. In a car-starter, the combination of a power gear-wheel and its shaft with a transmitting gear-wheel adapted to gear therewith, loosely journaled on its shaft, drums loosely journaled on each of said shafts, a shifter to shift said transmitting gear-wheel to connect and disconnect it with said power gear-wheel, a band or flexible connection between said drums, clutches operated by the shifter when shifted to disconnect said gear-wheels and to secure said drums to their shafts, and gearing between said gear-wheel and the car-axle.

14. In a car-starter, the combination of a power gear-wheel and its shaft with a transmitting gear-wheel adapted to gear therewith, loosely journaled on its shaft, drums loosely journaled on each of said shafts, a shifter to shift said transmitting gear-wheel to connect and disconnect it with said power gear-wheel, a band or flexible connection between said drums, spring-clutches secured to said shafts, adapted to engage with said drums and secure them to the shaft, a lock to hold said clutches out of connection, operated by the shifter when shifted to disconnect said gear-wheels to release said clutches, and gearing between said gear-wheel and the car-axle.

15. In a car-starter, the combination of a power gear-wheel and its shaft with a transmitting gear-wheel adapted to gear therewith, loosely journaled on its shaft, drums loosely journaled on each of said shafts, a shifter to shift said transmitting gear-wheel to connect and disconnect it with said power gear-wheel, band or flexible connection between said drums, spring-clutches secured to said shafts, adapted to engage with said drums and secure them to the shaft, a gear-wheel carried by one of said clutches, a lock to hold said clutches out of connection, operated by the shifter when shifted to disconnect said gear-wheels to release said clutches, and gearing between said gear-wheel on the clutch and the car-axle.

407,370. PISTON-PACKING. EDWARD F. PEACOCK, Philadelphia, Pa. Filed Mar. 12, 1888. Serial No. 302,944. (No model.)



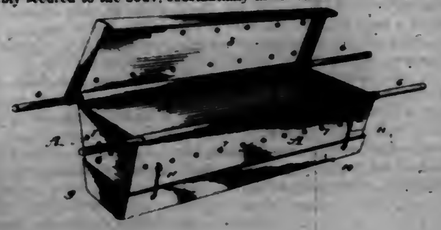
Claim.—1. The combination, with a piston provided with a packing-ring, of a break-joint block seated in a recess in the piston adjacent to the packing-ring groove and having a rib entering between the ends of the ring, the outer surface of the rib lying in the same superficies as the surface of the body of the block, and the depth of the rib being as great as the thickness of the packing-ring, substantially as set forth.

2. The combination, with a piston provided with a packing-ring groove and having a recess adjacent to said groove, of a packing-ring received in the groove and of the same cross-sectional area at all points, and a break-joint block seated in the recess, one face of the block forming a continuation of the wall of the groove, said block having a rib extending transversely of the groove between the ends of the packing-ring, the depth of the rib being as great as the thickness of the ring, substantially as described.

3. The combination, with a horizontal cylinder, of a piston provided with a packing-ring groove and a recess adjacent to but at one side of said groove and located at the bottom of the cylinder, a cut packing-ring lying in the groove, with its ends adjacent to the recess, and a break-joint block composed of a body received entirely within the recess and having a rib entering between the ends of the ring, the outer surface of the rib lying in the same superficies as the surface of the body of the block, and the ends of the ring being free from all tongues, grooves, shoulders, or other weakening conformations, substantially as described.

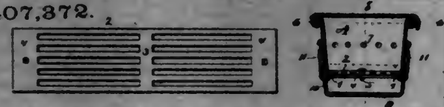
407,371. NAIL-EXTRACTOR. ABRAHAM ROSENBERGER, Chicago, Ill. Filed Sept. 10, 1888. Serial No. 285,082. (No model.)

Claim.—1. In a nail-extractor, in combination, a head and a handle, the head having a claw and a flat blow-receiving surface, the direction of both the handle and claw being oblique to the blow-receiving surface, and both pointing to the same side of a plane at right angles to said surface and to the opposite sides of the plane of said surface, substantially as set forth.



2. A nail-extractor comprising a head and a handle, the head having a flat blow-receiving surface at one end and a claw at the other end, the handle and the claw both pointing obliquely away from the plane of the blow-receiving surface and toward opposite sides thereof and obliquely away from a plane at right angles to said surface and toward the same side of said plane, such handle and claw being approximately at right angles to each other, substantially as set forth.

3. A nail-extractor comprising a handle and a head, the head having a flat blow-receiving surface at one end and a claw at the other end, and a convex outer surface from the handle to the claw, the handle and claw both pointing in directions oblique to the plane of the blow-receiving surface and toward opposite sides thereof and toward the same side of a plane at right angles to said surface, substantially as set forth.

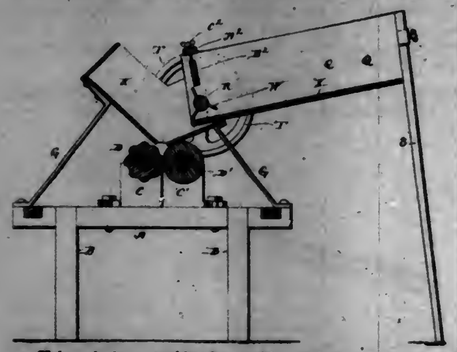


4. A nail-extractor comprising a handle and a head, the head having a claw and a flat blow-receiving surface, the direction of both the handle and claw being oblique to the blow-receiving surface and both pointing to the same side of a plane at right angles to said surface and to the opposite sides of the plane of said surface, the head having also a flat face B^2 intersecting the blow-receiving surface and extending parallel to the handle, substantially as set forth.

407,372. FURNACE. JAMES J. STORTS and EDWIN R. WALKER, Rotard, Ky. Filed Mar. 12, 1888. Serial No. 302,942. (No model.)

Claim.—1. The combination, with a body having a movable cover and a grate forming the bottom of said body, of an ash-pan detachably secured to the body, substantially as set forth.

407,372.



2. The combination, with the body and handle-bars, of a cover hinged to one of said handle-bars, substantially as set forth.

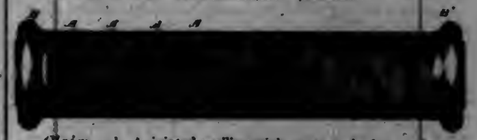
3. The combination, with the body having perforated sides and a grate secured to the bottom, of handle-bars connected with the sides, and a perforated lid or cover hinged to one of the handle-bars, substantially as set forth.

4. The combination, with the body having perforated sides, a continuous flange projecting inwardly from the sides and ends, and a grate secured on the flange, of a perforated lid or cover hinged to one of the handle-bars, and an ash-pan hooked to the body, substantially as set forth.

407,373. COTTON-SEED CRUSHER. GEORGE W. SERMON, Conyers, Ga. Filed Feb. 16, 1889. Serial No. 300,102. (No model.)

Claim.—1. In a machine for crushing seed, the combination of the crushing-rolls, a hopper secured above the same, and a secondary hopper connected pivotally to the main hopper, a shaft passing through the sides of the said hoppers, connecting them pivotally, and having a series of radial spoon-shaped projections, and mechanism for rotating the said shaft when the machine is in operation, substantially as set forth.

2. In a machine for crushing seed, the combination of the crushing-rolls, a hopper arranged above the same, a secondary hopper consisting of a box which is open at one end and connected pivotally at the said open end to the main hopper, a transverse shaft extending through the sides of said hoppers, connecting them pivotally, as described, and having radial spoon-shaped arms, and a prop or support attached adjustably to the free end of the said secondary hopper, which may thus be adjusted at any desired inclination, substantially as set forth.



3. In a machine for crushing seed, the combination of the crushing-rolls, a hopper arranged above the same, a secondary hopper consisting of an open-ended box pivoted between the sides of the main hopper, a transverse shaft extending through the sides of the hoppers, connecting them pivotally, as described, and having radial feed-arms, and a vertically-adjustable gage-board, arranged at the open end of the supplementary hopper, substantially as set forth.

4. In a machine for crushing seed, the combination of the crushing-rolls, the main hopper, the supplementary hopper, the feed-shaft having radial spoon-shaped feed-arms connecting the latter pivotally to the main hopper, and a brake-arm pivoted to one side of the main hopper, bearing against the upper side of the feed-shaft, and provided at its free end with an adjustable weight, substantially as and for the purpose set forth.

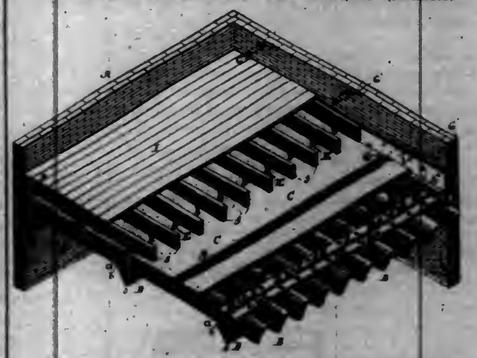
5. In a machine for crushing seed, in which one roll is arranged to be rotated by frictional contact with the other roll and with the material passing between said rolls, the combination, with the said rolls, of a hand-wheel secured upon one end of the shaft of the loose roll, which projects at one side of the frame, substantially as and for the purpose set forth.

6. In a machine for crushing seed, the combination of the crushing-rolls, the main hopper, the supplementary hopper connected pivotally to the main hopper, a transverse shaft extending through the sides of said hoppers, connecting them pivotally, as described, and having radial feed-arms, and a friction-wheel mounted upon the said feed-shaft and bearing against the shaft of one of the crushing-rolls, substantially as herein set forth.

407,374. SPELLING-STICK. ALONZO F. SMITH, Milwaukee, Wis. Filed Mar. 12, 1889. Serial No. 303,037. (No model.)

Claim.—1. A jointed spelling-stick composed of a number of separable interchangeable figured sections, each formed at one end with an annular flange and at the opposite end with a corresponding recess and capable of turning upon the adjoining section or sections, each section being wholly supported by and supporting the adjoining section or sections, substantially as and for the purposes set forth.

2. A jointed cylindrical spelling-stick composed of a number of separable interchangeable annular figured sections, each formed at one end with a reduced annular flange and at the other end with a corresponding recess, whereby said sections may be joined together in any order and each section may be turned upon the adjoining section or sections, and of closed end sections, one formed with a reduced cylindrical portion and the other with a corresponding recess, each section supporting and supported by the adjoining section or sections, substantially as and for the purposes set forth.



3. A jointed spelling-stick composed of separable interchangeable sections, each provided on its outer face with letters, figures, or the like, and formed at one end with a reduced cylindrical rim and at the other with a corresponding recess, whereby any number of said sections may be joined together, each supporting and supported by the adjoining section or sections, substantially as and for the purposes set forth.

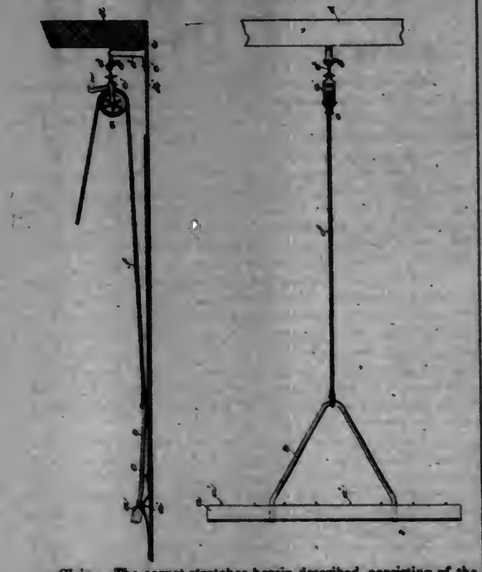
407,375. FERRULE FOR UMBRELLAS, CANES, &c. COMLY S. SMITH, Philadelphia, Pa. Filed Feb. 5, 1889. Serial No. 298,750. (No model.)

Claim.—In a ferrule, in combination with the shank or stem B, a hollow cup or tip D, having sides adapted to yield in being forced in position from above, said cup or tip secured firmly in position with end protruding from said ferrule-shank by soldering or otherwise, substantially as described.

407,376. FIRE AND WATER PROOF CEILING. JOHN SMITH, Kansas City, Mo. Filed Mar. 20, 1888. Serial No. 303,974. (No model.)

Claim.—1. The fire-proof ceiling having its corrugated iron sections or sheets resting upon the ledges or shelves of brackets, in combination with suspenders or hangers having their inner ends adapted to enter said brackets and to take in under the ledges or shelves of the brackets, their upper ends being adapted for connection with the floor-joists above, substantially as set forth.

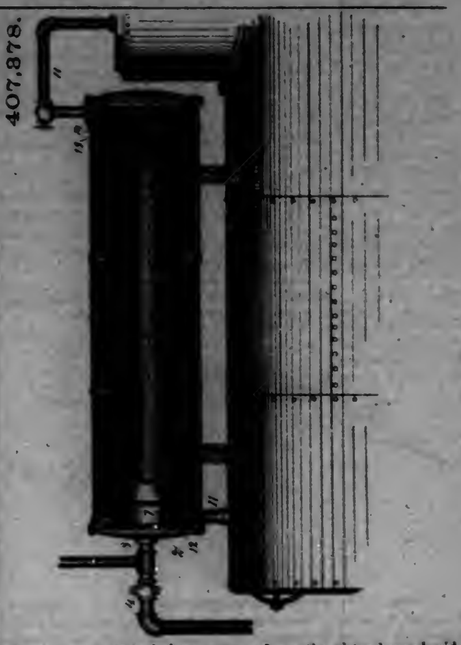
2. In a fire-proof ceiling, the brackets having a ledge or shelf to support corrugated iron sections or sheets and upwardly-extended parallel plates formed with lateral flanges at their upper edges, substantially as set forth.



3. In a fire-proof ceiling, the combination of the corrugated ceiling plates or sheets, the hollow brackets having ledges or shelves and their upwardly-extended parallel plates formed at their upper edges with lateral flanges having apertures therein, the hangers or suspenders having lateral arms or flanges let into the brackets and taking in

under the ledges of said brackets and having their upper ends adapted for connection to the floor-joists, the filling of cement, and the angular plates applied to the walls and between the same and the cement filling, substantially as specified.

4. In a fire-proof ceiling, the combination of the corrugated iron sheets or sections, the bracket supporting said sheets or sections, the suspenders or hangers for said brackets, and the cement filling having gutters at intervals in its upper surface, and the outlet spouts or pipes taking the waste water from said gutter, substantially as specified.



5. In a fire-proof ceiling, the combination of the corrugated iron sheets or sections, the brackets supporting said sheets or sections, the suspenders or hangers for said brackets, the filling of cement, the nozzle-like spouts or pipes having caps applied to their outer discharging ends, and the additional similar pipes or spouts arranged above the next floor, substantially as set forth.

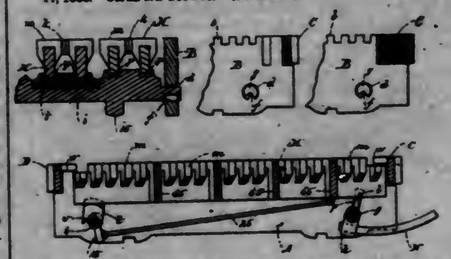
407,377. CARPET-STRETCHER. MOSES B. SMITH, Binghamton, N. Y. Filed Feb. 26, 1889. Serial No. 301,242. (No model.)

Claim.—The carpet-stretcher herein described, consisting of the carpet-engaging device, constructed substantially as described and having a rigid loop or bail, the flexible cord or chain attached thereto, the bracket or support having the wedge-shaped base to be forced beneath a base-board, the pulley journaled in the frame *c'*, supported by said bracket, and over which the flexible cord passes, and the locking device consisting of the wedge *n*, having a serrated face and inserted between the pulley-frame and pulley, its serrated face contacting with the cord to prevent any backward movement of the cord or carpet, substantially as described.

407,378. FEED-WATER HEATER AND PURIFIER. JAMES S. STEPHENS, St. Paul, Minn. Filed Mar. 28, 1889. Serial No. 304,470. (No model.)

Claim.—1. In a feed-water heater and purifier, a heating-chamber having steam communication with the boiler at one extremity and the other end connected with the feed and blow-off pipes, ports connecting the upper part of the interior of said chamber with the interior of the boiler, and a piston fitting said chamber and adapted to be moved in opposite directions by the pressure of the feed-water and steam, respectively, according to the excess of pressure, substantially as and for the purpose herein specified.

2. In a feed-water heater and purifier, a chamber having at one end feed-water and blow-off connections and at the other live-steam inlet and water-outlet ports, and a sliding piston adapted to close said steam-inlet and open said water-outlet by excess of feed-water pressure and to open said steam-inlet and close said water-outlet by excess of steam-pressure, substantially as and for the purpose herein specified.



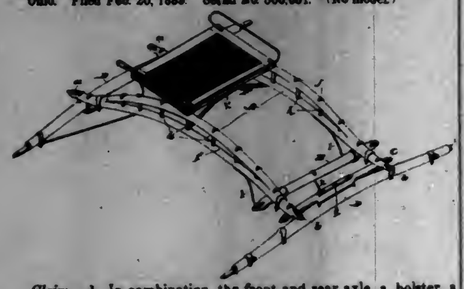
3. In a feed-water heater and purifier, a chamber having steam communication with the boiler at one end and feed-water and blow-off pipes at the other extremity, a piston within said chamber, and ports in the upper part of the chamber at a distance from said steam-inlet a little greater than the length of the piston, substantially as described, whereby excess of feed-water pressure forces the piston beyond said ports to afford escape for the water, and excess of steam-pressure caused by opening the blow-off valve forces the piston to the opposite end of the chamber, closing said ports, as and for the purpose set forth.

4. In a feed-water heater and purifier, a heating-chamber having at one extremity feed and blow-off connections and at the other live-steam inlet and water-outlet, and a cap forming the end of said chamber, to which the feed-pipe is attached, the said cap having a passage therethrough at an angle to the length of the chamber, substantially as specified, whereby a spiral direction is given to the course of the water through the chamber.

5. In a feed-water heater and purifier, a heating-chamber having in one end thereof an opening of less area than the cross-section of the chamber and the opposite end connected with the feed and blow-off pipes, a sliding piston fitting the interior of said chamber, the said chamber having perforations in its upper part at a distance from the inner end of the same a little greater than the length of said piston, and the whole located in the upper part of a boiler or in a suitable shell communicating therewith, substantially as and for the purpose herein set forth.

6. In a feed-water heater and purifier, a clearing-piston adapted to force out deposits in the heating-chamber, operated directly in either direction by the pressure of steam or feed-water, the movement of said piston being controlled by the variation in pressure caused by opening or closing the blow-off valve, substantially as and for the purpose herein set forth.

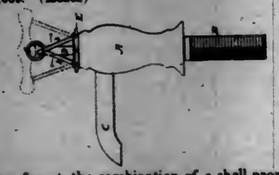
407,379. GRATE. HIRAM F. TALLMADGE, Boston, Mass. Filed Sept. 17, 1888. Serial No. 285,561. (No model.)



Claim.—1. In a grate, the combination of side bars, end bars connecting the side bars, rocking bars pivotally connected with the side bars, tilting carriages pivoted on said rocking bars, and grate-bars supported at their opposite ends on said rocking bars and carriages, respectively, substantially as described.

2. In a grate, the combination of side bars connected by end bars, grate-bars, rocking bars pivoted on knife-edge bearings in each end of said side bars, knife-edge bearings on said rocking bars for receiving an end of each group of grate-bars, and tilting carriages pivoted on said rocking bars for supporting the opposite ends of said grate-bars, whereby the grate-bars may be moved in opposite directions when said rocking bars are rotated, substantially as described.

3. In a grate, the combination of the side bars A B, connected by the bars C D, the rocking bars *g i*, pivoted in said side bars and provided with the knife-edge bearings *p e*, the tilting carriages *t*, disposed on the bearings *e*, the grate-bars H, disposed at one end on a carriage *t* and at the opposite end on a bearing *p*, and the rod 25, for connecting one or more of said groups, with a lug 15 on the bar *i*, whereby the grate-bars may be moved in opposite directions as said rocking bars are rotated, substantially as set forth.

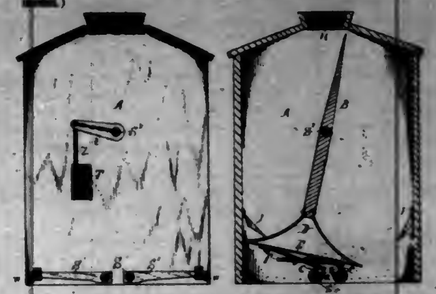


407,380. SKELETON WAGON. SAMUEL TOOMEY, Canal Dover, Ohio. Filed Feb. 20, 1889. Serial No. 300,631. (No model.)

Claim.—1. In combination, the front and rear axle, a bolster, a king-bolt for pivoting the bolster to the front axle, arched body-bars placed side by side and secured at their rear ends to the rear axle and at their forward ends to the bolster, a cross-bar E, uniting the forward ends of said arched bars, a brace *k*, secured to the middle portion of the cross-bar E and to the king-bolt, a seat, and a brace *k'*, secured with its intermediate portion to said seat and with its ends to the arched body-bars, substantially as set forth.

2. An arched body-bar having its opposite vertical sides recessed longitudinally, forming a reduced thickness of material connecting the portions of material above and below it, substantially as set forth.

407,381. FAUCET. FRANCIS E. TOTTEN, Newark, N. J., assignor of one-half to Joseph Stowe Cooke, same place. Filed Apr. 24, 1888. Serial No. 271,689. (Model.)



Claim.—In a faucet, the combination of a shell provided with a valve-seat, a valve, a valve-stem, a shell-cap provided with a perforation *f* and adjacent depressions 2 2, a spring encircling the valve-stem within the shell, a handle provided with depressions 4 4 on its under side, and inclined pins fitted into the depressions 2 2 at their lower ends and into the depressions 4 4 at their upper ends, the arrangement being such that the spring operates not only to force the valve down upon its seat and return all the moving parts to their normal positions, but to also hold the lifting-pins in place, as well as prevent their being raised and turned to the dead-point and thus locking open the valve.

407,382. GALLEY. CHARLES W. WALDRON, Lewiston, Me., and GILBERT R. JONES, New York, N. Y., assignors to the Liberty Manufacturing Company, same place. Filed Sept. 1, 1887. Serial No. 248,523. (No model.)

Claim.—A galley the side and end pieces of which are joined by means of tongues and grooves, together with rivets made integral with said tongues and secured in holes communicating with said grooves, substantially as set forth.

407,383. AUTOMATIC GRAIN-WEIGHING MACHINE. OSCAR L. WELLS, Marseilles, Ill. Filed May 6, 1889. Serial No. 309,732. (No model.)

Claim.—1. In the grain weighing and registering machine shown and described, in combination with the case and the oscillating valve having the arms F F, the rock-shafts S S, respectively having the arms *a* and fulcrum-arms *c* and the scale-beams S' S', substantially as and for the purpose set forth.

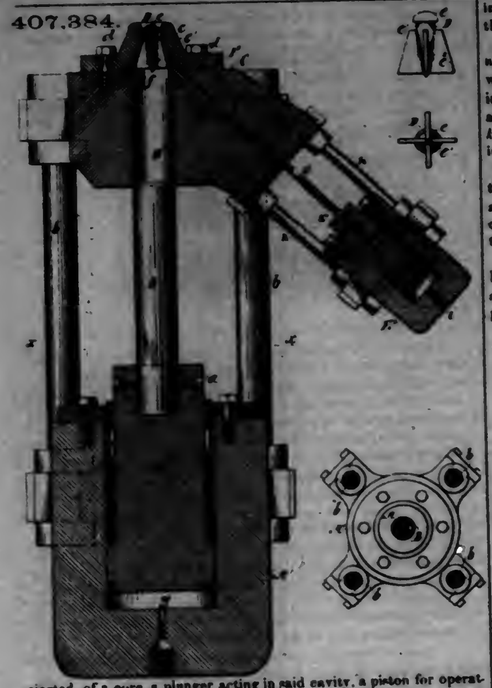
2. In the grain weighing and registering machine shown and described, in combination with the case A and oscillating valve B, having the flanges D D, the aprons J J, respectively hinged to the side walls of the case immediately above the point of contact of said flanges with the case and in such manner as to alternately engage therewith, substantially as and for the purpose set forth.

3. In the grain weighing and registering machine shown and described, in combination with the outer case A, the oscillating valve B, arranged on shaft S^2, passing about centrally through said valve and boxed at either end in the ends of the case, flanges D D, respectively secured to the lower outer sides of said valve, forming alternately with the sides of said case and said valve the grain-receptacles, the scale-beams S' S', and the means, substantially as specified, for alternately connecting the lower part of said valve and scale-beams, substantially as and for the purpose set forth.

4. In the grain-weighing machine shown and described, in combination with the case A, having a grain-inlet at its upper end and an open bottom, the valve B, arranged centrally and vertically therein and oscillating from a point at about its center, so the upper end will move under said inlet and cause grain to fall to either side thereof, and the side flanges D D, secured to the lower outer sides of said oscillating valve and forming alternately the floor of the grain-receptacle, having sides formed of said case and valve, substantially as and for the purpose set forth.

5. In combination with the case A, having the inlet-hopper H at its upper end, the oscillating valve B, having the concaved side flanges or bottoms D D, plate E, connecting said flanges, arms F, secured to said plate and having their free ends project in opposite directions, shaft S^2, shafts S S, having respectively the arms *a c*, and the aprons J J, substantially as and for the purpose set forth.

6. In combination with the case A, having the inlet-hopper H and an open bottom, the oscillating valve B, having the concave flanges D D, the aprons J J, the shaft S^2, having crank *r*, pitman Z, and tally T, shafts S S, respectively having the arms *a c* and scale-beams S' S', and the arms F F, substantially as and for the purpose set forth.



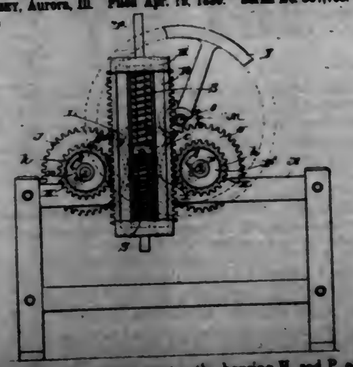
407,384. MACHINE FOR MAKING CURVED LEAD PIPE. GEORGE W. WIDEN, Brooklyn, N. Y. Filed Apr. 19, 1888. Serial No. 271,178. (No model.)

Claim.—1. In a machine for forming curved lead pipe, the combination, with a head-block provided with a cavity for receiving molten metal, and an aperture beyond said cavity through which the metal may be ejected, of a plunger acting in said cavity, a core for forming the interior of the pipe, and a second plunger operating alternately to withdraw metal from the said cavity and to inject it into the same near said discharge-aperture, substantially as specified.

2. In a machine for forming curved lead pipe, the combination, with the cap-piece, the head-block, and the curving device, of the core located wholly above said curving device, and consisting of the central piece, laterally-extending wings of gradually-increasing width from top to bottom, said wings commencing at a point below the top of said core, the core above said point being of the form of the interior of the pipe to be produced, substantially as specified.

3. In a machine for forming curved lead pipe, the combination, with a head-block provided with a cavity for receiving molten metal, and an aperture beyond said cavity through which the metal may be

407,384.

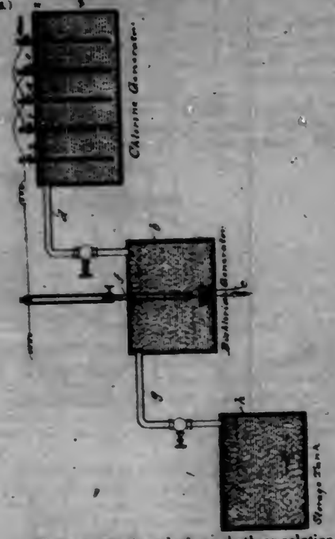


ejected, of a core, a plunger acting in said cavity, a piston for operating said plunger, a second cavity in the head-block, a plunger acting in said second cavity, and a piston for operating the second-named plunger to alternately withdraw metal from the said cavity and inject it into the same near the discharge-aperture, substantially as specified.

4. In a machine for forming curved lead pipe, the combination, with a recessed cap-piece, of a block having a cavity for containing the molten metal in communication with the recess of the cap-piece, a plunger within said cavity, and a second cavity in said block opening into said first cavity at a point near where it communicates with the recess of the cap-piece, and a plunger operating in said second cavity, substantially as specified.

5. In a machine for forming curved lead pipe, the combination of a cylinder and head-block secured thereto, said head-block being provided with two plunger-cavities, and a core wholly above the cavities, a plunger operated by the piston, of the cylinder supporting the head-block within one cavity of the head-block, and a second cylinder supported by said head-block and operating the plunger within the other cavity of said head-block at an angle to the first-named plunger, substantially as specified.

407,385. POWER-CONVERTER. GEORGE W. WILSEY and REUBEN A. WILSEY, Aurora, Ill. Filed Apr. 19, 1889. Serial No. 307,763. (No model.)



Claim.—1. In a power-converter, the housing H, rod P, collar C thereon, double rack R, guided in a slot *h* in said housing, and springs S coiled on said rod above and below said collar and within said rack, in combination with the twin shafts 1 and ratchet-gears K, mounted thereon and engaging said rack, substantially as described.

2. The rod P and the double rack R carried thereby, in combination with the twin shafts 1, and twin wheels mounted thereon, each wheel comprising a gear K, loosely mounted on the shaft and engaging said rack, a disk P', keyed to said shaft within said gear, a spring-actuated pawl *p*, carried by said disk and engaging an internal ratchet *k* in said gear, and with a main shaft 2 and gears J J and I connecting said twin shafts to said main shaft, substantially as described.

3. The double rack R, the rod P, and collar C fitting loosely thereon, and the spring S, coiled upon said rod within said rack above and below said collar, in combination with a pin *p'*, for securing the collar upon the rod and disconnecting it therefrom at will, substantially as described.

4. The rod P, the rack R, mounted loosely thereon, and the collar C upon said rod within said rack, in combination with cushion-springs within said rack above and below said collar, as and for the purpose set forth.

407,386. BATH OR SOLUTION FOR SEPARATING METALS FROM THEIR ORES. JACOB C. WIDWELL, Medford, assignor, by direct and mesne assignments, to the Electric Gold and Silver Chlorination Company, Boston, Mass. Filed Aug. 13, 1888. Serial No. 282,512. (No specimens.)

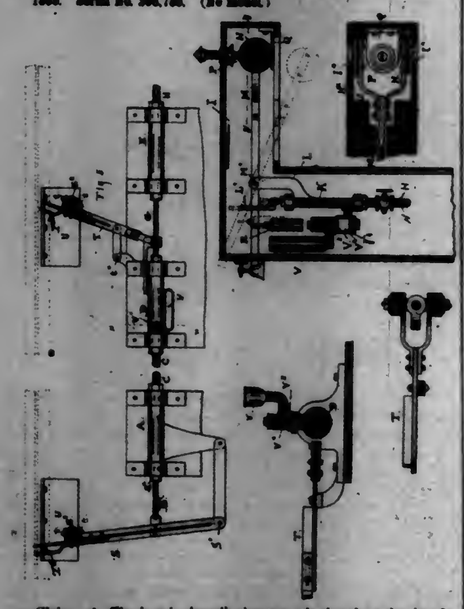
Claim.—1. The process of producing a bath or solution for the separation of metals from their ores, consisting of subjecting a solution of salt-water, muriate of ammonia, and muriatic acid to a current of electricity, then placing this solution in a tank containing liquid mercury, and subjecting the whole to a current of electricity, said mercury serving as the anode, as set forth.

2. The process of producing a bath or solution for the separation of metals from their ores, consisting in placing aqua-chlorine in a tank containing liquid mercury, and then subjecting the whole to a current of electricity, said mercury serving as the anode, as set forth.

407,387. FINGER-BAR FOR REAPERS, MOWERS, &c. ALEXANDER WORASK, Emmett, Idaho, assignor of one-half to Andrew Kelley, same place. Filed Feb. 5, 1889. Serial No. 298,768. (No model.)

Claim.—1. The combination, with a finger-bar having dovetailed recesses in its front edge, said recesses having forwardly and upwardly converging end walls, of the wear-blocks fitted in the said

recesses and having their ends converging upwardly and forwardly, and means for supporting the blocks, substantially as specified.



2. The combination of the finger-bar having guard-fingers attached thereto, of the wear-blocks beveled toward their front sides and toward their upper edges, fitted in similarly-shaped recesses in the front edge of the finger-bar and bearing at their lower edges on the fingers, respectively, whereby the latter serve to hold the blocks in place, substantially as specified.

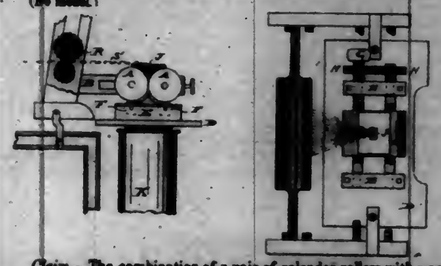
407,388. PULLEY. WILLIAM A. WOODWARD, Lowell, assignor to the Woodward Manufacturing Company, Hudson, Mass. Filed Jan. 24, 1889. Serial No. 297,416. (No model.)

Claim.—The improved pulley above described, consisting of the rim A, cross-pieces B B', bed-pieces D D', half-hubs F F', and means for securing the half-hubs together, combined and operating substantially as described.

407,389. AUTOMATIC SIGNAL FOR CROSSINGS OF CABLE RAILWAYS. GEORGE H. WRIGHT, San Francisco, Cal. Filed Feb. 5, 1889. Serial No. 298,726. (No model.)

Claim.—1. The herein-described automatic signal mechanism for railway-crossings, adapted to be operated by a moving car or train, consisting, essentially, of the line of pipe C, terminating in cylinders A D and filled with liquid, the line of pipe H, also containing liquid and having at one end a cylinder E in close relation to the cylinder at the end of the line of pipe C, the double plunger G, working in both of said cylinders, a plunger B, fitted to the leading cylinder A, the levers S T, connected with the plungers B and G, respectively, and projecting in the path of a bar or projecting part carried by the car to move said plungers when struck by said part, and the cylinder K at the end of the line having a plunger connected to a suitable signal, substantially as set forth.

2. In a signal mechanism, the combination of a line of pipe having cylinders at the opposite ends fitted with plungers, means for applying pressure to the end of the leading plunger to act on a body of liquid confined in said pipe and cylinders and through the medium thereof to move the plunger of the cylinder at the opposite end of the line, and the intermediate cylinders D H, having a plunger G common to both, and means by which said plunger can be moved back or in a direction contrary to the movement given to the leading plunger, substantially as set forth.

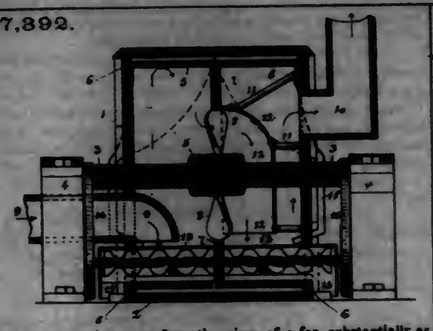


407,390. OIL-STOVE FOR HEATING PURPOSES. AUGUST F. ZINKEISEN, Milwaukee, Wis., assignor of one-half to John A. Dutcher and Pierrepont B. Dutcher, both of same place. Filed May 19, 1888. Serial No. 274,391. (No model.)

Claim.—1. The combination, in an oil heating-stove, of an annular base A, a reservoir N, located within the opening of said base A, annular wall J, cylindrical wick-tube C, located within said annular wall J, the center of which wick-tube forms an air-space communicating from the exterior air through the annular base A to the combustion-chamber above the wick-tube, inlet cold-air duct B, located centrally within said wick-tube C, at a slight distance therefrom, forming thereby an air-space I between said wick-tube C and said air-duct B, drum or exterior cylinder F, resting at its lower end upon the base A, exterior to said wick-tube, interior drum or cylinder E, communicating at its lower end with the upper end of the said cold air duct B, and its upper end through the perforated cover G, cover G, annular air-chamber F, affixed to the upper end of said drum F, and having communication therewith through the apertures D', said annular chamber E being provided with air-escape aperture E', communicating with the room and with air-duct T, communicating with the exterior air, substantially as and for the purpose specified.

2. In an oil-stove for heating purposes, the combination of the base A, drums or air-ducts E and F, arranged one within the other, forming thereby an annular combustion-chamber C, communicating at its lower end with the base A upon the respective sides of the wick-tube, and at its upper end with the annular chamber E, whereby an air-passage h formed on either side of said wick-tube, and also thereby forming a central hot-air duct-E, communicating from the base A through the center of the flame with the perforated cover G, cover G, annular chamber E, provided with a series of apertures E', air-controlling slide F, and air-escape pipe T, provided with air-controlling damper G', substantially as and for the purpose specified.

407,391. APPARATUS FOR DRAWING SLIVERS FROM GILL-BOXES. THOMAS H. ACKROYD and ALLAN BROADLEY, Rishworth, near Leeds, County of York, England. Filed Aug. 15, 1888. Serial No. 282,899. (No model.)



Claim.—The combination of a pair of calender-rollers with a pair of additional rollers, and means, substantially as described, for driving the latter, the calender-rollers being in contact with each other, and each additional roller being in contact with its respective calender-roller, all substantially as and for the purpose set forth.

407,392. DUST-COLLECTOR. JOSHUA R. BARRUS, Baltimore, Md., assignor of one-half to Joseph J. Sellner, same place. Filed Jan. 15, 1889. Serial No. 296,439. (No model.)

Claim.—1. In a dust-collector, the combination of a revolving centrifugal cylinder, through which the dust-laden air is made to pass, a fan suitably located to cause a current of air to flow through said cylinder, and a dust-laden air-inlet pipe projecting into the interior of said cylinder and delivering its air and dust at approximately right angles to the interior of the cylinder, as and for the purpose specified.

2. In a dust-collector, the combination of a revolving centrifugal cylinder provided with arms connecting said cylinder to a hub, said

407,392.

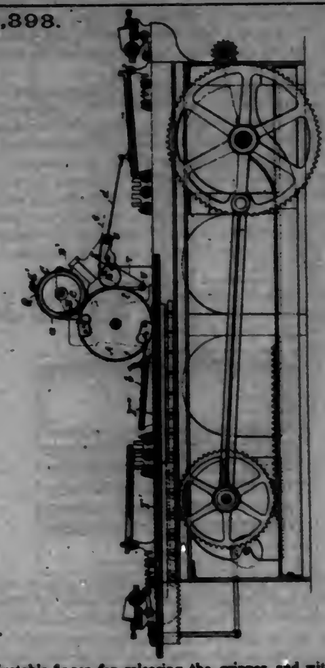
arms being skewed so as to form the wings of a fan, substantially as described.

3. In a dust-collector, the combination of a centrifugal cylinder provided with skewed arms connecting the interior thereof, with a revolving shaft passing through its center and by which said cylinder is turned, and dust-collectors projecting into the interior of said cylinder and bearing against the interior surface thereof, whereby the dust which adheres to the interior surface of said centrifugal cylinder will be collected and removed therefrom, and a dust-laden air-inlet pipe projecting into the cylinder on the side into which the air is drawn by the fan.

4. In a dust-collector, the combination of a centrifugal cylinder provided with skewed arms connecting the interior thereof, with a revolving shaft passing through its center and by which said cylinder is turned, and dust-collectors projecting into the interior surface thereof, and a screw conveyer operating within said dust-collector to remove the same therefrom, and a dust-laden air-inlet pipe projecting into the cylinder on the side into which the air is drawn by the fan, substantially as described.

5. In a dust-collector, the combination of a centrifugal cylinder connected to a revolving shaft by arms which are skewed so as to form fan-wings, and a dust-laden air-inlet pipe projecting into the cylinder on the side into which the air is drawn by the fan, and a deflector located within said centrifugal cylinder and on the side of the fan-arms, from which the air is forced in position to deflect the air which is forced through the fan and cause it to impinge upon the interior of the centrifugal cylinder at about right angles thereto.

6. In a dust-collector, the combination of a centrifugal cylinder connected to a revolving shaft which passes through the center thereof by arms which are skewed so as to form the wings of a fan, with a dust-inlet pipe the end of which is curved so as to deliver its dust at right angles to the interior surface of the centrifugal cylinder, and a deflector located on the side of the fan, to which the air is forced in position to deflect the air which comes through the fan and cause it to strike upon the interior surface of the centrifugal cylinder at about right angles thereto, substantially as described.



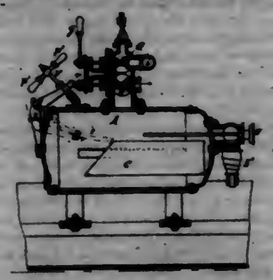
7. In a dust-collector, the combination of a centrifugal cylinder mounted upon and secured to a revolving shaft by arms which are skewed so as to have the wings of a fan, with a casing surrounding said cylinder and closing the ends thereof, and a dust-laden air-inlet pipe projecting into the cylinder on the side into which the air is drawn by the fan, and a pipe leading from the interspace between the cylinder and the casing and terminating upon the interior of the collector, so as to deliver air and dust which may escape into said interspace from the interior of the collector back into the interior of the collector, substantially as described.

8. In a dust-collector, the combination of a centrifugal cylinder connected to a revolving shaft which passes through the center thereof by arms which are skewed so as to form the wings of a fan, with a dust-inlet pipe the end of which is curved so as to deliver its dust at right angles to the interior surface of the centrifugal cylinder, and a deflector located on the side of the fan, to which the air is forced in position to deflect the air which comes through the fan and cause it to strike upon the interior surface of the centrifugal cylinder at about right angles thereto, and a head closing the end of the cylinder from which the air escapes, perforated with an air-outlet aperture.

407,393. PRINTING-MACHINE. JOHN H. BENTON, DAVIES BRAITHWAITE, and MARK SMITH, Manchester, County of Lancaster, England. Filed Feb. 9, 1888. Serial No. 263,543. (No model.) Patented in England Dec. 10, 1884, No. 16,201, Apr. 20, 1886, No. 5,469, and Nov. 22, 1887, No. 16,022.

Claim.—1. In a typographic and similar perfecting machine, the combination of a cylinder having two impression-surfaces with a reversing and refeeding apparatus consisting, essentially, of a rotary gripper, fixed rings concentric with the path of the gripper, gearing and devices, substantially as described, for operating the gripper, and

407,393.



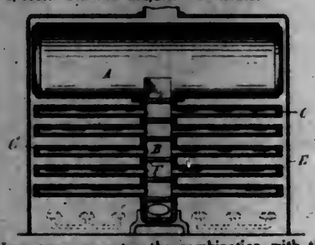
as adjustable finger for releasing the gripper, and with a taking-off apparatus consisting, essentially, of rotating grippers, gearing and devices, substantially as described, for operating the grippers, endless traveling bands, and devices for releasing the grippers of the impression-cylinder, substantially as hereinbefore described, and as illustrated by the accompanying drawings.

2. In a typographic and similar perfecting machine, the combination of a cylinder having two impression-surfaces with a rotary gripper, fixed rings concentric with the path of the gripper, gearing and devices, substantially as described, for operating the gripper, and an adjustable finger for releasing the gripper, substantially as hereinbefore described.

3. In a typographic or similar perfecting machine, a series or set of fixed rings upon or over which the paper is laid for reversal after being removed from the impression-cylinder, in combination with a series of grippers arranged to take the sheet from the impression-cylinder, for the purpose described.

407,394. APPARATUS AND MEANS FOR PROPELLING BY REACTION. ALEXANDRE CHARLES, Paris, France. Filed Oct. 30, 1888. Serial No. 289,669. (No model.) Patented in France Oct. 13, 1888, No. 179,691; in Germany Oct. 19, 1888, No. 52,894; in England June 7, 1887, No. 8,132; in Belgium June 6, 1887, No. 77,764; in Italy June 17, 1887, No. 21,988, and in Austria-Hungary Aug. 21, 1887, No. 41,139.

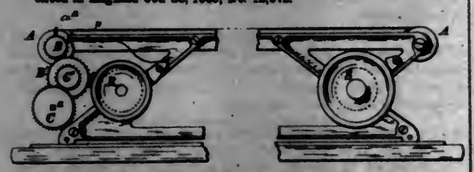
Claim.—1. A propelling apparatus consisting of the combination of a boat, a balloon-car, or other device to be propelled, with a gas-generating chamber provided with outlets for the direct escape of the gases from the generating-chamber, controlling-valves for the outlets, and an opening closed by a door through which the explosive materials are passed into the generator, substantially as described.



2. A propelling apparatus consisting of a boat, balloon-car, or similar device, in combination with a gas-generator having outlets

and controlling-valves and an opening closed by a door, a removable receptacle for holding the combustible material, and guides within the generator for the removable receptacle, as and for the purpose set forth.

3. A propelling apparatus consisting of the combination of a boat, balloon-car, or other device to be propelled, with a gas-generator consisting of a closed vessel with discharge-outlets and controlling-valves therefor, and a door in the vessel opening inward and closing against a seat under the gas-pressure, all substantially as described.



4. A gas-generator consisting of a closed vessel provided with suitable outlets and safety-valves, a door opening inward and closing against a seat under the gas-pressure, a pivoted lever, one end of which is fixed to the door, and a screw attached to the outside of the generator to fasten the other end of the lever when the door is closed, substantially as described.

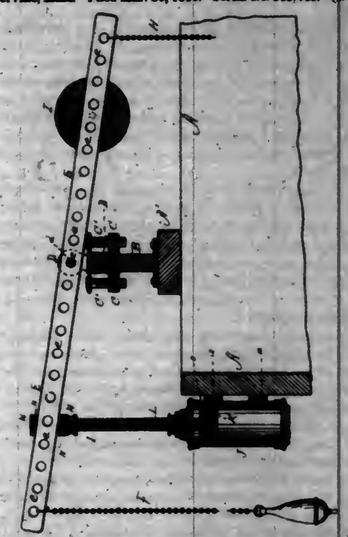
407,395. STEAM-GENERATOR. George D. Cooper, St. John's, Mich., assignor to the Cooper Boiler and Engine Company, same place. Filed Feb. 2, 1889. Serial No. 298,422. (No model.)

Claim.—In a steam-generator, the combination, with the horizontal cylindrical steam-drum, of the vertical water-leg supporting said drum arranged at right angles thereto and communicating therewith, as shown, and of greater width than the diameter of the drum, the water-tubes closed at their outer ends and at their inner ends communicating with the water-leg, said tubes extending from the opposite sides of the water-leg parallel with each other and with the drum, the stays F, spaced between the inner ends of the tubes from wall to wall of the water-leg, and the outer casing E, inclosing the tubes and drum and forming a jacket around the drum and a combustion-chamber around the tubes, substantially as shown and described.

407,396. ROLL-HOLDER INDICATOR. George Eastman, Rochester, N. Y. Filed July 13, 1885. Serial No. 171,560. (No model.) Patented in England Oct. 26, 1885, No. 12,972.

Claim.—1. In a roll-holder for photographic films, the combination, with the outer casing, of the supporting-frame carrying the winding, unwinding, and measuring rolls independent of and movable with reference to the casing, a gear on the measuring-roll, an indicator mounted upon the main casing and in gear with the measuring-roll, so as to make a single revolution as the measuring-roll is rotated the requisite number of times to reel forward an amount of film for one exposure, said indicator adapted to be connected to and disconnected from engagement with the indicating-roller when desired, substantially as described.

2. In a roller-holder for photographic films, the combination, with the outer casing, of the supporting-frame carrying the winding, unwinding, and measuring rollers independent of and movable with reference to the casing, a wheel or gear on the frame in gear with the measuring-roller, so as to make a single revolution as the latter is rotated the requisite number of times to reel forward an amount of film for one exposure, and an indicator mounted on the casing and adapted to be connected to and disconnected from the gear on the frame, substantially as described.



3. In a roller-holder for photographic films, the combination, with the outer casing, of the supporting-frame upon which the winding, unwinding, and measuring rollers are mounted independent of and movable with reference to the casing, the gears B and C, receiving motion from the measuring-roller, and the indicating device mounted upon the casing and adapted to be connected to and disconnected from the gear C, substantially as described.

4. The combination, in a photographic roll-holder, of an indicating device, a measuring-roll, and a gear or pinion for the purpose of connecting the same, substantially as described.

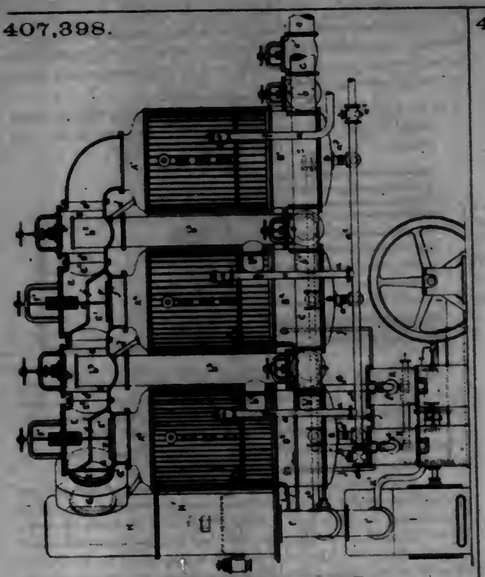
5. In a roller-holder such as described, the combination, with the measuring devices and the casing, of the indicating devices comprising a thimble inserted through the casing and provided with a plate or flange on the outer end, a longitudinally-movable spindle having its bearing in said thimble, and an indicator on its outer end co-operating with the thimble, and a spring contained within the thimble and engaging the indicator-spindle to project the latter toward and hold it in engagement with the measuring devices, substantially as described.

6. The combination, in a photographic roll-holder, of a film-marking device, an indicating device, a measuring-roll, and gearing intermediate the measuring-roll and indicator adapted to effect a single indicated movement of the indicator for two or more rotations of the measuring-roller, substantially as described.

407,397. WATER-CLOSET ATTACHMENT. George V. Eldridge, Somerville, Mass. Filed Mar. 20, 1889. Serial No. 305,315. (No model.)

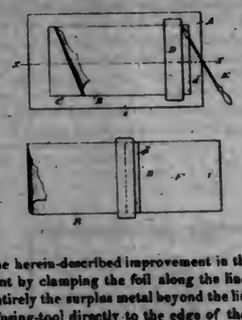
Claim.—1. In a water-closet attachment, the combination, with the lever E, adjustably weighted, as shown, and provided with the pull-chain F and valve-chain H, of the cylinder J, perforated at *o*, piston or plunger K, tubular rod L, open at its ends, and slotted head N, substantially as and for the purpose set forth.

2. In a water-closet attachment, the combination, with the lever E, adjustably weighted, as shown, and provided with the pull-chain F and valve-chain H, of the cylinder J, perforated at *o*, piston or plunger K, tubular rod L, open at its ends, and slotted head N, having the upper and lower edges of the slot convex at N', substantially as and for the purpose described.



407,398. EVAPORATING APPARATUS. James Foster, Samarang, and John Campbell, Soerabaya, Java. Filed Oct. 29, 1887. Serial No. 253,796. (No model.) Patented in England Dec. 29, 1886, No. 17,041; in France May 11, 1887, No. 183,489; in Belgium May 12, 1887, No. 77,447; in Spain Aug. 18, 1887, No. 7,099, and in Austria-Hungary Nov. 19, 1887, No. 55,023.

Claim.—1. In multiple evaporating steam vacuum-pans, the combination of a series of evaporating-vessels and their steam-heating chambers with connecting valve-boxes at the top, vertical pipes b^2 between the vessels opening at the upper ends into the said valve-boxes, with controlling valves, and near their lower ends having two or more branches b' b^2 b^4 opening radially into each adjacent heating-chamber, substantially as described.



2. The combination of a series of evaporating-vessels having heating-chambers at their lower ends with a supply-pipe C and valved transverse pipes *b*, each of which has two or more branches opening radially into the adjacent heating-chamber, substantially as described.

3. The combination of a series of evaporating-vessels having heating-chambers at their lower ends and having connecting valve-boxes at their upper ends with a supply-pipe C, valved transverse pipes *b*, upright pipes b^2, opening into the said boxes at their upper ends and provided there with valves, and branches on the pipes *b*, opening radially into the heating-chambers, all substantially as described.

407,398.

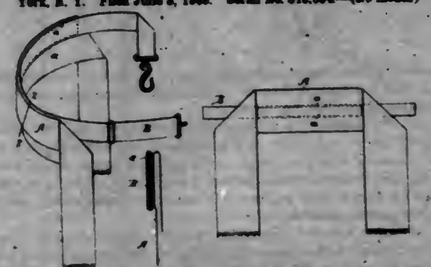
407,399. ART OF WELDING METAL FOIL. John H. J. Haiser, Flushing, N. Y., assignor of one-half to Alexander B. Furnald, Jersey City, N. J. Filed May 24, 1889. Serial No. 311,923. (No model.)

Claim.—1. The herein-described improvement in the art of forming a metal-foil joint by clamping the foil along the line of proposed union, removing entirely the surplus metal beyond the line of pressure, and applying the fusing-tool directly to the edge of the foil, thereby fusing the metal within the line of pressure and producing a joint which lies wholly within such line, as set forth.

2. The improvement in the art of forming a metal-foil joint, which improvement consists in clamping the foil along the line of proposed union and applying a fusing device to the surface of the foil directly along the edges of the clamping device, thereby effecting a separation of the foil at such line, and at the same operation fusing the foil under pressure, as set forth.

407,400. PLAITING ATTACHMENT FOR SEWING-MACHINES. Charles M. Hine, New York, N. Y., assignor of one-half to Charles C. Emmons, Pittsburg, Pa. Filed Nov. 5, 1888. Serial No. 290,049. (No model.)

Claim.—1. The combination, in a sewing-machine, of a plaiting attachment, and a shaft secured to one side of the machine-arm and connected by link and lever to the operating mechanism of the machine, the ratchet secured to said shaft and the pawl therefor, with a cam on the forward end of said shaft for imparting intermittent motion to the vertical levers K K' of the plaiting attachment, whereby said plaiting attachment is operated, substantially as described.



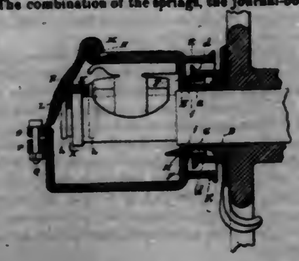
2. The combination of the operating mechanism of a sewing-machine with the shaft A, link C, slotted lever F, ratchet D and pawl therefor, cam J, the levers K K', receiving intermittent motion from said cam, and a plaiting attachment operated by said levers, substantially as described.

3. In combination with the operating mechanism of a sewing-machine, the shaft A, having the cam J and ratchet-wheel D, link G, and slotted lever F, the vertical levers K K', hangers L L', and plaiting-blades having regulating-pins O O', substantially as herein described.

407,400.

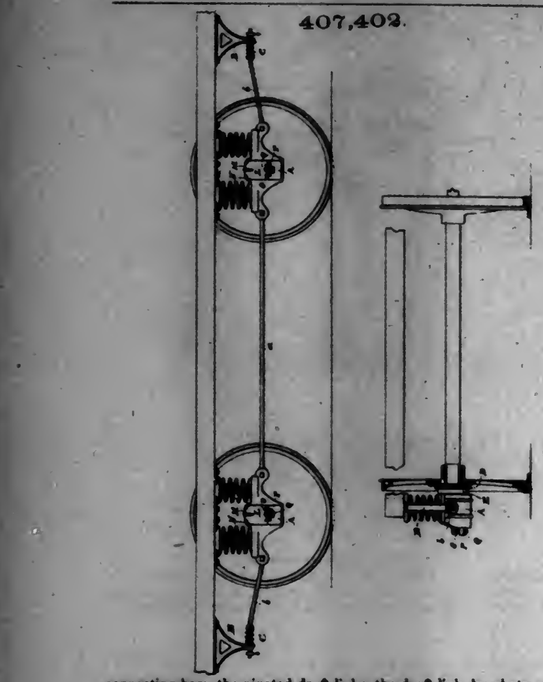
407,401. OUTING-BELT. Jacob Hirshfeld, New York, N. Y., assignor of one-half to A. G. Spalding & Bros., Chicago, Ill., and New York, N. Y. Filed June 3, 1889. Serial No. 312,004. (No model.)

Claim.—An outing belt and sash consisting of a belt and a sash of greater width than the latter permanently secured for a part of its length to the belt, whereby, when the belt is reversed, the opposite face of the sash will be exposed to view, substantially as and for the purpose described.



407,402. CAR-TRUCK. Moses G. Huddard, Philadelphia, Pa. Filed Sept. 22, 1888. Serial No. 286,116. (No model.)

Claim.—1. The combination of the car or truck frame, the springs arranged to support the car vertically and laterally without the aid of posts, pedestals, or side supports, and the journal-boxes, substantially as described, whereby side or lateral concussions are prevented, substantially as specified.



2. The combination of the car or truck frame, the springs arranged to support the car vertically and laterally without the aid of side supports of any kind, the journal-boxes, and the pivoted connecting-bars, substantially as set forth.

3. The combination of the springs, the journal-boxes, the pivoted connecting-bars, and the elastic draft-links, whereby a flexible and elastic attachment of the car to the wheels is obtained, substantially as specified.

4. The combination of the springs, the journal-boxes, the pivoted

407,402.

connecting-bars, the pivoted draft-links, the draft-link brackets, and the draft-link springs located between the journal-boxes and said brackets, substantially as described.

5. The combination of the car or truck, having the draft-links pivoted thereto and to the free or vertically and laterally vibrating journal-boxes, with the springs, and wheels and boxes, whereby the springs are held free to vibrate both laterally and vertically and the axles are held at right angles to the car or truck, substantially as and for the purpose specified.

6. A car-axle and journal-box having a flanged outer dirt-ring, in combination with an elastic expanding or telescoping dirt-ring projecting from the car-wheel, whereby all dirt and water are excluded from said journal-box, substantially as and for the purpose set forth.

7. The combination of the car-wheel, the car-axle, and a journal-box having a flanged outer dirt-ring, with a flanged expanding or telescoping wheel dirt-ring having a spring arranged to press the end of the expanding or telescoping portion against the journal-box, substantially as and for the purposes specified.

8. A wheel dirt-ring provided with an extended arm to press between and engage the spokes of the car-wheel, in combination with the car wheel and axle, substantially as and for the purposes described.

9. An expanding or elastic wheel dirt-ring having an annular flange or collar at or near one end, in combination with a journal-box dirt-ring having an annular flange or collar at or near its inner end to prevent dirt from dropping over it upon the wheel dirt-ring, for the purposes substantially as set forth.

10. The combination of a journal-box having a flanged outer dirt-ring with a car-wheel having a flanged expanding or telescoping inner dirt-ring composed of the ring and its inclosed plunger, washer, and spring, substantially as and for the purposes described.

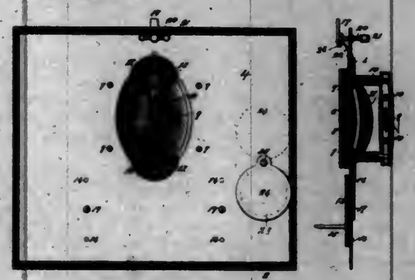
11. The combination of the journal-box and the ordinary button-axle journal with a recessed end-thrust key made to embrace one-half or more of the axle-button and to extend down over the end of the axle, whereby increased end-thrust wearing-surface is obtained, substantially as described.

12. An end plate for a journal-box, having an extending lip at its upper end formed at an angle therewith, in combination with a journal-box provided with an angular rib or flange to fit under said lip, and the vertical bolt, whereby the whole plate is drawn toward the journal-box by the combined action of said angular lip and rib and tightening the one bolt, substantially as and for the purposes set forth.

13. The combination of an end plate, having the angular attachment at its upper end and the vertical bolt at its lower end, with a journal-box provided with a lug or step to prevent the nut of said bolt from turning, whereby the nut is held securely and the bolt is made to remain in position by gravitation, substantially as and for the purposes described.

14. The combination of the pivoted joints, the joint-bolt, and the U-shaped springs, whereby the pivoted joints of the draft-links and connecting-bars and the joint-bolts are kept tight, substantially as and for the purposes specified.

407,403. COMBINED TYPE-TABLE AND GALLEY-RACK. JOHN JEWELL, St. Paul, Minn. Filed July 18, 1888. Serial No. 280,267. (No model.)



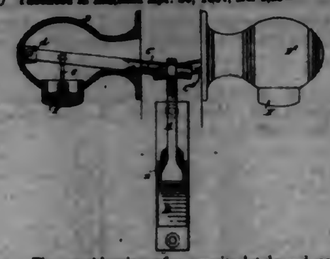
Claim.—1. A table for receiving type, having a metal-covered top, a surrounding ledge whose upper surface is slightly lower than the top of the table, a gutter or trough attached to the same and surrounding the table, and upwardly-projecting cross-ribs upon the upper surface and near the opposite ends of the table, substantially as and for the purpose herein specified

2. A table for receiving type, having a metal-covered top and upwardly-projecting cross-ribs thereon near each end, a surrounding ledge having its upper surface a little lower than the table-top, and a gutter or trough surrounding the table and attached to the said ledge, in combination with a series of portable tables similar to the first and adapted to rest thereupon, each having downwardly-extending supports on the under side thereof adapted to rest against the outer edges of said cross-ribs and be retained in position thereby, substantially as and for the purpose herein specified.

3. A type-receiving table consisting of a series of metal-covered shelves adapted to rest one upon another by means of supports at each end of the under side thereof, the said shelves and supports forming a series of compartments for the reception of type in galleys and forms, the said shelves each having a ledge at the front and rear edges slightly less in height than the surface of the shelf, and a gutter or trough surrounding the upper shelf and attached to said ledge, substantially as and for the purpose herein specified.

407,404. BLOWER. MOLESWORTH KING, Chicago, Ill., assignor of one-half to Louis E. Laflin, same place. Filed Feb. 1, 1889. Serial No. 298,384. (No model.)

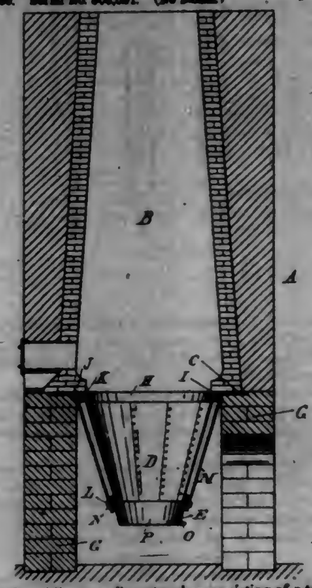
Claim.—1. The combination, with a blower, of the hollow handle 9, the shield 6, secured to the rear of the blower back of the handle 9, and the perforations 8 in said blower between the handle and the shield 6, substantially as described.



2. The combination, with a blower, of the hollow handle 9, and the shield 11, secured to said blower between the same and the handle, there being a multiplicity of perforations 8 in the part of the blower covered by said shield.

3. The combination, with a blower, of the perforated handle 9, the shield 6, secured to the rear thereof, a second shield 11, secured to said blower between the same and the handle, and a multiplicity of perforations in that part of the blower covered by said shield, substantially as described.

4. A blower for fire-grates, having a catch 19, and a spindle 20, passing through the blower, along which spindle said catch is adjustable, whereby the catch may be adjusted to suit any fire-place.

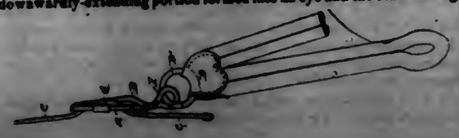


5. A blower for fire-grates, having a catch 19, a spindle 20, passing through the blower, along which spindle said catch is adjustable, a handle 21 for said spindle upon the outside of the blower, and a spring 22, secured to the blower and bearing upon said spindle, whereby the catch may be adjusted to suit any fire-place and will be held in whatever position it is placed.

407,405. LATCH. WILLIAM KRAMS, Barrow-in-Furness, County of Lancaster, England. Filed Apr. 19, 1888. Serial No. 271,193. (No model.) Patented in England Apr. 20, 1887, No. 6,204.

Claim.—The combination of a gravity-latch and catch-rods, each pivoted at one end within its respective knob and the inner ends passing through a slot in the latch, with pushers in the sides of the knobs connected to the catch-rods, substantially as and for the purposes set forth.

407,406. LIMEKILN. FREDERICK KRAMS, Sandusky, Ohio. Filed Apr. 25, 1888. Serial No. 308,281. (No model.)



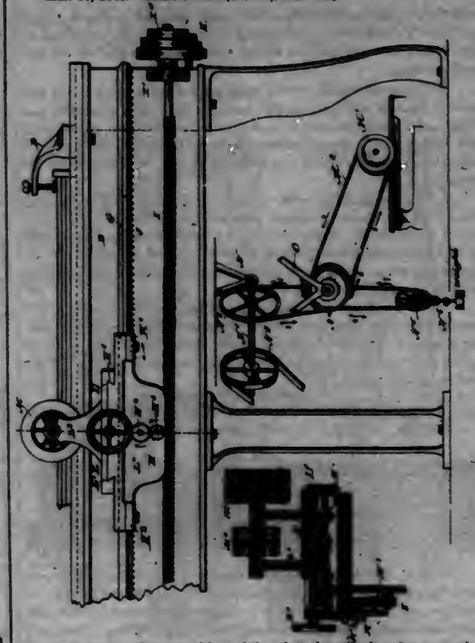
Claim.—1. In a kiln, a cooling-chamber consisting of a top plate and cone secured thereto, a nozzle engaging upon the lower end of the cone, and connection between the top plate and the nozzle, substantially as described.

2. In a kiln, and in combination with the firing-chamber, a cast top plate provided with eyebolts, and the inverted-V-shaped recess, a sheet-metal cone engaging into said recess, a nozzle at the lower end of the cone, and connections between the top plate and the nozzle, substantially as described.

3. In a kiln, a cooling-chamber consisting of the top plate having eyebolts and the inverted-V-shaped recess, a sheet-metal cone engaging with its upper end into said recess, a non-combustible packing in said recess, a nozzle provided with lugs, and bolts connecting the top plate and the nozzle, substantially as and for the purpose described.

407,407. SUSPENDER-BUCKLE. JOSEPH LAWRENCE, New York, N. Y. Filed Feb. 9, 1889. Serial No. 299,204. (No model.)

Claim.—A buckle comprising, essentially, two parts hinged together, between which the webbing is clamped, one part having a downwardly-extending portion formed into an eye and the other having



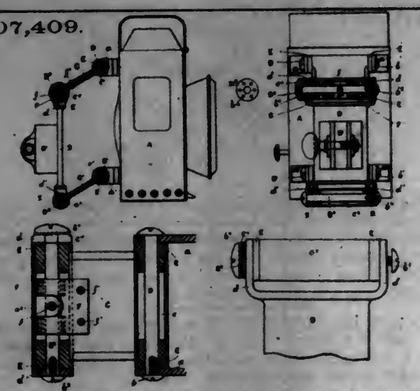
407,407.

a like extended portion formed into a hook which is bent rearwardly, the said extended portions crossing each other when the buckle is being closed, with the hook of the hook projecting beyond the eye-like part a sufficient distance to receive the ring of the suspender-end within the hook and between its back part and the eye-like part, substantially as and for the purpose set forth.

407,408. MACHINERY FOR GRINDING THE EDGES OF A SERIES OF SLABS OF SLATE, &c. SAMUEL LLOYD, West New Brighton, N. Y., assignor to the Old Bangor Slate Company, Bethlehem, Pa. Filed Mar. 20, 1888. Serial No. 268,265. (No model.)

Claim.—1. In a machine of the class described, a frame-work, the top or upper beam of which is formed with recesses, in combination with a bed-plate having similar recessed projections adapted to take therein, with clamps mounted in the recesses of the bed-plate, and a bolt passing through said clamp, bed-plate, and beam, substantially as specified.

2. In a machine of the class described, a frame-work provided with a longitudinal feed-screw and a rack-bar at its front, and with ways, in combination with a carriage mounted on said ways and carrying a grinding-wheel and provided with series of gear, one of which meshes with the feed-screw and the other with the rack-bar, substantially as specified.



3. In a machine of the class described, the combination of the bed-plate C, having recesses C', with the frame-work B, recessed as at B^1, and with the clamp D, substantially as specified.

407,409. LAMP FOR VELOCIPEDES. HARRY LOCAS, Birmingham, County of Warwick, England. Filed Dec. 3, 1888. Serial No. 292,442. (No model.) Patented in England Jan. 2, 1888, No. 8, and Aug. 30, 1888, No. 12,609.

Claim.—1. The combination, with a lamp and a fixed support, of an arm provided at one end with an eye having a bush of non-metallic material and a pin connecting it to the lamp, and a coiled spring connecting the other end of the arm with the said support, substantially as and for the purpose set forth.

2. The combination, with a lamp and a fixed support, of an arm provided at one end with an eye having a bush of non-metallic ma-

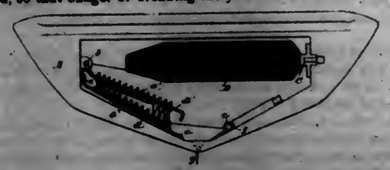
407,409.

terial and a pin connecting it to the lamp, and provided at the other end with a coiled spring connecting the arm with the said support, and an eye inclosing the said spring, substantially as and for the purpose set forth.

3. The combination, with a lamp and a fixed support, of an arm provided at one end with an eye having a bush of non-metallic material and a pin connecting it to the lamp, and provided at the other end with a coiled spring connected to said support, and having a bifurcated central portion, substantially as and for the purpose set forth.

4. The combination, with a lamp, of an arm pivoted to the lamp at one end and provided with an adjustable coiled spring at the other end, a revoluble pin passing axially through said spring and secured to it, a fixed bracket supporting the said pin, and projections for securing the pin to the bracket after the tension of the spring has been adjusted, substantially as set forth.

5. The combination, in a velocipede-lamp, of the arms C and C', having eyes or bushes c, c', and c^3, fitted with pliant washer-bushes, the pins B, B', and B^3, the pin B^3, having interlocking teeth b^4 b^4, the spring F, secured to the said pin B^3, and the sock D', carried by the socket-plate D, as set forth.



407,410. STOCK-WATERING TANK. MATTHEW LYNCH, Malta Bend, Mo. Filed Mar. 19, 1889. Serial No. 303,997. (No model.)

Claim.—The within-described circular brick water-tight stock-watering tank, comprising the solid bottom or foundation of brick or solid broken material and mortar and several courses of rectangular brick laid radially, flatwise, and edgewise and breaking joints, and with their inner ends binding closely against one another, forming practically water-tight joints, the bricks of the courses bound together by mortar placed between their bottom and top surfaces and in vertical wedge-shaped spaces between the bricks in rear of the said joints and suitably finished on its inner and upper surface, as set forth.

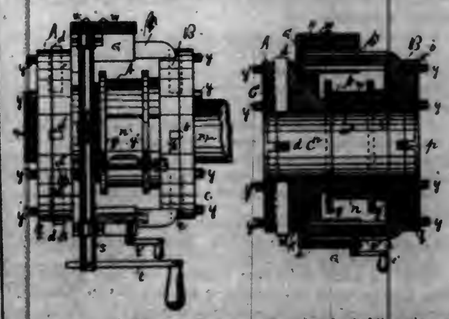
407,411. TENSION-REGULATING DEVICE FOR LOOM-SHUTTLES. GEORGE C. MOORE, Easthampton, Mass., assignor to Joseph W. Green, Jr., and the Glendale Elastic Fabrics Company, both of same place. Filed Aug. 20, 1888. Serial No. 283,259. (No model.)

Brief.—The object of the invention is to provide an improved self-compensating tension device for loom-shuttles of such construction that when there is a sudden jerk on the yarn the tension will be lessened, so that danger of breaking the yarn will be lessened.

Claim.—1. The combination, with a loom-shuttle body, of a tension device consisting of two coils of wire, one of said coils being stationary relative to the body of the shuttle, and a spring-arm by which the other of said coils is carried, whereby the latter coil is free to move toward and from the said stationary coil, substantially as set forth.

2. The combination, with the shuttle-body, of the frame consisting of the fixed and movable arms d and d', the latter being a spring-arm, and the coils e and e', attached to the said arms, substantially as set forth.

407,412. FOUNTAIN-PEN. JOSEPH MORRIS, London, England. Filed Jan. 31, 1889. Serial No. 298,249. (No model.) Patented in England Nov. 7, 1888, No. 16,114.



Claim.—1. The combination, in a fountain-pen, of a tube a, rubber sleeve b, valve g, rod e controlling said valve, screw-cap c, to which the rod is secured, rubber disk h, and clip d, substantially as and for the purpose described.

2. In a fountain-pen, the combination, with a barrel a, of an india-rubber or equivalent sleeve b, cap c, clip d, rod e, hole f, valve g, and india-rubber or equivalent disk or washer h, substantially as herein described.

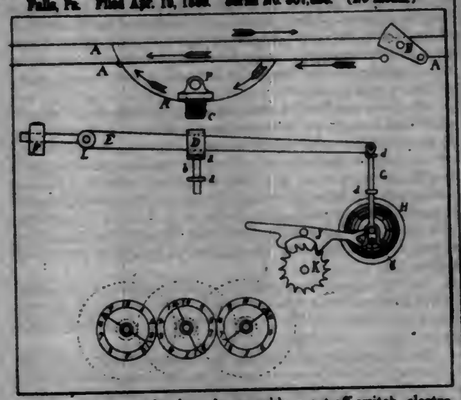
3. In a fountain-pen, the combination, with the reservoir or barrel a, having the opening f therein, and the projection a', with the aperture in the end, and the clip d, formed integral therewith, of the rubber tightly surrounding the reservoir, covering the aperture f to prevent the escape of ink, substantially as described.

407,413. PIPE-THREAD-CUTTING MACHINE. THOMAS MCFADDEN and DAVID ROGERS, Youngstown, Ohio. Filed June 23, 1888. Serial No. 277,946. (No model.)

Claim.—1. The combination, with a vise for holding pipe and the like, of a rotative die-stock and a feed for the latter, consisting of a screw-threaded hub on the die-stock and a nut secured to the vise and movable into and out of engagement with the said hub, substantially as described.

2. The combination, with a vise for holding pipe and the like, of a rotative die-stock and a feed for said stock, consisting of a split nut and an eccentric for operating the nut, the said nut being connected to the vise and die-stock, substantially as and for the purpose specified.

3. The combination, with a vise for holding pipe and the like, of a rotative die-stock, a carriage connecting the vise and die-stock, and gear carried by the carriage and connected to the said die-stock to rotate it, substantially as described.



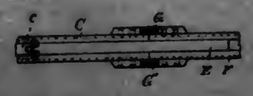
4. The combination, with a vise for holding pipe and the like, of a rotative die-stock, a carriage connecting the vise and stock, operating-gear for the die-stock, a split nut, and the means, substantially as described, for operating said nut to produce a slow feed for the said stock, and a rack and pinion between the vise and carriage to produce a quick feed for the stock, substantially as described.

5. In a thread-cutting machine, a stock consisting of a disk with radial grooves, dies or similar devices in said grooves, and provided with surface threads, a plate or scroll with spiral threads on one face and projecting pins near the periphery, and a washer for holding the scroll to the disk, substantially as described.

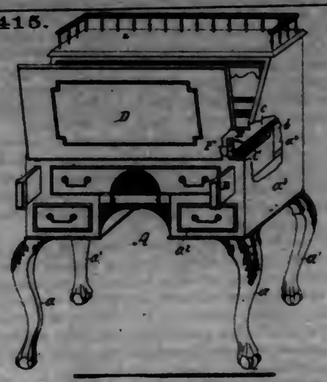
6. In combination with the die-stock of a thread-cutting machine, a feed for the said stock, consisting of an internally-threaded split nut engaging said stock, and frames with eccentric grooves engaging pins on said nut, one of the frames having an elliptical opening and embracing the nut, substantially as described.

7. A pipe threading and cutting machine consisting of a vise-stock composed of the disk B, with arms F and hub C, the jaws p, the scroll-plate b, and means, as the washer c, for retaining the plate on the disk, a die-stock composed of the disk a, having the gear A' and threaded hub C^3, dies, substantially as described, the scroll-plate A, and retaining means, as the washer c', for the said plate A, the feed-nut composed of two parts n n and frames g, the carriage G, composed of two parts united by the shafts S, the worms on the shafts to engage the gear A', and the rack-and-pinion feed r w', all combined to operate substantially as described.

407,414. ELECTRIC METER. WILLIAM MCKINNEY, Schuylkill Falls, Pa. Filed Apr. 19, 1889. Serial No. 307,886. (No model.)

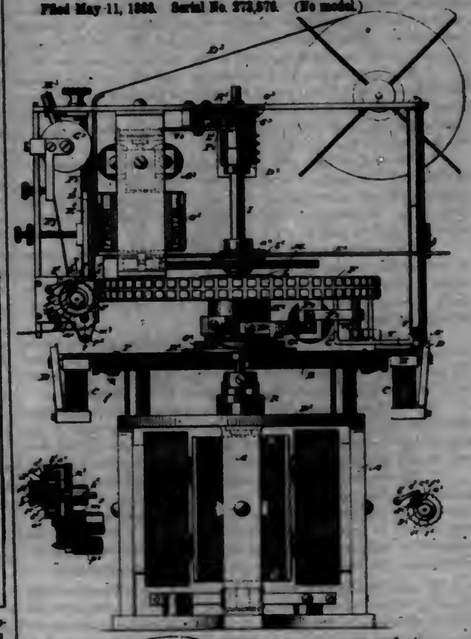


Claim.—1. A conducting wire or cable, a cut-off switch, electro-magnet having its armature connected to a lever, and a forked rod, in combination with a roller-pin and balance-wheel of a lever clock-movement, as shown and described, and for the purpose specified.

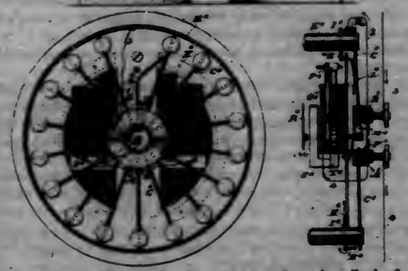


2. The conducting wire or cable, cut-off switch, electro-magnet, and an armature connected to a rod having a forked end, in combination with a roller-pin and balance-wheel of a lever clock-movement, as shown and described, and for the purpose specified.

407,415. DEVICE FOR ACTUATING THE SLIDES OR RESTS OF DESKS. FRANK D. POOLEY and EDWARD P. POOLEY, Philadelphia, Pa. Filed Mar. 26, 1889. Serial No. 305,169. (No model.)



Claim.—The combination, with the desk A and the lid or flap D, of two flanged channeled bars C and F, hinged to each other at G and G' and secured in the frame-work of said desk and lid or flap, and forming the hinge-connections between the lid or flap and the desk and bars E, pivotally connected at one of their ends to the channeled bars F and at their opposite ends to the flanged rails c, which fit in and are afforded a freedom of movement through the channeled bars C to actuate the slides or rests B of the desk, all arranged as shown, and for the purposes described.



407,415.

407,416. STATION AND WAIT PRINTER. MAJOR D. PORTER, Brooklyn, N. Y., assignor to the Porter Teletype Company, of New York. Filed May 11, 1888. Serial No. 273,876. (No model.)

Claim.—1. The combination, substantially as described, of a series of independent controlling-circuits, a rotary type-wheel controlled in common by said circuits and bearing characters corresponding to the designation of the circuits, a wait or message printing wheel, a transmitter therefor placed in each of the independent circuits and having a series of keys adapted to act upon the circuits at different points in the revolution of a circuit-closing arm connected with said circuit, an actuating or controlling magnet for said circuit-closing arm, and a pulsator connected with the driving mechanism for the message-wheel, as and for the purpose described.

2. The combination of the revolving stop-arm, stop devices therefor, the independent controlling-circuits separately connected with circuit-closing stations, an impelling electric motor in the normally-closed common connection for said circuits, a normally-open local circuit for the motor controlled by the stop devices, and a circuit-breaker between the motor and each line, said circuit-breaker being connected with the stop devices, as and for the purpose described.

3. The transmitter on a normally-open circuit and having a series of circuit-closers each adapted to close the normally-open circuit, in combination with the commutator or circuit-changer provided with a series of contacts severally connected with the normally-closed contacts of circuit-breakers corresponding to the circuit-closers, as and for the purpose described.

4. The combination, with the station-indicating mechanism, of a want or message receiver, electric switches disposed at the various stop-points of the station, indicating mechanism for controlling the connection of the message-receiver to the wire of a station calling, an actuating arm or lever controlled in its action by the device which brings the station-indicating mechanism to rest, and a simultaneously-actuated switch-contact in the connection of the circuit calling through the common return-wire.

5. The combination, with an impelling-shaft, of a room or station indicating device frictionally connected with said shaft, a series of separate stations or circuits controlling the position of the same, a want or message transmitter in each circuit, and a want or message indicator or receiver common to the circuits and also frictionally connected with the impelling-shaft, as and for the purpose described.

6. The combination, with a rotating stop-arm and stop devices therefor controlled from each of a number of independent stations or lines, of an impelling electric motor in the common return for said lines and a frictional connection between the motor and the shaft of the stop-arm.

7. The combination, with the rotating stop-arm and a number of independent lines, each controlling a stop device for said arm, of an impelling electric motor and an electric switch controlled by the stop devices for completing a local circuit for the motor when the stop-arm is brought to rest.

8. The combination of the station-indicating type-wheel, a series of independent controlling-circuits therefor, a message or want type-wheel, a transmitter for the latter in each of the independent circuits, and a printing-magnet for the same having also a printing pad or surface for the station-indicating wheel.

9. The combination, with the type-wheel and the printing pad or lever therefor, of the feed-roll, the actuating-spring, the winding-pawl for said spring actuated by the shaft which drives the type-wheel, and a stop or detent for the feed-roll carried by the printing-lever.

10. The combination, with the rotary stop-arm and its impelling electric motor, of a local circuit-closer for the latter controlled by the stop devices and a circuit-breaking magnet moving with the stop-arm and controlling the said local circuit, as and for the purpose described.

11. The combination, with a rotary station or circuit indicating device controlled from a number of separate stations, of a series of stop-magnets disposed in the circumference of revolution of said device, a latch or lock for temporarily holding the armature of the magnets in stopping position, and the releasing electro-magnet for withdrawing the latch or lock, as and for the purpose described.

12. The combination, with the room or station indicator and the impelling electric motor therefor included in a circuit common to the several stations, of a local circuit-closer for said motor, a message or want indicating wheel driven by the motor, a magnet for opening the local circuit, and a circuit-controller for said magnet actuated by the want-indicating mechanism at or near the zero-point, as and for the purpose described.

13. The combination, with a rotary stop-arm and a catch or latch for holding the same in the station or circuit indicating position, of a want or message receiver, an unlatching electro-magnet for the stop-arm, and a circuit-controller for the latter governed by the want or message receiver, as and for the purpose described.

14. The combination, with the station or circuit indicator controlled by a number of independent circuits, as described, of an alternating-current pulsator in a circuit common to said lines, a type-wheel having a controller-magnet also in said common circuit, and a transmitter at each station having a controlling or actuating magnet responsive to the reversals of current.

15. The combination of a series of transmitters in normally-open circuits, a station-indicator common to the same, a series of stop-magnets, one in each normally-open circuit, a want or message indicator having an actuating or controlling magnet responsive to reversals of current, an alternating-current pulsator driven with said indicator, and at each station an actuating or controlling magnet for the transmitter responsive also to reversals of current.

16. The combination, with the type-wheel and the tape-ejecting mechanism, of an actuating-spring for said mechanism and a rewinding device for the spring driven by the actuating-power of the type-wheel.

17. The combination, with the type-wheel, of the spring-actuated feed-wheel for ejecting the printed strip or tape, a detent or catch for said feed-wheel governed by the printing pad or lever, and a winding-pawl mounted on a support driven by the actuating-motor which is connected with the type-wheel.

18. The combination, with the rotating stop-arm, of a series of stop electro-magnets, a catch or latch carried by the stop-arm for engaging and holding up the armature of any magnet in action, and an unlatching-magnet and armature rotating with the stop-arm, as and for the purpose described.

19. The combination, with a station or circuit indicator controlled by independent circuits leading from separate transmitting-stations, and each including the circuit, of a stop-magnet, a latch or lock for holding the indicator in station-indicating position, and a magnet independent of a stop-magnet for unlocking said latch or lock, as and for the purpose described.

20. The combination, with the spring-actuated feed-wheel, of the rewinding ratchet-wheel and its retaining-pawl and a lifting arm or projection for the latter connected with the wheel by devices having a lost motion, as described.

21. The combination, with the rewinding-ratchet-wheel, of the lifting arm or projection for the retaining-pawl of said wheel and a resetting arm or projection for carrying the lifting device beyond lifting position, said resetting-arm being connected with the spring-driven wheel or shaft, which is intermittently released

22. The combination of a series of push-buttons, each connected with a spring arm or contact and normally tending to make connection electrically with a common plate or stop, of a second plate or stop common to the push-buttons and connected with the zero or unison contact of the rotary commutator, and means controlled by each push-button for completing the electric circuit of the transmitter through said zero or unison contact when any button is depressed.

23. The combination, with the rotary commutator and a unison or zero contact therefor connected to a series of normally-open switches or circuit-closers, of a series of circuit-breaking switches corresponding to the wants or calls and connected normally with contacts of the commutator and a controlling or actuating magnet for said commutator in the line-circuit common to said contacts, as and for the purpose described.

24. In a combined station and want call apparatus, a series of controlling-transmitters in independent circuits, each normally open at the transmitter, each of said transmitters having a series of keys corresponding to the wants or calls and arranged to act on the circuit at different points in the revolution, of a circuit-controlling arm and a circuit-closing device connected with each of the series of keys for completing the normally-open circuit when the key is depressed, whereby the circuit may be closed and the apparatus started into operation on the depression of any key, as and for the purpose described.

25. The combination, with the dial-transmitter, of the supplemental dials or indexes and connecting or switch devices for connecting the instrument with the lines corresponding to said dials, as and for the purpose described.

26. The combination, with the dial-instrument having means for connecting it with different central stations, of the supplemental cards or indexes B^1 B^2, inscribed with the wants or messages to be transmitted to such stations and with characters opposite the wants corresponding to the push-buttons of the transmitter.

27. The combination of the series of contacts, the contact-spring moving over the same, but normally out of connection therewith, the stop-magnets for controlling the movements of the moving support for the contact-spring, and an actuating arm or lever carried by the supporting-arm for the spring and arranged to engage with a stop and bring the spring into connection with a contact, as and for the purpose described.

28. The combination, with the type-wheel and its printing-magnet, of a circuit-controller for the latter carried by a reciprocating arm, a cam of irregular outline normally holding the circuit-controller out of operating position and engaging intermittently with a driving-surface which tends to rotate the cam into position for permitting the circuit-controller to act, and a spring which tends to rotate the cam in the opposite direction.

29. The combination, with the rotary arm or station-indicator, of stop devices for stopping the same at any one of a number of points in its revolution, a lock for holding the stop in position to arrest the indicator, and a releasing-magnet acting on the latch at any point in the revolution of the wheel.

30. The combination, with the station and want call at the common office, of a series of transmitters, each on normally-open circuit, and a commutator in each transmitter having a series of normally-open contacts connected, consecutively, to a series of normally-closed switches corresponding to the wants or calls and each adapted to open the circuit of the commutator-contact, as and for the purpose described.

31. In a combined station and want call apparatus, a series of transmitters on normally-open circuits, a commutator in each transmitter, a step-by-step controlling-magnet therefor in each transmitter, means for closing a branch circuit independent of the commutator, and a pulsator at an office common to the circuits, whereby the commutator may be caused to swing from its zero or unison point toward the want or call indicating point in unison with the central-station device.

32. In a transmitter, the combination of a series of push-buttons connected severally with the contacts of a commutator or circuit-changer, of a branch of the circuit upon which the transmitter is placed around the contacts of the commutator and the circuit-closer operated by each push-button for closing said branch upon depression of any key.

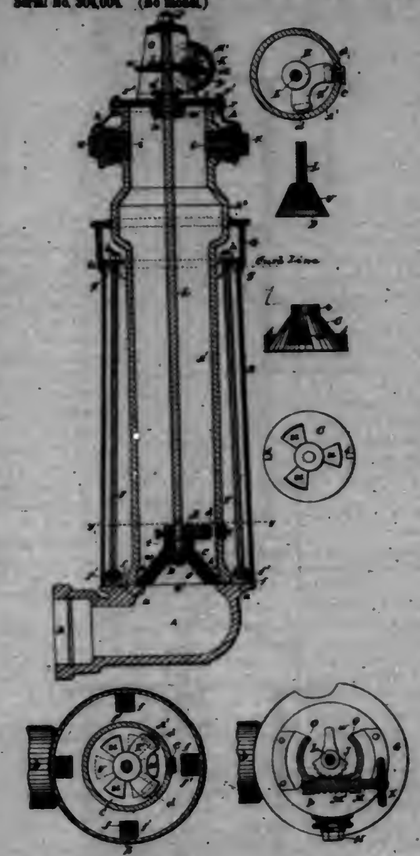
33. The combination, with the transmitter at a station on a normally-open circuit, of a commutator having a series of circuit-closing points and a zero-contact on normally-open circuit, as described, and a controlling-magnet in the circuit of the commutator, whereby the instrument is brought to rest automatically on the completion of its revolution.

34. The normally-open circuit-transmitter having a fixed zero-contact on normally-open circuit for bringing the transmitter to rest at every complete revolution, a controlling-magnet in the circuit of the commutator, a branch circuit, and means for closing said branch circuit at any point in the revolution of the transmitter independent of the zero-contact.

35. The combination of the series of independent circuits connected to a common receiving mechanism, a magnet in each circuit, a rotary transmitter controlled by each magnet, an open-circuiting zero-point for bringing the transmitter to rest at the completion of each whole revolution, a branch around it, a circuit-closer for the same, and a pulsator at the common station.

36. The combination, with the room or station indicating type-wheel, of a want or message type-wheel, a series of controlling-stations in independent circuits, a controlling-magnet for the want or message type-wheel in a circuit common to said stations, a paper strip common to both type-wheels, a printing-lever, and a spring-driven paper-ejecting mechanism controlled by the printing-lever.

37. The combination, with a station type-wheel controlled from a series of independent lines common to said wheel, of a want or message printer common to said lines and placed in a connection normally or when the apparatus is at rest disconnected from said lines, transmitters for the want or message printer at stations on each of said independent lines, and a circuit-closer connected with the several lines, and the want or message printer common to them for closing the connection of the line calling with said printer.



38. The combination, substantially as described, of a series of independent controlling-circuits, a rotary type-wheel controlled in common by said circuits, a want or message type-wheel having a controlling-magnet in a connection common to said independent controlling-circuits, a transmitter therefor in each circuit, a paper strip common to the two type-wheels, and a printer for taking the impression from the first-named type-wheel controlled by the transmitter of the want or message type-wheel.

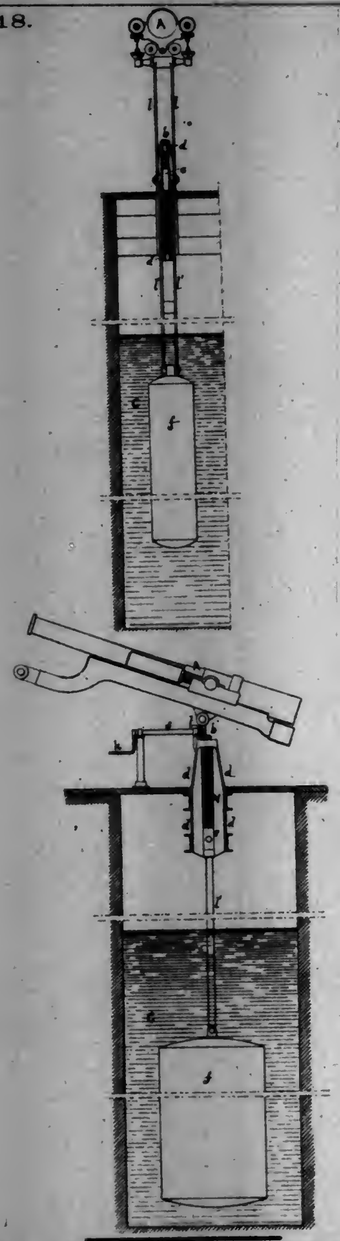
39. The combination, substantially as described, of a series of independent circuits, a station common to said circuits, a type-wheel controlled by the same and bearing characters corresponding to the designations of the circuits, a transmitter in each circuit having a rotary commutator and controlling-magnet, a want or message type-wheel common to the circuits and controlled by said transmitters, and a paper strip and printing device common to the said type-wheels.

40. The combination, substantially as described, of a series of independent circuits, each having a station containing a transmitter, an office common to said circuits containing a station type-wheel, with stop devices for bringing the same to rest in position corresponding to the separate circuits closed, a message type-wheel having a controlling-magnet in a connection common to the said independent circuits for printing the message sent by any transmitter, and a resetter for the station type-wheel controlled by the message-receiver, whereby on the completion of the message from any station the station type-wheel may be automatically freed and permitted to rotate into position for printing the number of another station.

41. The combination, substantially as described, of a number of separate transmitting-stations in lines branching from a common office, a transmitter at each station having a rotary circuit closer and breaker and controlling-magnet for the same in the circuit of the transmitter, an office common to the circuits containing a type-wheel bearing characters corresponding to the stations and controlled in common by the same, a second or message type-wheel mounted beside the first, a controlling-magnet for the message type-wheel in a connection common to the independent circuits, and switches or circuit-closers connected with the several circuits and with said magnet for throwing the same into the circuit with the magnet and circuit closer and breaker of the transmitter which is operated.

407,417. FIRE-HYDRANT. John W. Ramsey, Beaver Falls, Pa., assignor of one-half to M. M. George, same place. Filed Mar. 20, 1888. Serial No. 304,004. (No model.)

Claim.—1. In a fire-plug, the combination, with a sub-chamber, a stand-pipe, a conical valve, a conical removable valve-seat, a valve-rod, and gearing to revolve the valve-rod, of a drip-orifice formed in the stand-pipe wall and a bifurcated drip-gate arm attached to the valve-rod, which is adapted to close the drip-orifice when the main valve is opened, substantially as set forth.



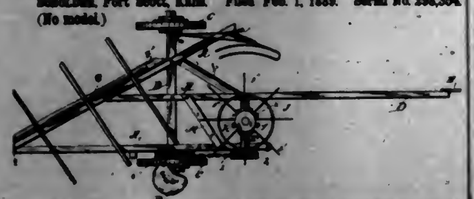
2. In a fire-plug, the combination, with a sub-chamber having a lateral and vertical outlet, a stand-pipe, bolts to connect the stand-pipe and sub-chamber, a hollow conical valve, a hollow conical valve-seat, both valve and seat having ports which are adapted to align with each other, a valve-rod, and worm-gearing which will revolubly move the valve-rod and attached valve, of a drip-orifice and a drip-closing gate attached to the valve-rod which has two limbs, either of which will close the drip-orifice when the plug is discharging water and uncover said orifice when the plug-valve is closed, substantially as set forth.

407,418. GUN-MOUNTING HAVING A DISAPPEARING ACTION. Henri Schneider, Paris, France. Filed July 21, 1887. Serial No. 244,960. (No model.)

Claim.—1. The combination of a gun and its mounting or carriage with a well or pit below it containing a liquid, a closed air-vessel immersed in the liquid, rods connecting the air-vessel with the gun mounting or carriage, and means for raising or lowering the gun, its mounting or carriage, and the plunger, substantially as described.

2. The combination of a gun-mounting with a well or pit below it containing a liquid, a buoyant plunger immersed in the liquid, supporting-rods connecting the plunger with the gun-mounting above it, a nut carried by the rods, and an adjusting-screw adapted to the nut to raise and lower the gun-mounting and plunger.

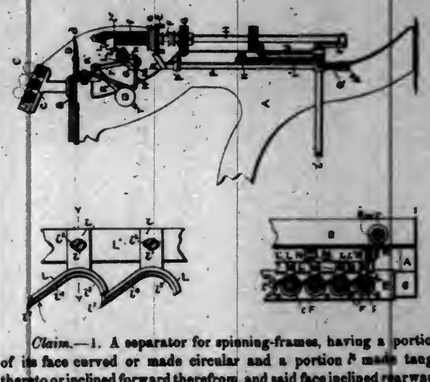
407,418.



and the diagonally-pivoted dropper Q, located at the rear of the knife for discharging the stalks, substantially as described.

2. The combination of the V-shaped carriage-frame, the angularly-disposed knife L, connected to the forward part thereof, diagonally-pivoted dropper Q behind the knife, vertically-adjustable feeder M, and vertically-adjustable reel *j' j'* K, whereby the stalks as they are cut by the knife are reeled onto the dropper and discharged from the carriage, substantially as described.

3. The combination of the V-shaped carriage-frame A, angularly-disposed knife L, connected to the forward part thereof, the diagonally-pivoted dropper Q, located at the rear of the knife, the vertically-adjustable feeder or guard M, secured to the forward part of the carriage and near one end of the axle, the vertically-adjustable reel *j' j'* K, adjusted by the set-screw *k*, said reel being located at the forward part of the carriage A and adjustably secured to the vertical shaft F, having gear-wheel *f* secured upon its lower end and meshing with gear-wheel *f'* upon and near the end of the transverse shaft G, sprocket-pinions *h i*, and sprocket-chain I, all arranged and operated substantially as described, and for the purposes set forth.



407,419. CORNSTALK CUTTER OR HARVESTER. EDWARD F. SWOLDER, Fort Scott, Kans. Filed Feb. 1, 1889. Serial No. 298,364. (No model.)

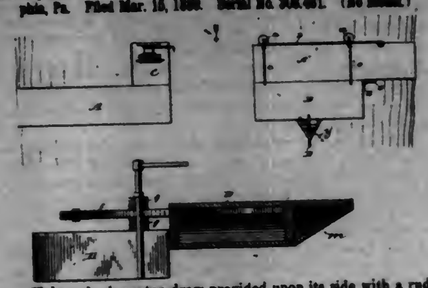
Claim.—1. The combination of the V-shaped carriage-frame, the angularly-disposed knife L, connected to the forward part thereof,

407,420. THREAD-SEPARATOR FOR SPINNING-FRAMES. WILLIAM B. SHARPLES, Fall River, Mass. Filed June 4, 1888. Serial No. 276,094. (No model.)

Brief.—The invention consists in the improved construction and arrangement of the thread-separators and of the means for moving them.

Claim.—1. A separator for spinning-frames, having a portion *a* of its face curved or made circular and a portion *b* made tangent thereto or inclined forward therefrom, and said face inclined rearwardly in an upward direction, and a support for the separator, which support is exterior to and independent of the ring-rail, substantially as and for the purposes specified.

2. A separator for spinning-frames, having a portion *a* of its face curved or made circular and a portion *b* made tangent thereto or inclined forward therefrom, and said face inclined rearwardly in an upward direction, substantially as set forth.



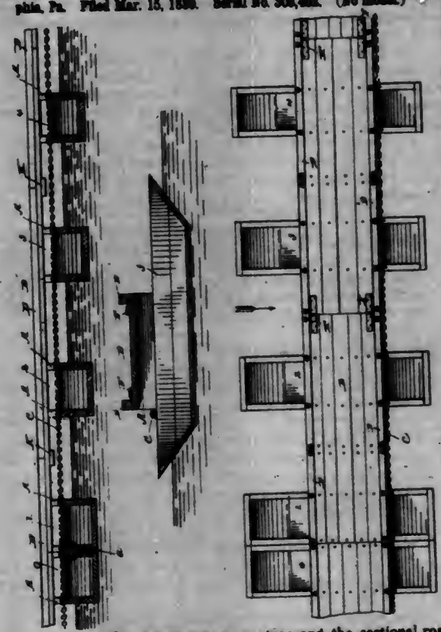
3. The combination, with the spindles, of a series of separators, crank-arms upon which they are mounted to swing in the arc of a circle lying in a horizontal plane, whereby the outer ends or points of the separators may be brought farther forward and nearer to the spindles, supports for said arms, and means, substantially as described, for giving a rearward movement to the separator, substantially as set forth.

4. The combination, with the spindles, of a series of separators, crank-arms upon which they are mounted to swing in the arc of a circle lying in a horizontal plane, whereby the outer ends or points of the separators may be brought farther forward and nearer to the spindles, supports for said arms, and means, substantially as described, for giving backward and forward movements to the separators, substantially as set forth.

5. The combination, with the spindles of a spinning-frame, of a series of separators having ends *a*, which, when in normal position, project forward of a line passing through the spindles, arms and supports therefor, upon which arms the series of separators are mounted to swing in a horizontal plane in the arc of a circle, the pivotal points of the arms on the supports being in the rear of a line passing through the points where the arms are pivoted to the series of separators, and means, substantially as described, for giving a rearward movement to the series of separators, substantially as set forth.

6. The combination of a series of separators, crank-arms upon which they are mounted to swing in a horizontal plane, supports for said arms, which supports are independent of the ring-rail of the machine, a vertically-reciprocating rod, and means, substantially as described, between said rod and separators for giving a rearward movement to the separators, substantially as set forth.

407,421. PONTON-BRIDGE. SYLVESTER H. STEWART, Philadelphia, Pa. Filed Mar. 15, 1889. Serial No. 303,461. (No model.)



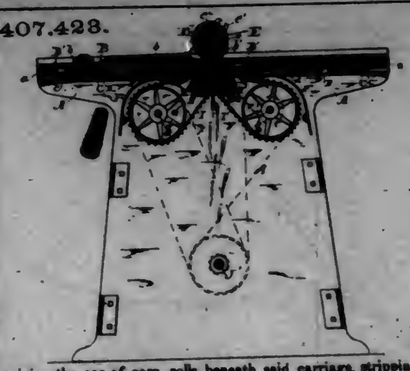
Claim.—1. A ponton-draw provided upon its side with a rudder arranged and adapted to operate substantially in the manner described.

2. The combination, with the floating causeways or main portions of the bridge, having a draw-opening between them, of a floating draw adapted to span the opening and movable to and from the same, and a rudder or rudders on the draw whereby the current-power is caused to move the draw, substantially in the manner hereinbefore set forth.

3. The combination of the floating causeways or main portions of the bridge, the draw, the draw supporting and guiding cable, and the fastenings whereby the draw when opened can be secured to the main portions of the bridge while the cable is slackened, substantially as and for the purposes hereinbefore set forth.

407,422. PONTON-BRIDGE. SYLVESTER H. STEWART, Philadelphia, Pa. Filed Mar. 15, 1889. Serial No. 303,462. (No model.)

Claim.—1. The catamarans or pontons and the sectional roadway thereon, in combination with the stringers or binders D, extending each from about the middle of one section of the roadway to the middle of the next adjoining section, as described.



2. The combination of the catamarans or pontons, the sectional roadway thereon, the longitudinal stringers or binders D, and the transverse stays K for stiffening and binding together the roadway, substantially as described.

3. The catamarans or pontons, in combination with the sectional roadway thereon, the stringers or binders D, the chain or rope C, and the hinges F, substantially as described.

407,428. CORN-HUSKING MACHINE. HENRY R. STINCHFIELD, Portland, Me. Filed Sept. 14, 1888. Serial No. 285,265. (No model.)

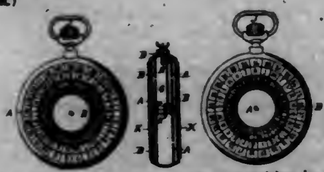
Claim.—1. In a machine for husking corn, the combination of a reciprocating carriage, an open-bottomed receptacle therein for containing the ear of corn, rolls beneath said carriage, stripping-bands running over said rolls and provided with yielding fingers adapted to operate on said ear, a slide arranged to close the bottom of said receptacle during a part of the forward motion of the carriage, and an apron beneath said carriage whereon said ear is discharged, substantially as shown.

407,428.

2. In a machine for husking corn, the combination of an open-bottomed receptacle for the ear, a pair of small rolls placed face to face beneath said receptacle, a pair of endless bands provided with yielding fingers adapted to run over said small rolls in opposite directions, and other supporting-rolls for said bands, substantially as shown.

3. In a machine for husking corn, the combination of a reciprocating carriage, an open-bottomed receptacle therein for containing the ear of corn, rolls beneath said carriage, and stripping-bands running over said rolls, and means for holding said ear in contact with said stripping-bands, substantially as shown.

4. In a machine for husking corn, the combination of a reciprocating carriage, an open-bottomed receptacle therein for containing the ears of corn, stripping-bands, substantially as shown, beneath said carriage, and a rotating cylinder above said stripping-bands adapted to rotate said ear in contact with said stripping-bands.



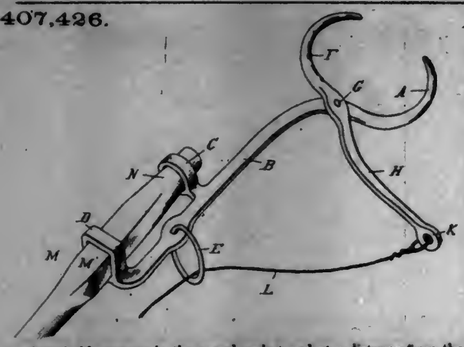
5. In a machine for husking corn, the combination of a reciprocating carriage, an open-bottomed receptacle therein for containing the ears of corn, stripping-bands, substantially as shown, beneath said carriage, a slide for closing said receptacle while the same is approaching the stripping-bands, and means for withdrawing the said slide.

6. In a machine for husking corn, the combination of a reciprocating carriage, an open-bottomed receptacle therein at each end for containing the ear of corn, and stripping-bands beneath said carriage, substantially as shown.

7. In a machine for husking corn, the combination of a reciprocating carriage, an open-bottomed receptacle therein for containing the ear of corn, a slide for closing the bottom of said receptacle, a spring for retracting said slide, a latch for locking the same, and a pin for disengaging said latch as the carriage moves forward, substantially as shown.

407,424. WITHDRAWN.

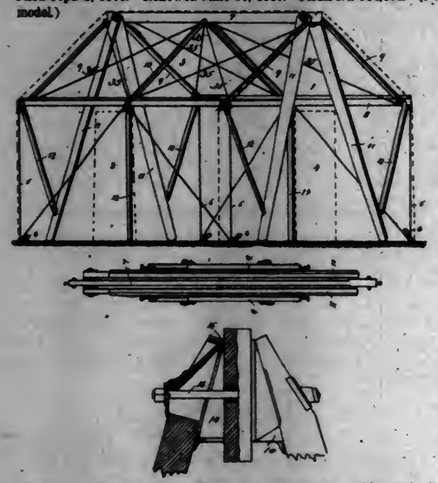
407,425. CRYPTOGRAPHIC APPARATUS. ALEXIS VON SIMON, Vienna, Austria-Hungary. Filed Sept. 3, 1888. Serial No. 284,457. (No model.)



Claim.—A cryptographic apparatus comprising, in combination, two parallel annular fixed ring-disks and two rotary circular disks of the same axis concentric with said annular disks, respectively, said circular and ring disks having on their exposed or reading surfaces visible characters, the characters on the circular disk on one side being repeated on the annular disk on the opposite side, substantially as set forth.

407,426. DEVICE FOR CATCHING ANIMALS. CLAYTON WEBB, Flat Rock, Mich. Filed Mar. 11, 1889. Serial No. 302,774. (No model.)

Claim.—1. In an animal-catcher, the combination of the stationary jaw A, provided with the shank B, and having the round and square sockets C and D formed therein, the pole M, with its end formed



407,426.

to detachably engage in the round socket and at a distance from the end with a squared portion to engage the square socket, the ring E, and the movable jaw F, provided with the shank H and rope L, all arranged and combined to operate substantially as described.

2. An animal-catcher consisting of the shank B, formed with curved jaw A, and with a square socket D at the end and a round socket C between the ends, the ring E on the shank between the sockets, the movable jaw pivoted to the stationary jaw and provided with a shank, the rope L, and the pole formed at its end with a tapering round portion and at a distance from the tapered end with a squared portion, substantially as shown and described.

407,427. TENT-FRAME. GEORGE W. ZIEGLER, Philadelphia, Pa. Filed Sept. 8, 1888. Renewed June 20, 1889. Serial No. 314,891. (No model.)

Claim.—1. A frame for wall-tents, consisting of a ridge-pole 7, having at the ends diverging legs 11, pivotally attached thereto, and inclined rafters 9, secured at the lower ends to eaves-strips 8, supported and braced by an inclined rod 12, supporting the eaves-strip 8 from the lower portion of the leg, substantially as shown and set forth.

2. A frame for wall-tents, having parallel eaves-strip 8, connected by end rafters 9 and 10 and intermediate rafters 10 to a ridge-pole 7, supported by diverging legs 11 and inclined supports 12, extending from the ends of the eaves-strips 8 to the lower portion of the legs 11, and by an intermediate support 13, reaching from the central rafter 10 to the ground, combined with vertical cords 5 and pin 6, adapted to be inserted in the earth, substantially as set forth.

3. A frame for wall-tents, consisting of a ridge-pole 7, supported by divergent folding legs 11 and connected by inclined rafters 9 and 10 with horizontal eaves-strips 8, supported by diagonal braces 12 and braced and held downward by cords 5 and 40, secured to pins 6, substantially as set forth.

4. In combination with a wall-tent frame consisting of a ridge-pole 7, supported by folding legs 11 and united to horizontal eaves-strips 8 by inclined rafters 9 and 10, supported at the lower ends by braces 12, the diagonal braces 35, extending obliquely from the intersection of one rafter with the ridge-pole to the intersection of another rafter with the eaves-strip, substantially as and for the purpose set forth

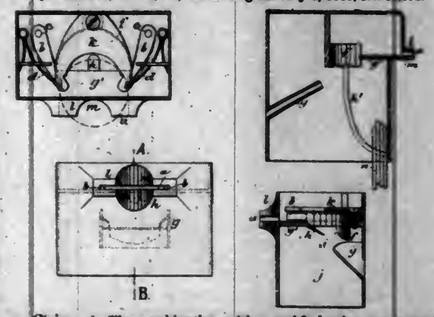
5. In a frame for wall-tents, the plate 17, having flanges 18, embracing the ridge-pole 7, and eyes 19, holding the hooks 20 upon plates 21, secured to the rafters 9, substantially as set forth.

6. In a frame for wall-tents, the plate 17, having flanges 18, embracing the ridge-pole 7, eyes 19, holding the hooks 20 upon plates 21, secured to the rafters 9, and eyes 30, arranged to hold the ends of the braces 35, substantially as set forth.

7. In a frame for a wall-tent, the plate 17, provided with flanges 18, embracing the ridge-pole 7, eyes 19, holding the hooks 20 on plates 21, attached to the rafters 9 and 10, and hooks 38 and eyes 39, arranged to fit and engage in similar hooks and eyes upon similar plates upon the ridge-poles of similar contiguous tents, substantially as set forth and described.

8. In a frame for wall-tents, the described plate 17, provided with eyes 19, 41, and 39, respectively fitting hooks 20, braces 35, and the hook 38 upon adjacent similar plates for uniting tents, substantially as set forth.

9. In a frame for wall-tents, the plate 24, fitted to the lower ends, rafters 9 and 10, provided with a stem 23, having a head 25, fitting in a fork 26, for the purpose of clamping the eaves-strips 8 to the rafters 9 and 10, and having a spur 28, constructed and arranged to hold in a canvas cover, substantially as set forth and described.



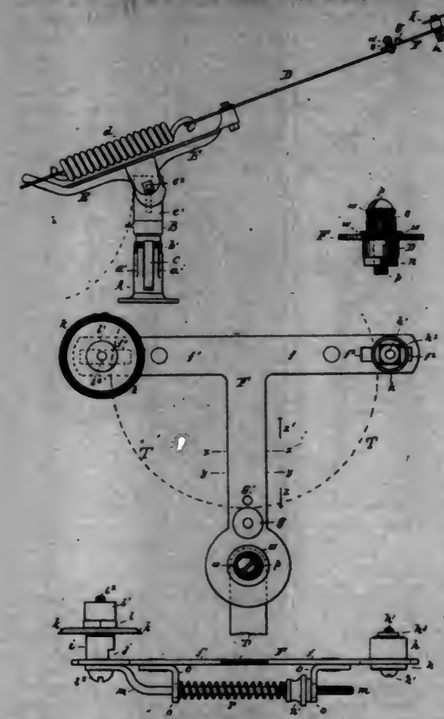
10. In a wall-tent frame, the plates 24, attached to the rafters 9 and 10, provided with stems 23, reaching across the eaves-strips 8 and through the forks 26, and having heads 25, arranged to clamp the eaves-strip 8 between the ends of the rafters 9 and 10 and the forks 26, and having eyes 29 for the attachment of the cords 5, and braces 35, substantially as shown and described.

11. In a wall-tent frame, the described plates 24, for attaching the rafters 9 and 10, eaves-strips 8, and braces 12 and 13, provided with eyes 37 and hooks 38, adapted to fit in and on similar hooks and eyes on similar plates on contiguous tent-frames, for the purpose of uniting the covers of tent-frames in a continuous series, substantially as set forth.

12. The combination of the ridge-pole 7, flexibly connected to the rafters 9 and 10 by the plates 17 and 21, attached thereto with the eaves-strips 8, and braces 12 and 13, detachably connected by the plates 24, and fork-plates 27, and the whole braced diagonally by the braces 35, substantially as shown and described.

13. The plates 27, attached to the braces 12 and 13, having tapering forks 26, in combination with the plates 24, attached to the rafters 9 and 10, having stems 23, and heads 25, for clamping the eaves-strips 8, substantially as set forth and shown.

407,428. APPARATUS FOR PREVENTING FRAUD IN VENDING-MACHINES. EDWARD P. APPLEYARD and JAMES JOHNSON, Bolton, assignors to Charles Arthur Barrett, London, England. Filed Oct. 15, 1888. Serial No. 288,148. (No model.) Patented in England July 10, 1887, No. 10,000; in France Apr. 24, 1888, No. 190,205; in Germany Apr. 27, 1888, No. 45,067, and in Belgium May 1, 1888, No. 81,668.



Claim.—1. The combination, with a casing having a money-slot, of a pair of similar spring catches or clips operating, substantially as set forth, to grasp a disk at its opposite edges, and whereby while they will allow the passage of genuine coin into the machine between the two clips the ends of both clips will by the spring action indent the periphery of soft disks so as to hold and prevent them being passed into the apparatus, all substantially as shown and described.

2. In a vending apparatus, a coin-receiving chamber made with a semicircular shroud or flange, as set forth, and for the purpose hereinbefore described.

3. In a vending-machine, a money chamber or receptacle the bottom of which is cut away to a width less than half the diameter of the coin required to operate the apparatus, leaving only a tongue or projection for the purpose of preventing washers being used to operate the machine, substantially as described.

4. In combination with the casing having a coin-receiving duct, the projection *h'*, made in the form of a hook, adapted to receive and hold washers which may be passed into this duct.

407,429. TARGET-TRAP. WILLIAM T. BEST, Minneapolis, Minn., assignor to Marion L. Best and Mattie M. Best, both of same place. Filed Jan. 28, 1889. Serial No. 297,778. (No model.)

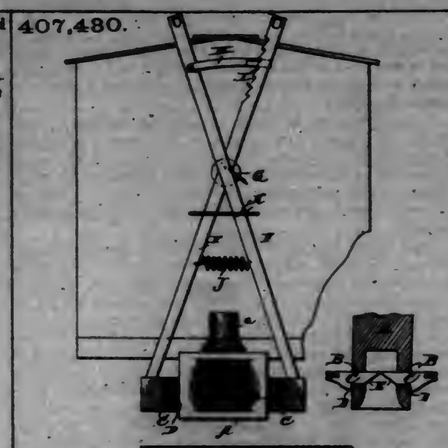
Claim.—1. In combination, in a target-carrier, a spring-actuated post having a notch for engaging the rim at one side of a target and adjustable elastic posts for engaging opposite points of the rim, substantially as set forth.

2. In a target-trap, the combination, with the throwing-arm thereof, of a target-carrier pivoted thereto and comprising a T-shaped frame having a spring-actuated clamping device on one arm and adjustable elastic stops on the opposite arm and stem, substantially as set forth.

3. In a target-carrier, a frame having slots at either side of the middle, an elastic block over one of said slots held by an adjusting-bolt, a post over the other slot provided with devices for engaging the rim or surface of a circular target, a spring-actuated rod, a bolt connecting said rod to said post, and a stop on the frame in rear of said post and block, substantially as set forth.

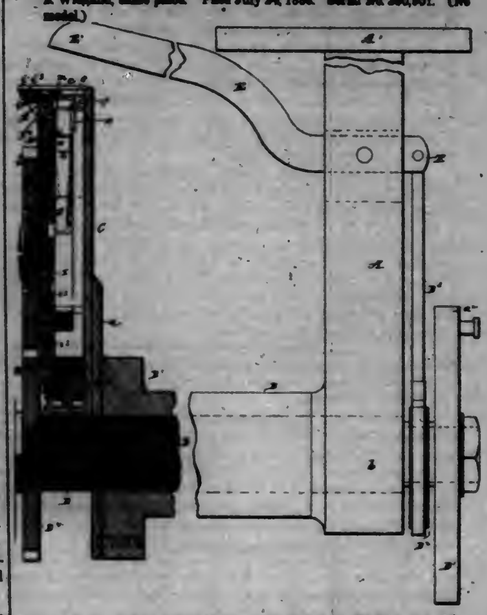
4. In combination, in a target-carrier, an adjustable spring-actuated rotary disk for engaging one side of a target above its rim and adjustable elastic stops for its rim at the opposite points, substantially as set forth.

5. In a target-carrier, a pair of pivoted curved arms, a sliding target-clamp on the one arm having a spring connecting it with the other arm, an adjustable stop on the latter arm, and a stop at the pivotal point, substantially as set forth.



407,480. CAR-COUPLING. WESTHILL J. BOSHER, Montague, Tex. Filed Apr. 11, 1888. Serial No. 306,389. (No model.)

Claim.—1. The combination of the crooked levers, the pawl pivoted to the upper end of one of the said levers, engaging ratchet-teeth on the upper end of the other lever, and the latches carried by the lower ends of said levers, as set forth.



2. The combination of the crooked levers, the bail extending over the same, the spring secured to and extending between said levers, and the latches carried by said levers, as set forth.

3. The combination, with the draw-head, of the cylinder *a* on the upper side thereof, the latches moving transversely in the draw-head and adapted to support the coupling-pin in said cylinder, and mechanism for operating said latches, as set forth.

407,480.

407,481. STAPLE FORMING, SETTING, AND CLINCHING MACHINE. JOHN CRAWFORD, Reading, Pa., assignor of one-half to Edwin R. Wiegand, same place. Filed July 24, 1888. Serial No. 280,901. (No model.)

Claim.—1. In a staple forming, setting, and clinching machine, the combination, with a casing, of piercing-awls, a staple-former, and a staple-clamp, the several parts being constructed and arranged to reciprocate in a single slot, and adapted to pierce the fabric and form and set the staples, substantially as set forth.

2. In a staple forming, setting, and clinching machine, the combination, with a casing having a slot, of a pair of awls adapted to slide in the slot on guide-bars, a staple-former that is located between the awls and their supporting-bars, and a staple-clamp that slides between the strips of the staple-former, substantially as set forth.

3. In a staple forming, setting, and clinching machine, the combination, with a casing having a slot, staple forming, setting, and clinching mechanism located in this slot and adapted to slide therein, of a wire-feeding device and a wire-cutting device that coact together and also with the staple forming, setting, and clinching devices to automatically form a staple of wire, set it in fabric, and clinch it there, substantially as set forth.

4. In a staple forming, setting, and clinching machine, the combination, with a casing and a support therefor, of staple forming, setting, and clinching devices located in a slot of the casing so as to slide in it, staple-wire-feeding mechanism and a wire-cutting device, also supported on the casing, and means to operate these devices and me-

chanical parts in harmonious relation to each other, so as to feed a blank of wire, sever it from a roll, form it into a staple, pierce holes in fabric to receive it, set it in these holes, and clinch it there, substantially as set forth.

5. In a staple forming, setting, and clinching machine, the combination, with a pair of awls mounted on guide-bars to reciprocate and pierce fabric, and an adequate support for these guide-bars that will permit them to slide vertically, of a staple-forming device, which is adapted to slide between the guide-bars that carry the awls and bend a staple into proper form to enter the pierced holes, substantially as set forth.

6. In a staple forming, setting, and clinching machine, the combination, with a casing, of guide-bars supported to slide in this casing and awls that are spring-mounted on the guide-bars and adapted to be spread apart by pressure and return to normal position when the cause of divergence is removed, substantially as set forth.

7. In a staple-forming, setting, and clinching machine, the combination, with a casing properly supported to receive fabric on its upper peripheral surface, of a wire-feeding device, a wire-cutting mechanism, a staple-former, a staple-clamp, two piercing-awls, and a staple-clinching device, all adapted to be moved in proper time with regard to each other, to feed a piece of wire, cut it off the proper length, bend it, pierce fabric, insert the bent staple in the fabric, and clinch it, substantially as set forth.

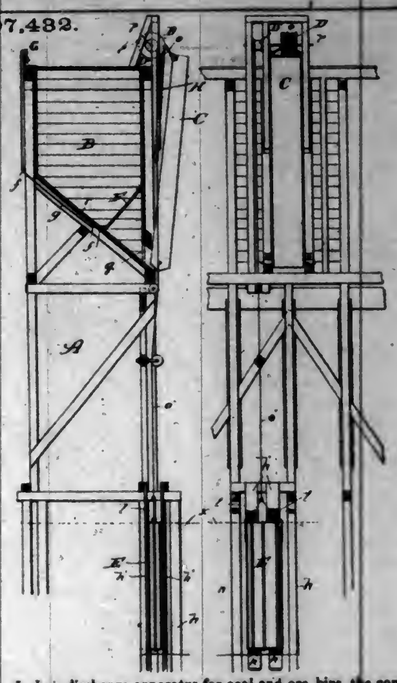
8. In a staple forming, setting, and clinching machine, the combination, with two guide-bars, of two plate-springs having inclines formed on their adjacent faces near their free ends, and two awls secured in these free ends, substantially as set forth.

9. In a staple forming, setting, and clinching machine, the combination, with a casing and two guide-bars, of two plate-springs, an awl affixed in the free end of each spring, inclines formed on the adjacent faces of the plate-springs near their free ends, and a staple-former that is located between the guide-bars, the ends of which engage the inclines and spread the awls apart when the guide-bars are retracted, substantially as set forth.

10. In a staple forming, setting, and clinching machine, the combination, with a wire-feeding device that may reciprocate on the edge of a circular casing, a wire-cutting device that severs the proper length of wire for a staple, and means to move these devices harmoniously, of two guide-bars, two plate-springs located in recesses of the guide-bars, each spring having an inclined surface formed near its free end to engage a staple-former and be spread apart, a staple-former which slides between the guide-bars, and a clampling device that slides within the side plates of the staple-former, all operated by a cam-plate, substantially as set forth.

407,432. DISCHARGE APPARATUS FOR COAL OR ORE BINS.

WARREN DUNBAR, Minneapolis, Minn. Filed Apr. 4, 1889. Serial No. 306,023. (No model.)



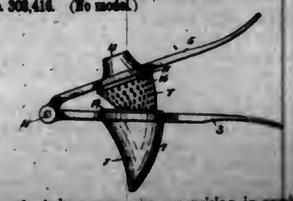
Claim.—1. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, a pivotal chute C, and means for raising and lowering the latter, of means for counterbalancing the chute, comprising a body in water and connected with the chute and adapted to be raised and lowered in the water by the adjustment of the chute, thereby automatically proportioning to each other the varying degrees of resistance of the said chute and body, substantially as described.

2. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, the pivotal chute C, and means for raising and lowering the latter, of means for counterbalancing the chute, comprising a weight E in water and connected with the chute and adapted to be raised and lowered in the water by the lowering and raising of the chute, thereby automatically proportioning to each other the varying degrees of resistance of the said chute and weight, substantially as described.

3. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, the pivotal chute C, and means for raising and lowering the latter, of means for counterbalancing the chute, comprising an oblong rectangular box flaring internally from near its upper toward its lower end and containing sand or the like, the box being connected with the chute and adapted to be raised and lowered in water by the lowering and raising of the chute, thereby automatically proportioning to each other the varying degrees of resistance of the said chute and weighted box, substantially as described.

4. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, and the pivotal chute C, of a shaft *p*, supporting drums D and D', a cable *o*, connecting the chute with the drum, means for rotating the shaft *p*, and a body in water and connected with the drum D' by a cable *o'* and adapted to be raised and lowered in the water by the adjustment of the chute, thereby automatically proportioning to each other the varying degrees of resistance of the said chute and body, substantially as described.

407,432.



5. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, and the pivotal chute C, of a shaft *p*, supporting drums D and D', a cable *o*, connecting the chute with the drum D, means for rotating the shaft *p*, and a weight E in water and connected with the drum D' by a cable *o'* and adapted to be raised and lowered in the water by the lowering and raising of the chute, thereby automatically proportioning to each other the varying degrees of resistance of the said chute and weight, substantially as described.

6. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, and the pivotal chute C, of a shaft *p*, supporting drums D and D', a cable *o*, connecting the chute with the drum D, means for rotating the shaft *p*, an oblong rectangular box flaring internally from near its upper toward its lower end and containing sand or the like, piles *h* in the water below the dock affording a guide for the weighted box, and a cable *o'*, connecting the box with the drum D', whereby in raising and lowering the chute the weighted box is adapted to be lowered and raised in the water and the varying degrees of resistance of the chute and weight are automatically proportioned to each other, substantially as described.

7. In a discharge apparatus for coal and ore bins, the combination, with the dock A, having a bin B, and the pivotal chute C, of a shaft *p*, supporting drums D and D', a cable *o*, connecting the chute with the drum D, means for rotating the shaft *p*, a hinged boom H, extending from the bin against the cable *o*, and a body E in the water below the dock and connected by a cable *o'* with the drum D' and adapted to be raised and lowered in the water by the adjustment of the chute, thereby automatically proportioning to each other the varying degrees of resistance of the said chute and body, substantially as described.

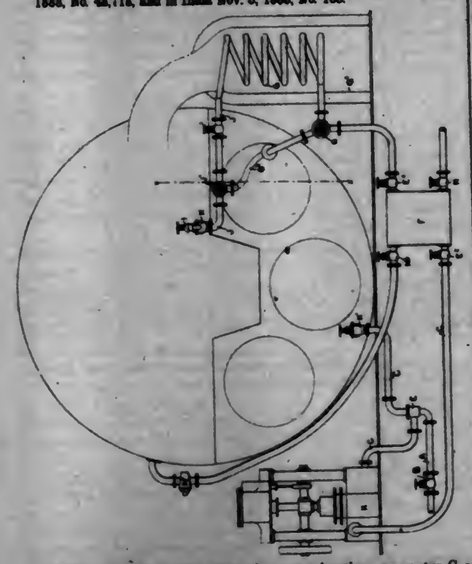
407,433. LEMON-SQUEEZER.

CLEMENT BEHR, St. Paul, Minn., assignor of one-half to Philibert Broyer, same place. Filed Mar. 15, 1889. Serial No. 303,416. (No model.)

Claim.—1. A lemon-squeezer comprising, in combination, the handles 3 and 5, having the common hinge 11, the imperforate receiver 1, rigidly secured to one of said handles, and the hollow perforated plunger 7, secured to the other handle and adapted to fit into said receiver, said plunger being pointed and having cutting-edges and provided with the outlet 13, combined and operating substantially as described.

2. In a lemon-squeezer, the combination, with suitable handles 3 and 5, having a common hinge 11, of the imperforate receiver 1, rigidly secured to one of said handles, said receiver being curved or horn-shaped and of elliptical form in cross-section, the hollow plunger 7, rigidly secured to the other handle, curved symmetrically with said receiver and adapted to fit into said receiver, and provided with a point and cutting-edge, the perforations 15 through its walls, and the outlet 13 for the flow of juices from its interior, substantially as described.

407,434. SOLAR BATH.



SAMUEL D. EVANS, Asbury Park, N. J. Filed Feb. 21, 1889. Serial No. 300,774. (No model.)

Claim.—A solar bath comprising a casing or cabinet having a detachable front frame and glass panel and frames, and reflector-surfaces hinged to said front frame and adapted to be turned down upon the glass panel, substantially as herein set forth.

407,435. FEED-WATER HEATING AND CIRCULATING APPARATUS.

ROBERT FRASER, Liverpool, County of Lancaster, England. Filed Oct. 13, 1888. Serial No. 288,530. (No model.) Patented in England Mar. 2, 1887, No. 3,210; in Germany Apr. 26, 1887, No. 41,176; in France Aug. 31, 1887, No. 185,748; in Belgium Aug. 31, 1887, No. 78,730; in Italy Dec. 31, 1887, XXI, 23,836, XLIV, 330; in New South Wales Mar. 12, 1888, No. 543; in Victoria Mar. 12, 1888, No. 5,602; in Austria-Hungary Mar. 22, 1888, No. 41,510 and No. 6,140; in Canada Oct. 20, 1888, No. 43,718, and in India Nov. 5, 1888, No. 105.

Claim.—1. The combination of a water-heating apparatus G or G^2 with self-acting valves H H' at each end of the circulating-pipes, safety-valve I, a pipe C, connecting one end of the apparatus with a low point of the boiler, and a second pipe J, connecting the other end with the boiler higher up, substantially as described.

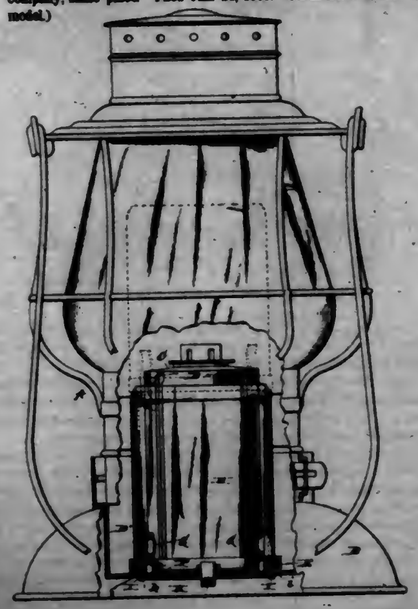
2. The combination of a pipe or pipes G G^2, passing through a heating-space and having automatic cut-off valves H H', one at each end of the circulating-pipes, and a safety relief-valve I, with automatically-adjustable feed and circulating valve E, feed-pipe A, and pipe C, connected with the bottom of the boiler, substantially as described.

3. In a feed-water circulating and cleaning apparatus, the boiler, the three-way self-acting valve E, the pipe delivering the feed-water thereto, and the pipe connecting said valve with the boiler at a point below the water-line, in combination with the pump K and filter F and their connecting-pipes, and the pipe connecting said filter with the boiler, whereby on the cessation of the feed the water from the boiler automatically passes therefrom through the valve to the pump, and is forced thereby through the filter to the boiler.

4. The combination of a heating-pipe G G^2, passing through a furnace, with a pipe C, leading to the bottom of a boiler, and pipe J, leading to the boiler at or near the water-line, pipes C and J being fitted with automatic valves H H', respectively, and a safety-valve I being also on the circuit, whereby overpressure is avoided, and in case of fracture escape of water and steam from the boiler is prevented.

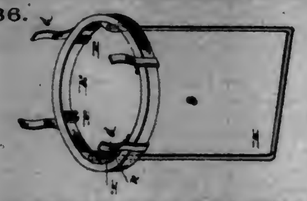
5. In a feed-water-circulating apparatus, the inwardly-opening self-acting stop-valve H, in combination with the outwardly-opening relief-valve I, communicating therewith and formed as one piece with the valve H.

6. In a feed-water-circulating apparatus, the self-acting stop-valve H, kept open by the force of the water entering the boiler, in combination with the relief-valve I, communicating with said valve and closed under ordinary pressure, but adapted to open under undue pressure in the valve H, whereby said valve H is rendered available both as an automatic stop-valve and a relief-valve.



7. In a circulating apparatus for a boiler, a pipe G, and a separate furnace for heating said circulating-pipe outside the boiler, in combination with stop-valves between it and the boiler at both ends of the circulating-pipe, whereby, if the pipe fails, it can be cut off from the boiler and repaired at leisure without any stoppage of the boiler.

8. The combination of a circulating-pipe G^2, passing through the furnace of a boiler, with a self-acting stop-valve at each end capable of self-closing when the pressure on the circulating-pipe is reduced to a given amount below the pressure in the boiler, and a safety-valve on said pipe, whereby the bursting of said pipe from undue pressure is prevented, and if a fracture occurs the said pipe is instantly cut off from the boiler.

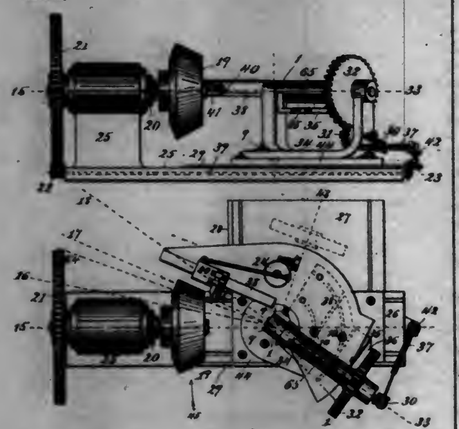


9. In a boiler having a circulating and feed-heating pipe passing through the furnace, a subsidiary circulating-pipe and subsidiary furnace besides the ordinary furnace, whereby, when an accident happens to the ordinary circulating and feed-heating pipe in the boiler-furnace, the said pipe may be put out of operation and the circulation and feed-heating may be conducted through the subsidiary pipe.

407,436. SIGNAL-LANTERN.

ADELBERT R. GIBSON, Cleveland, Ohio, assignor of one-half to the Buckeye Car Seal and Manufacturing Company, same place. Filed Jan. 30, 1889. Serial No. 297,972. (No model.)

407,436.



Claim.—1. In a signal-lantern, the combination, with the base, of the concentric oil-cup provided on its sides with vertical guide-bars, the ring provided with the vertical clip-springs and sliding on the said guide-bars and provided with depending eyes which project through apertures in the base when the ring is lowered, and the bail provided with eyes engaging the eyes on the ring, substantially as specified.

2. In a signal-lantern, the combination, with the base and the oil-cup arranged concentrically thereon, of the vertical guide-bars D, attached to the sides of the oil-cup, the ring provided with the vertical clip-springs and surrounding the oil-cup and provided with interior grooved slides F, fitting on the said guide-bars, and the swinging bail connected to the under side of the ring and extending through apertures in the base, substantially as specified.

3. In a signal-lantern, the combination, with the base and the oil-cup, of the sliding ring provided with the vertical clip-springs, whereby it readily receives the colored globe, which is adapted when lowered to surround the oil-cup, the swinging bail connected to the under side of the ring and projecting through apertures in the base, the spring-catch L, to engage the free end of the bail when the ring is lowered, and the spring-hook M, to engage the said bail when the ring is elevated, substantially as specified.

4. In a signal-lantern, the combination, with the body, of a removable base B, provided with central oil-cup C, and an annular receiver or well surrounding the oil-cup, the vertically-movable ring provided with the vertical clip-springs and surrounding the oil-cup and operating in the receiver or well, the colored globe affixed to the ring and adapted when the latter is lowered to be received in the receiver or well and surround the oil-cup, and the swinging bail connected to the ring, substantially as specified.

407,437. MACHINE FOR PLANING GEAR-TEETH. GEORGE B. GRANT, Lexington, Mass. Filed Jan. 14, 1887. Serial No. 224,382. (No model.)

Claim.—1. In a gear-planing machine, the combination of a frame, a gear-spindle, a tool-shaft, the axes of the gear-spindle and the tool-shaft intersecting and being angularly adjustable with respect to each other, a positive connecting mechanism, whereby the gear-spindle and the tool-shaft are simultaneously oscillated, a tool-guide attached to the tool-shaft, and a tool-carriage, with means for reciprocating it upon the tool-guide, substantially as described.

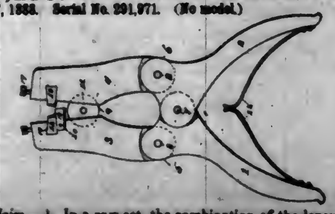
2. In a gear-planing machine, the combination of a frame, a gear-spindle, a tool-shaft, the axes of the gear-spindle and the tool-shaft intersecting and being angularly adjustable with respect to each other, a positive connecting mechanism, whereby the gear-spindle and the tool-shaft are simultaneously oscillated, a tool-guide attached to the tool-shaft and adjustable upon it in a plane parallel to its axis, whereby the tool-guide is attached to the tool-shaft at an angle with its axis and on either side of it in a plane parallel to it, and a tool-carriage, with means for reciprocating it upon the tool-guide, substantially as described.

3. In a gear-planing machine, the combination of the frame 25, the gear-spindle 20, for holding the gear-wheel to be planed, the tool-shaft 65, for holding the planing-tool, the axes of the gear-spindle and the tool-shaft intersecting at the point 1 and being angularly adjustable with respect to each other, the train of gearing whereby the gear-spindle and the tool-shaft are simultaneously oscillated, the tool-guide 38, attached to the tool-shaft in a plane parallel with its axis, and the tool-carriage 40, with means for reciprocating it upon the tool-guide, substantially as described.

4. In a gear-planing machine, the combination of the gear-spindle 20, the frame 25, the tool-shaft 65, the axes of the gear-spindle and the tool-shaft intersecting and being angularly adjustable with respect to each other, the train of gearing whereby the gear-spindle and the tool-shaft are simultaneously oscillated, the tool-guide 38, attached to the tool-shaft and angularly adjustable upon it in a plane parallel with its axis, and the tool-carriage 40, with means for reciprocating it upon the tool-guide, substantially as described.

5. In a gear-planing machine, the combination of the frame 25, the gear-spindle 20, the tool-shaft 65, the axes of the gear-spindle and the tool-shaft intersecting and being angularly adjustable with respect to each other, the train of gearing whereby the gear-spindle and the tool-shaft are simultaneously oscillated, the tool-guide 38, attached to the tool-shaft at right angles with its axis, and the tool-carriage 40, with means for reciprocating it upon the tool-guide, substantially as described.

6. In a gear-planing machine, the combination of the gear-spindle 20, the frame 25, supporting the gear-spindle, the stand 34, supported upon the frame and adjustable upon it in a direction parallel with the axis of the gear-spindle, the tool-shaft 65, supported on the stand 34, with its axis intersecting the axis of the gear-spindle, the tool-guide 38, attached to the tool-shaft, and the tool-carriage 40, with means for reciprocating it upon the tool-guide, substantially as described.



7. In a gear-planing machine, the combination of the gear-spindle 20, the frame 25, supporting the gear-spindle, the stand 34, supported on the frame and adjustable upon it in a direction parallel to the axis of the gear-spindle, the tool-shaft 65, supported by the stand, with its axis intersecting the axis of the gear-spindle, the train of gearing whereby the gear-spindle and the tool-shaft are simultaneously oscillated, the tool-guide 38, attached to the tool-shaft and angularly adjustable upon it in a plane parallel to its axis, and the tool-carriage 40, with means for reciprocating it upon the tool-guide, substantially as described.

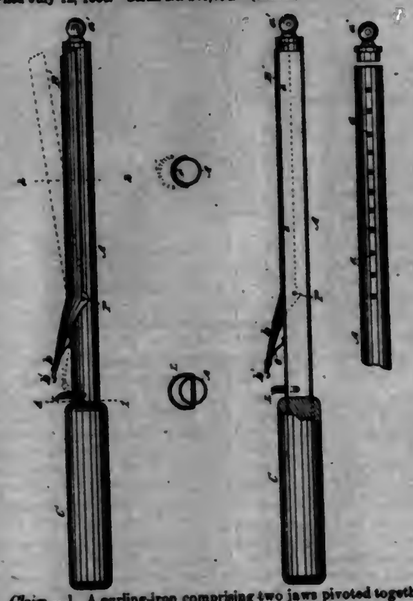
8. In a gear-planing machine, the combination of the frame, the gear-spindle, the tool-shaft, the axes of the gear-spindle and the tool-shaft being laterally adjustable with respect to each other, the positive connecting mechanism whereby the gear-spindle and the tool-shaft are simultaneously oscillated, the tool-guide attached to the tool-shaft, and the tool-carriage, with means for reciprocating it upon the tool-guide, substantially as described.

9. In a gear-planing machine, the combination of a frame, a gear-spindle, a tool-shaft, the axes of the gear-spindle and the tool-shaft intersecting and being laterally and angularly adjustable with respect to each other, a positive connecting mechanism, whereby the gear-spindle and the tool-shaft are simultaneously oscillated, a tool-guide attached to the tool-shaft in a plane parallel with its axis, and a tool-carriage, with means for reciprocating it upon the tool-guide, substantially as described.

10. In a gear-planing machine, the combination of the frame 25, the gear-spindle 20, the tool-shaft 65, laterally adjustable with respect to the gear-spindle, the train of gearing connecting the gear-spindle with the tool-shaft, the tool-guide 38, attached to the tool-shaft, and the tool-carriage 40, with means for reciprocating it upon the tool-guide, substantially as described.

407,438. SAW-SET. MILTON H. GROSS, Abilene, Kans. Filed Nov. 27, 1888. Serial No. 291,971. (No model.)

Claim.—1. In a saw-set, the combination of the levers, the jaws pivotally connected together at an intermediate point of their length and pivoted to the levers, and the dies carried by the jaws, substantially as and for the purpose described.



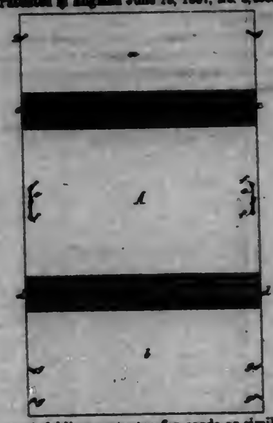
2. In a saw-set, substantially as described, the combination of a pair of jaws pivotally connected together at an intermediate point of their length, a pair of dies secured to the opposing edges of the jaws at one side of the pivotal connection thereof, said dies having coincident teeth and notches in their opposing contiguous faces, and a pair of levers pivotally connected to the jaws for moving the latter and the dies laterally, as and for the purpose described.

3. In a saw-set, substantially as described, the combination of a pair of laterally-movable jaws 3 4, pivotally connected together at an intermediate point of their length, a pair of dies carried by said jaws and located on one side of the pivotal connection thereof, near the free ends of the same, and a pair of levers pivotally connected to each other at 7 and to the jaws at 8, as and for the purpose described.

4. In a saw-set, substantially as described, the combination of a pair of pivoted jaws 3 4, a pair of dies carried by said jaws, the levers pivoted to the jaws for moving the latter and the dies laterally of each other, and a transverse stop fixed to one of the jaws below the die thereof, as and for the purpose described.

5. In a saw-set, substantially as described, the combination of a pair of jaws pivotally connected to each other at an intermediate point of their length, a pair of dies detachably secured to the jaws and having the coincident teeth and depressions in their contiguous opposing faces, a transverse stop fixed to one of the jaws below the die thereon and projecting laterally of the jaw to a line beyond the exposed face of the die on the jaw, to which said stop is fixed, and a pair of levers pivoted to each other and to the jaws, as and for the purpose described.

407,439. CURLING-IRON. SAMUEL HAWKRIDGE, Hoboken, N. J. Filed July 12, 1888. Serial No. 279,794. (Model.)

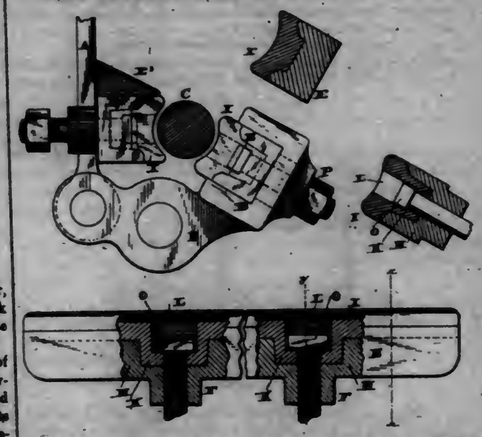


Claim.—1. A curling-iron comprising two jaws pivoted together, one of said jaws being hollow to receive and hold a saturated wick and having one or more openings on the side toward the opposite jaw, substantially as shown and described.

2. A curling-iron comprising two jaws pivoted together, one of said jaws being hollow to receive and hold a saturated wick and having one or more openings on the side toward the opposite jaw, and the other jaw being in the form of a semi-cylindrical shell with its concave side toward the hollow jaw, substantially as shown and described.

3. A curling-iron comprising two jaws pivoted together, one of said jaws being hollow to receive and hold a saturated wick and having one or more openings on the side toward its mate, the other jaw being a semi-cylindrical shell with its concave side toward the hollow jaw to partially surround or embrace the latter and having an arm or extension in rear of the pivot, a spring to press the jaws together, and a loop or catch to engage said arm or extension and hold them apart, substantially as shown and described.

4. In a curling-iron of the character described, the combination of a hollow cylindrical rod or bar adapted to receive and hold a saturated wick and having at one end a handle and in one side one or more openings, a semi-cylindrical or concavo-convex jaw pivoted to said rod or bar and adapted to partially surround or embrace the same, and having a rearward-extending arm or extension, a spring between said arm or extension and the rear end of the said rod or bar, and a loop or catch to engage and hold said extension, substantially as shown and described.



407,440. CASE OR WRAPPER FOR CARDS, PHOTOGRAPHS, BOOKS, &c. GEORGE A. HEARN, Plymouth, England, assignor to Henry Harvell, same place. Filed Nov. 14, 1888. Serial No. 290,613. (No model.) Patented in England June 13, 1887, No. 8,493.

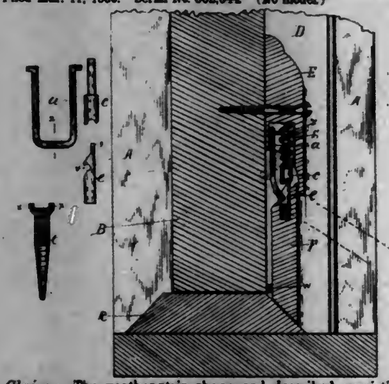
Claim.—1. A folding protector for cards or similar articles, provided with two holes, such as *f*, near its edge, and with two inclined slots, such as *g*, diverging from each other and open at the edge of the protector, in combination with elastic cords or bands *e e*, as and for the purposes described.

2. The described protector or wrapper, constructed as follows, namely: of a single piece of card-board or other suitably thick and stiff material, having the two described similar sets or groups of parallel grooves or scores, the scores being made close to each other, and also having the holes *f*, slots *g*, and elastic cord or band applied thereto, as set forth.

407,441. GRIP. WILLIAM JOHNSON, Penn Yan, N. Y. Filed May 25, 1888. Serial No. 312,067. (No model.)

Claim.—1. The combination, with a cable-grip, of a grip-shoe and a removable wear-plate, said shoe and removable wear-plate being held together and attached to the grip by the same means, substantially as described.

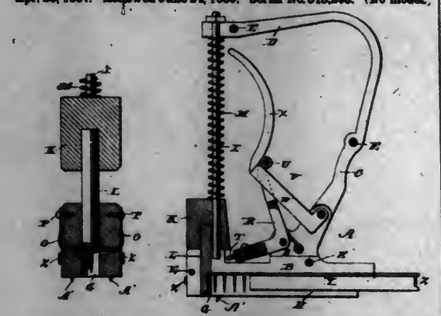
2. The combination of the grip-shoe having recesses therein, a wear-plate having projections which enter said recesses, and a pocket in its wearing-face and securing-bolts passing through the plate and shoe, and having their heads sunk in said pockets practically below the depth of wear, substantially as described.



3. The combination, with a grip-shoe E, made with an overhanging incline F, solidly attached thereto, of a removable wear-plate I, having its edge under the overhang of the incline, substantially as described.

407,442. PROCESS OF OBTAINING METHYL ALCOHOL FROM WOOD-PULP LYES. EMIL MEYER, Berlin, Germany. Filed Jan. 8, 1889. Serial No. 295,775. (No specimens.) Patented in Germany Dec. 13, 1887, No. 45,901.

Claim.—1. The process of treating lyes produced in the manufacture of wood pulp, which consists of the following successive steps: first, concentrating said lyes; secondly, mixing the concentrated lyes with charcoal and forming the mass into briquettes; thirdly, roasting the briquettes, and, lastly, condensing the products of distillation, substantially as set forth.

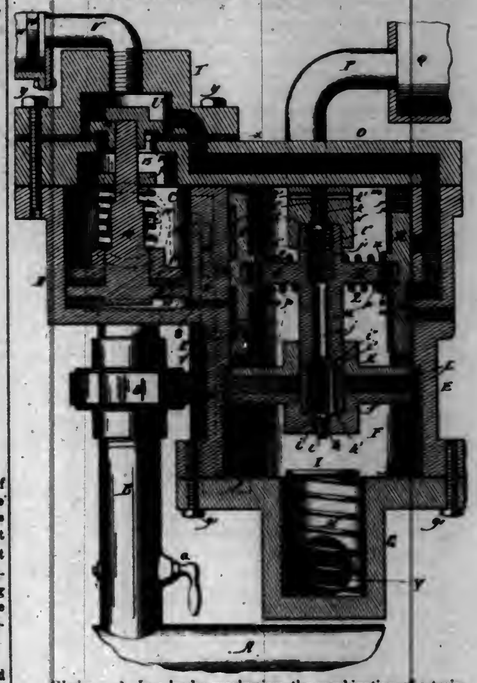


2. In the process of treating lyes produced in the manufacture of wood pulp, the method herein described of regaining the charcoal for further use by lixiviating the same and remixing it with concentrated lyes, substantially as set forth.

407,443. WEATHER-STRIP. ROBERT C. MILLER, Channahon, Ill. Filed Mar. 11, 1889. Serial No. 302,844. (No model.)

Claim.—The weather-strip shown and described, consisting of the combination of the cleat E, leaf F, stud *e*, secured in the upper side of said leaf and having the hooked notch V, and the bearing on its upper end provided with studs X, stirrup *a*, having its lower part curved outwardly from the door and its upper part secured to cleat E in the recess in its lower side, plunger C, having its lower end concaved to rest on the bearing on the upper end of stud *e*, and having its upper end terminate in a stem, and coil-spring S, arranged on the stem of said plunger and seated in said recess, all arranged substantially as and for the purpose set forth.

407,444. TACK-DRIVER. NELSON NEWMAN, Springfield, Ill. Filed Apr. 20, 1887. Renewed June 24, 1889. Serial No. 315,293. (No model.)



Claim.—1. The combination of the frame A, having the base B, provided with the vertical opening G in its front end and the horizontal opening H, communicating therewith, the standard C, rising from one end of the base, and the horizontal arm D, projecting forward from the standard and arranged over the base, with the spring-actuated feed-slide fitting in the opening H, the rod I, connecting the front ends of the base and arm D, the vertically-movable hammer guided on said rod and having the depending stem L to enter the opening G, and the lever to raise the hammer-head and then release the same, all combined and arranged to operate substantially as described.

2. The frame A, having the horizontal opening H in its base, the vertical opening G, communicating therewith, and the depending engaging studs A', for the purpose set forth, in combination with the vertically-movable spring-actuated hammer having the depending stud adapted to enter the opening G, (on its downstroke,) the spring-actuated feed-slide Y, fitting in the opening H, and the lever pivoted to the frame and adapted to raise the hammer and then release the same, substantially as described.

3. In a magazine-hammer, the combination of the frame, the vertically-movable hammer-head, the lever S, having the spring-actuated detent T to engage the hammer-head, and the roller U, and the handle-lever having the inclined arm W, on which the roller U bears, for the purpose set forth, substantially as described.

407,445. AIR-BRAKE. HARVEY S. PARK, Chicago, Ill. Filed Dec. 3, 1888. Serial No. 292,471. (No model.)

Claim.—1. In a brake mechanism, the combination of a train-pipe, an interposed chamber between the train-pipe, brake-cylinder, and main valve-chamber, a pipe leading from the train-pipe to the interposed chamber, a passage leading from the interposed chamber to the main-valve chamber outside of the main-valve piston, a passage leading from the interposed chamber to the brake-cylinder, and a valve controlling the passage from the interposed chamber to the brake-cylinder and operated by train-pipe pressure, substantially as and for the purposes specified.

2. In a brake mechanism, the combination of a train-pipe, an interposed chamber between the train-pipe, brake-cylinder, and main-valve chamber, a pipe leading from the train-pipe to the interposed chamber, a passage leading from the interposed chamber to the main-valve chamber outside of the main-valve piston, a passage leading from the interposed chamber to the brake-cylinder, a valve controlling the passage from the interposed chamber to the brake-cylinder, a piston in the interposed chamber for operating the valve of the passage to the brake-cylinder, ports and passages leading from the interposed chamber to both sides of the piston therein, and a valve controlling said ports and passages, substantially as and for the purposes specified.

3. In a brake mechanism, the combination of a train-pipe, an interposed chamber between the train-pipe, brake-cylinder, and main-valve chamber, a pipe leading from the interposed chamber to the train-pipe, a passage leading from the interposed chamber to the main-valve chamber outside of the main-valve piston, a passage leading from the interposed chamber to the brake-cylinder, a valve controlling the passage from the interposed chamber to the brake-cylinder, a piston in the interposed chamber for operating the valve for the brake-cylinder passage, ports and passages leading from the interposed chamber on both sides of the piston, a valve controlling such ports and passages, and a piston in the main-valve chamber, operating the valve for the ports and passages, substantially as and for the purpose specified.

4. In a brake mechanism, the combination of a main-valve chamber lying horizontal, a cap or cover for the end of the main-valve chamber, a vertical discharge-passage in the cap or cover, and a horizontal passage leading from the main-valve chamber in line with the bottom thereof to the vertical discharge-passage in the cap or cover for draining the main-valve chamber, substantially as specified.

5. In a brake mechanism, the combination of a main-valve chamber lying horizontal, a cap or cover for the end of the main-valve chamber, a vertical discharge-passage in the lower side of the cap or cover, a horizontal passage leading from the main-valve chamber in line with the bottom thereof to the discharge-passage in the cap or cover, and a plug for closing the discharge-passage in the cap or cover and provided with a blow-off cock, substantially as and for the purposes specified.

6. In a brake mechanism, the combination of a main-valve chamber, a pipe leading from the under side of the main-valve chamber to a car-reservoir, and a passage in the wall of the main-valve chamber for preventing water of condensation from accumulating in the main-valve chamber in front of the piston therein, substantially as specified.

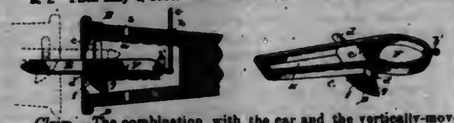
7. The train-pipe A, pipe B, and interposed chamber C, in combination with the passage *d e f* and chamber F, substantially as and for the purpose specified.

8. The train-pipe A, pipe B, union *b*, and chamber C, in combination with the passage *d e f* and chamber F, substantially as and for the purpose specified.

9. The train-pipe A, connecting-pipe B, interposed chamber C, passage *d e f*, and chamber F, in combination with a piston in the chamber C, piston-stem 10, valve 13, passage 14, and chamber 15, substantially as and for the purpose specified.

10. The chamber C, stem 10, a piston on the stem 10, valve 13, and gasket *x*, in combination with the passage 14, chamber 15, bar 16, and spring 17, substantially as and for the purpose specified.

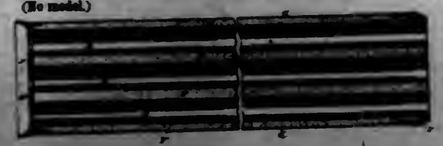
11. The chamber C, stem 10, and piston on stem 10, valve 13, and passage 14, in combination with the chamber U, chamber 15, gasket *x*, and bar 16, substantially as and for the purpose specified.



12. The chamber F, lying horizontal, and end cap or cover G, having the vertical discharge-passage Y, in combination with the horizontal passage X in line with the bottom of the chamber F, and the plug Z, closing the passage Y, substantially as and for the purpose specified.

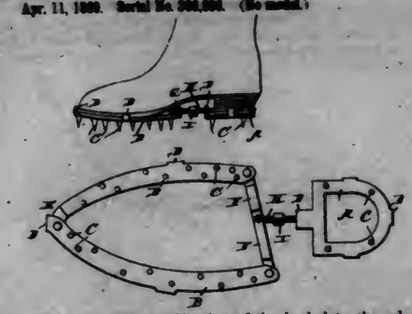
13. The chamber F and groove 3, in combination with a pipe P, leading from the chamber F at the under side thereof, for drainage purposes, substantially as specified.

14. The wall or casing E and chamber F, in combination with a piston traveling in the chamber F, and having a piston-stem M, the arm R' and valve R, the arm 4 and valve 5, and the arm 1, having the ends 2 traveling in the grooves 3, for maintaining the travel of the valve and piston in a straight line, substantially as and for the purposes specified.



15. In a brake mechanism, the combination of a main-valve chamber, a piston in said chamber, a piston-stem, an arm projecting from the piston-stem, and a valve controlling the passage of air from the car-reservoir to the brake-cylinder, and having a slot larger than the width of the stem-arm entering thereinto for enabling the piston to move slightly without moving the valve, to overcome any sticking of the piston, substantially as specified.

407,446. CAR-COUPLING. JAMES W. PEMBERTON, Providence R. I. Filed May 4, 1889. Serial No. 309,590. (No model.)



Claim.—The combination, with the car and the vertically-movable link in the draw-head, of the arm *k'*, connected to the rear end of the link, the stiff rod G, pivotally connected at its lower end to said arm and passed through a guide on the end of the car, and the chains or cords connected to the upper end of said rod G, and extending to the top and sides of the car, substantially as shown and described, and for the purpose specified.

407,447. UNDERGROUND ELECTRIC CONDUIT. EDWARD H. PHIPPS, New Haven, Conn. Filed June 17, 1889. Serial No. 314,559. (No model.)

Claim.—A conduit-section consisting of a metal shell and a lining composed of hydraulic cement, silicon, silicate of sodium, and anhydrous calcium sulphate or its equivalent, combined in substantially the proportions set forth.

407,448. ICE-CREEPER. BENJAMIN POPE, Merrill, Wis. Filed Apr. 11, 1889. Serial No. 306,806. (No model.)

Claim.—1. The combination of the heel-plate, the sole-plates pivoted together at their front ends, the links connecting the rear ends of the sole-plates, and the screw extending between the heel-plate and the said links, as set forth.

2. The combination of the heel-plate having a lug at its front edge, the sole-plates pivoted together at their front ends, the links having their outer ends pivoted to the rear ends of the sole-plates, the bearing-block G, having a depending stud forming a pivot for the inner ends of said links, and the screw having its ends mounted in said bearing-block and the lug D, as set forth

407,449. POWDER-BOX. JONAS H. ROEDER, Philadelphia, Pa. Filed Jan. 21, 1889. Serial No. 297,080. (No model.)

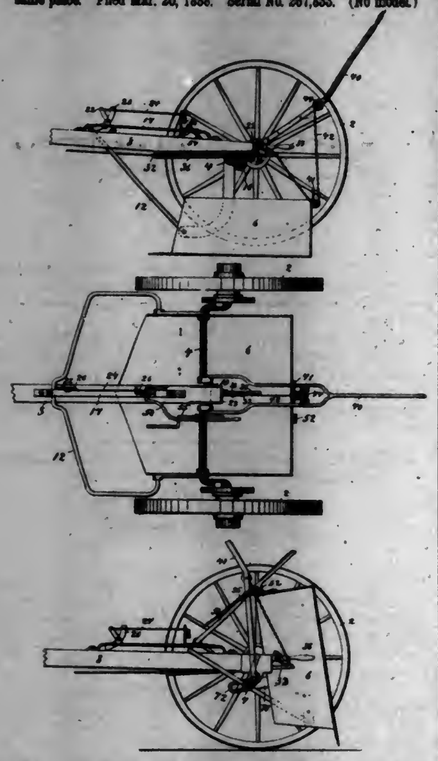
Claim.—1. The powder-box hereinbefore described, consisting of the combination, with the body portion or receptacle in which the powder is freely contained, of the lid or cover provided with the chamois or other soft material on one side thereof, so as to form a pad or puff which may be readily charged with said powder, substantially as and for the purpose set forth.

2. The powder-box hereinbefore described, consisting of the combination, with the body portion or receptacle in which the powder is freely contained, of the lid or cover provided with the chamois or other soft material on the inner side thereof, so as to form a pad or puff which may be readily charged with said powder, substantially as and for the purpose set forth.

3. In a powder-box, the combination, with the body portion or receptacle, of the lid or cover, the diaphragm on the inner side thereof, and the chamois or other soft material secured to said diaphragm, substantially as described.

4. In a powder-box, the combination, with the body portion or receptacle, of the lid or cover, and the pad composed of chamois and cotton and secured on the inner side of said lid, substantially as described.

407,450. ATTACHMENT FOR PLOWS. HANS H. SATER, Dubuque, Iowa. Filed Aug. 22, 1888. Serial No. 283,420. (No model.)



Claim.—1. A brace for mold-board, consisting of a straight portion *d*, secured to the mold-board, a deflected portion *d'*, connected

to the share, and an arm E, for the reception of the mold-board handle, substantially as described and set forth.

2. The combination of a brace D, secured to the mold-board and share and having a corrugated portion thereon, a supplemental brace secured to the landside and also provided with a corrugated portion, and a bolt or screw passing through the two and thereby securing said corrugated portions together.

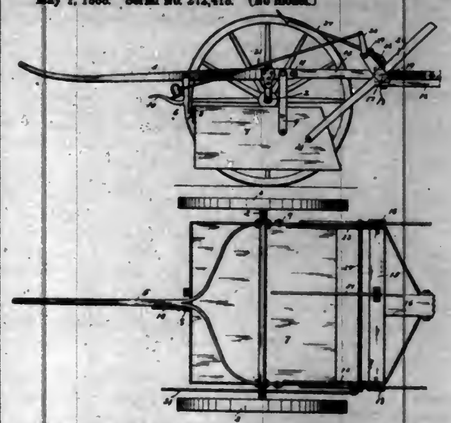
407,451. WHEELED SCRAPER OR SELF-LOADING CART. CHAS. H. SAWYER, Minneapolis, Minn., assignor of one-half to H. A. Smith, same place. Filed Mar. 20, 1888. Serial No. 267,833. (No model.)

Claim.—1. The combination, in a wheeled scraper, with the cranked axle and the pan suspended from said axle, of the tongue attached to said axle, the strap 14, secured to said tongue and forming a way thereon, the bail attached to the forward end of said pan and passing under said strap and adapted to slide in said way, and the pivoted catch adapted to lock said bail in said way, substantially as described.

2. The combination, in a wheeled scraper, with the cranked axle and the pan suspended from said axle, of the tongue attached to said axle, the strap 14, secured to said tongue and forming a way thereon, the bail attached to the forward end of said pan and passing under said strap, the pivoted catch 16, having the curved end 20, and means for turning said catch upon its pivot, substantially as described.

3. The combination, in a wheeled scraper, with the axle and pan, of the tongue attached to the axle, the tube 30, secured to said tongue and passing above the axle, the snatch-bar 32, arranged in said tube and adapted to slide therein, and the chain connected with said snatch-bar and with said pan, substantially as described.

4. The combination, in a wheeled scraper, with the axle and pan, of the tongue attached to the axle, the raising-lever 40, provided with the spool 44 and springs 48, the snatch-bar, and chain connected to said snatch-bar and adapted to be wound on said spool, substantially as described.



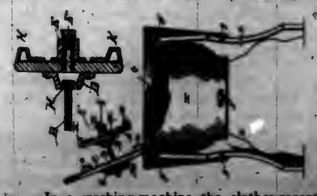
5. The combination, in a wheeled scraper, with the axle and pan, of the tongue attached to the axle, the snatch-bar 32, having the notch 34, the pivoted lever 38, and the catch 36, pivoted on said lever and adapted to engage said snatch-bar when in its retracted position, substantially as described.

6. The combination, in a wheeled scraper, with the axle and the tongue secured thereto, of the pan supported upon said axle, the lever 50 upon said tongue and adapted to hold said pan in its reversed position, and the tripping-lever 55, pivoted upon said lever 50 and adapted to bear upon said pan, substantially as described.

7. The combination, in a wheeled scraper, with the axle and tongue, of a pan swinging on said axle, the auxiliary sliding tongue, the draft mechanism attached to said auxiliary tongue, a detachable connection between the two tongues, and a chain connecting the auxiliary tongue with the back of said pan, whereby when the auxiliary tongue is released the draft of the team will cause the pan to be dumped, substantially as described.

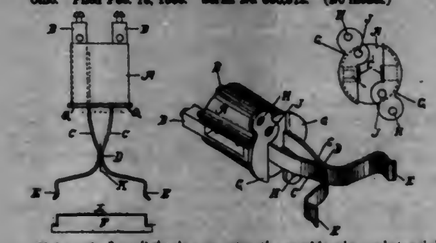
8. The combination, in a wheeled scraper, with the axle and tongue, of the pan swinging on said axle, the auxiliary sliding tongue, the catch 65, for connecting the two tongues together, a bell-crank lever 62, for operating said catch and releasing said tongue, and the chain 67, attached to the auxiliary tongue, passing around suitable pulleys 63 and 64, and secured to the back of the pan, whereby as the chain is drawn over the pulleys by said auxiliary tongue the pan is dumped, substantially as described.

407,452. WHEELED SCRAPER. CHARLES H. SAWYER, Minneapolis, Minn., assignor of one-half to H. A. Smith, same place. Filed May 1, 1888. Serial No. 272,413. (No model.)



Claim.—1. In a wheeled scraper, the combination, with the wheels 3 and cranked axle 2, of the lever 5, secured to the axle, the pan 7, suspended from the lever in front of the axle, the frame or bars 13, forming a continuation of the tongue pivoted to the lever 5 in front of the suspension-links, and the bars 20, connecting the nose of the pan with the frame, substantially as described.

2. In a wheeled scraper, the combination, with the wheels and cranked axle, of the lever 5, secured to said axle, the pan suspended below said axle, the suspension-links 9, secured to said pan and pivoted to said lever in front of said axle, the bars 13, secured to the tongue and pivoted to the lever 5 at a point in front of said suspension-links, the bars 20, pivoted to the pan, and the blocks 18, pivotally secured to the frame and receiving the bars 20, substantially as described.



3. In a wheeled scraper, the combination, with the wheels, of the cranked axle, a lever secured to and operating said axle, the front end of said lever extending forward beyond the axle, a frame pivoted to the forward end of the lever and secured to the tongue, a pan or scraper suspended from the lever by suitable links supported upon the lever at a point between its forward end and the axle, and the bars 20, pivotally secured to the frame and to the nose of the pan and capable of being released from said frame when the pan is reversed, substantially as described.

407,453. WASHING-MACHINE. DAVID SAVAGE, Bloomsburg, Pa. Filed June 23, 1888. Serial No. 278,234. (No model.)

Claim.—In a washing-machine, the clothes-receptacle and an agitator-rod, in combination with a perforated agitator which slides upon said agitator-rod, said agitator having a hollow rod-projector extending below the rubber and closed at its lower end, substantially as and for the purposes specified.

407,454. LIGHTNING-ARRESTER. JAMES W. GEE, Hamilton, Ohio. Filed Feb. 18, 1888. Serial No. 300,312. (No model.)

Claim.—1. In a lightning-arrester, the combination, substantially as set forth, of a cylindrical plug of insulating material, a pair of binding-posts rigidly attached thereto, and a pair of metallic springs mounted on said block and adapted to make contact with each other and connected one to each of said binding-posts.

2. In a lightning-arrester, the combination, substantially as set forth, of a cylindrical plug of insulating material, a pair of binding-posts attached thereto, and a pair of metallic springs tending toward each other and connected one to each binding-post and provided with side extensions having clips.

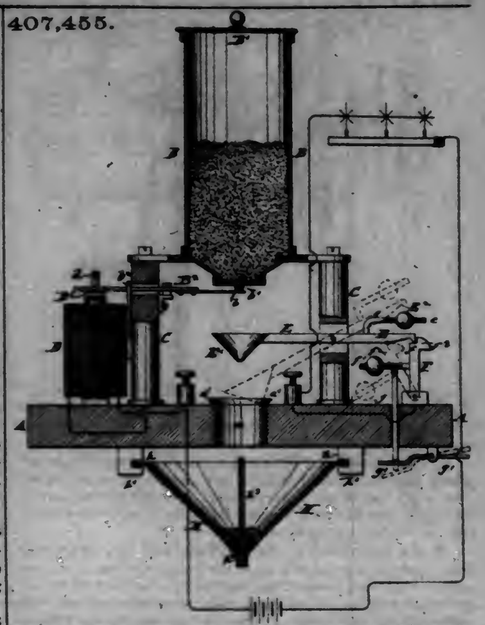
3. In a lightning-arrester, the combination, substantially as set forth, of a cylindrical plug of insulating material, a pair of binding-posts attached thereto, and a pair of metallic springs adapted to make contact with each other and provided with side extensions having clips and connected one with each of the binding-posts.

4. In a lightning-arrester, the combination, substantially as set forth, of a cylindrical plug of insulating material, a pair of binding-posts disposed within said plug and projecting to the rear thereof, and a pair of metallic springs tending toward each other and connected one with each of the binding-posts and projecting from the front of the plug.

5. In a lightning-arrester, the combination, substantially as set forth, of a plug of insulating material provided with two longitudinal grooves, a binding-post secured in each of said grooves, and a metallic spring clamped in each of said grooves between the binding-posts and plug.

6. In a lightning-arrester, the combination, substantially as set forth, of a plug of insulating material, a pair of binding-posts attached thereto and projecting to the rear thereof, a metallic flange attached to each binding-post at the front of the plug and provided with a hole adapted to receive an attaching-screw, and a metallic spring connected with each binding-post at the front of the plug.

7. In a lightning-arrester, the combination, substantially as set forth, of a plug A, of insulating material, provided with holes J, a pair of binding-posts B, attached to the plug and projecting to the rear thereof, a metallic spring connected to each binding-post at the front of the plug, and a metallic flange G, connected with the front end of each binding-post and provided with hole H to receive an attaching-screw.



407,455. ELECTRIC CUT-OUT. ADOLPH T. SMITH, New York, N. Y. Filed Jan. 30, 1889. Serial No. 298,122. (No model.)

Claim.—1. In an electric cut-off, the combination of a receptacle for sand or other suitable material, a fulcrumed and spring-actuated valve-lever for closing the bottom opening of said receptacle, an electro-magnet in a normally-open circuit, an armature for operating said valve-lever, a fulcrumed and weighted contact-lever provided with a funnel vertically below the discharge-opening of the receptacle, and a pivoted and weighted contact-piece for the outer end of the contact-lever, the contact of the lever and contact-piece being interrupted by the tilting of the contact-lever whenever the circuit is short-circuited and the funnel filled with sand from the receptacle, substantially as set forth.

2. In an electric cut-off, the combination of a receptacle containing sand or other suitable material and having a bottom opening, a fulcrumed and spring-actuated valve-lever, a valve at the outer end of said lever below the bottom opening of the receptacle, an electro-magnet located in a normally-open circuit, an armature adapted to operate the valve-lever and open the receptacle, and a circuit-breaking device operated by the discharge of sand from the receptacle when short-circuiting takes place, substantially as set forth.

3. The combination of a supporting-bracket, a receptacle for the sand or other suitable material supported on said bracket and provided with a bottom opening, a fulcrumed and spring-actuated valve-lever, an electro-magnet in an electric circuit, an armature adapted to

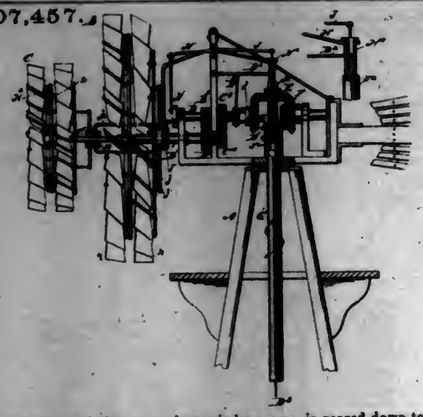
407,455.

operate said valve-lever when attracted by the magnet, a fulcrumed contact-lever provided with a funnel vertically below the discharge-opening of the receptacle, a pivoted contact-piece for the outer end of the contact-lever, and a receiving-funnel below the funnel of the contact-lever supported in ways at the under side of the bracket, substantially as set forth.

4. In an electric cut-off, the combination of a receptacle for sand or other suitable material, a fulcrumed contact-lever provided with a funnel at one end below the discharge-opening of the receptacle and with an adjustable weight at the opposite end, and a pivoted and weighted contact-piece having a stop-shoulder for the contact-lever, the weight of said lever serving to regulate the length of time after which the tilting of the lever takes place, substantially as set forth.

5. In an electric cut-off, the combination of a receptacle for sand or other suitable material, a fulcrumed and weighted contact-lever, a funnel attached to the end of said lever below the discharge-opening of the receptacle, a pivoted and weighted contact-piece having a stop-shoulder for the contact-lever, and a setting-lever and pin for returning the contact-levers into their normal position of contact after a cutting out of the battery has taken place, substantially as set forth.

407,456. HOSE-COUPLING. GEORGE R. WILLIAMS, La Crosse, Wis. Filed Nov. 15, 1887. Serial No. 255,240. (No model.)



Claim.—1. In a hose-coupling, the case or body having a stop-cock provided with a cam or eccentric disk and having a rigid hook which projects beyond the inner end of the case or body and engages the cam or eccentric disk on the opposing case or body, substantially as specified.

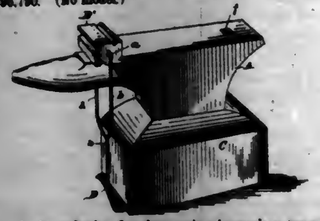
2. In a hose-coupling of that class provided with twin members, each member having a rigid hook 12, the turning plug 10, and the lever 13, fitted to the turning plug to operate the same, the members when coupled together having the hook of one member engaged with the turning plug of the other member, and vice versa, as set forth.

407,457. WINDMILL. ALVIN T. WISSELL, Albion, Mich. Filed Apr. 26, 1888. Serial No. 271,927. (No model.)

Claim.—1. The combination, in a windmill, of wind-wheels of different diameters and concentric shafts, said wheels each independently geared with the drive-shaft by gear-wheels graded to conform to the normal speed of its wind-wheel, whereby each wheel driven at

407,457.

its normal speed, due to a given wind-pressure, is geared down to a common speed at the drive-shaft, substantially as and for the purposes described.



2. In a windmill, the combination, with its wheel and blade-supporting rings, of blades arranged in pairs, one blade forward and the other to the rear of the supporting-rings, each said pair engaged by the angular arm K, pivoted between the blades to said rings, substantially as and for the purposes described.

3. The combination of the fan-blades and their supporting-frame, said blades arranged in pairs, one blade in advance of and one in rear of their supporting-frame, said blades provided with the angular supporting-arms K, said arms engaged at their rear ends with a common rod M, whereby motion communicated to one blade is transmitted to all, substantially as and for the purposes described.

4. In a windmill, the combination, with the drive-shaft D, of gearing for imparting motion from said shaft to the machinery below, the crank H, eccentrically connected with said drive-shaft, and the walking-lever H', for operating a pump, the clutch *d*, and the pinion D', adapted to be thrown out of gear with the shaft by said clutch, whereby the pump may be operated while the gearing is at rest, substantially as described.

5. In a windmill, the combination, with wind-wheels of different diameters and concentric shafts, of sleeves J' J', provided with arms for adjusting the blades of said wind-wheels, the said sleeves connected by arms j^3, whereby the adjustment of the blades of said wheels is effected simultaneously, substantially as described.

407,458. DEVICE FOR SHARPENING CALKS. JOHN ZURBRICK, Cheektowaga, N. Y. Filed May 7, 1888. Renewed Jan. 16, 1889. Serial No. 296,790. (No model.)

Claim.—1. In a device for sharpening horseshoe toe-calks, the die B, having four flat sides and each side having a V-shaped slot therein, and each slot nearer one side than the other on each face, substantially as shown and set forth.

2. In combination with an anvil, the die B, having the V-shaped slots therein and adapted to revolve on the anvil-horn by means of the trunnions *c*, formed on the ends of the die, the rods *b b*, the lower end or ends of which are fastened to a treadle D, attached to the anvil-block, all substantially as and for the purpose specified.

407,459. CAR-COUPLING. AARON B. ALLEN, Pueblo, Colo. Filed May 22, 1889. Serial No. 311,697. (No model.)

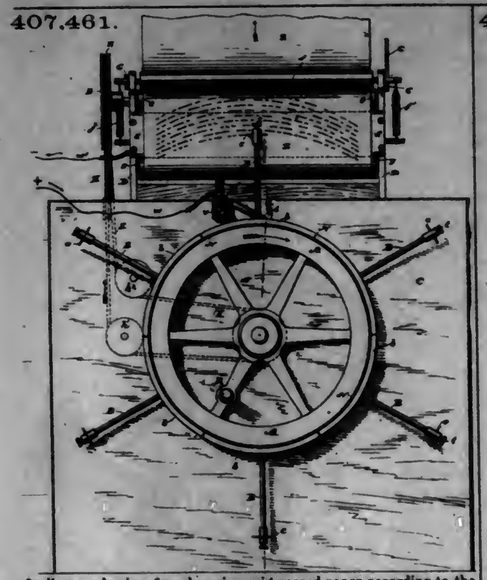
407,459.

Claim.—The car-coupling combining a coupling-hook, a draw-head, cross-bars applied to the latter and between which the hook is pivoted, the spring connected to said hook, and the lever pivoted to the car and acting upon said spring, and the lever pivoted to the aforesaid lever, substantially as specified.

407,460. AUTOMATIC TELEGRAPH. FRANK ANDERSON, Peekskill, N. Y. Filed Dec. 15, 1888. Serial No. 293,710. (No model.)

Claim.—1. In an automatic telegraph, the following combination of elements: a single transmitting-battery connected to earth and directly to a main line, which it normally charges, and a shunt around said battery, including in its circuit an automatic transmitter adapted to open and close said shunt, a recording-receiver located in the main line, and an electro-magnetic device located in a shunt around said receiving-instrument, substantially as described.

2. An automatic telegraph system consisting of the following elements: a main line earthed at each end and including a single main-line or transmitting battery normally in circuit, a transmitter consisting of a perforated fillet and contact brush or pen, a transmitting-cylinder located in a normally-open shunt around the entire battery, a receiver located at the receiving-station, and an electro-magnetic device included in the shunt about said receiver, substantially as described.



3. In a system of automatic telegraphy, the combination of a normally-charged main line, including a receiving-instrument, with an electro-magnet located in a shunt about the receiver, and a transmitter located in a shunt about the charging-battery, substantially as described.

4. In a system of automatic telegraphy, the combination of a main line, including a battery and a receiving-instrument, with a shunt around the battery, including a transmitter, and a second shunt about the receiver, including an electro-magnetic device for preventing tailings, substantially as described.

407,461. AUTOMATIC TELEGRAPHY. FRANK ANDERSON, Peekskill, N. Y. Filed Feb. 9, 1889. Serial No. 299,364. (No model.)

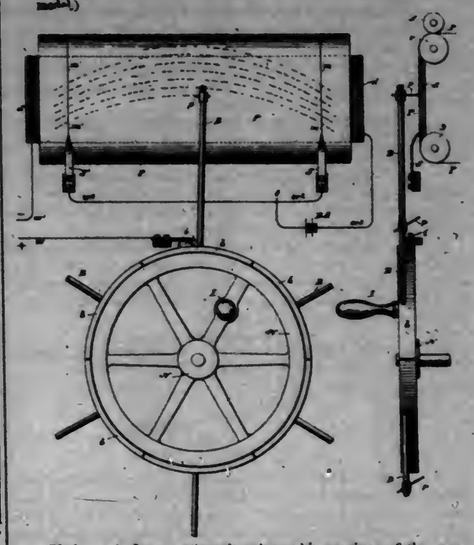
Claim.—1. An automatic telegraphic receiver consisting of a record roll or supply of sensitized paper or equivalent material, with

407,461.

feeding mechanism for advancing said record-paper according to the demands of the transmitting apparatus, and a series of independent receiving-styluses connected to a wheel, said styluses being insulated from each other and having electrical connections for bringing them successively into circuit as the wheel is rotated, substantially as described.

2. In an automatic telegraphic recording apparatus, a series of independent recording-pens mounted on the periphery of a rotatable disk and insulated from each other, in combination with a recording-surface lying in a plane parallel to that of the series of pens, and electrical connections consisting of electrical conducting-segments, and a contacting spring adapted to bear successively thereon as the disk is rotated, whereby said recording-pens are brought successively into circuit, substantially as described.

3. In an automatic telegraphic receiver, the combination of a series of pens or styluses attached to a wheel or disk and having sliding motion in the direction of a radius of the disk, with a fixed cam for giving to said pens or styluses such sliding motion in succession, substantially as described.



4. In an automatic telegraphic receiver, the combination of the following elements: a supply or roll of record-paper or analogous material, a series of record pens or styluses insulated from each other and adapted to come successively into contact with said record-paper, feeding mechanism for advancing said paper, said mechanism consisting of a pair of feed-rolls, one of which is provided with means for lifting it from the paper and thereby preventing the forward feed, and electrical connections consisting of electrical conducting-segments, and a contact-spring adapted to rest thereon, as described, whereby either an entire message or a series of messages may be placed upon the record-paper and then the feed of the record-paper discontinued, substantially as described.

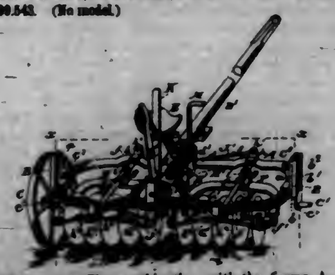
5. In an automatic telegraphic receiver, the combination of a series of pens carried by arms attached to independent sectors arranged around a disk and insulated therefrom, with a contacting surface and a record-surface resting on said contacting surface, and a contact-spring, said contact-spring and contacting surface being included in an electrical circuit with the successive pens and sectors, whereby as said disk is rotated the pens are brought successively into the electrical circuit and successive record-lines are made, substantially as described.

6. In an automatic telegraphic receiver, a series of recording-pens rigidly secured to a wheel or disk by insulated contacting segments, in combination with a flat conducting-surface on which the record-paper rests, and a contact-spring adapted to rest on the contacting segments successively, whereby a page-record is made transverse to the direction of motion of the record as it is fed forward, and with a margin on each side of the paper, substantially as described.

7. In an automatic telegraphic receiver, the combination of a rotary disk or wheel carrying a series of recording-pens rigidly secured thereto, said recording-pens being insulated from each other, substantially as described.

407,462. AUTOMATIC TELEGRAPHIC RECORDER. FRANK ANDERSON, Peekskill, N. Y. Filed May 7, 1888. Serial No. 309,862. (No model.)

Claim.—1. In an automatic telegraphic receiver of the page type, a message-blank having marginal lines, in combination with a receiving-recorder having a series of pens connected to contacting surfaces, insulated from each other, and electrically connected by a two-point contact-spring to the distant transmitter, the contacting surfaces having a fixed relation to the distance between the two marginal lines, whereby the characters near the ends of the successive lines are repeated, substantially as described.



2. An automatic telegraphic record consisting of a series of concentrically-recorded lines of characters upon a sheet of sensitized paper or equivalent material, said record having a definite portion of the characters repeated at the ending and beginning of successive lines, substantially as described.

3. An automatic telegraphic record consisting of a series of concentrically-recorded lines of characters upon a sheet of sensitized paper or equivalent material, said record-paper having two marginal lines as indexes, outside of which all the characters or portions thereof representing telegraphic symbols are duplicated, substantially as described.

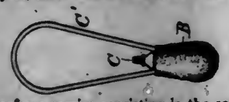
4. The combination of two or more rotary receiving-pens with apparatus for producing marginal lines upon a sensitized page-record, consisting of two electrical contact pens or springs connected to one pole of an electrical generator, in combination with a sensitized sheet of paper and a contacting surface connected to the other pole of said electrical generator, substantially as described.

5. The combination of two or more rotary receiving-pens with means for making marginal lines on a page-record, consisting of two contact-pens, in combination with a sensitized sheet of paper, a conducting supporting-surface, and an electrical generator connected to said pens and the conducting-surface, substantially as described.

407,463. ROTARY OR DISK HARROW. GEORGE W. ASHLEY and JOSEPH H. BOYD, Medical Lake, Wash. Filed Feb. 11, 1889. Serial No. 299,543. (No model.)

Claim.—1. The combination, with the frame A, of the longitudinal shafts supported at their ends on the frame A, the frames F, free to oscillate on said shafts, and the disks carried by a shaft ar-

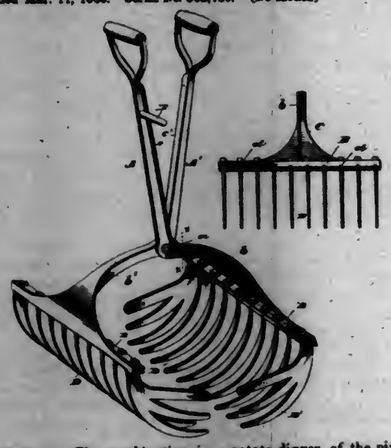
ranged transversely of the frames F, substantially as and for the purpose specified.



2. The combination, with the frame A and the two independent harrow-frames free to oscillate independently of each other on longitudinal shafts, of the transverse shafts journaled in said frames and carrying the disks, the shaft I, and connections between said shaft and the longitudinal shafts of the harrow-frames, substantially as shown and described, and for the purpose specified.

3. The combination, with the frame A, formed with the curves *f*, of the harrow-frames provided with the lugs *g*, and the means for adjusting said frames, substantially as and for the purpose specified.

4. The combination, with the frame A and the tongue, of the independent rocking harrow-frames, the pivoted foot-levers, and the chains connecting said levers with the inner ends of the harrow-frames, substantially as and for the purpose specified.

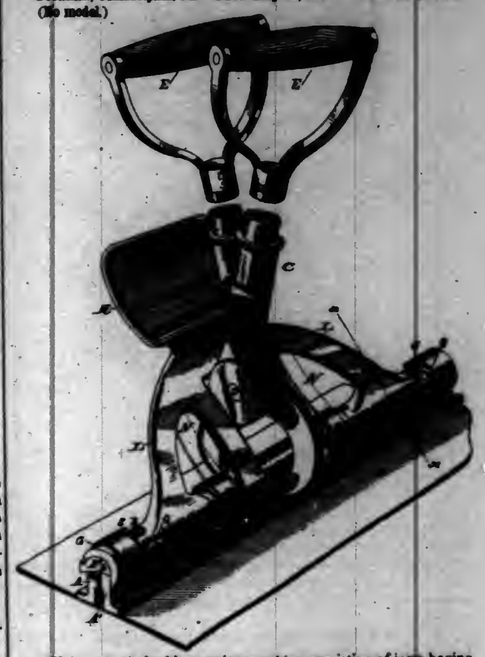


5. The combination, with the frame A and the two independent harrow-frames, of the shafts of said harrow-frames, the shaft I, the operating-lever on one end of said shaft I, and the rods connecting the shafts of the harrow-frames with the said lever and shaft I, substantially as and for the purpose specified.

407,464. PERFUME-CARRIER. Otto Arbenbuster, Brooklyn, N. Y. Filed May 14, 1888. Serial No. 273,383. (No model.)

Claim.—A perfume-carrier consisting in the combination, with the elastic receptacle A, provided with a metallic cap having the open nozzle C projecting therefrom, of the removable jacket B, formed with open mouth and fitted closely to the body of the said receptacle, with the cap of the receptacle exposed at such mouth and the nozzle projected outside the same, and the jacket being provided with a handle C', as and for the purpose set forth.

407,465. POTATO-DIGGER. Charles Brick, South Bend, Ind. Filed Mar. 11, 1889. Serial No. 302,789. (No model.)

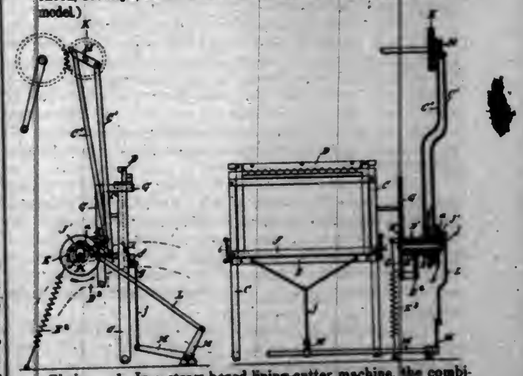


Claim.—1. The combination, in a potato-digger, of the pivoted handle-bars A and A', provided at their lower ends with cross-bars B, to which tines or teeth are attached, re-enforcing strips *c* and *c'*, secured to said handle-bars, the lower portion of said re-enforcing strips having diverging ends which overlap the outer edges of the cross-bars B, substantially as shown, and for the purpose set forth.

2. The combination, in a potato-digger, of the handles A and A', pivoted to each other and provided at their upper ends with spade-handle grips, one of said handles being provided below its grip with a laterally-extending handle, whereby the upper ends of the handles can be held together by one hand while they are being drawn upwardly by the other hand, substantially as shown, and for the purpose set forth.

3. The combination, in a potato-digger, of the handle-bars A and A', pivoted to each other and provided with downwardly-curved portions *b b*, a flat portion being provided above the pivot when the handle-bars are separated, and re-enforcing strips or plates *c* and *c'*, secured at right angles with the handle-bars, cross-bars B, attached to the lower end of the handle-bars and to the re-enforcing plates, curved teeth D, and end tines carrying two or more teeth, the parts being organized substantially as shown, and for the purpose set forth.

407,466. ROOFING DOUBLE-SEAMING MACHINE. Samuel Y. Buckman, Philadelphia, Pa. Filed May 15, 1889. Serial No. 310,817. (No model.)

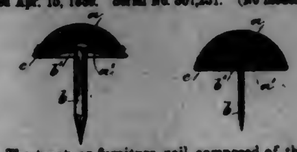


Claim.—1. A double-seaming machine consisting of jaws having flat faces, and connected with tongs, open ears on one of said jaws, a bending-plate journaled in said ears, detachable arms on said plate, and shoulders on the said ears on which said arms are guided and which retain said plate in said ears, said parts being combined substantially as described.

2. A double-seaming machine having jaws with tongs carrying the same, ears on one of said jaws, a bending-plate journaled in said ears, a treadle having arms connected with said plate, and a spring connected with the said ears and adapted to bear against the treadle or arms thereof, said parts being combined substantially as described.

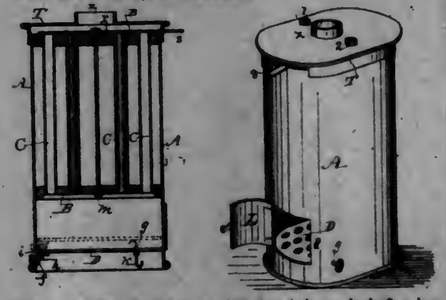
3. A double-seaming machine having jaws with tongs, ears on one of said jaws, and a bending-plate journaled in said ears and provided with an operative treadle connected therewith, the said bending-plate in its normal position having its contact-face downwardly inclined toward the movable jaw, the upper face of the latter being at substantially a right angle with the contact-face of the stationary jaw when closed against it, whereby an angular space is formed between the bending-plate and the upper face of the movable jaw, said parts being combined substantially as and for the purpose set forth.

407,467. STRAW-BOARD-LINING-CUTTER MACHINE. Charles Crook, Brooklyn, N. Y. Filed Oct. 18, 1888. Serial No. 288,605. (No model.)



Claim.—1. In a straw-board-lining-cutter machine, the combination, with the frame C, provided with a web-severing knife D and adapted to be moved by a straw-board, and with the L-shaped extension G, provided with a pin *g*, of the cam E, spring E^2, ratchet-wheel A', the ratchet-wheel A, provided with a pin *a*, the pawls B and C'', and arm J', substantially as shown and described.

2. The combination, with the L-shaped extension G, provided with the pin *g* and with the cam E, spring E^2, ratchet-wheel A', and the ratchet-wheel A, provided with the pin *a*, the pawls B and C'', and also with the arm J', of the cross-bar H, wheel K, and rods C' and C'', as and for the uses and purpose set forth.

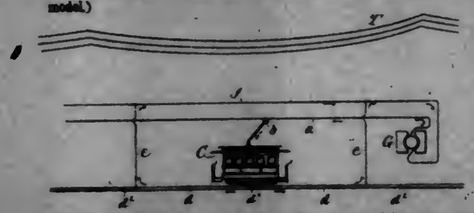


3. The combination, with the frame C and the L-shaped extension G, provided with the pin *g*, of the cam E, spring E^2, ratchet-wheel A', the ratchet-wheel A, provided with the pin *a* and the pawls B and C'', arm J', bar L, bell-crank M, and cord *j*, as and for the uses and purpose set forth.

407,468. NAIL FOR TRUNKS, &c. George Crouch, New York, N. Y. Filed Apr. 15, 1889. Serial No. 307,231. (No model.)

Claim.—The trunk or furniture nail composed of the circular disk or button *a*, of compressed leather or vulcanized fiber, having a recess on the under side, the metal nail having a head integral therewith, and the disk *c*, perforated for the nail to pass through and having a turned-over edge by which the parts are united and held together, substantially as and for the purposes set forth.

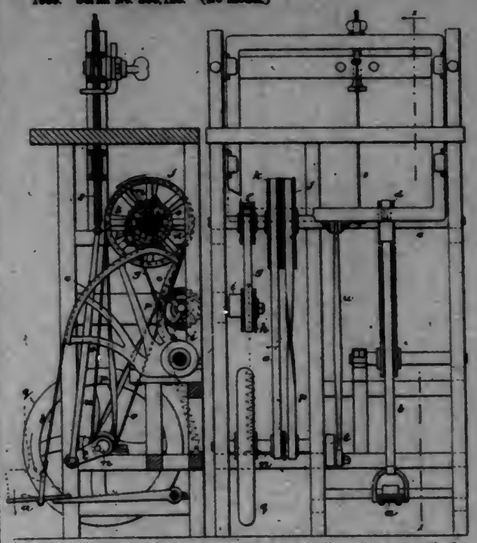
407,469. STEAM-GENERATOR. Statis R. Crowder, Newell, Iowa, assignor of one-half to W. J. Miles, same place. Filed Mar. 11, 1889. Serial No. 302,870. (No model.)



Claim.—1. The adjustable bracket *f*, and the rock-shaft *g*, having projections *k*, in combination with the furnace and boiler-wall A, for the purposes stated.

2. In a steam-generator, the combination of the multiple damper *r*, with the boiler composed of the plates B, tubes C, and wall A, by means of the rod *m*, substantially as shown and described, for the purposes stated.

3. A steam-generator comprising a sheet-metal wall having a grate in its bottom portion, a perforated plate at some distance above the grate, a perforated plate at its top, a series of tubes extending from the lower perforated plate to the upper, a multiple damper pivoted on top of the upper plate by means of a rod that binds the two perforated plates together, a cover fitted to the top, and two open-ended tubes extended through the cover and the upper perforated plate, arranged and combined substantially as shown and described, for the purposes stated



407,470. CIRCUIT FOR ELECTRIC RAILWAYS. Henry M. Cutler, Newton, Mass. Filed Apr. 13, 1889. Serial No. 307,065. (No model.)

Claim.—A circuit for an electric railway, comprising two conductors or main leads connected with opposite terminals of the generator and placed in proximity to one another, whereby each neutralizes the disturbing effect of the other upon adjacent lines, and a contact surface or conductor made in short sections electrically insulated from one another, but with each of said sections connected with one of said main leads, substantially as and for the purpose described.

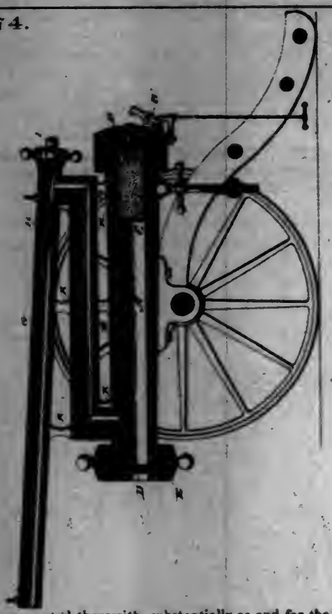
407,471. WITHDRAWN.

407,472. TREADLE-MOTION. William H. Doughty, Brooklyn, N. Y., assignor of one-half to Wm. Eagle, same place. Filed Feb. 6, 1889. Serial No. 299,128. (No model.)

Claim.—1. The combination, with the treadle and counter-shaft, of the forward-and-backward rotatable shaft connected to said treadle by the band *b*, and the pulley *d*, keyed fast on said shaft, the pulleys *j* and *k* on said shaft alternately driving in opposite directions through the ratchets and pawls respectively connecting them with said shaft reversely, said pulleys connected with the counter-shaft, the one by a direct and the other by a crossed belt, and the spring connected with shaft *c* and opposing thereon the action of the treadle, substantially as described.

2. The combination of the rocker-segment *c* with the treadle *a*, band *b*, pulley *d*, reversely-rotatable shaft *c*, the oppositely-driving pulleys *j k*, and the spring impelling said shaft reversely to the action of the treadle, substantially as described.

407,473. ELECTRO-GALVANIC BELT. Alonzo Dow, Wooster, Ohio. Filed Apr. 11, 1889. Serial No. 306,871. (No model.)



Claim.—1. In an electro-galvanic belt, a cell consisting of two metallic plates and an interposed absorbent pad, which are united together by transverse fastenings, each plate having an integral tongue that is folded or doubled upon the plate and arranged on the inside of the cell adjacent to the absorbent pad, the tongue of one element of the cell forming an eye at one end of said cell, and the tongue of the other element forming an eye at the opposite end of said cell, substantially as and for the purpose described.

2. In an electro-galvanic belt, a cell consisting of two metallic plates, each having a bent or folded tongue and a central and corner perforations, an absorbent pad interposed between said plates, and transverse fastenings passing through the corner apertures of the plates and the absorbent pads, substantially as and for the purpose described.

407,474. METHOD OF COMPRESSING AIR FOR PNEUMATIC GUNS. Dana Dudley, Lynn, Mass., assignor to the Hotchkiss Ordnance Company, (Limited,) London, England. Filed Apr. 26, 1888. Serial No. 308,654. (No model.)

Claim.—1. The method of discharging a pneumatic gun, which consists in compressing air in a suitable chamber by means of the explosion of an explosive therein, and communicating the air-pressure thus produced to the base of a projectile in another chamber sub-

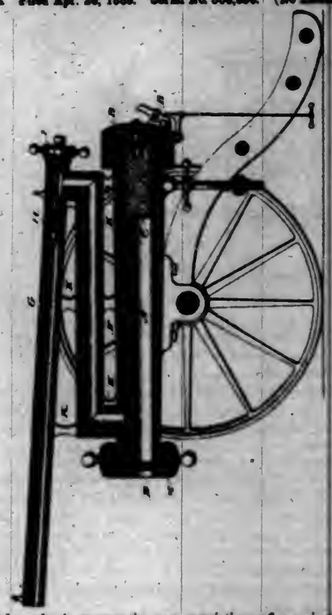
407,474.

terruptedly connected therewith, substantially as and for the purpose described.

2. The method of discharging a pneumatic gun, which consists in compressing air in a suitable chamber by exploding an explosive therein, and causing the compressed air so produced to act uninterruptedly upon a projectile in a gun-barrel connected therewith to expel the same, substantially as described.

3. The method of discharging projectiles by means of the explosion of an explosive in an air-chamber, which consists in interposing a confined body of air uninterruptedly between the projectile and such explosive, and then exploding the explosive in said chamber, whereby high pressure is developed and the projectile discharged, substantially as described.

407,475. PNEUMATIC PISTON-GUN. DANA DUDLEY, Lynn, Mass., assignor to the Hotchkiss Ordnance Company, (Limited,) London, England. Filed Apr. 28, 1889. Serial No. 308,655. (No model.)



Claim.—1. A pneumatic gun consisting of an air-compression chamber adapted to contain an explosive located in the rear of the piston, a piston driven by the discharge of the explosive, a barrel or tube adapted to discharge a projectile, means for communicating the air-compression produced by the piston to the projectile in the gun barrel or tube, and means for discharging the explosive, substantially as described.

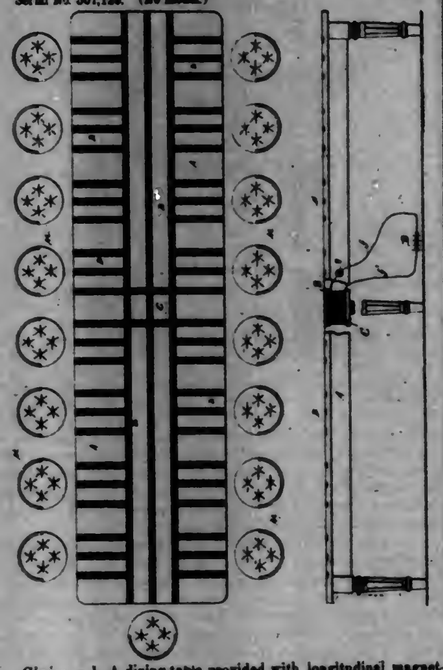
2. The combination, with a pneumatic gun, of an air-compressing chamber adapted to contain an explosive, a piston located in the air-compressing chamber, an explosive in the chamber in the rear of the piston, by the explosion of which the piston is driven, a projectile, means between the air-compressing chamber and the projectile whereby the air compressed in front of the piston acts upon the projectile to discharge it, and means for exploding the explosive, substantially as described.

3. The combination of the air-compressing chamber A, adapted to contain an explosive, a piston B, located in the air-compressing chamber, an explosive in the chamber in the rear of the piston, a projectile, a gun-barrel D, having an uninterrupted confined body of air between the rear of the projectile therein and the piston in the air-compressing chamber, and means for charging and igniting the explosive, substantially as described.

4. The combination of chamber A, adapted to contain an explosive, a piston B, located therein, an explosive in the chamber in the rear of the piston, a projectile, gun-barrel D, head-piece F, connecting the gun-barrel with the air-compressing chamber in front of the piston, means for loading the barrel, and means for loading and exploding the explosive in chamber A, substantially as and for the purpose set forth.

407,476. PNEUMATIC GUN. DANA DUDLEY, Lynn, Mass., assignor to the Hotchkiss Ordnance Company, (Limited,) London, England. Filed Apr. 26, 1889. Serial No. 308,664. (No model.)

Claim.—1. A pneumatic gun consisting of an air-compressing chamber adapted to contain air to be compressed by an explosive therein, a barrel to contain the projectile, means for communicating the air-pressure uninterruptedly to the projectile in the barrel, means for charging the air-compressing chamber and the barrel, and means for exploding the explosive in the air-compressing chamber, substantially as and for the purpose described.



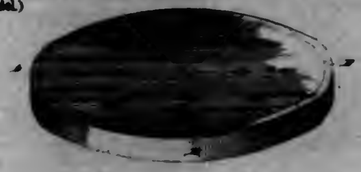
2. The combination of chamber A, adapted to contain air to be compressed by an explosive therein, having a breech-piece B, an explosive contained in said chamber and firing mechanism, barrel G, having the breech-piece I, and tube F, uninterruptedly connecting the air-compressing chamber and the barrel, substantially as and for the purpose set forth.

3. The combination, with a pneumatic gun having an air-compressing chamber A, adapted to contain an explosive, of a safety-valve consisting of a diaphragm D and means for holding it in place, an explosive contained in said chamber, a barrel to contain a projectile, a projectile therein, tube F, uninterruptedly connecting the air-chamber to the barrel of the gun in the rear of the projectile, and firing mechanism for exploding the explosive, substantially as set forth.

4. The combination, with a pneumatic gun, of a chamber adapted to contain air to be compressed by an explosive therein, means for exploding the explosive, and means whereby the compressed air acts uninterruptedly upon the projectile to discharge the same, substantially as described.

5. The combination of chamber A, adapted to contain air to be compressed by an explosive therein and having the breech-piece and firing mechanism for exploding the explosive, diaphragm D and cap E E, closing the explosion-chamber, barrel G, having breech-piece I and tube F F, uninterruptedly connecting chamber A with barrel G in the rear of the projectile, substantially as and for the purpose described.

407,477. MEANS FOR SECURING DISHES TO THE TABLES OF STEAMSHIPS. FRANK BELL, Maranham, Brazil. Filed Apr. 13, 1889. Serial No. 307,139. (No model.)



Claim.—1. A dining-table provided with longitudinal magnetizable metallic strips and with laterally-projecting magnetizable metallic strips in connection with said longitudinal strips.

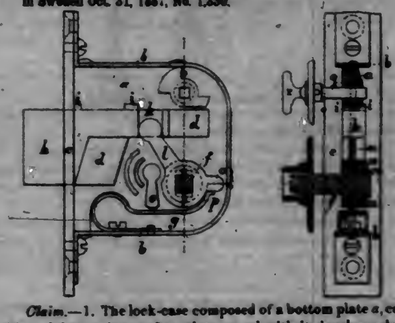
2. A dining-table provided with longitudinal magnetizable metallic strips extending through the center thereof and with laterally-projecting magnetizable metallic strips in connection with the longitudinal strips and disposed at intervals along the table.

3. A dining-table provided with longitudinal magnetizable metallic strips and with laterally-projecting magnetizable metallic strips in connection with said longitudinal strips, in combination with an electro-magnet in connection with the system of strips.

4. A dining-table provided with longitudinal magnetizable metallic strips extending through the center thereof and with laterally-projecting magnetizable metallic strips in connection with the longitudinal strips and disposed at intervals along the table, in combination with an electro-magnet in connection with the system of strips.

407,478. PACKING-DISK FOR HYDRAULIC PRESSES. EDWARD H. GARCIE, Richmond, Va. Filed May 3, 1889. Serial No. 309,468. (No model.)

407,478.



Claim.—1. The piston consisting of the circular vulcanized-rubber part or member having the lower continuous rubber surface and an upper annulus or ring-like surface and the steel wearing plate or disk having its upper surface flush with the upper surface of the said annulus or ring-like rubber portion, substantially as specified.

2. The herein-described piston, consisting of a steel plate provided with a series of upwardly-flared apertures, said plate forming the upper surface of the piston, and a body of rubber which forms the under surface molded upon said metallic disk with portions thereof located in such flared apertures, substantially as described.

3. The herein-described piston, consisting of the central steel disk or plate having a series of flared apertures and the main body having portions located in said flared apertures, and a marginal portion surrounding said disk or plate and made of combined vulcanized rubber and plumbago, substantially as specified.

407,479. LOCK. OSCAR B. HAGLUND, Nyköping, Södermanland Sweden. Filed June 16, 1888. Serial No. 277,360. (Model.) Patented in Sweden Oct. 31, 1887, No. 1,330.

Claim.—1. The lock-case composed of a bottom plate *a*, combined with and fastened on a face-plate *c*, and with its borders edged with a plate-strip *b*, projecting on both sides of the bottom plate, substantially as shown and described.

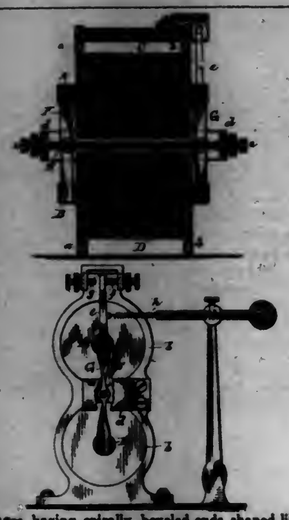
2. In combination, the bottom plate *a*, having an opening *d* therein, a main bolt *h*, movable in such opening, and the projecting lugs *i*, serving to guide said bolt and embracing the bottom plate, substantially as shown and described.

3. In combination with the slide-bolt *h*, having the side niche *k*, the bottom plate *a*, the two-armed lever *l*, its spring *g*, applied directly to its toe part or short arm *o*, as described, said bottom plate *a* having also a key-hole *e* close to such lever, all substantially as shown and described.

4. In combination with the lock-case having a central plate *a*, the shaft *f* of the door-handle extended through the lock-case and formed with an extension *f'*, such extension constituting on the opposite side of the lock-case a pin for putting on the key at that side, substantially as shown and described.

5. In combination with the bottom plate *a* and with the bolt *h*, a turn-bolt *q*, located at the back part of the bolt and above the same, and a staple *s*, spanning the bottom plate, the pin of the turn-bolt reposing in the corresponding branches of such staple, substantially as shown and described.

6. In combination with the bolt *h* and at one side thereof a tumbler 1, pivoted at 2, the lever *l*, acting on said tumbler when in its lowest position, this tumbler having a longitudinal slot-hole 3 with a curved branch, the side bar 7, having a projecting flap 5, embraced by such curved branch, such slide-bar being arranged to be raised or lowered by the key and thereby raising or lowering the tumbler and preventing the action of the lever on the bolt, substantially as shown and described.



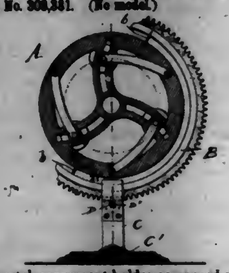
407,480. RELAY FOR QUADRUPLEX TELEGRAPHS. CLARENCE L. HEALY, Brooklyn, N. Y. Filed Sept. 15, 1888. Serial No. 285,502. (No model.)

Claim.—1. A neutral quadruplex relay having, in combination, two straight or bar electro-magnets and two movable armatures connected to move together and bridging adjacent ends of the cores of such magnets, substantially as set forth.

2. A neutral quadruplex relay having, in combination, two straight or bar electro-magnets and two armatures mounted on a shaft between the magnets and overlapping opposite ends of the cores of the magnets, substantially as set forth.

3. In a neutral relay, the combination, with magnet-cores having beveled ends, of an armature pivoted centrally and overlapping such

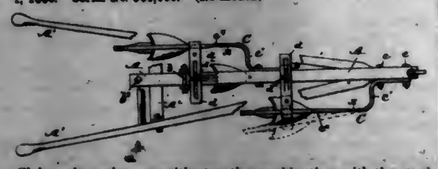
407,480.



cores, said armature having spirally-beveled ends shaped like propeller blades, substantially as set forth.

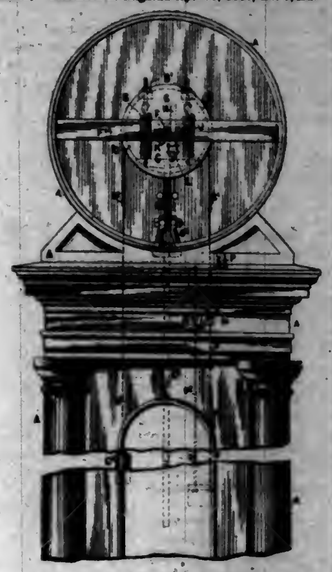
4. The combination of the two differentially-wound straight or bar electro-magnets having cores with beveled ends, the intermediate shaft, the propeller-blade armatures, the contact-points, and retracting-spring, substantially as set forth.

5. A neutral quadruplex relay having, in combination, two straight or bar magnet-cores, a differential winding upon each of said cores, and two movable armatures connected to move together and bridging adjacent ends of said cores, substantially as set forth.



407,481. WATCH-MOVEMENT HOLDER. HEINRICH HEIDENREICH, New York, N. Y., assignor to Henry Stemmern, same place. Filed Apr. 24, 1889. Serial No. 308,381. (No model.)

Claim.—1. A watch-movement holder composed of a supporting-standard, a toothed segment guided in ways of said standard, a pinion for adjusting said segment, and a movement-holder proper that is pivoted to said segment so as to be adjustable on its axis, substantially as set forth.



2. The combination of a supporting-standard having guideways, a toothed segment guided in said ways, a pinion meshing with the toothed circumference of said segment, and a movement-holding device that is pivoted at diametrically-opposite points to said segment and provided with a pawl-and-ratchet device for retaining the holding device at any suitable inclination to the segment, substantially as set forth.

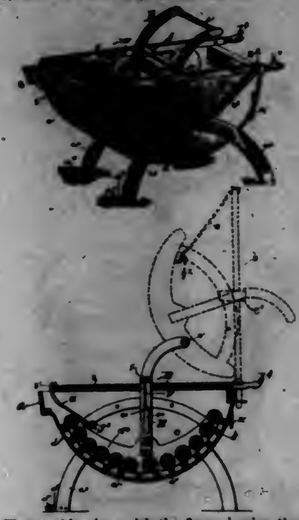
407,482. PLOW. JOHN R. HOLLAR, Huntersville, S. C. Filed Mar. 1, 1889. Serial No. 301,609. (No model.)

Claim.—In a plow or cultivator, the combination, with the stock A, of the rigid arms having the thin spring portions *x* and carrying the shanks for the side shovels, said arms being secured at their forward ends to said stock and provided at their rear ends with adjustable clamping devices, whereby their latter ends and the shovels may be adjusted to and maintained at the desired distances from the stock, substantially as set forth.

407,483. COIN-FREED WEIGHING-MACHINE. HENRY KNIGHT, Ryde, Isle of Wight, England. Filed Mar. 16, 1889. Serial No. 303,601. (No model.) Patented in England Apr. 13, 1888, No. 5,092.

Claim.—1. In automatic coin-freed weighing-machines, the combination, with the cross-head C and its operating mechanism, of the pulley G, the cord around the same, the coin-receiving vessel M, attached to said cord, the vertical guides for the coin-receiver, the spindle F, upon which the pulley is mounted, and the pinion and pointer upon said spindle, and the rack-bar meshing with said pinion, whereby the descent of the coin-vessel and revolution of the pinion permit the rack-bar to descend until stopped by contact with the cross-head, substantially as and for the purposes specified.

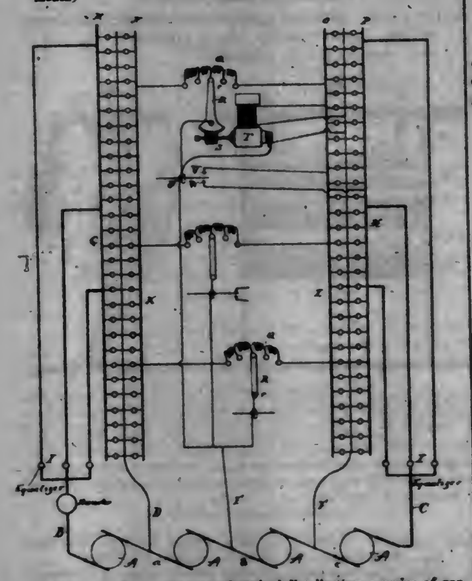
2. In an automatic coin-freed weighing-machine, the compound weighing-levers D, rod C^3, coiled springs B B, and T-shaped cross-head C, all operated by the weight or pressure of the person or object to be weighed, in combination with the separately acting and detached rack H, the pinion F', the spindle F, the grooved pulleys G, and the cords G' G^2, and the coin-receiving vessel M and its counterpoise G^x, all operated by the weight of a coin or several coins, as set forth.



3. In automatic coin-freed weighing-machines, the weighing-platform, weighing-springs, connecting-rods, and the cross-head C, in combination with the receiving-vessel M, with guides N and counterweight G^x, the cords G' G^2, pulley G, spindle F, the pointer and the pinion F', and the rack H, said indicating mechanism being balanced, as described, whereby accuracy of indication is insured, as set forth.

4. In weighing-machines, the combination, with the cross-head C, of the weighing-rod and the screw L in same, the coin-vessel M, guides N, counter-weight G^x, the cords G' G^2, pulley G, the pointer and pinion F', carried by spindle F, and the rack H, the adjustment nut or collar H^3, the rack-guide H^4, and rack-head H^5, whereby the pointer may be adjusted, as set forth.

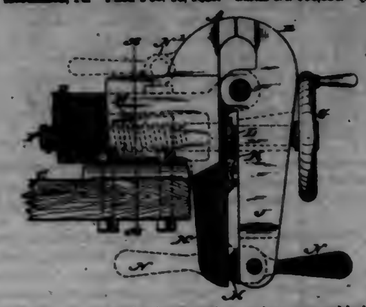
5. The coin receptacle or vessel M, open at the top and bottom and having pivots M^2 and an arm M^4, a frame surrounding said vessel and in which it is hung by said pivots, the lower part of said frame forming the bottom of the receptacle and serving to retain a coin, in combination with the weighing mechanism and a stop to swing the coin-receptacle upon the upward movement and deliver the coin, substantially as specified.



6. In automatic coin-freed weighing-machines, the combination, with a weighted cord and pulley around which the cord passes, of the guides N, the strap-frame M', to which one end of the cord is secured, the tilting coin-receiving vessel M, open at both ends and pivoted in the frame M' and having an arm M^3, and the latch *o*, for operating the arm, whereby the lower part of the frame M' forms a bottom to the coin-vessel to retain the coin until the same is discharged by tilting the vessel, substantially as specified.

407,484. WASHING-MACHINE. JOHN LEE, Jr., Sterling, Ohio. Filed Oct. 8, 1888. Serial No. 287,322. (No model.)

Claim.—The combination, with the frame having the depending lugs, of the rubber, the vertical bars, the short bars or plates having slots, the cross-rod secured to said depending lugs, the transverse bar attached to said vertical bars, the springs, and the handle-bar, substantially as described.

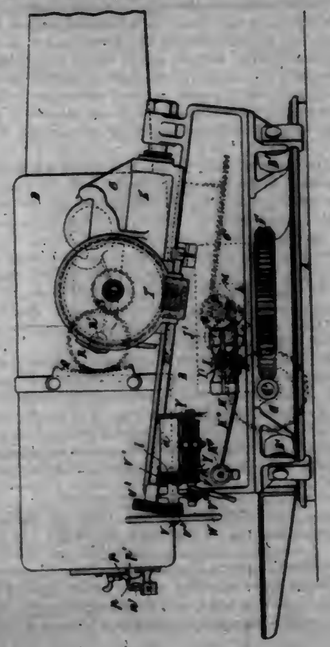


407,485. MULTIPLE-WIRE SYSTEM OF ELECTRICAL DISTRIBUTION. JAMES A. LIGHTIPE, Wilmington, Del., assignor to himself, George W. Bratton, Philadelphia, Pa., and Henry Human, New York, N. Y. Filed Apr. 25, 1888. Renewed Dec. 28, 1888. Serial No. 294,848. (No model.)

Claim.—1. In a system of electrical distribution, a series of generators, two or more groups of translating devices, compensating conductors for the groups connecting with the source of energy, and a central compensator connected with the groups through one or more variable resistances.

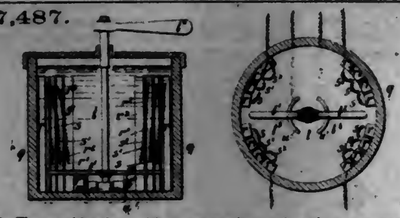
2. In a system of electrical distribution, a series of generators, two or more groups of translating devices, and compensating conductors therefor connecting with the source of energy, and one or more central compensators connected to the groups through one or more automatic variable resistances.

407,486. VISE. WILLIAM LOBBY, Philadelphia, Pa., assignor of two-thirds to Christian Gotz, same place, and Frederick S. Dickenshied, Rosemont, Pa. Filed Feb. 16, 1888. Serial No. 263,901. (No model.)



Claim.—1. A vise having a stationary jaw, a movable jaw, a slide to which the movable jaw is pivoted, legs which depend from said slide and movable jaw, and an eccentric which is pivoted to one leg and adapted to tighten against the other jaw, substantially as described.

2. A vise having a stationary jaw, a slide working in said jaw, a movable jaw pivoted to said slide, a nut secured to said stationary jaw, a screw swiveled to the slide and freely passing through the movable jaw and working in said nut, the said slide and movable jaw each having a depending leg, and means connected to one of said legs for clamping said jaws, said parts being combined substantially as described.



3. In a vise, jaws having parallel motions in opening and closing, in combination with a slide to which the movable jaw is pivoted and an eccentric which is mounted on said jaw in order to close the same against the other jaw, substantially as described.

407,487. APPARATUS FOR ADJUSTING, POINTING, OR TRAINING CANNON. HIRAM S. MAXIM, London, England. Filed Aug. 20, 1887. Serial No. 247,511. (No model.) Patented in England Oct. 17, 1884, No. 13,702; in France Apr. 10, 1885, No. 166,196; in Italy June 6, 1885, No. 18,466; in Belgium June 30, 1885, No. 69,347; in Sweden Aug. 17, 1885, No. 682, and in Austria-Hungary Aug. 19, 1886, No. 30 and No. 1,751.

Claim.—1. The combination, with a gun and gun-carriage, of an electro-magnetic motor connected with the carriage, and gearing for communicating motion from the said motor to the gun, whereby the gun may be elevated or depressed.

407,487.

2. The combination, with a gun-carriage, of an electro-magnetic motor connected therewith, and gearing for communicating motion from said motor to the carriage, whereby the gun may be trained, as set forth.

3. The combination, with the controlling-gears of the adjustable supports of a cannon, of electro-magnetic motors engaging, respectively, with such gears and adapted by their rotation to impart movement to the supports through the gears, a generator for producing the current to operate the motors, independent circuits including said motors, and a circuit controller and reverser connected with or included in said circuits and adapted to vary the strength and direction of the currents therein, as herein set forth.

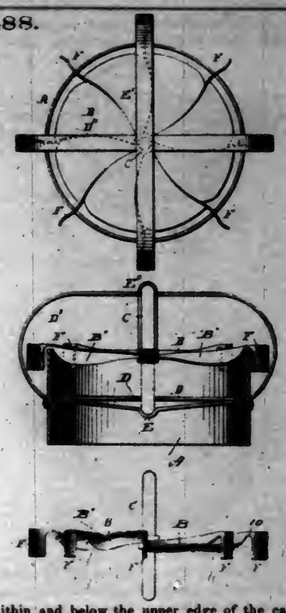
4. The combination, with the vertically and horizontally adjustable supports of a cannon, and independent sets or systems of gears for adjusting the same for pointing and training the cannon, of two electro-magnetic motors engaging, respectively, with said gears and adapted by their rotation to impart movement to the supports through the gears, a generator for producing the current to operate the motors, independent circuit-connections between the generator and the motors, and a circuit controller and reverser connected with or included in said circuits and adapted to vary the strength and direction of the currents therein, as set forth.

5. The combination, with the horizontally and vertically adjustable supports of a cannon, of two electro-magnetic motors and intermediate gearing between said supports and the motors, respectively, for pointing and training the cannon through the action of the motors, a generator for producing the current that operates the motors, circuits from the generator including the motors, respectively, rheostats or variable resistances and switch-terminals in each of said circuits, and a contact-lever or handle operatively combined therewith and adapted by its movement to vary the rheostats and switch-connections and thereby control the strength and direction of the currents in the motor-circuits, as herein set forth.

6. The combination, with the gun D, of the rack C', movable with the gun on its carriage, the shaft J', and rotary electro-magnetic motor L, gearing therewith and mounted on the carriage, the pinion F on shaft O' and engaging with the rack C', the gear-wheel O, engaging with a loose pinion on shaft J', and the controlling-clutch K, for operatively connecting and disconnecting the shafts J' and O', as set forth.

7. The combination, with the gun D, of the worm-wheel F, secured horizontally to the base A, the shaft J', and the electro-magnetic motor geared with the same, mounted on the gun-carriage, the intermediate gearing between the wheel F and the shaft J', and the clutch K, for throwing said gear into or out of operation, as herein set forth.

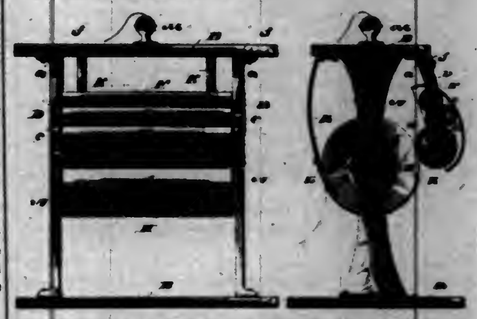
8. The combination, with the gun D, of the worm-wheel F, secured horizontally to the base A, the shaft J', and the electro-magnetic motor geared therewith, mounted on the gun-carriage, the worm-wheel G', engaging with wheel F, the shaft G, carrying said worm, the gear-wheels H I J, connecting shafts G and J', and the clutch K, for disconnecting the shaft J' from the gears specified.



9. The combination, with the gun D, of the toothed segment Q, secured to the side thereof, the worm U, its shaft U', and the rotary electro-magnetic motor mounted on the carriage and geared to the shaft U', the gear-wheels R S, and worm-wheel T between the segment Q and worm U, as herein described.

10. The combination, with the horizontally and vertically adjustable supports of a cannon, of two electro-magnetic motors and intermediate gearing between the said supports and the motors, respectively, of a generator for supplying the current to run the motors, a circuit controller and reverser for varying the strength and direction of the currents transmitted to the motors, and an operating or controlling handle therefor formed or provided with a pistol grip or butt, as herein set forth.

407,488. EXHAUST-VENTILATOR. CHARLES T. MURRAY, Kansas City, Mo. Filed Feb. 15, 1889. Serial No. 299,896. (No model.)

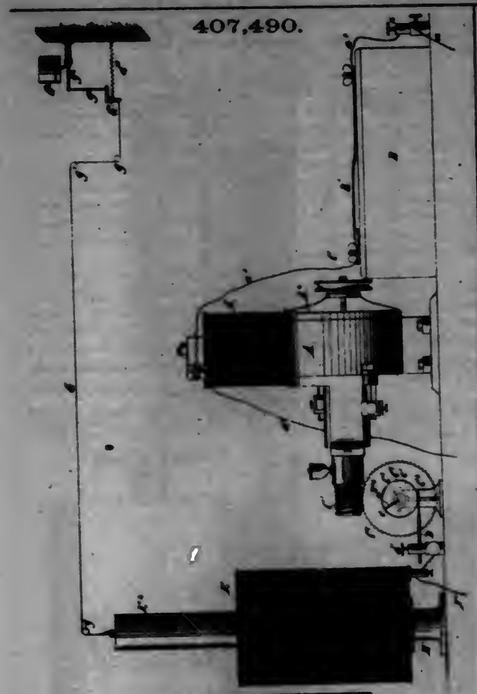


Claim.—In a chimney cowl or ventilator, the combination, with a cap less cylindrical casing A, provided with transverse supporting-bars, of the herein-described rotary wheel or vane provided with a central vertical shaft mounted on said supporting-bars, and consisting of a series of radially-disposed inclined plates or wings B' B', arranged

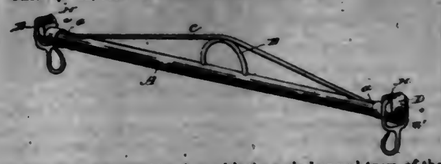
407,488.

entirely within and below the upper edge of the casing out of the range of external currents of air, and having their lower edges curved upwardly and outwardly to the upper edge of the casing, said plates or wings being provided with supplementary wings F, which depend from their extremities and are arranged below and outside of the upper edge of the casing, so as to rotate around the same out of the range of internal currents of air, all constructed substantially as and for the purpose specified.

407,489. COMBINED PAPER HOLDER, CUTTER, AND PRINTING DEVICE. LUTHER A. MCCORD, Laurens County, S. C. Filed Nov. 16, 1887. Serial No. 255,301. (No model.)



Claim.—The combination of the upright frame having the notched standards for the journals of the paper roll, the cutter secured to spring-arms connected with the main frame, the arms hinged to the top of the said frame, and the printing and inking rolls journaled in the said arms, whereby the paper may be printed and severed at will, the drawing of the paper operating the printing and inking rolls, substantially as specified.

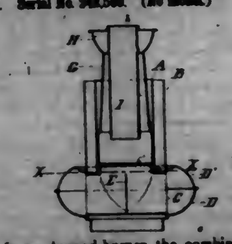


407,490. ELECTRIC SIGNAL. GEORGE MCINTOSH, Stonington, Conn. Filed Apr. 20, 1889. Serial No. 307,974. (No model.)

Claim.—The combination, with an electric motor, of a commutator-wheel continuously rotated thereby when the motor is in motion, and provided upon its periphery with a metallic and a non-metallic surface, a helix, a brush bearing upon said commutator-wheel and in electrical circuit with said helix and commutator-wheel, a movable core for said helix moved in one direction when said helix is energized through the commutator-wheel and in the other direction by a spring when said helix is de-energized by the commutator-wheel, and a signal connected with said movable core and operated when said core is moved by the energizing of the helix, substantially as specified.

407,490.

407,491. WHIFFLETREE. ALFRED R. GUIDOBY, Montpelier, Ohio. Filed Apr. 12, 1889. Serial No. 306,952. (No model.)



Claim.—1. The combination, with the main bar and truss, of the ferrule formed with an interior partition, through which the truss passes, and means applied to the end of the rod inside the ferrule to hold it and the ferrule in place, substantially as and for the purposes described.

2. The combination, with the main bar and truss, of the thimble or ferrule provided with an interior perforated partition, a key to prevent the thimble from turning on the main bar, and a hook to receive the ring or eye of a tug, substantially as and for the purposes set forth.

3. The combination, with the main bar and truss, of a ferrule or thimble for holding the parts together, formed with a hook on its rear face and made oblong in cross-section where the ring or eye of a tug will lie, substantially as and for the purposes set forth.

4. The ferrule or thimble, for the purposes specified, formed with an interior perforated partition, a hook on its rear face, and means for preventing it from turning, substantially as described.

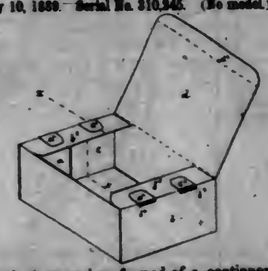
407,492. ARGAND LAMP-BURNER. FRANK REED, Meriden, Conn., assignor of one-half to Charles S. Upton, New York, N. Y. Filed June 27, 1887. Serial No. 242,569. (No model.)

Claim.—1. In an Argand burner, the combination of a foraminous inner air-distributer and a foraminous shell within said distributer, the lower end of said shell being of a diameter less than that of said distributer, so as to leave an annular opening between said shell and said distributer, substantially as described.

2. In an Argand burner, the combination of a foraminous inner air-distributer and a concentric foraminous portion of substantially cylindric form within said distributer, said concentric portion being of a less diameter than the lower end of said distributer, and so as to leave an annular opening between said concentric portion and said distributer, substantially as described.

3. In an Argand burner, the combination of a foraminous inner air-distributer provided with an imperforate top and a concentric foraminous portion of substantially cylindric form within said distributer, the lower end of said concentric portion open, its upper end closed by said cap, said concentric portion being of less diameter than said distributer, and so as to leave an annular opening between the lower end of said concentric portion and said distributer, substantially as described.

4. In an Argand burner, the combination of an inner air-distributer consisting of a foraminous cone-frustum surmounted by a foraminous button-shaped portion covered by an imperforate cap and a foraminous open-ended cylinder within said distributer, the upper end of said cylinder being closed by said cap, the lower end of less diameter than said distributer, and so as to leave an annular opening between said cylinder and said distributer, substantially as described.

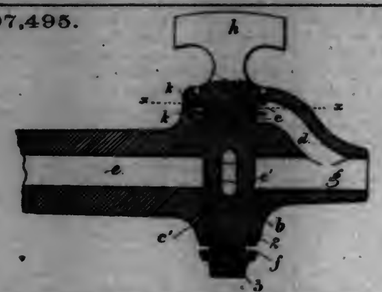


407,493. BLANK FOR PASTEBOARD BOXES. THEODOR REMER, Dresden, Saxony, Germany, assignor to the Actien-Gesellschaft für Cartonnagen Industrie, same place. Filed Apr. 10, 1888. Serial No. 269,677. (No model.)

Claim.—1. As an improved article of manufacture, a blank for pasteboard boxes, consisting of a creased sheet of pasteboard provided on the outer surface of the sheet and along the lines of the creases with angle-binding strips pasted thereon and edge-binding strips pasted on the edges, substantially as set forth.

2. As an improved article of manufacture, a blank for pasteboard boxes, consisting of a sheet of pasteboard grooved on the outer surface and having binding-strips pasted along their side parts only to the outer surface of the sheet at the sides of the grooves, the longitudinal central parts of the strips being raised to form hollow ridges over the grooves, substantially as herein shown and described.

407,494. PAPER BOX. CHARLES SCHWARTZ, Brooklyn, N. Y. Filed May 10, 1889. Serial No. 310,245. (No model.)



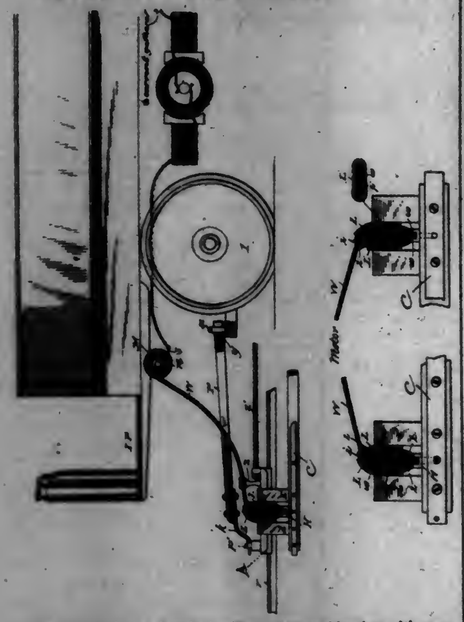
Claim.—1. A paper box formed of a continuous blank, cut out to form three laterally-projecting flaps at each side, the central flaps being provided with slots and with a creased margin b^2, and the end flaps being provided with tongs that engage said slots, the margin b^2 being adapted to fold over the end flaps, substantially as specified.

2. A paper box formed of a continuous blank, cut out to form three laterally-projecting flaps *a b c* at each side, and an upwardly-projecting cover-forming flap *d*, the central flaps *b* being provided with slots and a creased margin, and the end flaps being provided with tongs adapted to engage said slots, the blank being creased in continuation of the lines of flaps *d* and in continuation of the upper edges of the three laterally-projecting flaps, substantially as specified.

407,495. FAUCET. WILLIAM H. SHAW, Brooklyn, N. Y., assignor to himself and John Boerman, same place. Filed Apr. 29, 1889. Serial No. 308,982. (No model.)

Claim.—1. The combination, with the faucet-barrel *b*, of the plug

407,495.



a, having around it grooves, and the spring *f*, whereby an end movement is allowed to the faucet for the passage of the beer or similar liquid around the plug without turning the same, substantially as set forth.

2. The faucet having a barrel *b*, plug *a*, and spring *f*, there being grooves around the plug or within the barrel, or both, for the passage of liquid when an end motion is given to the plug, substantially as set forth.

3. The combination, with the plug *a* and spring *f*, of the barrel *b*, having grooves around within the same, and the passage *d*, extending to the bib or delivery-pipe of the faucet, substantially as set forth.

407,496. ELECTRICAL RAILWAY. SIDNEY H. SHORT, Denver, Colo., assignor to the United States Electric Company, same place. Filed Feb. 19, 1887. Serial No. 228,223. (No model.)

Claim.—1. In an electrical railway, the combination, with a car, of a current-collector within the conduit, a shoe for supporting the same, electrical connections to the car, and a driver between the car and shoe, said driver having both ends forked and detachably connected to the car and shoe, the said connection being adapted to be broken in case an obstruction is met with, substantially as described.

2. In an electrical railway, the combination, with a car, of a current-collector, a shoe supporting the same, a driver or rod between the car and shoe, and extensible electrical connections between the car and collector, substantially as described.

3. In an electrical railway, the combination, with a car, of a current-collector, a shoe supporting the same, a detachable driver or rod between the car and shoe, a spring-roller suitably supported and in connection with the motor on the car, and a wire or cable connected at one end to the current-collector and secured at the other end to the spring-roller, substantially as described.

4. In an electrical railway, the combination, with a car, of a current-collector, extensible electrical connections between the collector and each end of the car, suitable supports for the collector, and a driver or rod connecting the car at each end with the collector-support, substantially as described.

5. In an electrical railway, the combination, with a car, of a current-collector supported on shoes, extensible electrical connections at each end of the car with the collector, a detachable driver or rod connecting the car at each end with the supporting-shoes, and a rod *x'*, connecting the shoes, substantially as described.

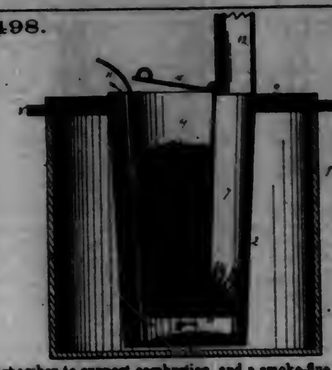
6. In an electrical railway, the combination, with the car, of a current-collector within the conduit and a cable for connecting electrically the collector with the car, the said cable being composed of a series of wires, these wires being separated and insulated from each other and arranged side by side at the point where they pass through the conduit-slot, substantially as described.

7. The combination, with an electrical railway, of a current-collector within the conduit-supports *d* E, connecting the same with a shoe traveling in the slot, a cable for electrically connecting the collector with the car, composed of a series of wires, said wires being separated, insulated from each other, and arranged side by side between the supports *d* E in the slot and an outer protecting covering L, substantially as described.

407,497. AGRICULTURAL BOILER. ISRAEL SHOUDY, Jr., and LUTHER L. MILLER, Paw Paw, Ill. Filed Jan. 31, 1888. Serial No. 262,533. (No model.)

Claim.—1. The combination, in an agricultural boiler, of a furnace and a suitable receptacle to contain the substance to be heated, said furnace consisting of a fire-chamber, a fire-grate, an air-flue communicating with the fire-chamber through the fire-grate to support combustion, a smoke-flue, a diving-flue, and a base-flue to connect the diving-flue and smoke-flue, substantially as set forth.

2. The combination, in an agricultural boiler, of a furnace and a suitable receptacle to contain the substance to be heated, said furnace consisting of a fire-chamber, a fire-grate, an air-flue communicating with the fire-chamber through the fire-grate to support combustion, a smoke-flue, a diving-flue, and a base-flue passing under the ash-pan and connecting the diving-flue and the smoke-flue, substantially as set forth.



3. In an agricultural boiler, the combination, with a suitable receptacle adapted to contain the substance to be heated, of the outer casing suspended within said receptacle, the fire-pot within said casing, the reservoir suspended within the casing above the fire-pot, and a circulating-coil having its lower section arranged beneath said fire-pot, its intermediate portion extending upward against the exterior side thereof and its upper section arranged within the fire-pot, the said coil communicating at each end with the said receptacle, substantially as set forth.

4. In an agricultural boiler, the combination, with a receptacle adapted to contain the substance to be heated, of an outer casing supported therein and provided with an opening in one of its walls, a fire-pot provided with a closed bottom, a grate supported therein, a damper for opening and closing said opening, the suspended reservoir, the diving-flue, the base-flue, the smoke-flue, the air-supply flues extending vertically within the smoke-flues and communicating at their lower ends with the fire-pot and at their upper ends with the open air, and a circulating-coil in communication with the said receptacle.

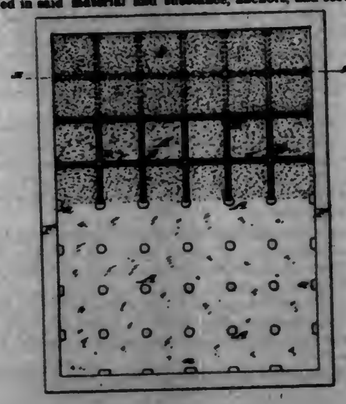
407,498. AGRICULTURAL BOILER. ISRAEL SHOUDY, Jr., Paw Paw, Ill. Filed Jan. 30, 1888. Serial No. 262,362. (No model.)

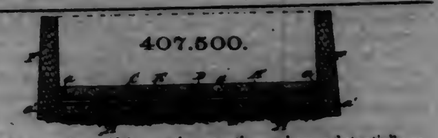
Claim.—In an agricultural boiler, the combination of an outer receptacle to contain the substance to be heated and a furnace within the receptacle, said furnace consisting of a fire-chamber, a fire-grate, a reservoir to contain a supply of fuel, an air-flue communicating with

407,498.

the fire-chamber to support combustion, and a smoke-flue to the fire-chamber, substantially as set forth.

407,499. STEAM-INJECTOR. THOMAS J. SWEENEY, Detroit, Mich., assignor to the Penberthy Injector Company, same place. Filed Feb. 8, 1889. Serial No. 299,206. (Model.)



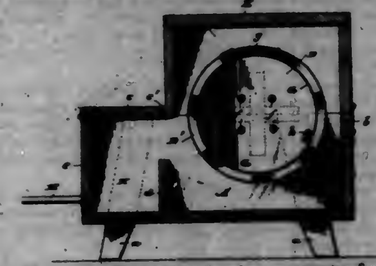


Claim.—1. The steam-injector having the lifting-valve consisting of a disk having plain upper and lower surfaces, in combination with the combining-tube and vacuum-chamber, said valve normally resting wholly upon a shoulder of the combining-tube and arranged below the vacuum-chamber, a narrow space being provided between said disk or valve and the lower edge of said vacuum-chamber, substantially as shown and described.

2. In a steam-injector, the combination, with the tubular casing having the overflow water-chamber provided at its bottom with an unthreaded circular flange, and the hollow plug arranged in alignment with the overflow water-chamber, provided at its bottom with an unthreaded circular flange, and the hollow plug arranged in alignment with the overflow water-chamber, of the integral combining and delivery tube formed with an unthreaded ring or flange, having its upper side fitting against the under side of the flange of the overflow water-chamber and its lower side resting upon the upper edge of said plug, substantially as set forth.

407,500. CELLAR-BOTTOM. ELBAZAR S. VANBRAM, Flatbush, N.Y. Filed Apr. 11, 1888. Serial No. 269,869. (No model.)

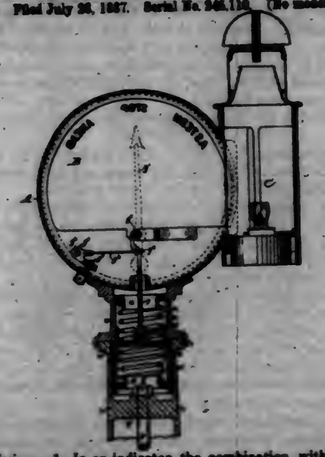
Claim.—A cellar-bottom comprising the combination of solid building material and asphalt or bituminous substance, bar-sections embedded in said material and substance, anchors, and securing de-



vices for securing said bar-sections to the anchors, substantially as specified.

407,501. METHOD OF MANUFACTURING BRASS KETTLES. WILLIAM R. WALDO, Ansonia, Conn., assignor to the Ansonia Brass and Copper Company, same place. Filed May 6, 1889. Serial No. 309,786. (No specimens.)

Claim.—The method herein specified of tinning and finishing brass kettles, consisting in annealing the kettle when ready for the final spinning or finishing operation, removing oxide or stain from the surface of the brass, then tinning the interior of the kettle, and then spinning or otherwise finishing the kettle to harden and stiffen the metal and leave the blank in a condition ready for trimming, wiring, and bailing, substantially as set forth.



407,502. STARCHING-MACHINE. DENIS B. YOUNG, East Douglas, Mass. Filed Apr. 10, 1888. Serial No. 307,099. (No model.)

Claim.—1. The combination, in an apparatus for starching clothes, of a receptacle A, provided with a top and containing a partition forming two compartments communicating with each other over the upper edge of the partition beneath the receptacle-top, a steam-pipe communicating with one compartment, and a revoluble cylinder mounted in the other, provided with a door and having its ends perforated, substantially as set forth.

2. The combination, in an apparatus for starching clothes, of a receptacle A, having a compartment H formed in one end thereof, a cylinder mounted near the opposite end of the receptacle, said cylinder having a hinged door *g*, adapted to be brought opposite the hinged door *b* at the end of the receptacle A, a hinged cover *c* above the compartment H, a cover E', and a steam-pipe leading into the compartment H, the parts being organized substantially as shown, and for the purpose set forth.

407,503. INDICATOR FOR THE MOTIONS OF THE ENGINES IN STEAMSHIPS. JAMES G. ALDEN, Birkenhead, County of Chester, England. Filed July 26, 1887. Serial No. 245,126. (No model.)

Claim.—1. In an indicator, the combination, with pipe F and cylinder K, of piston G, fitting therein, a dial, a pointer connected

with the piston, and springs upon opposite faces of the piston adapted to maintain the pointer normally at the zero-point.

2. In an indicator, the combination, with pipe F, cylinder K, and piston G, of abutments or rings M M', screwing into the ends of the cylinder, springs N N', bearing at one end against the piston and at the other end upon the abutments, and a pointer connected with and adapted to be operated by the piston.

3. In an indicator for ships, &c., the combination, with the standard L, having the internal web or flange *l* near its upper end and hollow above the flange, of an indicating mechanism, substantially such as shown, secured to the upper end of the standard, and a pipe F passing through the web or flange and adapted to convey the actuating force to the indicating mechanism.

4. In combination with a standard L, provided with an internal web or flange *l* and with a hollow upper end, an indicating mechanism provided with a cylinder K to set into the upper end of the standard, and a pipe F passing through the web or flange and communicating with the cylinder to convey the actuating fluid to the interior of the latter.

5. In combination with a dial, a pointer, a pair of semaphores connected together and adapted to be engaged and actuated by the pointer, and mechanism, substantially such as shown, for actuating the pointer.

6. In an indicator, the combination, with a dial, of a pointer, a moving part G for imparting motion to the pointer, two semaphores connected one with the other and adapted to be actuated by the pointer, and a pipe F to convey fluid to the part G to cause the proper movements of the latter.

7. In an indicator, the combination, with a dial, of a pointer, a moving part G for imparting motion to the pointer, two semaphores connected one with the other and marked to correspond with the dial, said semaphores being adapted to be actuated by the pointer, and a pipe F to convey fluid to the part G to cause the proper movements of the latter.

8. In combination with the semaphores, a dial, a pivoted arm carrying the semaphores, a pivoted pointer and means for actuating the same, and pins i^2 i^3, secured to the pivoted arm and adapted to be struck by the pointer.

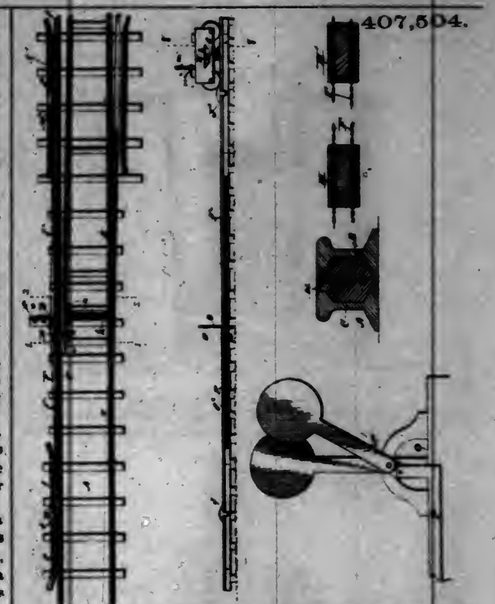
9. In combination with an oscillating pointer and means for actuating the same, pivoted semaphores *i i*, connected one with the other and engaging and actuated by the pointer.

10. In combination with a dial, a bridge l', having an open space l^2, a pair of semaphores carried by a pivoted arm and adapted to pass in line with the space l^2, pins i^2 i^3, carried by the pivoted arm, and a pointer adapted to strike the pins on the arm, whereby, whenever the pointer passes to one side or the other of the zero-line, the semaphores will be thrown over.

11. In an indicator, the combination, with a shell or casing, of a pointer g', swiveled therein and provided with an arm g^3, a rod or stem *g*, connected with the arm, and a spring g^3, secured to the shell and engaging with the rod or stem.

12. In an indicator, the combination, with a casing, of a shaft having an arm g^3, a pointer connected with the shaft, a stem *g*, connected with the arm, a bolt g^6, pivoted in the shell and provided with a spring g^7 to engage the stem *g*, and a screw g^8, swiveled in the case and engaging the block.

407,504. AUTOMATIC SWITCH FOR RAILWAYS. JOHN T. ABOO, Poindexter, Ky. Filed July 26, 1888. Serial No. 281,005. (No model.)



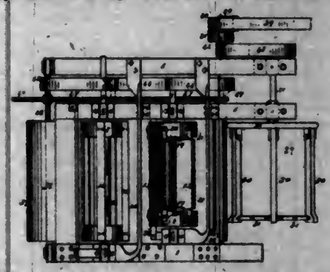
Claim.—1. The combination, with the main track and the switch, of the lever D, means for operating the said lever, as the cable having stops connected with the lever, the connection E, passing through a rail of the switch and having a stop *e*, and the spring *e'*, held between the said rail and the stop *e*, substantially as and for the purpose described.

2. The combination, with the switch, the lever D, for operating the switch and the endless cable, of the stops and the double-inclined blocks, substantially as and for the purpose described.

3. In a switch-operating mechanism, the combination, with the endless cable, of the two stops, one stop being at one end and connected with the upper portion of the cable, the other stop being at the other end and connected with the lower portion of the cable, substantially as and for the purpose described.

4. The combination, with the main and switch rails, the endless cable connected with a lever to operate the said switch-rails and the guard-rail, of the stop having two longitudinal openings which receive the upper and the lower parts of the cable, one of said parts being secured to the said stop and having its side expanded to fit in the space between the foot and the top of the said rails, substantially as and for the purpose described.

5. The combination, with the main track, the switch, the lever D, for opening and closing the switch, and means for operating the said lever, of the connection E, passing through the switch and connected at its outer end with the lever D, and having a stop *e* on its



407,504.

inner end, and the spring *e'*, interposed between the said stop *e* and the side of the said switch-rail, substantially as described, for the purpose specified.

6. The combination, with the switch, the switch-operating devices, and the inclined block, of the truck, the vertically-movable arm K, the stops, the spring, and the lateral rollers, substantially as and for the purpose specified.

407,505. INTESTINE-CLEANER. WILLIAM BACHMAN, Kansas City, Kans. Filed Aug. 8, 1888. Serial No. 282,206. (No model.)

Claim.—1. In a casing-cleaning machine, the combination of a pair of cylinders having knives mounted thereon, a pair of cylinders having brushes mounted thereon, and means for revolving the cylinders, substantially as and for the purpose set forth.

2. In a casing-cleaning machine, the combination of a pair of cylinders, knives mounted on the cylinders, a bar within each cylinder having a rubber strip attached thereto for cleaning the inside of the knives, and bars secured outside of the cylinders for the purpose of cleaning the outside of the knives, substantially as and for the purpose set forth.

3. In a casing-cleaning machine, the combination of a feed-roller, a pair of cylinders having knives attached thereto, a pair of cylinders having brushes attached thereto, said brushes being made adjustable, a winding-reel situated to the rear of the cylinders, and suitable means for driving said reel, cylinders, and feed-roller, substantially as and for the purpose set forth.

4. In a casing-cleaning machine, the combination of the supporting-frame 1, feed-roller 37, cylinders 2 3, knives 10 11, cleaners 26, 26½, and 27, supports 32, 33, and 34, cylinders 4 5, brushes 12, shield 15, and reel 29, substantially as and for the purpose set forth.

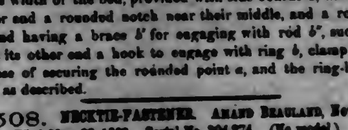
5. In a casing-cleaning machine, the combination of the cylinder provided with cleaning-brushes, guards 15 behind the brushes, and strips between said guards and brushes, substantially as and for the purpose set forth.

6. In a casing-cleaning machine, the combination of the cylinders,

brushes 12, guards 15, frame 13, and strips 17 18, substantially as and for the purpose set forth.

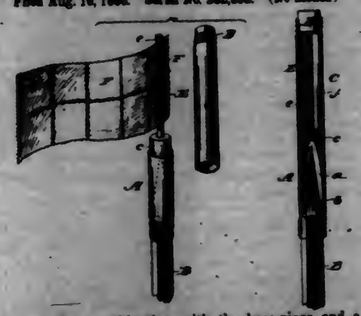
407,506. SHIELD FOR HORSESHOE-CALKS. SETH T. BABB, Detroit, Mich. Filed Nov. 23, 1888. Serial No. 291,693. (No model.)

Claim.—1. A box adapted to receive the two heel-calks of a horseshoe, in combination with an angle-iron to fit over the heel of the shoe, and means, substantially as described, for locking said box and angle-iron together, substantially as and for the purposes set forth.



2. The combination of the box G, having the flange C thereon, angle-iron B, bolt E, and nut D, substantially as and for the purposes set forth.

407,507. COMBINED END-GATE AND SCOOP-BOARD. LAWSON W. BAYLISS, Neola, Iowa. Filed Mar. 30, 1889. Serial No. 305,355. (No model.)

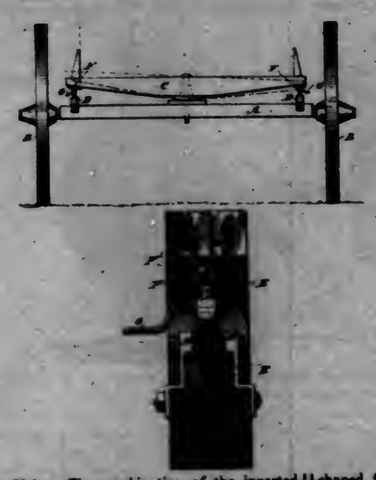


Claim.—In a combination scoop-board and end-gate, the combination, with a wagon-bed, the body A of sufficient width to slightly exceed the width of the bed, provided with side-boards C, having on their lower end a rounded notch near their middle, and a rounded point *a*, and having a brace *b'* for engaging with rod *b''*, such rod having at its other end a hook to engage with ring *b*, clamp B, for the purpose of securing the rounded point *a*, and the ring-headed bolt *b*, all as described.

407,508. NECKTIE-FASTENER. AMAND BEAULAND, New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,274. (No model.)

Claim.—As an improved article of manufacture, a necktie-fastener consisting in an attaching-plate 10, having a key-hole slot 11, an open spring 12, bent to form the figure 8 and secured to the said plate, the upper oval being smaller than the lower oval, and the upper and lower hooks 17, secured to the same side of the plate as the spring and having their points projecting inwardly toward each other, substantially as set forth.

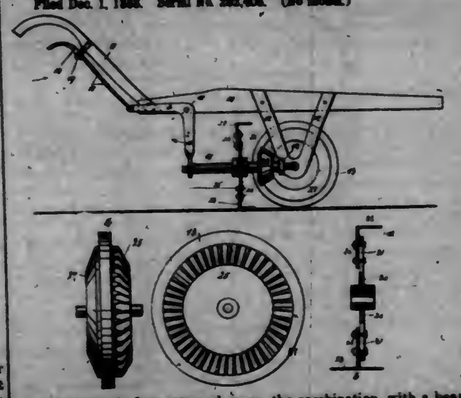
407,509. POSTAGE-STAMP HOLDER. DAVID M. BLOCH, New York, N. Y. Filed Aug. 16, 1888. Serial No. 282,892. (No model.)



Claim.—1. The combination, with the base-piece and a pin or spindle secured at its lower end thereto and having a longitudinal slit extending from its upper end downwardly, the upper end of said slit being open to admit of the insertion of a stamp or stamps from said upper end, of a tubular cap closed at its upper end, passed downward over the pin or spindle, and fitting at its lower open end over the base or part thereof and removable bodily from said base and pin, substantially as set forth.

2. As an improved article of manufacture, a combined pencil-tip, eraser, and stamp-holder, consisting in the sleeve A, a pin or spindle secured at its lower end to the upper end of the sleeve, said upper end forming a base therefor, a separate and independent tubular cap or cover C, inclosing said pin or spindle and fitting at its lower open end upon the upper end of the sleeve A, and an eraser D, separate and independent from the rod and closing the upper end of the cap or cover C, the cover C and its eraser D being bodily removable together upwardly or outwardly from the sleeve A and pin E, substantially as set forth.

407,510. SIZING COMPOUND. RICHARD D. BUSHER, Jersey City, N. J., assignor to William W. Fenshé, Jr., New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,861. (No specimens.)

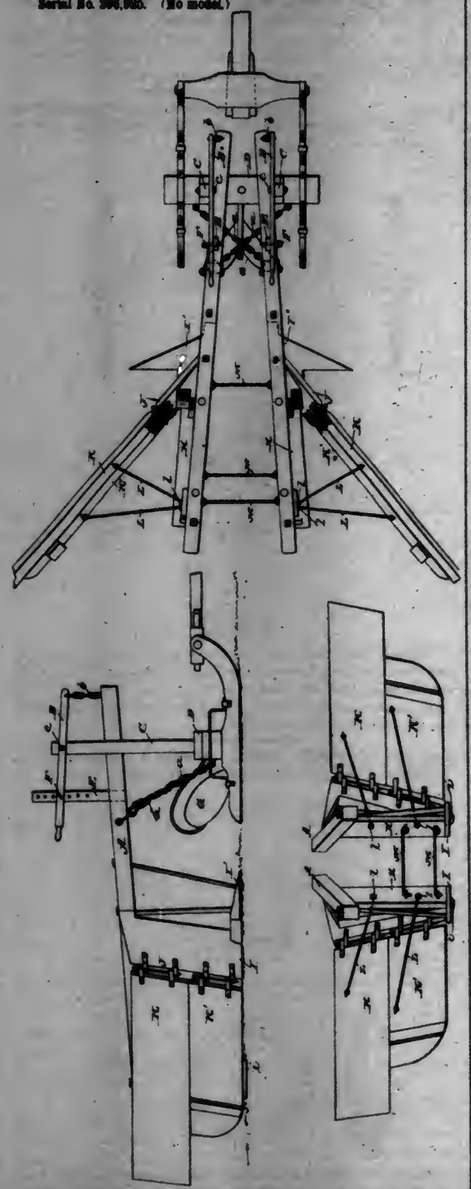


Claim.—A sizing compound consisting of beeswax, copal varnish, and thin and thick lithographic varnish, similar to that described in the trade as 00 and No. 5, in the proportions substantially as specified.

407,511. ADJUSTING ATTACHMENT FOR THRASHING-MACHINES. JOHN D. BURKHART, Dayton, Wash. Filed Mar. 27, 1889. Serial No. 305,096. (No model.)

Claim.—The combination of the inverted-U-shaped frame D, formed with the central threaded opening D', the threaded adjusting-screw E, formed with the pointed upper end and having the small lever G, and the metal casting F, having the recess F^2 formed in its lower side, substantially as set forth.

407,512. COTTON-CHOPPER. WILLIAM P. CLARK, Riberton, Ga. Filed Dec. 1, 1888. Serial No. 292,402. (No model.)



Claim.—1. In a cotton-chopper, the combination, with a beam and hangers secured thereto, of a drive-wheel journaled in said hangers, a bell-crank lever pivoted to the rear end of the beam, a shaft journaled in said bell-crank lever, and a bracket on one of the hangers, a disk provided with adjustable cutters secured to the shaft, and means for operating the shaft from the drive-wheel, substantially as herein shown and described.

2. A driving-wheel for cotton-choppers, provided with a gear upon one face and a friction-ring upon the other, substantially as described.

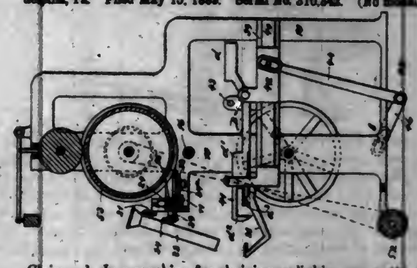
3. In a cotton-chopper, the combination of the driving-wheel provided with a gear upon one face and a friction-ring upon the other face, a cutter-shaft, and interchangeable pinion and friction-disk adapted to be secured on said shaft, substantially as and for the purpose set forth.

407,513. SNOW-PLOW. WILLIAM H. DEADMAN, Alpena, Mich., assignor of one-half to Austin Deadman, same place. Filed Jan. 19, 1889. Serial No. 296,925. (No model.)

Claim.—1. In a snow-plow, the combination of the truck, the beam-support mounted thereon, the two plow-sections having the forward ends of their beams adjustable and having such beams connected with said supports, and the draft-connections between said plow-sections and the truck, substantially as and for the purposes specified.

2. In a snow-plow, the combination, with the two plows proper having their beams or frames adjustable close together or apart, of an adjustable separating connection or connections by which said beams or frames may be held apart, substantially as set forth.

3. The combination, with the two plows arranged side by side, of an eye or eyes on the inner side of one of said plows, and a rod or rods pivoted at one end to the other plow and having at its free end a hook to enter the eye of the other plow, substantially as set forth.



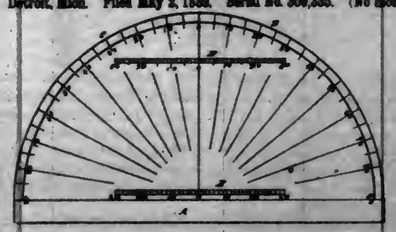
4. A snow-plow having its sole-piece provided with a rib secured to and depending from its under side near its rear end, substantially as set forth.

5. A snow-plow having a plurality of independently-adjustable hinged wings arranged one above the other, substantially as set forth.

6. A snow-plow having a plurality of independently-adjustable wings arranged one above the other, the upper wing being longer than the lower one, substantially as set forth.

7. In a snow-plow, the combination of the beam, the landside connected to and depending from said beam, the sole-piece secured to the landside and extended in advance thereof, the point on said extension, the mold-board, the mold-board wings hinged independently to the mold-board and arranged one above the other, and the brace-rods connected with said wings and having adjustable stops, substantially as set forth.

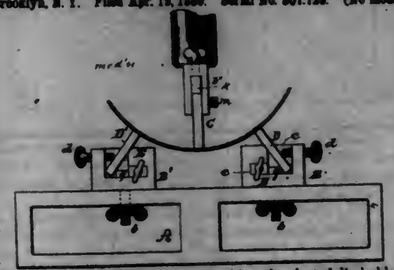
407,514. MACHINE FOR LINKING WARPS. CLAYTON DUNN, Philadelphia, Pa. Filed May 15, 1889. Serial No. 310,842. (No model.)



Claim.—1. In a machine for chaining or linking warps, the combination, with the warp-guiding trumpet, of an angled rock-shaft hinged at one end to the trumpet, a spring-actuated bar having a slotted arm at its outer end, a pin passing through the slot into the trumpet, and means, substantially as described, for operating the said rock-shaft and bar to impart a lateral movement in two directions to the lower end of the trumpet, substantially as set forth.

2. In a machine for chaining or linking warps, the combination, with a warp-guiding trumpet, a cam-wheel having a peripheral camway and a smaller wheel having a cam-face mounted upon the same shaft, and shifting-rods contacting with the cam-surfaces of each wheel, of an angled rock-shaft hinged at one end to the trumpet, a link-connection between the shaft and the shifting-rod of the larger cam, a spring-actuated bar connected with the shifting-rod of the smaller cam, a slotted arm projected from said bar, and a pin secured to the trumpet and passing through the slot in said arm, substantially as shown and described.

3. In a machine for chaining or linking warps, the combination, with an angled rock-shaft, a warp-guiding trumpet pivoted to the shaft and provided with an angled pin below its pivot-point, a shaft carrying a large wheel having a camway, and a smaller wheel having a cam-face, a shifting-rod actuated by the larger cam, a connection between the said rod and angled shaft, a spring-actuated bar provided with a slotted arm engaging the angled pin of the trumpet, a shifting-rod actuated by the smaller cam, and a connection between said shifting-rod and arm-carrying bar, of sets of stationary twin hooks below the trumpet and loopers sliding between the members of the hooks, and means for operating the loopers, substantially as shown and described.

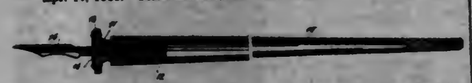


407,515. DRAFTSMAN'S PROTRACTOR. WILLIAM W. DUFFIELD, Detroit, Mich. Filed May 2, 1889. Serial No. 309,335. (No model.)

Claim.—1. A draftsman's protractor made in semicircular form having its circumference graduated equally in both directions from the vertical center and having thereon two equal parallel scales, each laid off on both sides of the vertical center, and located, respectively, between the horizontal or ninety-degree line and the circle of graduations at the circumference, substantially as shown and described.

2. A draftsman's protractor having outer graduated lines extending both ways from its center and having two equal parallel immovable scales located wholly between the horizontal or ninety-degree line and the circle of graduations at the circumference, substantially as and for the purposes set forth.

407,516. METAL-FORMING MACHINE. MICHAEL T. DURKIN, Brooklyn, N. Y. Filed Apr. 19, 1889. Serial No. 307,720. (No model.)



Claim.—1. In a metal-forming machine, the slotted die-holder D, provided with the lateral recess *e* and having inclined surfaces *f f'*, the bar *g*, having inclined surfaces *h h'* and provided with the slotted ear *i*, and the adjusting-screw E and nuts *j j*, substantially as specified.

2. In a metal-forming machine, a slotted die-holder D, provided with a lateral recess *e* and having inclined surfaces *f f'*, the bar *g*, having inclined surfaces *h h'* and provided with the slotted ear *i*, the adjusting-screws E, nuts *j j*, and the screws *d d*, substantially as specified.

3. In a metal-forming machine, the die-holder F, provided with the gib *k* and the adjusting-screws *l*, substantially as specified.

407,517. PEN-HOLDER. JAMES P. BEAN, New York, N. Y. Filed Apr. 17, 1889. Serial No. 307,562. (No model.)

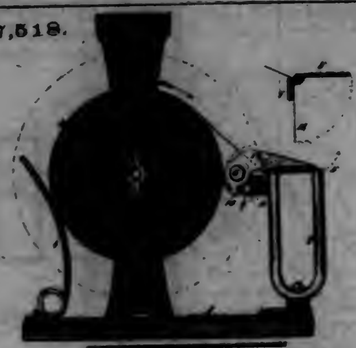
Claim.—1. In a pen-holder, the combination, with a handle, of a flexible pen-receiver consisting of a shank attached to the handle, and a head having a pen-slot produced thereon, and a shield secured to the head provided with a slot registering with the slot in said head, substantially as shown and described.

2. The combination, with a handle, of a flexible pen-receiver comprising a shank attached to the handle, a head having a pen-slot therein, and a shield secured to the head provided with a slot registering with the shank-slot, and a sleeve capable of sliding upon the shank, substantially as shown and described.

3. As an improved article of manufacture, a flexible pen-receiver comprising a shank, a head provided with a pen-slot at or near the center, a plate secured to the said head provided with a slot registering with the shank-slot, substantially as shown and described.

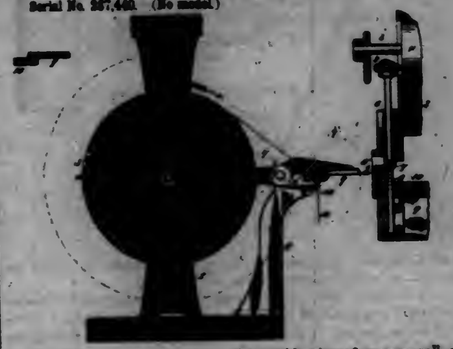
4. As an improved article of manufacture, a flexible pen-receiver comprising a shank, a head provided with a pen-slot, a plate secured to said head provided with a slot registering with the shank-slot, and a sleeve capable of sliding upon the shank, substantially as shown and described.

407,518. PAPER-CUTTER. LEO BERLIEB, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed Oct. 6, 1888. Serial No. 287,438. (No model.)



Claim.—1. In a paper-cutter, the combination of a paper-roll, a suitable support for the roll, a knife, and a magnet, substantially as and for the purpose set forth.

2. In a paper-cutter, the combination of the paper-roll, a suitable support for the roll, magnet, a knife, and a bar between which and the knife the paper passes, substantially as set forth.



3. In a paper-cutter, the combination of a paper-roll, a suitable support for the roll, magnets, a knife pivoted to the magnets, and a bar secured to the magnets, all substantially as and for the purpose set forth.

4. In a paper-cutter, the combination of a paper-roll, a suitable support for the roll, magnets, bar 7, secured to the magnets, lugs 9 on the magnets, projections 11 on the lugs 9, knife 5, having extension 13, and spurs 10 on the extensions, substantially as set forth.

407,518.

407,519. PAPER-CUTTER. LEO BERLIEB, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed Oct. 6, 1888. Serial No. 287,440. (No model.)

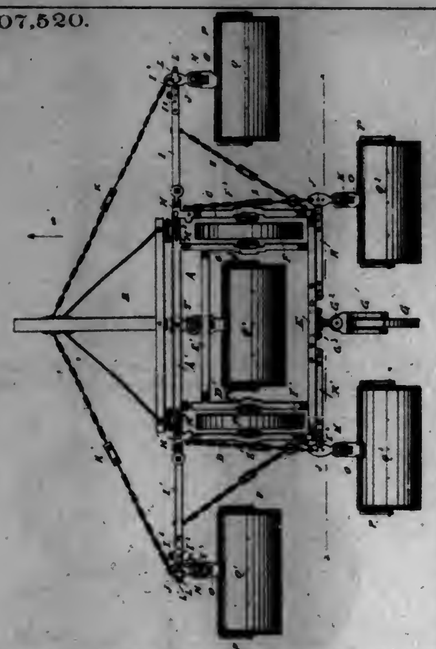
Claim.—1. In a paper-cutter, the combination of a paper-roll, a suitable support for the roll, hinged arms, a knife secured to the outer ends of the hinged arms, and rollers secured to the inner ends of the hinged arms, all substantially as and for the purpose set forth.

2. In a paper-cutter, the combination of the paper-roll, suitable support for the roll, hinged arms, rollers secured to the inner ends of the hinged arms, knife secured to the outer ends of the hinged arms, and a bar between which and the knife the paper fits when the knife is in its normal position, substantially as set forth.

3. In a paper-cutter, the combination of the paper-roll, hinged arms, knife secured to the arms, rollers secured to the inner ends of the arms, and posts to which the arms are pivoted, substantially as and for the purpose set forth.

4. In a paper-cutter, the combination of the paper-roll, suitable support for the roll, posts 5, bar 10, secured to the posts, arms 6, pivoted to the posts 5, and a knife 9, secured to the arms 6, substantially as and for the purpose set forth.

407,520. LAND-ROLLER. JOHN M. FELLOWS, Burlington, Ind. Filed Sept. 5, 1888. Serial No. 284,608. (No model.)

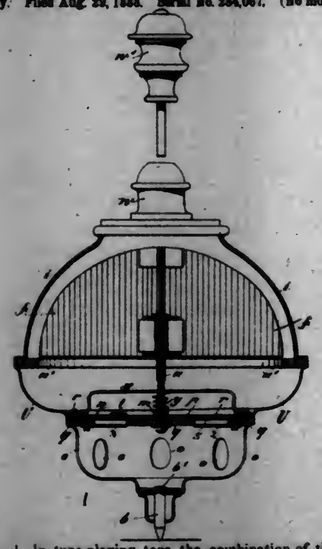


Claim.—1. In a land-roller, the combination, with a main frame, of beams pivoted to said frame, and the clevises for connecting the beams and main frame, the clevises carried at the free end of the beams and connected with the roller-carrying frame, substantially as shown and described.

2. The combination, with the main frame consisting of the beam A E and cross-beams C C' D D', of the slotted vertical bearings F^2 F^2, secured, respectively, to the cross-beams C' D' and C D, the bearings F^2 being provided with racks, the wheels F F', carried between the slotted bearings, shafts F^3, carrying said wheels and provided with pinions F^4 upon their outer ends and adapted to engage with the racks F^2, and the nut F^5, for holding the shaft securely between the slotted bearings, substantially as shown and described.

3. In a land-roller, the combination, with a main frame and a roller universally jointed on the said frame, of beams pivotally connected with the said main frame, a universal joint connected with each pivoted beam, a frame held on the said universal joint, and a roller supported on the said frame, substantially as shown and described.

4. In a land-roller, the combination, with wheels and a main frame held vertically adjustable on the axis of the said wheels, of beams pivoted on the said main frame, a clevis held on the free end of each beam, a universal joint connected with the said clevis, a frame

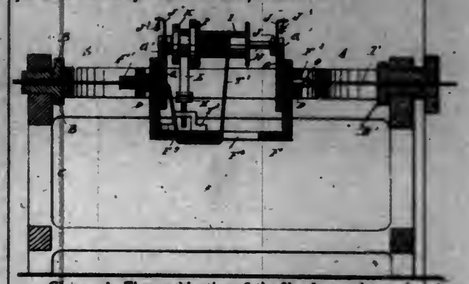


407,520.

held on the said universal joint, and a roller mounted to turn in the said frame, substantially as shown and described.

5. In a land-roller, the combination, with a main frame, of beams pivotally connected with the front beam of the said frame, a clevis held on the free end of each of the said beams, a roller held on the said clevis, and a wheel mounted on a rod held to slide vertically in each of the said beams, substantially as shown and described.

407,521. MUSICAL TOP. GEORG FISCHER, Nuremberg, Bavaria, Germany. Filed Aug. 29, 1888. Serial No. 284,067. (No model.)



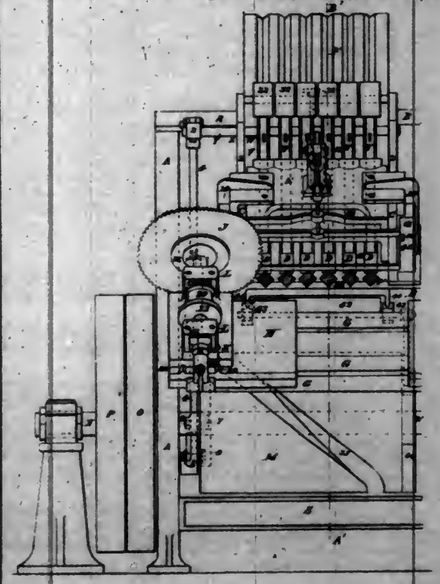
Claim.—1. In tune-playing tops, the combination of the lower body U, having the holes *v v*, reed-plate *q*, covering-plate *p*, having the hole *s*, point *b*, wings *f f*, axle *a* with the head *w*, and wires *i i*, for the purpose as described.

2. In tune-playing tops, the combination of the under body U, head *w*, wires *i i*, point *b*, reed-plate *q*, covering-plate *p*, with the wings *f f*, axle *a*, having the pinion *m*, cog-wheel *n*, cogged ring *r*, and guide *x*, for the purpose as described.

407,522. MACHINE FOR MAKING ROPE. MICHAEL PURSEL, Brooklyn, N. Y. Filed Jan. 26, 1889. Serial No. 297,915. (No model.)

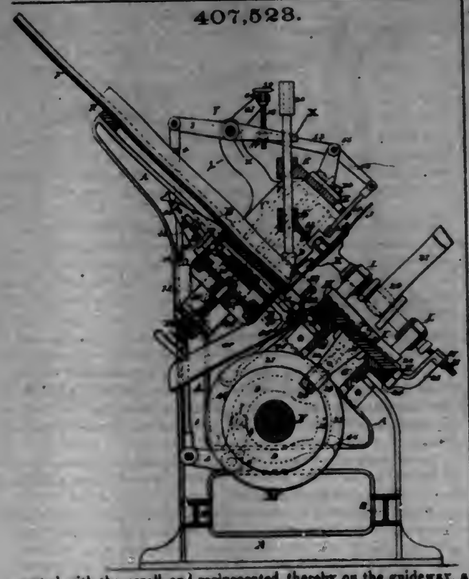
Brief.—The object of the invention is to provide a flier of simple and durable construction, which shall hold the bobbin securely and permit of its ready removal and replacement.

Claim.—1. The combination of the flier-frame, the carriage hung loosely therein, and a spindle mounted on the carriage and having a brake-wheel provided with a pin P, for the purpose described, substantially as set forth.



2. In a flier, the combination, with the flier-frame and a carriage provided with forked bearings, of a spindle held to turn in the said forked bearings, and pivoted arms passing through slots in the said forked bearings to engage the top of the said spindle to hold the latter in place, substantially as shown and described.

3. In a flier, the combination, with the flier-frame and a carriage provided with forked bearings, of a spindle held to turn in the said forked bearings, pivoted arms passing through slots in the said forked bearings to engage the top of the said spindle to hold the latter in place, and springs engaging the said pivoted arms to hold the same over the said spindle, substantially as shown and described.



4. A flier-frame A, having parallel legs A' A', transverse bars D D, connecting said legs between their ends, the ends of legs beyond the said bars being inclined toward each other and apertured just in advance of the ends of said bars for the passage of the strands, the hollow trunnions B B, connecting the ends of said legs, the covers R, secured to the outer faces of the parallel portions of said legs, and pulleys journaled at the ends of said covers and over which the strands pass to said apertures and trunnions, substantially as set forth.

407,523. SELF-ACTING SAWING-MACHINE. ARTHUR GREG, Ingley Mills, near Bolton, County of Lancaster, England. Filed May 13, 1889. Serial No. 310,526. (No model.) Patented in England Sept. 15, 1888, No. 13,319.

Claim.—1. In a self-acting sawing-machine, the combination of a frame-work A, having a bed-plate B and a stationary guideway G, a rotating drive-shaft N, having a scroll M, a sliding frame H, con-

407,528.

nected with the scroll and reciprocated thereby on the guideway, a head-stock I on the sliding frame, having a rotating spindle provided with a circular saw, a grip-frame E on the bed-plate, a series of feed-guides F above the bed-plate, a series of feeding and holding grips D over the feed-guides, and means for automatically operating the grips to hold and release the timber, substantially as described.

2. In a self-acting sawing-machine, the combination of a frame-work A, having a bed-plate B and a stationary guideway G, a rotating shaft N, having a scroll M, a sliding frame H, connected with the scroll and moved thereby on the guideway, a head-stock I on the sliding frame, having a rotating spindle provided with a circular saw, a grip-frame E on the bed-plate, a series of inclined feed-guides F, a series of feeding and holding grips D, means for raising and lowering the grips, a stop 33 for limiting the movement of the timber downward on the feed-guides, and means for adjusting the stop relatively to the saw, substantially as described.

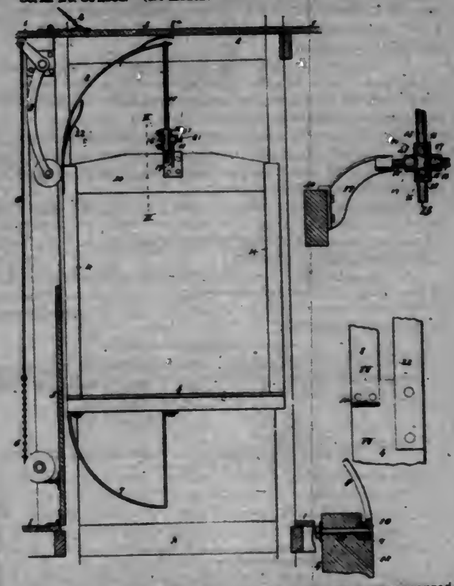
407,524. BRUSH-HOLDING CABINET. SAMUEL HALL, St. John, New Brunswick, Canada. Filed Apr. 20, 1889. Serial No. 307,976. (No model.)

Claim.—1. A brush-holding cabinet consisting of a receptacle adapted to contain liquid in its lower portion, a door arranged in one side of the cabinet, and a brush-holding device arranged within the case, substantially as and for the purpose described.

2. An air-tight brush holding and carrying cabinet consisting of a receptacle having a door in one side, said door being provided with a suitable packing, and a brush-holding device carried within the receptacle, substantially as shown and described.

3. An air-tight brush-holding case consisting of a rectangular case having its lower portion divided into two compartments by a vertical partition, a door hinged to the case and provided with a suitable packing, and a brush-holder arranged within the case, substantially as described.

4. An air-tight brush holding and carrying case consisting of a suitable receptacle and having its bottom portion lined with metal and formed with an opening for the introduction of the brushes, a door hinged to the case, provided with a suitable packing and adapted to close the opening, and a brush-holding device arranged within the case, substantially as shown and described.



407,525. FASTENING FOR RUBBER SHOES. FURMAN S. HAND and EBEN RICHARDSON, Flanagan, Ill. Filed Apr. 10, 1889. Serial No. 306,703. (No model.)

Claim.—1. A fastening device for rubber shoes, consisting of a cup-shaped retaining device provided with an aperture and clinching-points, whereby it is secured to the inner shoe outside of the same, and a plate attached to the outer shoe and having a projection adapted to engage the aperture of the retaining device, substantially as described.

2. The fastening-plate provided with clinching-points and tongue *d*, in combination with a retaining device having an aperture to receive said tongue, substantially as described.

407,526. HATCHWAY. EMILE J. HERMAN, St. Louis, Mo., assignor to the Safety Hatch Door Company, same place. Filed Sept. 1, 1888. Serial No. 284,332. (No model.)

Claim.—1. The combination, with the cage and a cam secured to an upright of the cage, of the clip and the rod by which the cam is adjusted on the beam, substantially as and for the purpose set forth.

2. The combination, with the cage and a cam hinged to the cage at one end, of the adjustable rigid rod and clip by which the cam is connected to the cage at the other end, substantially as set forth.

3. The combination of a cage, a cam hinged to the cage at one end and adjustably connected to the cage at the other end by means of a vertical rod, a sleeve through which the rod passes, and a set-screw, substantially as set forth.

4. The combination of a cage, a cam secured to the cage, and a horizontally-adjustable clip for securing the upper end of the cam to the cage, substantially as set forth.

5. The combination of the cage, a cam hinged to the cage, a vertical rod secured to the upper end of the cam, and a horizontally-adjustable clip provided with a set-screw for receiving said rod and holding the cam to any suitable adjustment, substantially as set forth.

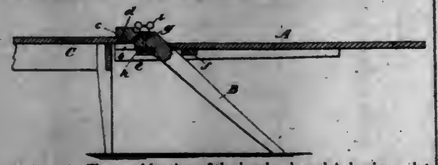
6. The combination of the cage, a cam hinged to the cage, a vertical rod secured to the upper end of the cam, a clip having a sleeve provided with a set-screw for receiving said rod, a horizontal rod secured to the cage, and a sleeve on said clip provided with a set-screw for receiving said horizontal rod, substantially as and for the purpose set forth.

7. The combination of the cage, a cam secured to the cage, and device for adjusting the upper end of the cam, said cam being con-

nected to the cage at its lower end by a hinged joint consisting of a perforated head fitting in a socket in the cage and a connecting-bolt, the perforation in the head being made larger at its ends than in the center, substantially as and for the purpose set forth.

407,527. INHALER-MASK. BERNET H. HILCHEN, Jersey City, N. J. Filed Jan. 31, 1889. Serial No. 298,184. (No model.)

Claim.—1. In a mask, the combination, with an outer plate provided with a transparent panel, of a rear plate apertured to receive the face of the wearer, a yielding cushion 15, mounted about the aperture and consisting of a strip having a tubular body c and flanges *d*, and connections between the flanges and the apertured plate, substantially as described.



2. In a mask, the combination, with an outer plate provided with a transparent panel, of a rear plate apertured to receive the face of the wearer and a yielding cushion arranged about the edge of the said aperture, substantially as described.

3. In a mask, the combination, with a plate provided with a transparent panel, of an apertured plate, a yielding cushion arranged in connection with said apertured plate, a tube 20, and a check-valve, substantially as described.

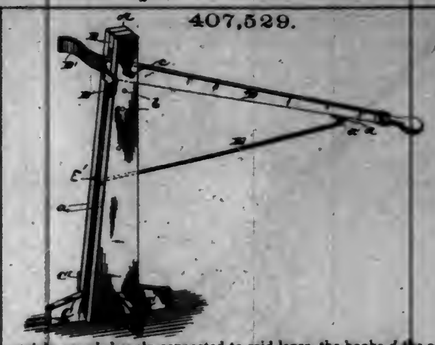
4. In a mask, the combination, with a plate provided with a transparent panel and a trap, of an apertured plate, a yielding cushion arranged in connection with said plate, an induction-tube, and a check-valve, substantially as described.

5. The combination, with a mask adapted to fit against the face of the wearer, of an air-reservoir arranged to be worn upon the head of the wearer and connections between the mask and the reservoir, substantially as described.

407,528. IRONING-BOARD. PHILLIP HERR, Clinton, Ky., assignor to himself, W. Clayton Porter, and John P. Davis, all of same place. Filed Apr. 9, 1889. Serial No. 306,518. (No model.)

Claim.—1. The combination of the ironing-board A, having a slot *b* in its inner end, the detachable brace B, provided with a series of steps on the under side of its upper end portion, the screw-bolt *g*, thumb-nut *i*, and transverse clamp *h*, substantially as specified.

2. In an ironing-board, the combination, with the detachable brace B, provided with one or more steps or bearing-surfaces c on the under side of its upper portion, screw-bolt *g*, thumb-nut *i*, and clamp *h*, of the board A, having a slot *b* in its inner end, and the spurs *d*, arranged to project above the upper surface of the board, essentially as described.



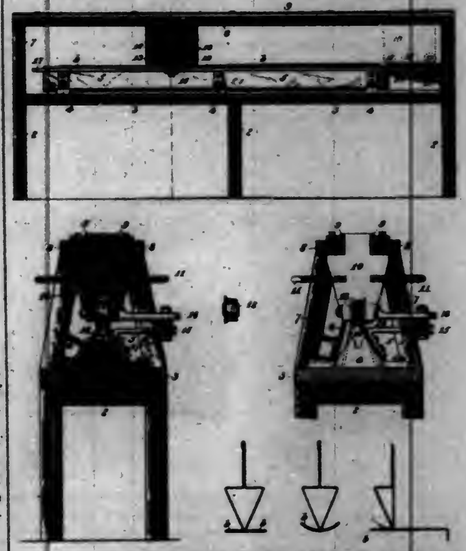
407,529. WAGON-JACK. WILLIAM J. HOLLENBECK, Cortland, N. Y. Filed Dec. 5, 1887. Serial No. 257,051. (No model.)

Claim.—1. In a wagon-jack, the combination, with the double standard the parts of which are rigidly connected together, of a double lifting-lever pivoted one part in each portion of said standard, the said lever parts having their long arms connected together and provided with a handle and retaining-pawls, substantially as described.

2. In a wagon-jack, the combination, with a double standard the parts of which are rigidly connected together, of a double lifting-lever pivoted one part in each part of the standard, said lever parts having their long arms connected together and provided with a handle, T-headed retaining-pawls, and a cord for simultaneously raising said retaining-pawls, substantially as described.

3. In a wagon-jack, the combination of the double standard A A, double lever D D, pivoted in said standard, the handle J, the

407,529.



retaining-pawls loosely connected to said lever, the hooks *d*, the cord *k*, and the eyelets *i i*, for guiding the cord, substantially as described.

4. In a wagon-jack, the combination, with a standard, of a lever passing therethrough, provided at one end with a handle and at the other end with two axle-engaging projections diverging out of the vertical plane of the handle, and a retaining-pawl, substantially as described.

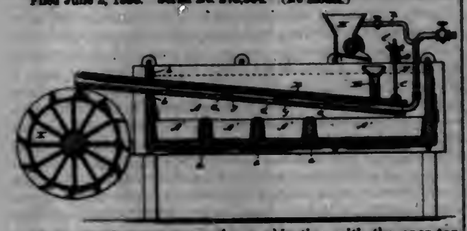
5. In a wagon-jack, the combination, with a standard having openings in its sides for the reception of a pivotal pin, of a lever pivoted therein, a T-headed retaining-pawl loosely connected at one end to said lever and operating between the sides of the standard, the T-head of said retaining-pawl having a curved standard engaging face and operating entirely by frictional contact with the front of the standard to hold the lever and weight to be raised stationary at any desired point, substantially as described.

407,530. MACHINE FOR SHAPING SHEET METAL. THOMAS W. IRWIN, Allegheny, Pa. Filed Dec. 6, 1888. Serial No. 292,623. (No model.)

Claim.—1. An improvement in machines for bending sheet metal, which consists in the combination of a die-bed for supporting the article to be formed and of corresponding shape with the formed article, and a traveling weighted forming-roller arranged loosely in guides above the die-bed and supported by the die-bed and freely movable thereon by hand, substantially as described.

2. A machine for bending sheet metal, comprising a die-bed shaped correspondingly to the formed article, combined with a roller similarly shaped, a weighted carriage in which the roller is supported, and guideways which direct the carriage laterally, substantially as described.

3. The combination of a die-bed shaped substantially like the article to be formed, a forming-roller of complemental peripheral outline, a carriage in which the roller is supported, the die-bed directly receiving the carriage and roller and supporting their weight, and



ways arranged over the die-bed and parallel therewith and by which the carriage is guided and adapted to be traversed along the same to act upon and shape the article upon the die-bed, substantially as and for the purposes described.

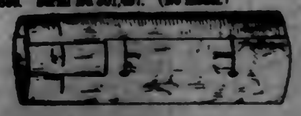
4. A machine for bending sheet-metal blanks, having flanges and a part forming the shank, which consists in a die-bed constituted of side pieces, between which the shank is placed and on which the flanges rest, and a head-moved weighted forming-roller, of complemental peripheral outline, which travels on the said flanges and shapes them on the said die-bed, substantially as and for the purposes described.

5. An improvement in machines for bending sheet-metal articles, which consists in the combination of a die-bed for supporting the article to be formed and of corresponding shape with the formed article and constituted of side pieces, at least one of which is separable from the others to permit the introduction of the article to be shaped, and a traveling weighted forming-roller arranged loosely in guides above the die-bed and supported by the die-bed and freely movable thereon by hand, substantially as described.

6. In machines for bending sheet metal, having flanges and a part forming the shank, a die-bed consisting of side pieces, at least one of which is hinged to admit the shank, and on which side pieces the flanges rest, a forming-roller, and a reciprocating carriage in which the roller is arranged and which causes the roller to travel on said flanges and shape the flanges upon the die-bed, substantially as and for the purposes described.

407,531. ORE-SEPARATOR. JAMES JENKINS, Harrisburg, Pa. Filed June 2, 1888. Serial No. 275,804. (No model.)

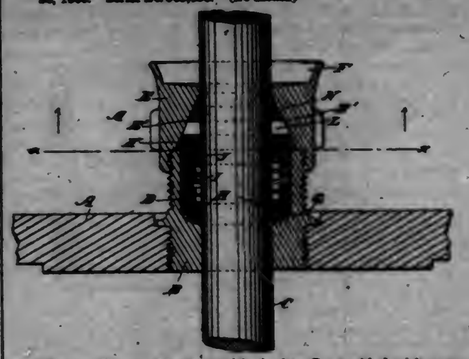
Claim.—1. In a separator, the combination, with the open-top settling-tank having the compartments therein, of the substantially-straight conduit for conveying the material to be separated, located within the tank above the compartments and below the water-level, with the apertures therein corresponding to the compartments, substantially as described.



2. In a separator, the combination, with the settling-tank having the compartments therein, of the conduit for conveying the material to be separated, having apertures in the bottom corresponding to the compartments in the tank, the sides of the said apertures in the direction from which the material flows being provided with inclines, substantially as and for the purpose specified.

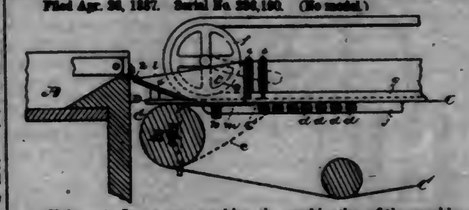
3. In a separator, the combination, with the settling-tank having the compartments therein, of the substantially-straight inclined conduit for conveying the material, located within the tank above the compartments and below the water-level, with its discharge end above the opposite end, and having the apertures therein corresponding to the compartments, and means for supplying water under pressure to the lower end, substantially as described.

4. In a separator, the combination, with the settling-tank, of the conduit located in the same below the water-level, having apertures in its bottom, through which the separated material passes, and a discharge-orifice outside the tank, and a flexible water-tight joint between the conduit and walls of the orifice in the tank, through which it passes, whereby the end of the conduit is permitted a vertical movement, substantially as described.



5. In a separator, the combination, with the settling-tank, of the adjustable conduit located in the same below the water-level, having apertures in its bottom, through which the separated material passes, and the discharge-orifice outside the tank, with a water-tight connection between the tank and conduit, and a flexible pipe for supplying water to said conduit, whereby it may be adjusted to different levels, substantially as described.

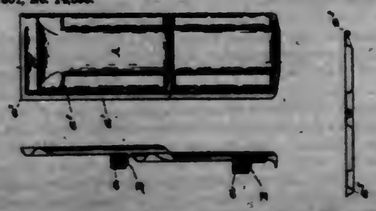
407,532. TREE-PROTECTOR. HERMAN F. JUSTIS, Palmyra, Mo., assignor, by mesne assignments, to AMY E. Justis, same place. Filed Feb. 23, 1889. Serial No. 301,497. (No model.)



Claim.—As an improved article of manufacture, a tree-protector consisting of a perforated sheet of tarred felt having its upper portion slitted to form a series of flaps, and provided with a wire passing through the flaps, the said flaps being adapted to overlap each other, and the wire being bent at the time that the flaps are overlapped to permit the protector to expand as the tree grows, as set forth.

407,533. PISTON-ROD PACKING. PERCHARTH G. KELLOGG, Brainerd, Minn., assignor to himself and Frank Bell, same place. Filed Mar. 23, 1888. Serial No. 268,126. (No model.)

Claim.—The combination, with the box B, provided with an enlarged central opening D, having a concave bottom, the ring G, having a rounded lower face to fit said bottom, and an annular flange H, the upper ring J, and the spring I on said ring and flange, of the head E, screwed on box B, and having an inner conical opening E', and an outer cup F, and the series of sectional packing-rings L N, breaking joint in the conical opening and beveled on their peripheries, substantially as set forth.

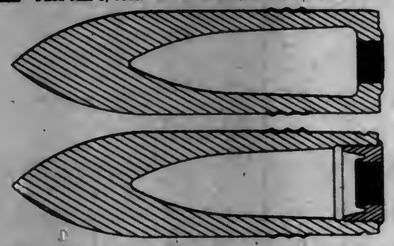


407,534. PAPER-MACHINE. JOSEPH KIDSLAND, Jr., Hatley, N. J. Filed Apr. 26, 1887. Serial No. 236,190. (No model.)

Claim.—1. In a paper-machine, the combination of the machine-frame D, tube-roll frame *j*, tube-rolls *d d d*, a breast-roll B, a wire-cloth disposed on said breast and tube-rolls, slices *c*, arranged over said wire-cloth, and a supplemental apron *m*, arranged underneath the wire-cloth between said breast-roll and tube-rolls *d d*, substantially as and for the purposes set forth.

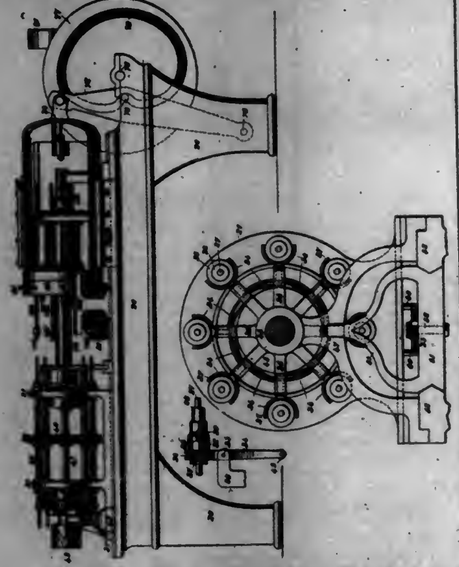
2. In a paper-machine, the combination of the machine and tube-roll frames, a breast-roll, series of tube-rolls, a wire-cloth arranged over said breast-roll and lying upon the series of tube-rolls, slices, a supplemental apron *m*, arranged beneath the wire between the tube-rolls and breast-roll, and an upper apron *i*, rigidly secured to the machine-frame and extending to the wire-cloth, the said supplemental apron underlying the said upper apron at one edge and terminating at the slices, substantially as and for the purposes set forth.

407,535. METALLIC ROOFING. HERMANN KLEMM, Baden-Baden, Germany, assignor to Julius Klehm, Mauch Chunk, Pa. Filed Nov. 20, 1888. Serial No. 291,269. (No model.) Patented in Germany Jan. 1, 1881, No. 14,336.



Claim.—1. A roof made up of a series of metallic sections provided on their under sides with hooks and also provided with interlocking edges forming joints, substantially as described.

2. A roof made up of a series of metallic sections provided with hooks and interlocking edges and with grooves or conduits forming receptacles for projecting parts of adjacent sections and means for conducting water, substantially as described.



3. As a new article of manufacture, a roofing section consisting of the body provided on two sides with downturned grooved edges, and curved edges designed to interlock with the downturned edges of adjacent sections and provided with hooks for securing the sections in place, substantially as described.

407,586. METHOD OF MANUFACTURING PROJECTILES. GEORGE KYNOCH and HENRY A. SCHLESS, Birmingham, County of Warwick, England. Filed Jan. 5, 1888. Serial No. 259,863. (No model.)

Claim.—The improvement in the art of forming the shell of a pointed projectile, which consists in subjecting a disk of metal of uniform thickness to the action of dies by which the metal is cupped and driven upon itself toward the center, whereby a shallow cup having a thickened and compressed end is formed, then by the successive action of other dies simultaneously extending in length the cup-shaped article thus formed and thinning the walls, and finally finishing the shell by partially closing the open end thereof, substantially as described.

407,587. MACHINE FOR MAKING SCREWS. GUSTAVUS LARRABEE, Hartford, Conn. Filed Aug. 14, 1888. Serial No. 282,723. (No model.)

Claim.—1. In a screw-making machine, the combination of a set of running rod-supplying spindles mounted in a stationary stock supplying the screw-rods to the machine, and a step-by-step rotating tool-holder having a reciprocating movement and provided with a set of tools whereby the tools of the holder may be presented to the work and withdrawn therefrom and the holder rotatively shifted, and said operations repeated, so that the said tools may be presented in succession to the work.

2. In a screw-making machine, the combination of a set of running rod-supplying spindles mounted in a stationary stock in a circle and supplying the screw-rods to the machine, a step-by-step rotating tool-holder adapted to be moved toward and away from the rod-supplying spindles on the line of length of the same and having a set of tools arranged on a circle concentric with the circle of the spindles, whereby the tool-holder may advance toward the spindles, retreat therefrom, and then be rotated, and these operations repeated, so as to present in succession each one of a set of tools in the holder to the rods carried by the spindles.

3. In a screw-making machine, the combination of a set of running rod-supplying spindles mounted in a stock and disposed equidistant on a circle and supplying the rods to the machine, a tool-holder adapted to move toward and away from the said spindles on the line of length of the same, and provided with a set of tools arranged equidistant and on a circle concentric with the circle of the said spindles, the tool-holder acting to simultaneously move the tools longitudinally into contact with the work and to withdraw them therefrom at each reciprocation, the tool-holder and said spindle-stock having a relative step-by-step rotative movement to permit the successive engagement of the tools with the screw-rods.

4. In a screw-making machine, the combination of a set of running rod-supplying spindles mounted in a stock and disposed on a circle and supplying the screw-rods to the machine, a tool-holder adapted to move toward and away from the spindles in the direction of the length of the spindles, a set of independently-operated tools mounted in the tool-holder and arranged in a circle concentric with the circle of the spindles and adapted to be simultaneously carried by the tool-holder into contact with the rods in the spindles, the tool-holder and the said spindle-stock having a relative step-by-step rotating movement to permit the successive engagement of the tools and the work.

5. In a screw-making machine, the combination of a set of running rod-supplying spindles supplying the screw-rods to the machine, and mounted in a stationary stock and disposed equidistant in a circle, a step-by-step rotating tool-holder adapted to move toward and away from the spindles in the direction of the length of the same and making partial revolutions upon its recession, a set of tools mounted in the tool-holder equidistant in a circle concentric with the circle of the said spindles and arranged correspondingly therewith, a feed-clamp mounted in the tool-holder midway between two of the tools and on the circle therewith, whereby at each recession the tool-holder by its partial revolutions may bring the feed-clamp and then the tools into axial alignment with the feed-spindles, and adapted to be periodically thrust forward to grasp the blank screw-rod to be fed when the same is brought into alignment therewith, such feed-clamp being retracted by the further recession of the tool-holder to feed the grasped rod a predetermined length, so that upon advancement of the tool-holder the tools being in alignment with the work are carried onto the same, and upon retreat the tools are shifted out of alignment, while the feed-clamp is shifted into alignment with the rod to be fed and grasps and feeds the rod for a certain length, and then the tool-holder is again shifted, bringing the tools into alignment with the spindles for a repetition of said operation.

6. In a screw-making machine, in combination, a set of running rod-supplying spindles mounted equidistant in a circle in a stock and supplying the rods to the machine, a tool-turret provided with a set of reciprocating tools adapted to be projected and retracted therefrom, so as to engage the screw-rods laterally, and arranged with its axis coincident with the center of the circle of disposition of the spindles, the said spindle-stock and the tool-turret having a relative step-by-step rotative movement, whereby the tools of the turret may be introduced in succession to the screw-rods.

7. In a screw-making machine, in combination, a set of running rod-supplying spindles mounted in a stationary stock and disposed equidistant in a circle and supplying the screw-rods to the machine, a step-by-step rotating tool-turret concentrically arranged with the circle of the spindles and provided with a set of reciprocating tools disposed radially and equidistant in the turret, and the tools adapted to be periodically projected and retracted, so as to encounter the screw-rods laterally, the step-by-step rotative motion of the turret permitting the tools thereof to be presented in succession to the screw-rods.

8. In a screw-making machine, in combination, a set of running rod-supplying spindles mounted in a stationary stock and disposed equidistant in a circle and supplying the screw-rods to the machine, a step-by-step rotating tool-holder provided with a set of tools disposed equidistant in a circle about the axis of rotation of the tool-holder concentric with the circle of the spindles, a rotative mandrel extending through the center of the tool-holder and turning step by step therewith and having a tool-turret mounted thereon and rotating therewith about a common axis, the tool-turret provided with a set of reciprocating tools disposed radially and equidistant, and adapted to be periodically projected and retracted, so as to come into lateral contact with the screw-rods, whereby the step-by-step rotating motion of the tool-holder may be imparted to the tool-turret through means of the mandrel.

9. In a screw-making machine, the combination of the suitably-mounted step-by-step rotated mandrel having a drum-like tool-turret mounted concentrically thereon and rotating therewith and provided with a set of radially-disposed reciprocating tool-slides having the retracting means, a chamber formed in the mandrel and into which the inner ends of the slides project, an endwise-reciprocating spring-actuated projector mounted within said chamber and provided with an inclined surface for engaging and forcing outwardly the tool-slides when the projector is moved in one direction, a tool-holder mounted concentrically on the mandrel and sliding thereover and provided with the means for engaging the tool-slide projector for a limited period in one way of its movement for imparting the requisite motion to said projector to project the slides, substantially as and for the purpose set forth.

10. In a screw-making machine, the combination of the suitably-mounted step-by-step rotated mandrel formed with an interior chamber and having lateral openings communicating therewith, a tool-turret mounted concentrically on the mandrel and rotating therewith and provided with a set of spring-actuated radially-disposed reciprocating tool-slides having their inner ends projecting into said chamber, a projector mounted within said chamber and adapted to reciprocate endwise in the axial line of the mandrel, and having an inclined surface engaging the said inner ends of the tool-slides and projecting the slides when the said projector is moved in one direction, and a spring for returning the projector after such movement, a step-by-step rotating tool-holder mounted concentrically on the mandrel and reciprocating thereon and turning therewith and provided with spring-pawls for taking through said openings in the mandrel and engaging periodically the tool-slide projector within the mandrel, whereby the tool-holder in one direction of its reciprocating movement will impart its motion to the said projector to effect the projection of the tool-slides, substantially as and for the purpose set forth.

11. In a screw-making machine, the combination of a spindle-stock and the running rod-supplying spindles mounted therein, the spindle-driving shaft and the gears intermediate the shaft and spindles, the hollow rotary mandrel having lateral openings and mounted in axial alignment with the spindle-driving shaft and having an extension of the same passing therethrough and rotating therein, the tool-turret mounted concentrically on the mandrel and turning therewith and provided with a set of radially-disposed reciprocating tool-slides having springs to normally hold them within the turret, and having their inner ends engaging the conical surface of the slide-projecting tube, which lies within the mandrel and incases a sleeve mounted loosely on the extension of the spindle-driving shaft, and the step-by-step rotating tool-holder mounted on and sliding over the mandrel and imparting its step-by-step rotating motion thereto, the spring-pawls on the tool-holder acting to periodically engage the projecting tube, so as to move the tube endwise and project the slides from the turret, substantially as and for the purpose set forth.

12. In a screw-making machine, the combination, with a step-by-step rotating tool-turret provided with the periodically-reciprocating tool-slides, of the ratchet-teeth on the turret and the spring-clicks for engaging said teeth to prevent the turret from moving one way, substantially as described.

13. In a screw-making machine, in combination, a set of running rod-supplying spindles mounted in a stationary stock and disposed equidistant in a circle and supplying the screw-rods to the machine, a reciprocating carriage having a step-by-step actuated tool-holder mounted thereon with its axis of rotation parallel with the plane of reciprocation of the carriage and including the center of the circle of the said spindles, a set of tools mounted in the tool-holder, so as to be brought into opposite alignment with the spindles, such tools including the threading-tool and all tools designed to move upon the work in the spindles longitudinally relatively thereto, whereby such tools may be carried onto and withdrawn from the work, then shifted and presented again, and so on, in order that each screw-rod may have such tools act upon it in succession.

14. In a screw-making machine, the combination, to effect the unthreading motion for the threading-die with the spindle-driving shaft, of the reciprocating carriage having the tool-holder rotatively mounted thereon, the threading-die having its supporting-rod mounted loosely in the tool-holder, a clutch mounted on the spindle-driving shaft and having the loose member thereof connected with the said die-supporting rod through means of speed-multiplying gearing, the clutch being periodically operated by the tool-holder in its reciprocations, the retreat of the holder effecting the closing of the clutch and the consequent rotation of the threading-die.

15. In a screw-making machine, the combination, with the running rod-supplying spindles disposed equidistant in a circle and supplying the screw-rods to the machine and a centrally-disposed shaft for driving the spindles, of a reciprocating carriage having a step-by-step rotating tool-holder mounted thereon and having a set of tools, including the threading-die, disposed equidistant in a circle concentric with the circle of the spindles, the said driving-shaft passing through the axis of rotation of the tool-holder, and a clutch mounted on the said shaft and periodically operated by the reciprocations of the tool-holder, multiplying-gearing intermediate the loose member of said clutch and the threading-die rod in the tool-holder, whereby upon the closing of the clutch the threading-die may be rotated at a greater speed than its co-operating rod-supplying spindle and in the same direction therewith.

16. In a screw-making machine, the combination, with the set of running rod-supplying spindles mounted in a stationary stock and disposed equidistant in a circle and supplying the screw-rods to the machine and the centrally-disposed drive-shaft for driving the spindles, of a reciprocating carriage having a step-by-step rotating tool-holder mounted thereon and a hollow rotary mandrel extending from the spindle-stock through the center of the tool-holder and having the spindle shaft extending through its center and projecting thereabeyond, one or more threading-dies mounted in the tool-holder, so as to come into opposite alignment with the co-operating rod-supplying spindles, a clutch on said shaft and speed-multiplying gearing intermediate the said clutch and the threading-die rods, a movable plunger sliding on said shaft and acting to close the clutch, such plunger being connected with the notched slide-bars reciprocating in slots formed in the sides of the mandrel, and the spring-pawls mounted on the tool-holder and automatically engaging and disengaging said slide-bars to periodically move the clutch-plunger back and forth during the reciprocating movement of the tool-holder, substantially as and for the purpose set forth.

17. In a screw-making machine, the combination, with the reciprocating carriage having the step-by-step rotating tool-holder mounted thereon, of a disk rotatively mounted in a stationary bearing and rotating step by step in unison with the tool-holder, the drive-shaft extending through both the center of the tool-holder and the disk, a clutch mounted on the shaft and having its loose member driving a gear, and a threading-die rod loosely mounted in the tool-holder and the disk and provided with a gear meshing with said clutch-driven gear, the said clutch connected with the tool-holder, whereby the reciprocating movements of the holder may periodically operate the clutch, substantially as and for the purpose set forth.

18. In a screw-making machine, the combination, with the step-by-step rotating tool-holder and the disk mounted in a stationary bearing and rotating step by step in unison with the holder, of the drive-shaft extending through the center of both the tool-holder and disk, a clutch mounted on the shaft and having the loose member thereof provided with a sleeve surrounding the shaft and extending loosely through the center of the disk, and a gear-wheel mounted fast on said sleeve, a pinion having a hollow arbor loosely journaled in and extending through said disk and provided with one clutch member, a threading-die having its rod loosely mounted through the tool-holder and extending through said hollow arbor of said pinion and provided with a second clutch member coacting with the member on said arbor, whereby upon the closing of the main clutch on the drive-shaft the clutch on the die-rod will be closed and the rod rotated, substantially as and for the purpose set forth.

19. In a screw-making machine, the combination of the tool-holder and the threading-die having its sustaining-rod mounted thereon and provided with a fast clutch member, a pinion having a hollow arbor through which said rod extends, and a second clutch member mounted on said arbor and having a limited endwise play thereon, the drive-shaft, and the main clutch mounted thereon and operatively connected with the said pinion, whereby upon the closing of the main clutch the motion of the shaft is not immediately imparted to the die because of the play of said clutch member.

20. In a screw-making machine, the combination, with the reciprocating and step-by-step rotating tool-holder and the tools mounted thereon, of the disk mounted in a stationary bearing and rotating step by step in unison with the tool-holder and supporting in part the tools of the holder, which receive operations independently of the operations of the tool-holder.

21. In a screw-making machine, the combination of the reciprocating carriage having the step-by-step rotating tool-holder mounted thereon and carrying the tools, the disk rotatively mounted in the stationary bearing and having said tools extending therethrough, and the mechanism, substantially as described, for operating the tools independently of the tool-holder, the hollow mandrel extending through the center of the tool-holder, and the drive-shaft extending through the mandrel, the rigid connections intermediate the said disk and mandrel, whereby the step-by-step rotating movement of the tool-holder may be imparted to the disk through means of the mandrel and said intermediate connections, substantially as and for the purpose set forth.

22. In a screw-making machine, the combination of a set of running rod-supplying spindles mounted equidistant in a circle in a stock, a reciprocating carriage having a step-by-step rotating tool-holder mounted thereon, a set of tools mounted in the tool-holder in a circle coincident with the circle of said spindles, and a locking device for automatically locking the tool-holder against rotation between each step-by-step movement, for the purpose set forth.

23. In a screw-making machine, the combination, with a recip-

rocating carriage and a cylindrical tool-holder rotatively mounted thereon and provided with a set of radially-disposed push-pins, of a stationary cam arranged near the tool-holder and appropriate to be engaged by a push-pin at each retreating motion of the carriage to give the tool-holder partial revolutions, substantially as and for the purpose set forth.

24. In a screw-making machine, the combination, with a reciprocating carriage and a step-by-step rotating tool-holder mounted in an annular bearing thereon and formed with a series of bolt-holes, of a spring locking device located on said bearing and locking with the holes in the tool-holder, and a cam for engaging and operating said locking device to lock and unlock the tool-holder, substantially as and for the purpose set forth.

25. In a screw-making machine, the combination, with the tool-holder having a reciprocating motion and the threading-die rotatively mounted therein, of a locking device for the die acting to lock it against rotation when the thread is being cut, such locking device being operated by the reciprocating movement of the tool-holder.

26. In a screw-making machine, the combination, with the tool-holder and the mandrel upon which the holder reciprocates, of the threading-die loosely mounted in the holder and having its rod formed with a groove, a spring-actuated detent pivoted on the tool-holder and adapted to take in the groove of the rod, and a pivoted lever actuating the detent and having its foot engaged by the cams fixed upon the mandrel, substantially as and for the purpose set forth.

27. In a screw-making machine, the combination, with a reciprocating carriage provided with an annular bearing and a step-by-step rotating tool-holder mounted in the said bearing and provided with a series of bolt-holes, of a spring-actuated bolt mounted on the bearing and locking with the bolt-holes, a spring-actuated presser for retracting the bolt when pressed on, and a stationary cam-track having depressions and elevations thereon and arranged to be engaged by the end of the presser-rod to lock and unlock the tool-holder, substantially as and for the purpose set forth.

28. In a screw-making machine, the combination, with a reciprocating carriage having a tool-holder mounted thereon and a feed-clamp loosely mounted in the tool-holder and adapted to move endwise in its bearing, of mechanism, substantially as described, for holding the feed-clamp against movement upon advancement of the carriage and then effecting its endwise movement to force it onto a blank screw-rod upon retreat of the carriage.

29. In a screw-making machine, the combination, with the running rod-supplying spindles mounted in a stationary stock and provided each with a feed-clutch, of a reciprocating carriage having a step-by-step rotating tool-holder mounted thereon, and a feed-clamp mounted in the holder and adapted to move endwise therein, and mechanism, substantially as described, for holding the feed-clamp away from the rod-supplying spindles upon advancement of the carriage and forcing it onto a blank-rod in a spindle upon retreat of the carriage, and each retreat effecting the reverse endwise movement of the feed-clamp to feed the clamped blank-rod, the said feed-clutches connected with the said carriage and operated thereby, whereby upon the retreat of the carriage the clutch engaging the blank-rod then to be fed may be held open for such feed.

30. In a screw-making machine, the combination of the running rod-supplying spindles mounted in a stationary stock and disposed equidistant in a circle and provided each with a feed-clutch and supplying the screw-rods to the machine, a reciprocating carriage having a step-by-step rotating tool-holder mounted thereon, and a feed-clamp for each set of tools mounted in the holder and adapted to move endwise therein and to be brought into opposite alignment with a rod-supplying spindle upon retreat of the carriage, the mechanism, substantially as described, for holding the feed-clamp away from the said spindles upon advancement of the carriage and forcing it upon the blank-rod then to be fed when upon retreat of the carriage the clamp is brought into alignment with the same, and the said feed-clutches connected with and operated by the said carriage, for the purpose set forth.

31. In a screw-making machine, the combination, with a reciprocating carriage having a step-by-step rotating tool-holder mounted thereon, a disk mounted in a stationary bearing and rotating step-by-step in unison with the tool-holder, a spring-actuated feed-clamp mounted through the tool-holder and disk and adapted to move endwise therethrough, a feed-fork fulcrumed on the disk and engaging with one prong a shoulder on the rod of the feed-clamp to prevent one-way movement thereof, the other end of said fork adapted to press upon the end of said feed-clamp rod to force the clamp onto the blank-rod to be fed, and a spring-actuated slide engaging and operating the feed-fork, such slide being engaged and moved for a limited distance to press forward the feed-clamp by a device, substantially as described, which is operated by the retreating motion of the carriage.

32. In a screw-making machine, the combination, with the reciprocating carriage, the tool-holder mounted thereon, the disk, and the endwise-moving feed-clamp and the pivoted feed-fork engaging with one prong the rod of the feed-clamp and adapted to press with the other prong upon the end of the clamp-rod to force the clamp onto the blank-rod to be fed, of a spring-actuated slide engaging and actuating the feed-fork, the slide mounted on a stationary arbor having lateral slots formed therein and provided with the depressions, the notched slide-bars engaging said slide and sliding in said slots, and the spring-actuated pawls provided with the disengaging-pins and mounted on the carriage and engaging and moving the slide-bars as the carriage retreats, substantially as and for the purpose set forth.

33. In a screw-making machine, a reciprocating tool-holder carriage consisting in a U-shaped yoke-frame having an attached annular tool-holder bearing the plane of which is normal to that of the yoke-frame, so that access may be had to the working parts of the machine embraced within the yoke-frame, substantially as described.

34. In a screw-making machine, a reciprocating tool-holder carriage consisting in a U-shaped yoke-frame having an attached tool-holder bearing the plane of which is normal to that of the yoke-frame, and the means, substantially as described, for reciprocating the carriage, such means connected to the yoke-frame at the center of the arch thereof, so that the line on which the power is applied to the carriage may be coincident with the longitudinal axial line of the yoke-frame, substantially as and for the purpose set forth.

35. In a screw-making machine, the combination of the rotary spindle-casing having a hub at one end formed with an outwardly-inclined face, and the clutch-tube extending through said casing and provided with a hub lying without the casing, a spring wedging-collar having wedge-shaped lugs at its ends and having an inwardly-inclined face adapted to engage the said inclined face of the hub on the casing, said collar disposed between the two said hubs, a wedging-sleeve sliding over the hub on the clutch-tube and provided with a notch for engaging the wedging-lugs of the collar, which is wedged in between the hubs and acts to retract the clutch-tube when the notch in the sleeve is forced on the lugs, and a lever for sliding the wedging-sleeve to and fro to effect the opening and closing of the feed-clutch.

36. In a screw-making machine, the combination, with the rod-supplying spindles for supplying the screw-rods to the machine and having feed-clutches for clamping such rods, of a reciprocating carriage carrying a tool-holder co-operating with the feed-spindles and adjustably connected with the said feed-clutches of the spindles, whereby the feed-clutches may be operated by the movements of the carriage and the period during which each clutch remains open may be regulated by the adjustment of said intermediate connections.

37. In a screw-making machine, the combination, with the rod-supplying spindles having feed-clutches and supplying the screw-rods to the machine and the reciprocating carriage carrying the tool-holder co-operating with said spindles, of a step-by-step actuated mechanism, substantially as described, intermediate the said feed-spindles and carriage for operating the feed-clutches periodically, such mechanism being operated by the continuous reciprocation of the carriage.

38. In a screw-making machine, the combination, with the rod-supplying spindles and the feed-clutches thereof, and means, substantially as described, mounted on the spindles, for operating the clutches, of the pivoted cam-levers engaging and operating said clutch-operating means, and the intermittently-rotating cam-wheel having a straight cam-groove for the cam-levers, with as many equally-spaced turn-outs in each groove as there are sets of feed-spindles, whereby the feed-clutches of certain spindles may be simultaneously operated.

39. In a screw-making machine, the combination, with the cam-wheel and the cam-drum for operating the same, of a step-by-step actuated reciprocating slide for driving the cam-drum, and the reciprocating tool-holder carriage adjustably connected with said slide whereby the slide may be reciprocated step by step through the continuous reciprocation of the carriage.

40. In a screw-making machine, the combination, with the rotary cam-drum and the slide engaging and operating the drum, of a reciprocating tool-holder carriage, a second slide connected with and responding to the movements of the carriage, and an automatic grip-and-release device between the two said slides, whereby a step-by-step motion may be imparted to the first said slide, for the purpose described.

41. In a screw-making machine, the combination, with the rotary cam-drum and a slide for rotating the same step by step, of a second slide connected adjustably to the reciprocating tool-holder carriage and responding to the movements thereof and engaging and pushing the said first slide in one direction of its reciprocation, a spring-actuated grip-and-release device mounted on the second said slide, a pair of adjustable coupling-studs mounted on said first slide and engaged by the said device, and the trip-pins for engaging and opening said grip device to release it from one of the coupling-pins, whereby as the carriage advances the continuous movement of the second slide may actuate the first slide step by step.

42. In a screw-making machine, the combination, with the rotary cam-drum and the step-by-step reciprocating slide operating the drum, of a second slide provided with an automatic grip-and-release device, substantially as described, for engaging the first slide, the reciprocating tool-holder carriage and a connecting-rod adjustably attached between the carriage and the second slide, a pair of adjustable stops mounted on said rod, and a push-piece projecting from the carriage and engaging said stops, substantially as and for the purpose described.

43. In a screw-making machine, the combination of a set of running rod-supplying spindles 22 22, mounted in a stationary stock and disposed equidistant in a circle and supplying the screw-rods to the machine, and the step-by-step rotating tool-holder 82, having the tools thereof arranged equidistant on a circle about the axis of rotation and concentric with the circle of the said spindles, said tool-holder adapted to reciprocate toward and away from the spindles in the direction of the length of the same, substantially as and for the purpose set forth.

44. In a screw-making machine, the combination of the step-by-step rotating tool-holder 82, adapted to reciprocate, the rotary disk 117, mounted in a stationary bearing and rotating step by step in unison with the tool-holder, the threading-die 113 110, mounted loosely through the tool-holder and disk and provided with the clutch 123 126 and the pinion 121, the shaft 41, and the clutch 116 119, mounted thereon and operated by the reciprocating movements of the tool-holder, the loose member of said latter clutch provided with the fast gear 120, meshing with and driving the pinion 121, substantially as and for the purpose set forth.

45. In a screw-making machine, the combination of the hollow mandrel 83, formed with the lateral slots 142, having the depressions 144 in the edges thereof, the spindle-shaft 41, extending through the center of the mandrel, and the clutch 116 119, mounted thereon and provided with the clutch-levers 126, pivoted to slide 80 on the shaft and engaging collar 127 and having the pivoted cam-toes 163, the clutch-plunger 128, sliding on shaft 41, the slide-bars 141, pivoted to the plunger and sliding in slots 142 of the mandrel and provided with the notches 143, the step-by-step actuated tool-holder 82, feathered on the mandrel so as to turn therewith and reciprocate thereon and provided with the spring-pawls 146, having hooked heads and provided with laterally-projecting lift-pins 150, substantially as and for the purpose set forth.

46. In a screw-making machine, the combination of the step-by-step rotating tool-holder 82 and the reciprocating carriage 62 therefor, the rotary disk 117, rotating step by step in unison with the tool-holder and mounted in a stationary bearing, the spring-actuated feed-clamp 157 156, mounted loosely through the tool-holder and disk and adapted to slide but not to rotate therein, the feed-fork 164, pivoted on disk 117 and engaging with one prong the notch 163 of the clamp-rod and engaging with the other prong the end of said rod, the slotted arbor having the spring-pressed feed-fork carrier 169 mounted thereon and engaging the stem of the fork and provided with the annular shoulder 171, the slide-bars 173, sliding in the slots of the arbor and provided with the projections 172 and the notches 174, and the spring-pawls 177, mounted on the carriage and engaging the slide-bars, substantially as and for the purpose set forth.

47. In a screw-making machine, the combination of the reciprocating carriage provided with the step-by-step rotating tool-holder 82, the mandrel 83, on which the holder reciprocates and with which it turns, the rotary disk 117, mounted in the stationary bearing 118 and supporting in part some of the tools of the tool-holder, and the hollow shaft 151, rigidly connecting the mandrel with the disk, so that the two may move together, substantially as and for the purpose set forth.

48. In a screw-making machine, the combination of the reciprocating carriage 62, having the step-by-step rotating tool-holder 82 mounted thereon, the threading-die mounted in the holder and having its rod formed with a notch 132, the spring-detent pivoted on the holder and engaging the die-rod, the pivoted trip-lever 133, for engaging the detent, the mandrel 83, over which the tool-holder reciprocates, and the cam 134, mounted on the mandrel and engaging the foot of the trip-lever, substantially as and for the purpose set forth.

49. In a screw-making machine, the combination of the reciprocating carriage 62, provided with the annular bearing 66, the cylindrical tool-holder 82, rotatively mounted in the carriage and provided with the radially-projecting push-pins 87, the stationary cam 88, disposed adjacent to the carriage and engaged by the push-pins for giving the partial revolutions to the holder, and the spring-trip device for compelling the push-pins to move onto the cam, substantially as and for the purpose set forth.

50. In a screw-making machine, the combination of the reciprocating carriage 62, provided with the annular bearing 66 and having the step-by-step rotating tool-holder 82 rotatively mounted in the bearing and formed with the series of bolt-holes 96, the locking device consisting in the spring-actuated bolt 98, working in the perforation 97, formed in the bearing 66, and provided with the lateral pins 103, the spring-actuated presser 100, formed with the inclined heads 102, engaging the pins 103, the cam-track 107, formed with the depressions 106 and the elevations 109 and engaged by the presser 100, substantially as described, for the purpose set forth.

51. In a screw-making machine, the combination of the reciprocating carriage 62, having the annular bearing 66, and the yoke-frame 67, provided with the guide-ribs, the cylindrical tool-holder 82, mounted in said bearing, and the semi-cylindrical bed-piece 70, provided with the guideways for the yoke and mounted on the machine-frame, substantially as and for the purpose set forth.

52. In a screw-making machine, the combination of the reciprocating carriage 62, the rocker-bar 72, hinged to the carriage at 74 on the axial line thereof and pivoted at 73, the cam-stud 75, fixed on the rocker-bar, the rotating cam-disk 77, provided with the heart-shaped cam-groove 76, into which the cam-stud 75 projects, and means for rotating the cam-disk, substantially as and for the purpose set forth.

53. In a screw-making machine, the combination of the set of running rod-supplying spindles 22, disposed equidistant and in a circle, the step-by-step rotating tool-turret 183, mounted concentrically with the circle of disposition of the rod-spindles and provided with a set of radially-reciprocating tool-slides, so as to bring the tools on such slides into lateral contact with the work in the rod-supplying spindles, substantially as and for the purpose set forth.

54. In a screw-making machine, the combination of the running rod-supplying spindles 22, disposed equidistant in a circle, the step-by-step rotating mandrel 83, having its center coincident with the center of the circle of the rod-supplying spindles, and the tool-turret 183, mounted on the mandrel and provided with a set of tool-slides 185, having means, substantially as described, for projecting and retracting them, so as to carry the tools laterally onto the work in the spindles, substantially as and for the purpose set forth.

55. In a screw-making machine, the combination of the set of rod-supplying spindles 22, arranged as described, the rotary mandrel 83, formed with the interior chamber 193, and the slots 206, the tool-turret 183, mounted on and turning with the mandrel and provided with a set of movable spring-actuated tool-slides 185, the spring-actuated slide-projecting tube 192, having the conical portion 195 and mounted within the chamber 193 of the mandrel and adapted to move endwise therein and engaging the inner ends of the tool-slides, the step-by-step rotating tool-holder 82, sliding over and turning with the mandrel and provided with the spring-pawls 202, for engaging and drawing out the projecting tube 192, substantially as and for the purpose set forth.

56. In a screw-making machine, the combination of the rotary mandrel 83, formed with the chamber 193, and the endwise-movable projecting tube 192, formed with the conical portion 195 and mounted within the mandrel and having means, substantially as described, for moving it, the tool-turret 183, provided with the set of slide-beds 184, and the spring-actuated tool-slides 185, mounted on such beds and having their inner ends provided with anti-friction rollers 191, engaging the conical portion of the projecting tube, substantially as and for the purpose set forth.

57. In a screw-making machine, the combination of the rotatively-mounted casing 23, having a beveled mouth and provided with a hub 31, having an inclined outer face, the clutch-tube 24, arranged within the casing and provided with the spring feed-clutch 25, the hub 26, fixed upon the end of the clutch-tube, the split spring-collar 29, provided with the wedging-lugs 30 and having an inclined face engaging the incline of hub 31, the said collar lying between the two said hubs 31 and 26, the wedging-sleeve 32, sliding on hub 26 and formed with notch 33, for engaging the wedging-lugs, and a lever for sliding said sleeve, substantially as and for the purpose set forth.

58. In a screw-making machine, the combination of the rod-supplying spindles 22, having the feed-clutches 25 and the mechanism, substantially as described, for operating said clutches, and the cam-levers 34, pivoted upon arms 36 and formed with forked ends for engaging the wedging-sleeves and having their other ends taking into the cam-groove 44 of the step-by-step rotating cam-wheel 45, such cam-groove formed with the turn-outs 50, for effecting the opening and closing of the feed-clutches, substantially as and for the purpose set forth.

59. In a screw-making machine, the combination of the pivoted cam-levers 34, the cam-wheel 45, formed with the cam-groove 44, having turn-outs 50 therein, the shaft 46 and the cam-drum 48 fixed thereon and provided with the peculiar camways 49, the step-by-step actuated slide 51, having its head taking into the camways 49 of the drum, so that the movements of the slide may be imparted to the drum, and the reciprocating tool-holder carriage adjustably connected with the slide 51, whereby the continuous reciprocation of the carriage may impart to the slide a step-by-step movement, substantially as and for the purpose set forth.

60. In a screw-making machine, the combination of the reciprocating slide 51, having a step-by-step movement in one way of its reciprocation, and the coupling-studs 58, adjustably mounted on said

slide, a second reciprocating slide 54, provided with the grip-and-release device 55, for engaging the coupling-studs of slide 51, the trip-studs 56, for engaging said device, the reciprocating tool-holder carriage and the connecting-rod 63, adjustably attached to slide 54 and provided with the adjustable stops 68, and the push-piece 64 on the carriage for engaging the stops 68, substantially as and for the purpose set forth.

61. In a screw-making machine, the combination, with a step-by-step rotating tool-holder having the tools arranged equidistant in a circle therein, of the rod-supplying spindles 22, arranged in a similar circle and equidistant and each provided with a gear 39, and the spindle-driving shaft 41, provided with a gear 40, in mesh with said gears 39, for driving the spindles at uniform speeds, substantially as described.

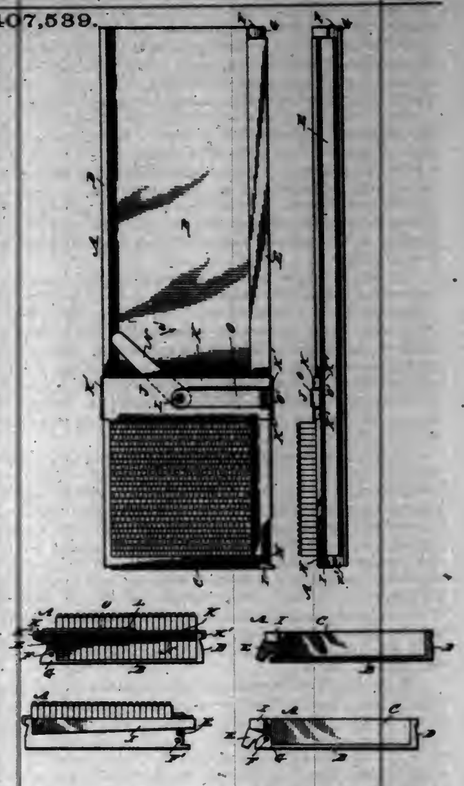
62. In a screw-making machine, the combination of the rod-supplying spindles 22, arranged as described and provided each with a gear 39, the drive-shaft 41, provided with gear 40, for driving the gears 39, said shaft extending through the mandrel 83 and the disk 117, the tool-holder 82, mounted on the reciprocating carriage and rotating step by step on its axis, and the disk 117, moving in unison therewith, the threading-die 113 110, rotatively mounted in the tool-holder and the disk and provided with a locking device, the speed-multiplying gearing intermediate the shaft 41, and the die-rod 110, for effecting the nothreading motion, and the main clutch on the spindle-shaft operated by the reciprocation of the tool-holder, substantially as and for the purpose set forth.

63. In a screw-making machine, the combination of the rod-supplying spindles 22, arranged as described and provided with feed-clutches 25 and the operating means for the said clutches, the centrally-disposed spindle-driving shaft 41, geared to the spindles, the reciprocating carriage 62, having the step-by-step rotating tool-holder 82 mounted thereon and provided with the tool-sockets 111, the mandrel 83, having the shaft 41 extending therethrough and loosely extending through the tool-holder, which is adapted to slide over the mandrel and to impart its partial revolutions thereto, the tool-turret 183, mounted concentrically on the mandrel 83 and turning therewith, and provided with tool-slides adapted to be projected and retracted, and having the means, substantially as described, for projecting and retracting them, all substantially as and for the purpose set forth.

64. In a screw-making machine, the combination of the rod-supplying spindles, a reciprocating carriage having a tool-holder mounted thereon, and a feed-clamp loosely mounted in the tool-holder, so as to be capable of endwise movement therein, the reciprocations of said tool-holder operating to periodically thrust the feed-clamp onto the blank screw-rod in a spindle and to retract said clamp to effect the drawing out of the rod, for the purpose set forth.

65. In a screw-making machine, the combination of the running rod-supplying spindles, each provided with a feed-clutch for the screw-rods, a tool-holder having a reciprocating carriage for advancing the tools upon and withdrawing them from the screw-rods in the spindles, said feed-clutches connected to the reciprocatiog carriage and intermittently opened and closed by the reciprocations thereof, and an endwise-movable feed-clamp mounted in the tool-holder and adapted, by the reciprocations of the tool-holder, to be forced into engagement with a screw-rod and then withdrawn to effect the feeding of the engaged rod, the feed-clutch being open during such feeding, substantially as and for the purpose set forth.

407,538. STEAM-BOILER. DANIEL T. LAWSON, Wellsville, Ohio. Filed Feb. 13, 1889. Serial No. 299,787. (No model.)



Claim.—1. A steam-boiler having its steam-space separated from the water-space by a horizontal diaphragm provided with openings in the same, and combined with upwardly-opening check-valves arranged upon the diaphragm, substantially as and for the purpose described.

2. The combination, with a steam-boiler, of a horizontal diaphragm separating the steam-space from the water-space and provided with upwardly-opening check-valves and gathering-troughs for sediment, and blow-out pipes extending through the boiler from the level of the troughs, substantially as and for the purpose described.

407,589. GALLEY. GEORGE E. LINCOLN, New York, assignor, by mesne assignments, of one-half to John R. Conner, Brooklyn, N. Y. Filed Dec. 19, 1888. Serial No. 294,091. (No model.)

407,589.

Claim.—1. A galley provided with one side pivoted by means of pivots located near the plane of the inner face of said side, substantially as shown.

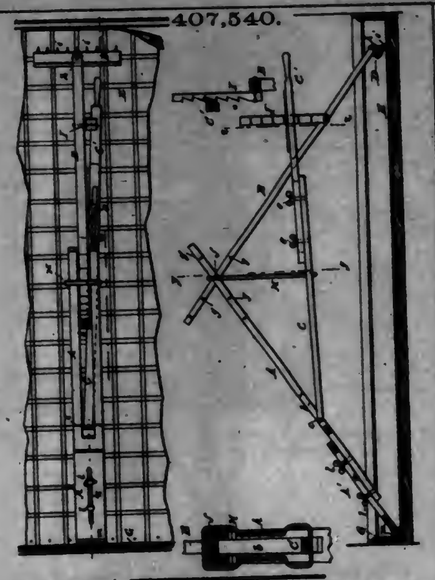
2. A galley provided with one side pivoted by means of pivots located near the plane of the inner face of the said side and close to the bottom of said side, substantially as specified.

3. A galley provided with one pivoted side, which has its bottom rounded off and has its pivots located near the plane of its inner face, substantially as specified.

4. A galley provided with a pivoted side, in combination with a clamp for locking the said pivoted side in place, substantially as shown and described.

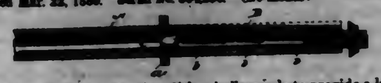
5. A galley provided with a pivoted side, in combination with a clamp adapted to engage the upper ends of the fixed and the said pivoted side and serving to lock the pivoted side in place, substantially as shown and described.

6. A galley comprising a bottom, a fixed side, a fixed end, a pivoted side, and a spring-catch secured to the said fixed end and adapted to engage the said pivoted side, all arranged and operating substantially as shown and described.



7. A galley comprising a bottom, a fixed side, a fixed end, a pivoted side, and a spring-catch secured to the said fixed end and adapted to engage the said pivoted side, and a clamp adapted to engage the upper ends of the said fixed and pivoted sides to lock the latter in place, substantially as shown and described.

8. A galley comprising a bottom, a fixed side, a fixed end, a pivoted side, and a spring-catch secured to the said fixed end and adapted to engage the said pivoted side, and a clamp comprising a transverse plate carrying an eccentric, a lever for operating the said eccentric, and a clamping-rod held on the said eccentric and adapted to engage one of the said sides, substantially as shown and described.



407,540. CARPET-STRETCHER. THOMAS H. MALBY, Andover, Dak. Filed Sept. 24, 1888. Serial No. 286,146. (No model.)

Claim.—The combination, with the slotted body piece or piece A A' and crossing-strip B, adjustably and pivotally connected with each other, as described, of the pivoted stretching comb or toothed head D, the lever C C, the stirrup H, and the rack I, essentially as herein set forth.

407,540.

407,541. VEHICLE-AXLE. CHARLES F. MILDREN, Toledo, Ohio. Filed Mar. 22, 1889. Serial No. 304,260. (No model.)

Claim.—1. In combination with a hollow axle to provide a lubricant-chamber and having suitable perforations to permit the escape of the lubricant, a dam provided with integral retaining-lugs projecting radially from its body, whereby to secure the dam within the hollow of the axle, substantially as described.

2. In combination with a hollow axle to provide a lubricant-chamber and having suitable perforations to permit the escape of the lubricant, a dam having tapered peripheral walls provided with integral retaining-lugs projecting radially from its body, whereby to secure the dam within the hollow of the axle, substantially as described.

3. In combination with a hollow axle to provide a lubricant-chamber and having suitable perforations to permit the escape of the lubricant, a dam of smaller diameter than the hollow of the axle and having projections adapted to engage the walls of the axle, substantially as described.

407,542. GRAIN-SEPARATOR. ARCHIBALD M. MISSELDINE, Colfax, Wash. Filed Nov. 7, 1888. Serial No. 290,191. (No model.)

Claim.—1. The upper shoe provided with a sieve adapted to receive the grain from the hopper, said shoe pivotally hung at its upper end in the frame, a rock-shaft disposed transversely in the machine at the lower end of the shoe, a crank-arm I, connecting said shaft with the shoe, and an upwardly-projecting arm K, secured upon the outer end of said rock-shaft, in combination with the drive-shaft D, the drive-wheel E, mounted thereon, provided with a series of projections L, adapted to successively engage and pass the said arm K, and a spring attached to the frame and to the upper edge of the shoe, whereby said shoe is suddenly drawn backward and upward when each projection L passes by the arm K, substantially in the manner and for the purpose described.

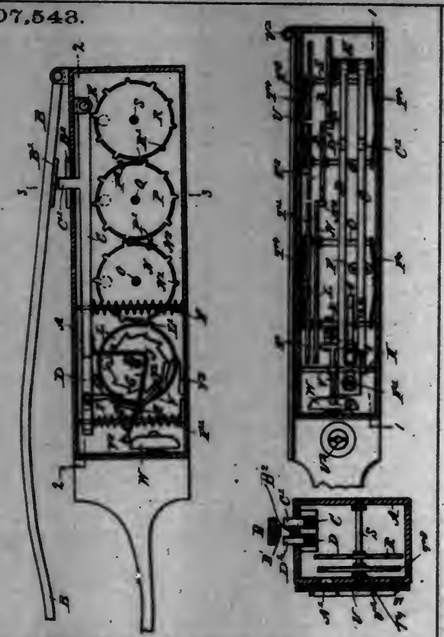
2. The combination, with the shoe F, the hangers G, secured thereto and arranged diagonally across the same, and link-connections H H between the upper ends of said bars and the frame, of a rock-shaft J, journaled transversely in the frame near the lower end of the shoe F, a crank-arm I, secured to said shaft and connected to one of the arms G, a projecting arm K, secured upon the outer free end of said shaft, a spring secured to the shoe and frame to normally draw said shoe backward, and means, substantially as shown, for oscillating the arm K, all arranged substantially as shown, and for the purpose described.

3. The combination, with the shoe F, pivotally hung at its upper edge in the main frame, a rock-shaft J, journaled transversely in the frame near the lower end of said shoe, a crank-arm connection between said shaft and the lower end of the shoe, and means, substantially as shown, for rocking the shaft, of a spring secured at its lower end to the upper edge of the shoe, its upper end secured to the frame above the rear end of the shoe, said spring normally drawing said shoe in an upward and rearward direction, and fixed stops *m*, secured to sides of the frame above the upper edge of the shoe, as shown, and adapted to abruptly limit the rearward and upward movement of said shoe after each successive rocking of the shaft J, substantially in the manner and for the purpose described.

4. The combination, with the shoe F, bars or hangers G, secured to the sides thereof, said bars provided with lateral inwardly-projecting members g^4 at the upper ends thereof, links H, pivoted to the frame and to the bars G, a rock-shaft J, journaled transversely in the frame near the lower end of the shoe, and a crank-arm connection between bars G and the shaft J, of the castings M, secured to the sides of the frame, the lower ends provided with projections forming fixed stops *m*, adapted to engage the projecting members g^4 of the bars and limit the same in the rearward movement thereof, and the springs N, secured at their upper ends to the castings M, their lower ends connected to the members g^4 of the bars G, and means for rocking the shaft J, substantially as shown, and for the purpose described.

5. The combination, with the shoe P, hung in the lower portion of the frame, provided with a screen *p*, of the rack R, said rack centrally supported upon a pivot-bolt S, said bolt supported in the framing of the machine, substantially as and for the purpose described.

407,543. CANCELING AND REGISTERING DEVICE. ARTHUR J. MILLER, Sweden, Pa. Filed Sept. 25, 1888. Serial No. 286,308. (No model.)



Claim.—1. In a canceling and registering device, the combination, with a box having slots, of a main lever pivoted and held on the outside of the said box, two spring-levers held on the inside of the box and provided with lugs projecting through the slots in the said box, to be engaged by the said main lever, a pawl held on the end of one of the said spring-levers, the ratchet-wheel operated thereby, and a spring-lever secured on the other lever and provided with an arm having a loop inclosing said pawl to guide the same and the register, substantially as shown and described.

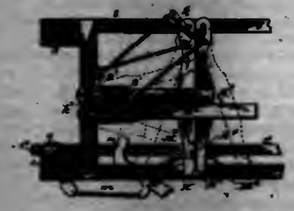
2. In a canceling and registering device, the combination, with a box having slots, of a main lever pivoted and held on the outside of the said box, two spring-levers held on the inside of the box and provided with lugs projecting through the slots in the said box, to be engaged by the said main lever, a pawl held on the end of one of the said two levers, a spring-lever secured on the other lever and provided with an arm having a loop inclosing said pawl to guide the same, and a ratchet-wheel adapted to be engaged by the said pawl and carrying a units-wheel, substantially as shown and described.

3. In a canceling and registering device, the combination, with a box having slots, of a main lever pivoted and held on the outside of the said box, two spring-levers held on the inside of the box and provided with lugs projecting through the slots in the said box, to be engaged by the said main lever, a pawl held on the end of one of the said two levers, a spring-lever secured on the other lever and provided with an arm having a loop inclosing said pawl to guide the same, a ratchet-wheel adapted to be engaged by the said pawl and carrying units, tens, hundreds, and thousands wheels, and mechanism, substantially as described, for imparting motion to said tens, hundreds, and thousands wheels from the said units-wheel, as set forth.

4. In a canceling and registering device, the combination, with

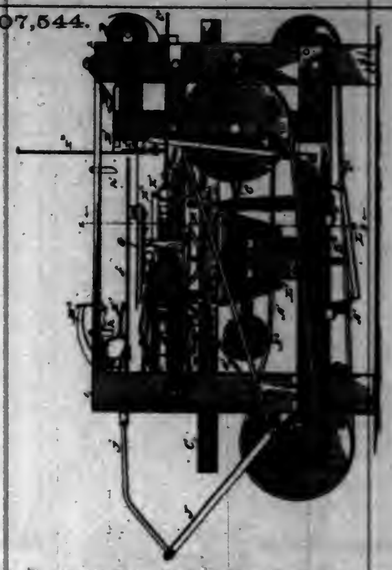
407,543.

a box provided with slots and a projection on its top, of a main lever pivoted and fulcrumed on the outside of the said box and provided on its under side with a projection similar to the projection on the said box, two spring-levers held on the inside of the said box and provided with lugs projecting through the slots in the said box at each side of the said projections, the pawl-and-ratchet mechanism, and a register, substantially as shown and described.



5. In a canceling and registering device, the combination, with a box, of a main lever pivoted and held on the outside of the said box, two spring-levers pivoted and held on the inside of the said box and provided with upwardly-projecting lugs passing through the said box under the said main lever, a pawl held on the end of one of the said two levers, a spring-lever secured on the other of the said two levers and fulcrumed on the said box, an arm projecting upward from the said spring-lever and provided with a loop engaging the said pawl, a ratchet-wheel mounted to turn in the said box and adapted to be engaged by the said pawl, a spring-arm fulcrumed in the said box and held in contact with the said ratchet-wheel, a striker held on the said spring-arm, a bell held in the said box and sounded by the said striker at every revolution of the said ratchet-wheel, and a register, substantially as shown and described.

407,544. WRAPPING-MACHINE. DAVID F. MCDONALD, Lake Butler, Fla. Filed Mar. 15, 1888. Serial No. 267,269. (No model.)



Claim.—1. In a wrapping-machine, a paper-clamp consisting of a series of pivoted bars and connections between said bars, whereby the movement of one bar on its pivot will effect a movement of the others, substantially as set forth.

2. In a wrapping-machine, the combination of the framing, a series of pivoted bars forming a paper-clamp and connected together, whereby the movement of one bar will effect a movement of the others, a slide-bar, and interengaging projections on said slide-bar and one of the clamp-bars, substantially as and for the purposes specified.

3. In a wrapping-machine, the combination of a series of pivoted bars connected together and forming a wrapper-clamp, a slide-bar engaging one of said bars, and a rotating holder arranged adjacent to the said clamp, all substantially as and for the purposes specified.

407,544.

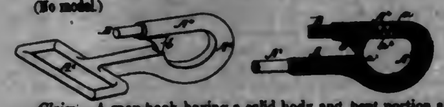
4. The combination, with the holder, of a discharger having a portion movable across said holder, whereby to discharge the article therefrom, and having a shank M' pivotally supported, and having an extension m', a spring for retracting said discharger, and the slide-bar having a stud or projection arranged to engage the extension m', all substantially as and for the purposes specified.

5. In a wrapping-machine, the combination of the framing, the holder supported therein, a slide-bar movable in said frame and having a trip projection, a discharger pivoted to the framing and having a portion movable across the holder and provided with a lug or portion projecting into the path of the trip projection of the slide-bar, and a retracting-spring connected with said discharger, substantially as set forth.

6. In a wrapping-machine, the combination, with the rotatable holder constructed to receive the wrapper and the article to be inclosed therein and having a pulley and the drive-belt movable into and out of contact with said pulley, of the belt-shifter engaging said belt, whereby it may be moved into contact with the pulley of the holder, substantially as set forth.

7. In a wrapping-machine, the combination, with the framing, the rotatable holder having a pulley, the drive-belt movable into engagement with said pulley, and a shifter whereby to adjust said belt into engagement with the pulley of the holder and the paper-clamp, of the slide-bar supported in the framing and a bell-crank lever pivoted in said framing and having one arm connected with the shifter and its other arm connected with the slide-bar, substantially as set forth.

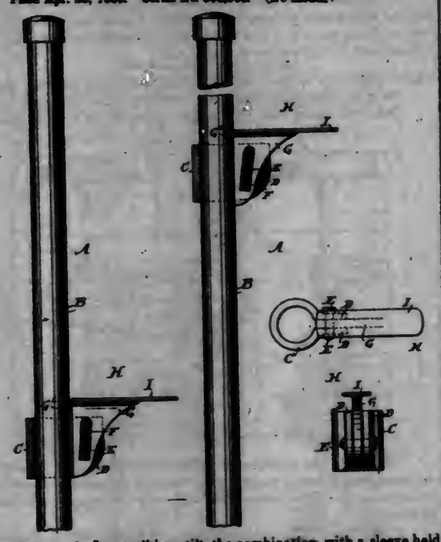
8. In a wrapping-machine, the combination of the framing, the drive-shaft, a counter-shaft geared therewith and having a crank-pin, a slide-bar, a pitman connecting the slide-bar with the said crank-pin, the holder having its shaft provided with a pulley and provided with movable fingers and with a rod for operating such fingers, a drive-belt movable into and out of contact with the pulley of the holder, the shifter for moving such drive-belt, the lifting-bar arranged to trip the spring-actuated rod of the holder, the lever connected with said lifting-bar, a pitman connecting the said lever with the sliding bar, the discharger-connections between such discharger and the slide-bar, and the bell-crank lever connected at one end with the shifter and at its other end with the slide-bar, all substantially as and for the purposes specified.



9. In a wrapping-machine, the combination of the framing, the rotatable holder, a shifter whereby said holder may be geared at intervals with the drive-gearing, and intermediate connections between said shifter and the drive-gearing, whereby the shifter may be operated thereby, substantially as and for the purposes specified.

10. In a wrapping-machine, the combination of a rotatable holder having movable fingers and a rod whereby to operate the same, a shifter whereby the holder is at intervals geared with the drive-gearing, the discharger movable across the holder, the slide-bar and connections, whereby the movement of said slide-bar will operate the discharger, the shifter, and the finger-operating rod of the holder, substantially as set forth.

11. In a wrapping-machine, the combination of a paper-carrier, the wrapper-clamp, the rotatable holder, the discharger, whereby to force the wrapped article out of such holder, and the shifter, whereby the drive-gearing may be moved into operative engagement with the holder, substantially as set forth.



12. In a wrapping-machine, the combination of the framing, the paper-carrier, the wrapper-clamp, the holder, the discharger, the shifter, the slide-bar movably supported in the framing, and connections between said slide-bar and the carrier, clamp, holder, discharger, and shifter, substantially as and for the purposes specified.

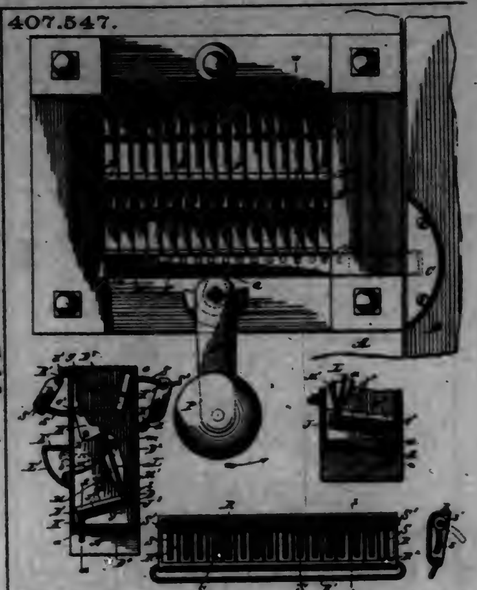
407,545. MAP-HOOK. HENRY MCPHERSON, Troy, N. Y., assignor to Jay Willard Glark, same place. Filed Mar. 1, 1888. Serial No. 301,610. (No model.)

Claim.—A map-hook having a solid body and bent portion and its free end tubular and longitudinally slotted, in combination with a solid bolt and a lug to arrest said bolt, and a spring within said free end, substantially as and for the purpose described.

407,546. WALKING-STILT. GEORGE R. HAYS, Brooklyn, N. Y. Filed Apr. 25, 1888. Serial No. 308,503. (No model.)

Claim.—1. In a walking-stilt, the combination, with a sleeve held to slide on a pole and parted lengthwise of the same, of a pin held transversely in the parted ends of the said sleeve, and a step-bracket held between the parted ends of the sleeve and provided with an inclined slot, through which passes the said pin, substantially as shown and described.

2. In a walking-stilt, the combination, with a sleeve held to slide on the pole and parted lengthwise of the same, and lugs projecting from the ends of the said sleeve, of a pin extending transversely through the said lugs, a step-bracket provided with a brace having an inclined slot, through which said pin passes, said brace fitting between the said lugs, and a top plate held on the said brace, substantially as shown and described.



3. In a walking-stilt, the combination, with a pole or standard, of a sleeve held to slide on the said pole or standard and parted lengthwise of the same, lugs projecting from the ends of the said sleeve, a pin extending transversely through the said lugs, a step-bracket provided with a brace having an inclined slot, through which said pin passes, said brace fitting between the said lugs, and a top plate held on the said brace, substantially as shown and described.

407,547. LOCK. GABRIEL HERBRAND, St. Louis, Mo. Filed Aug. 13, 1888. Serial No. 282,495. (Model.)

Claim.—1. In a lock, the combination, with a bolt having a series of recesses or openings, of a series of independent and apertured cases, a locking-pin in each case, and a pin projecting and retracting mechanism carried by the case, substantially as herein shown and described.

2. In a lock, the combination, with a bolt having a series of recesses or openings, of a series of independent and apertured cases, a

407,547.

locking-pin in each case, a pin-actuating mechanism for each pin, and a frame having a series of finger-pieces adapted to be projected into the case to operate the pin-actuating mechanism, substantially as described.

3. A lock consisting of two pivoted bars or levers F J, bell-crank H, jointed connecting-arms I L, a locking-pin K, connected to the lever J, and a spring G, in combination with a bolt provided with a recess or opening for the reception of the locking-pin aforesaid, substantially as shown and described.

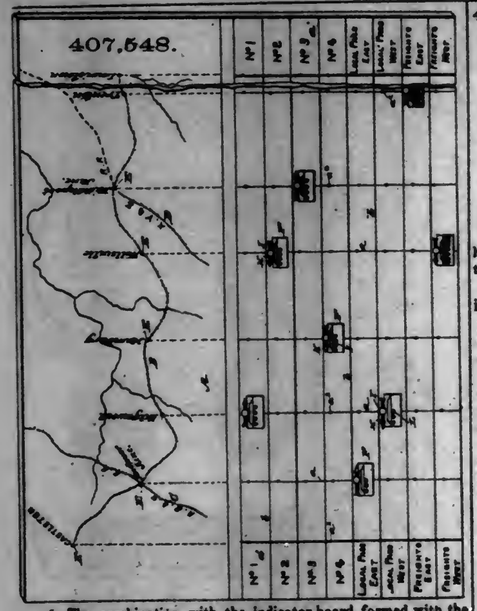
4. A lock consisting of two pivoted bars or levers F J, the latter being provided with a groove, a bell-crank H, jointed connecting-arms I L, the latter arm being provided on one end with a ball seated in the groove aforesaid, and a pin K, connected to the bar J, in combination with a pivoted plate M, having an arm M^2, and a casing for the lock provided with a slot *b*, substantially as shown and described.

5. A lock consisting of two pivoted bars or levers F J, the latter being provided with a groove, a bell-crank H, jointed connecting-arms I L, the latter arm being provided on one end with a ball seated in the groove aforesaid, and a pin K, connected to the bar J, in combination with the pivoted plate M, having an arm M^2, and a casing for the lock provided with a slot *b*, and a housing E, substantially as shown and described.

6. The combination, with a frame, of a series of finger-pieces or keys pivoted in the said frame, substantially as described.

7. A rectangular frame having an elongated link or bar pivotally secured thereto, and also provided with a series of cross-bars R^2, and a series of finger-pieces or keys, said finger-pieces or keys being pivotally secured to a rod whose ends are secured in the respective ends of the frame aforesaid, substantially as shown and described.

407,548. RAILROAD-TRAIN INDICATOR. JAMES T. COBBS, Richmond, Va., and THOMAS J. DE LASHMET, St. Paul, Minn. Filed Feb. 8, 1888. Serial No. 263,257. (No model.)



Claim.—1. The combination, with the indicator-board formed with the series of apertures, of the movable indicator-box having a transverse retaining-peg and a series of apertures at its forward side and the removable pegs fitting in said holes, substantially as set forth.

2. The combination, with the indicator-board formed with the series of apertures, of the movable indicator-box having a transverse retaining-peg and a series of apertures at its forward side and removable pegs having the wafers affixed to them, substantially as set forth.

3. The combination, with the indicator-board formed with the series of apertures, of the movable indicator-box having a transverse retaining-pin, a removable slide at the front of said box, having a series of apertures, and removable pegs fitting in said apertures.

4. The combination, with the indicator-board formed with the series of apertures, of an indicator-box having a transverse retaining-peg, an arrow indicating the direction in which the train is running, a slide formed with a series of apertures, and removable pegs fitting said apertures.

407,548.

5. The combination, with the indicator-board formed with the series of apertures, of an indicator-box having a transverse retaining-peg, an arrow indicating the direction in which the train is running, a slide formed with a series of apertures, removable pegs fitting said apertures, and the different colored wafers adapted to be attached to said pegs.

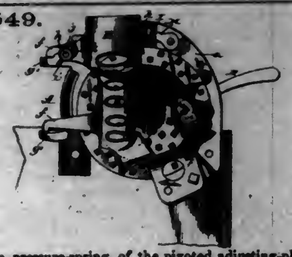
6. The combination, with the indicator-board formed with the series of apertures, of an indicator-box having the transverse retaining-peg, the arrow, the dial marked with hours and minutes and having the movable hands, the grooved ways and the perforated slide fitting therein, the removable pegs, and the wafers, substantially as set forth.

7. A train-indicator comprising the main board having upon its upper part a representation of a railroad-line and the telegraph-stations thereon and having apertures arranged below said stations, and movable boxes having retaining-pegs to fit said apertures and having apertures at their forward sides, and indicator-pegs fitting in said apertures.

8. In a train-indicator, the combination of the main board marked with the lines and stations and having the series of apertures below said stations, and the side spaces in which the names of the trains are placed, and the indicator-boxes formed each with the retaining-peg, the arrow, the dial marked with hours and minutes and having the movable hands, the grooved ways and the perforated slide fitting therein, the removable pegs, and the wafers, substantially as set forth.

9. The combination, with the indicator-board, of the movable indicator-boxes and the movable car-indicating pegs L, the series of colored wafers adapted to be attached to the car-indicating-pegs L, and the color-reference chart having the reference-colors N upon it, substantially as set forth.

10. In a train-indicator, the combination, with the indicator-board formed with the apertures a^3, in which the retaining-pegs of the movable indicator-boxes fit, and the movable indicator-boxes, of the flat paper tags R, adapted to be secured by the apertures a^3, substantially as set forth.



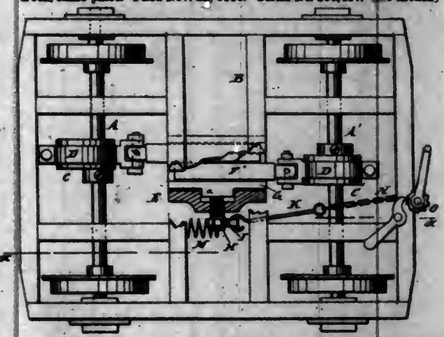
407,549. CORN-SHELLER. ASAHEL H. PATCH, Clarksville, Tenn. Filed Apr. 12, 1888. Serial No. 306,960. (No model.)

Claim.—1. In a corn-sheller, the combination, with the wheel C, shell F, having the guide *a* and chute G, of the semicircular guard *p*, having its upper end extended around and secured to the yoke *a*, substantially as set forth.

2. In a corn-sheller, the combination, with the yoke-frame *a* and hopper E, and the shell F, hinged to the yoke-frame at one side and having the pressure-spring, of an adjusting-plate pivoted at one end to the yoke-frame and adapted to have its free end inserted between the free edge of the shell F and the corresponding edge of the hopper, substantially as set forth.

3. In a corn-sheller, the combination, with the yoke-frame *a* and hopper E, and the shell F, hinged to the yoke-frame at one side and

407,549.



having the pressure-spring, of the pivoted adjusting-plate H, having the beveled free end *h'*, substantially as set forth.

4. In a corn-sheller, the combination of the yoke-frame *a*, having the notched rack I and the hopper E, the shell F, hinged to the yoke-frame at one side and having the pressure-spring, and the pivoted adjusting-plate H, having the rib 1 on its inner side, substantially as set forth.

5. In a corn-sheller, the combination, with the yoke-frame *a*, of the curved clamping-plates J, having the projections J' at their lower ends, and the central apertures, and adapted to be secured to the yoke-frame by a clamping-screw, substantially as set forth.

6. In a corn-sheller, the combination, with the yoke-frame *a*, having the rear slots a^2 and apertures a^3, of the curved clamping-plates J, having the projections *j* J' at their ends, and the screws K, having the winged nuts K^2, substantially as set forth.

407,550. BRAKE FOR CONTROLLING ROTARY MOTION. FREDERICK W. RIMA, Philadelphia, Pa., assignor to himself and JESSE R. ELFRETH, same place. Filed Nov. 22, 1888. Serial No. 291,417. (No model.)

Claim.—1. The combination, with the car-axle, of an eccentric, an eccentric-strap, a reciprocating bar adapted to be slid by the eccentric-strap, and a clamp-box provided with a friction-plate, substantially as specified.

2. The combination, with the axle A, of the eccentric C, the strap D, friction-bar F, recessed clamping-box E, the plate G, provided with the projection *a*, and the clamping-screw H, provided with the lever I, substantially as specified.

3. The combination, with the axle A, of the eccentric C, the strap D, friction-bar F, recessed clamping-box E, the plate G, provided with the projection *a*, the clamping-screw H, provided with the lever I, the retractile spring M and brake-rod K, the chain N, and the windlass O, substantially as specified.

407,551. LINIMENT. JAMES S. SCHRACK, Jessup, Iowa. Filed Mar. 26, 1889. Serial No. 304,821. (No specimens.)

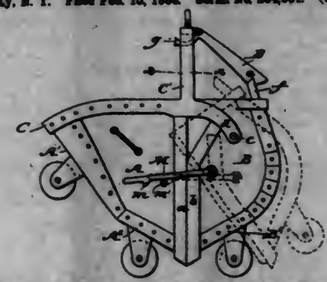
Claim.—The herein-described composition of matter, to be used for curing and healing flesh wounds, consisting of spirits of turpentine, olive-oil, sulphuric acid, carbolic acid, strained honey, and oil of amber, in the proportions specified.

407,552. MAGAZINE-GUN. JOSEPH J. SPEER, Waltham Cross, England. Filed Jan. 5, 1888. Serial No. 259,866. (No model.) Patented in England Oct. 1, 1887, No. 13,236.

Claim.—1. In a breech-loading fire-arm, the combination of a shoe or body provided with socket for rear stock, having slot, groove, or notch at the lower side thereof, and a trigger-guard seated in said slot, and having a forward extension which engages the forward part of the breech-frame, substantially as described.

2. The combination of a shoe or body for breech-loading fire-arms, provided with socket for the rear stock, a slot or groove for the trigger-guard, which engages the stock and the front of the breech-frame, and abutting shoulders for the fore-end stock of a rear stock

407,552.



fitting in the socket and a fore-end stock embracing the body of the shoe, substantially as described.

3. The combination, in a breech-loading fire-arm, of a breech-bolt provided with a groove in the side of its head, a shoe or body provided with a rib which works in the groove, and a locking device which, when in locking position, is in line with and forms a continuation of said rib, substantially as described.

4. In a breech-loading gun, the combination, with the shoe or body thereof, having a socket *c* and a groove in the under side of said socket, of a trigger-guard provided with a forward extension, and a bolt or screw for locking the extension and the shoe together, a distance-piece interposed between the shoe and the extension, substantially as described.

5. The combination, with the breech-bolt of a fire-arm, of a two-part shield or cover, one part connected with the body of the bolt, to reciprocate and rotate therewith, and the other part connected with the head of the breech-bolt, substantially as described.

407,553. COAL-BUCKET. GUSTAVUS L. STEARNS, Long Island City, N. Y. Filed Feb. 15, 1888. Serial No. 264,061. (No model.)

Claim.—1. The section A of the bucket, formed or provided with rearwardly-projecting arms *d*, in combination with the section B, hinged to and between the ends of said arms, substantially as shown and described.

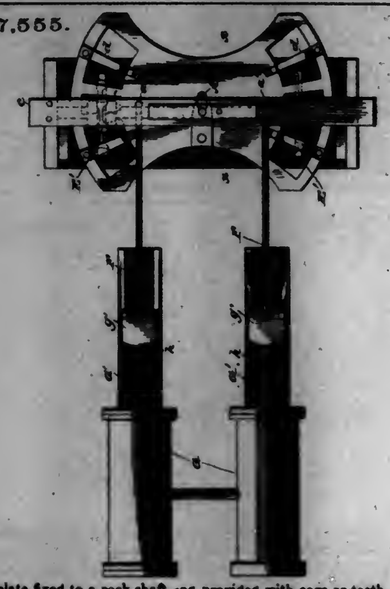
2. The section A, having the rim C and bail C' made in one part and riveted to the section A, in combination with the hinged section B, substantially as described.

3. The section A, having the rim C formed with the bail C', and rearwardly-projecting arms *d*, in combination with the section B, hinged to and between the arms *d*, substantially as described.

4. The bail C, having trigger D, in combination with the section A, arm *d*, and section B, hinged to the arms *d*, and provided with a locking-stud *f* for the said trigger D, substantially as described.

407,554. DRILL-CHUCK. CHARLES TAYLOR and GEORGE B. TAYLOR, Birmingham, England. Filed Nov. 30, 1888. Serial No. 291,411. (No model.) Patented in England Oct. 18, 1887, No. 14,146; in France July 24, 1888, No. 191,894, and in Belgium July 26, 1888, No. 82,695.

Claim.—In a lathe-chuck, the combination of a chuck-body having its conical face provided with radial slots parallel with said face and at an angle to the axis of the chuck, sliding jaws adapted to move in said ways and provided with toothed faces projecting above the conical face of the chuck-body, an inclosing-shell surrounding the chuck-body and having a conical portion provided with internal screw-threads that engage the teeth of the sliding jaws, and a ring having a screw-threaded engagement with the rear end of said shell and provided with a shoulder that abuts against a shoulder on the rear portion of the chuck-body, substantially as described.



407,555. MECHANISM FOR CONVERTING AND REVERSING MOTION. THOMAS C. THOMAS, Salt Lake City, Utah. Filed Dec. 6, 1888. Serial No. 292,837. (No model.)

Claim.—1. The combination, in a mechanism for converting motion, of an oscillating contrivance or plate provided with series of radial teeth or cogs, one series at each end, with a shaft carrying segments or disks provided with teeth or cogs adapted to successively engage with the aforesaid series of cogs or teeth as the said contrivance or plate is oscillated, substantially as and for the purpose set forth.

2. The combination, in a mechanism for converting motion, of a centrally-hung plate provided with means for the application of power at each side of its axis and with series of cogs or teeth, one series at each end, with a shaft carrying segments or disks provided with cogs or teeth engaging successively with the aforesaid teeth or cogs as the said contrivance or plate is oscillated, substantially as and for the purpose specified.

3. The mechanism for converting and reversing motion, consisting

407,555.

of a plate fixed to a rock-shaft and provided with cogs or teeth, the intermediate ones being flush with the surface of the plate, while the end ones are in a plane above the surface of the latter, and a shaft carrying segments or disks provided with teeth or cogs engaging successively with the aforesaid cogs or teeth as said plate is oscillated, substantially as and for the purpose set forth.

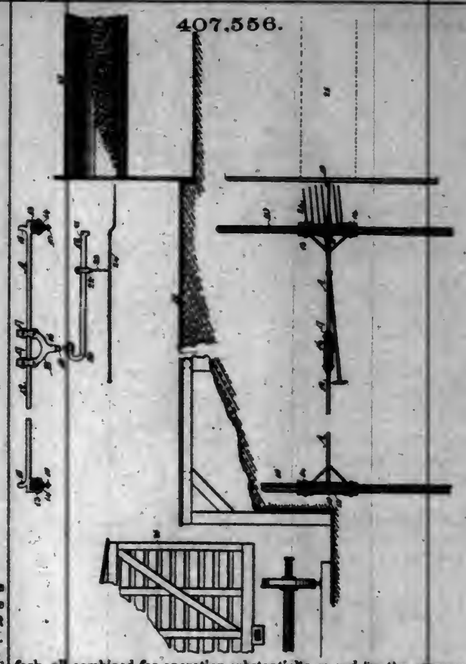
4. The mechanism for converting and reversing motion, comprising an oscillating contrivance or plate, a rotary shaft, and reversing mechanism, said oscillating contrivance or plate and rotary shaft being adapted to intergear, and said reversing mechanism effecting the reversal of said rotary shaft, substantially as set forth.

5. The mechanism for converting and reversing motion, having an oscillating contrivance or plate intergearing with a rotary shaft and the reversing mechanism consisting of the eccentric applied to the upper end of the shaft-extension and provided with a reversing-lever, substantially as set forth.

6. The mechanism for converting and reversing motion, comprising an oscillating plate or contrivance provided at each end with a series of teeth or cogs, a rotary shaft provided with toothed segments or disks gearing with the aforesaid teeth, and the rock-shaft offset or inclined to caress the said plate, substantially as set forth.

7. The mechanism for converting and reversing motion, having the rotary shaft provided with the toothed segments or disks, the oscillating plate or contrivance having at each end a series of teeth or cogs gearing with the aforesaid teeth or cogs, the inclined rock-shaft to which said plate is secured, and the eccentric receiving the upper end of said shaft and provided with a lever having a pin-and-aperture connection with the top cross-bar of the supporting-frame, substantially as set forth.

8. The mechanism for converting and reversing motion, comprising the rotary shaft provided with segments or disks, the inclined oscillating plate or contrivance having a series of teeth gearing with the aforesaid teeth, the inclined rock-shaft having an adjustable bearing at its upper end and passing through the plate, substantially as specified.

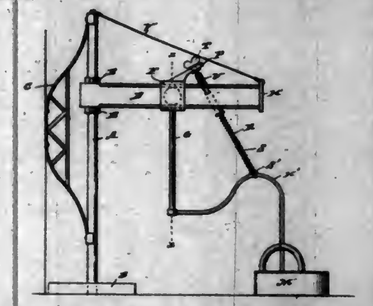


407,556. DEVICE FOR HANDLING COKE. JOSEPH WATT, McKee's Rocks, Pa. Filed Apr. 9, 1889. Serial No. 306,627. (No model.)

Claim.—1. The combination, with a carriage, of a crane mounted to travel on the carriage and a fork having a sliding and flexible connection with the crane, substantially as described.

2. The combination, with a carriage, of a crane comprising a body portion provided with wheels adapted for contact with the carriage, and a horizontal arm, a wheeled frame held to travel upon the arm of the crane, and a fork pivotally suspended from the said frame, substantially as shown and described.

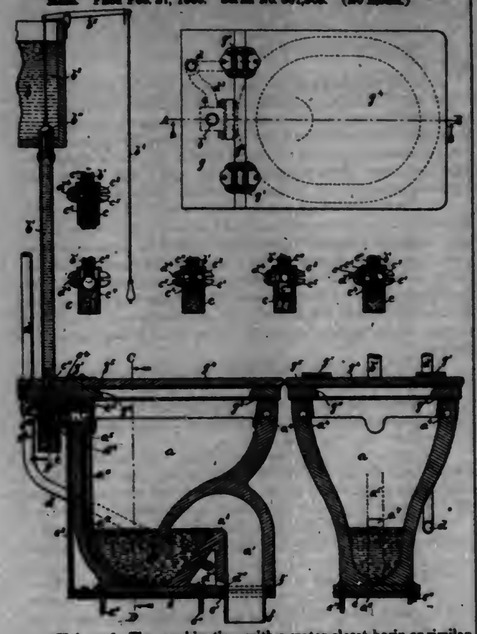
3. The combination, with a carriage comprising a rail and wheeled trucks, of a crane comprising a body provided with wheels capable of contact with the upper and lower surfaces of the carriage-rail and a horizontal arm swiveled to the body, a wheeled frame held to travel upon the crane-arm, a fork, and a connection between said frame and



407,556.

fork, all combined for operation substantially as and for the purpose specified.

4. The combination, with a carriage comprising a rail, a wheeled truck at each extremity of the rail, and stop-lugs projected from said extremities, of a crane comprising a body provided with wheels capable of contact with the upper and lower surfaces of the carriage-rail, and a horizontal arm curved at one end, swiveled at said curved end to the body, and provided at its free end with a downwardly-extending stop-ing, a wheel-carrying sleeve traveling upon the crane-arm, and a fork suspended from said sleeve by a chain, substantially as shown and described.



407,557. LAUNDRY-IRON ATTACHMENT. JOHN J. WEBER, Grand Rapids, Mich. Filed Feb. 5, 1889. Serial No. 298,760. (No model.)

Claim.—1. The combination of an upright standard, a horizontally-swinging frame pivoted on said standard, a horizontally-movable sleeve F, supported on said frame and carrying a thumb-screw, an internally-threaded sleeve U, adjustably supported by the thumb-screw, a rod R', connected at one end with the sliding sleeve F and at the other end with a laundry-iron, a rod R, connecting the sleeve U and rod H', and a spring S, mounted on said rod R to exert pressure on the iron, substantially as described.

2. The combination of the standard A, the horizontally-swinging frame D, the sleeve F, mounted on said frame and provided with lug P, pulleys P' P', and depending rod G, a rod H', connected at its lower end to a laundry-iron and having its opposite end attached to the rod G, depending from the sleeve F, the thumb-screw T, supported in the lug P, the internally-threaded sleeve U, the rod R, and the spring S substantially as described.

407,558. WATER-CLOSET, &c. DARIUS WELLINGTON, Boston, Mass. Filed Feb. 27, 1888. Serial No. 301,303. (No model.)

Claim.—1. The combination, with a water-closet basin or similar receptacle having a water-inlet opening, a water-supply tank, a service-pipe for connecting the tank with the inlet-opening, and a supply-controlling valve at the upper portion of the service-pipe, of a valve-casing interposed between and communicating with the lower end of the service-pipe and the inlet-opening of the basin, and a self-closing valve located in said valve-casing between the lower end of the service-pipe and the basin, and automatically opened by the water-pressure when the supply-controlling valve is opened to obtain a noiseless flush at all times, substantially as described.

2. A water-closet basin or similar receptacle having opening a^1 to admit water to flush the basin, the tank b, supply-pipe b', valve b'' to close the supply-pipe at the tank, valve-casing c, having valve-seat c^2, and opening c', communicating with opening a^1 in the basin, valve c^3, and float c^4 to automatically open and close supply-pipe b' at or near the water-closet basin, all combined to be operated as described, for the purpose set forth.

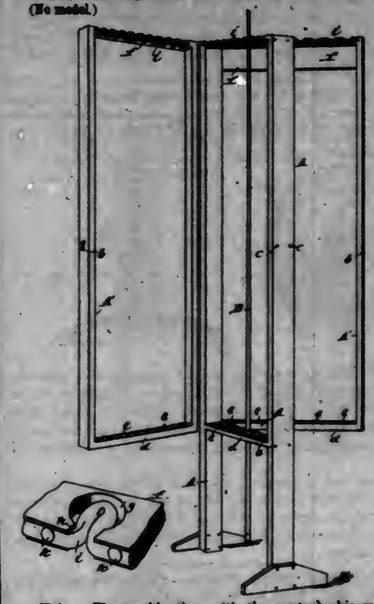
3. In a water-closet or similar receptacle, a basin provided with a flushing-rim and opening to admit water to flush the basin, a valve-casing communicating with the flushing-opening, a supply-pipe entering the valve-casing, a valve to close the supply-pipe, and an air-space in the upper part of the valve-casing and communicating with the basin through the flushing-opening, combined with a ventilating-pipe leading from the upper part of the valve-casing, for the purpose set forth and described.

4. In a trapped water-closet or similar receptacle provided with an opening to admit water to flush the closet, a valve-casing communicating with the flushing-opening, a supply-pipe entering the valve-casing, a valve to close the supply-pipe, an air-space in the upper part of the valve-casing and communicating with the flushing-opening, and a ventilating-pipe leading from the upper part of the valve-casing, combined with a passage-way in the wall of the water-closet, and an opening through the wall connecting the passage-way with the basin of the closet at or a little above the level of the water in the seal of the closet, to operate as and for the purpose set forth.

407,559. HOOP-CLAMP. ASA R. WELLS, San Francisco, Cal. Filed May 2, 1888. Serial No. 309,371. (No model.)

Claim.—1. In a hoop-clamp, the combination of the opposing heads to which the ends of the hoop are secured, a tightening-bolt extending between said heads, and a connection comprising hemispherical nuts and seats between said bolt and the heads, whereby the latter may conform to the line of curvature of the hoop, substantially as described.

2. A hoop-clamp consisting of the combination of the opposing heads to which the hoop ends are secured, said heads having in their inner or adjacent ends hemispherical seats, hemispherical nuts fitted



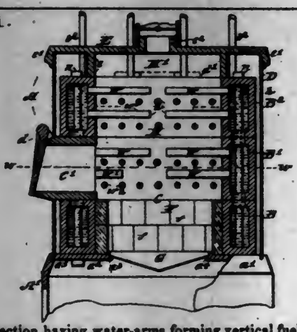
407,559.

to said seats, and the tightening-bolt extending between and into the heads and seated in the nuts, whereby the heads may conform themselves to the curvature of the hoop, substantially as described.

3. A hoop-clamp consisting of the combination of the opposing heads to which the ends of the hoops are secured, said heads having in their inner or adjacent ends the hemispherical seats provided with grooves, the hemispherical nuts fitted to said seats and having the ribs fitting in the grooves thereof, and the right and left hand threaded tightening-bolt extending between the heads and seated in the nuts thereof, substantially as herein described.

407,560. WHIP-RACK. DANIEL T. WILSON and FRANK C. REDINGTON, Union City, Mich. Filed Dec. 12, 1888. Serial No. 293,341. (No model.)

Claim.—The combination, with the central whip-rack frame A, of the outer whip-rack frames A', hinged thereto, and fastenings locking or securing the several frames together when closed one upon or against the other, said frames being each constructed with a lower rail d, having one or more rows of perforations e, and an upper rail having pockets g, constructed with contracted mouths h and provided with flexible loop-like linings i to said pockets and their mouths, essentially as shown and described.

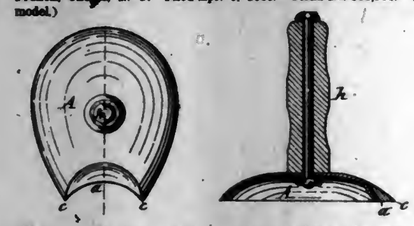


407,561. WATER-HEATER. FRANK WILSON, Easton, Pa., assignor of two-thirds to John L. Wilson and James R. Wilson, same place. Filed Apr. 19, 1888. Serial No. 307,201. (No model.)

Claim.—1. In a hot-water-heating apparatus, the combination, with a grooved base or ash-pit section having securing perforations and an upwardly-extending flange, of a fuel-chamber water-section having vertical passages corresponding to the securing perforations in the base, a casing adapted to the groove in the base, and fire-brick sections between the inner face of the water-sections and the upwardly-extending flange of the base.

2. In a hot-water-heating apparatus, a water-section which is provided with a fuel-supply chute, front, rear, and side series of water-arms of uniform length which extend toward transverse and longitudinal central lines of the heater, and transverse and longitudinal short water-arms in the front portion of the water-section, whereby a vertical fuel-opening at the ends of the short water-arms is produced.

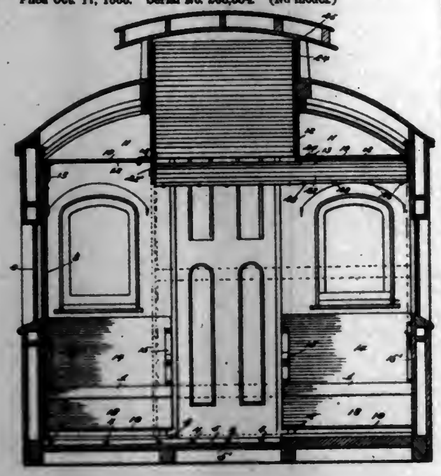
3. In a hot-water-heating apparatus, the combination, with the base or ash-pit section, of the fuel-chamber water-section, the feed-



407,561.

chute water-section having water-arms forming vertical fuel-opening, and the upper water-section, the three water-sections and the base or ash-pit section being secured together by the holding-rods *h*, substantially as shown and described.

4. In a hot-water-heating apparatus, the combination, with the base or ash-pit section, of the described water-sections secured together and to such base, as set forth, the vertical exterior casing supported upon the base-section, and the flanged cap or top plate resting upon the upper water-section and upon the vertical exterior casing, substantially as specified.



407,562. HOG-SCRAPER. HIRAM AGAN, Rome, N. Y., assignor to Celia A. Agan and Charles H. Dunning, same place, and Edward R. French, Oneida, N. Y. Filed Apr. 8, 1889. Serial No. 306,358. (No model.)

Claim.—1. The improved hog-scraper, consisting of a concavo-convex metal plate, the edge of the main portion of which is oval in contour and the edge of the remainder thereof curved reverse from that of the main portion, and the handle projecting from the convex side of the main portion of said plate, substantially as described and shown.

2. The described hog-scraper, consisting of the concavo-convex metal plate A, the main portion of which is oval in contour, the remainder *a* having its edge curved reverse from that of the main portion and joined therewith by the angular portions *c c*, substantially as described and shown.

407,563. SLEEPING-CAR. CHARLES L. ARNOLD, Wilmington, N. C. Filed Oct. 17, 1888. Serial No. 288,354. (No model.)

Claim.—1. A railway passenger-car having seats movable away from the side of the car to the opposite seats, with partitions extending lengthwise of the car, and transverse folding partitions forming with the laterally-movable lengthwise partitions compartments, and a side passage-way extending lengthwise of the car, substantially as described.

2. A railway passenger-car having seats movable away from the side of the car to the opposite seats, the seats having swinging backs with means for fastening the swinging backs in an elevated horizontal position above the seats, partitions extending lengthwise of the car, and transverse folding partitions forming with the laterally-movable lengthwise partitions compartments, and a side passage-way extending lengthwise of the car, substantially as described.

3. A railway passenger-car having seats movable away from the side of the car to the opposite seats, the seats having swinging backs, with means for fastening the swinging backs in an elevated position above the seats, compartments for holding bedding located above the ceiling at the sides of the car above the seats, partitions extending lengthwise of the car, and transverse folding partitions forming with the laterally-movable lengthwise partitions compartments, and a side passage-way extending lengthwise of the car, substantially as described.

4. A railway passenger-car having seats movable endwise across the center aisle of the car to abut end to end with the seats on the opposite side of the car and form a passage-way on one side of the car, the abutting seats being convertible into sleeping-berths, substantially as shown and described.

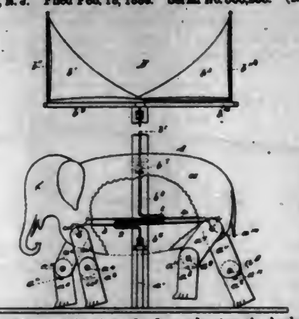
5. A railway passenger-car having seats mounted on platforms movable from the side of the car to the opposite seats and friction-rollers located in the floor of the car upon which the platforms rest and over which they move, substantially as described.

6. A railway passenger-car having a series of seats 1, the seats 1 on one side of the car being mounted on platforms 3, provided at the end adjacent to the car-wall with a lengthwise partition 6, having door 7 and windows 8, a series of transverse grooves 5 in the floor of the car, with rollers 4 extending from the side of the car to the opposite seats, the platforms 3, resting upon and movable over the rollers 4, a series of compartments 11, with hinged doors 12, located in the ceilings 10 at the sides of the car above the seats, the top of the partitions 6 abutting against the ceilings 10, and a series of upper and lower rolling slat partitions 22, 23, and 25', mounted on spring-rollers 24, located in and beneath the central elevated portion 25 of the car, and the ceiling 10 at one side of the car and beneath the seats 1, the outer ends of the lower slat partitions 23 being fastened to the seats 1, and the outer ends of the upper slat partitions having detachable fastening devices for securing them to partitions 22, substantially as described.

7. A railway passenger-car having a series of seats 1, the seats 1 at one side of the car having vertical partitions on their inner ends and being movable with the partitions across the car to the opposite seats, the seats 1 having backs 14, mounted on brackets 15', pivoted to one side of the car, and partition 6, with fastening devices for holding the backs 14 in horizontal position, and movable partitions extending crosswise of the car between the seats, substantially as described.

8. A railway passenger-car having seats movable from one side of the car to the seats on the opposite side, and slat partitions extensible over the vertical spaces between the floor and seats and the seats and ceiling of the car to form compartments, substantially as described.

9. A railway passenger-car having a series of seats 1, the seats 1 on one side of the car being movable from the side of the car to the opposite seats, and having vertical partitions 6, extending over their inner ends and movable therewith across the car to form a side passage-way, the seats 1, having backs 14, mounted on brackets 15', pivoted to the partitions 6 and a wall of the car, with fastening devices for holding the backs 14 in a horizontal position, a folding extension 17, hinged to the edge of the backs 14, and an extension 18, hinged to the front edge of the seats 1, and having a foot-rest and guard 19, with a curved notched supporting-bar 20, projecting through a plate 21 on the floor beneath the seats, substantially as described.

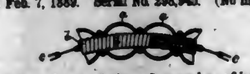


10. A railway passenger-car having seats movable from one side of the car to the opposite seats, and the extensible transverse upper and lower slat partitions 22 and 23, mounted on spring-rollers 24 in the vertical elevated portion 25 of the car beneath the ceiling 10 at one side of the car and beneath the seats 1, the slat partitions being adapted to extend in a vertical plane transverse to the car from the top of the car to the floor, thereby dividing the pairs of seats moved end to end into compartments, substantially as described.

407,564. TOP-PROP NUT FOR VEHICLES. CLAYTON L. BAKER, Moline, Ill. Filed Apr. 9, 1889. Serial No. 306,621. (No model.)

Claim.—A top-prop nut comprising, in combination, a threaded shank provided with a peripheral flange having rivet-apertures therein, a head adapted to be secured to the flange of the shank portion by suitable rivets, a sheet or disk of leather interposed between the head and the flange of the shank portion and secured therebetween, and a leather covering for the head, secured to the described leather disk at their peripheral portions, substantially as described.

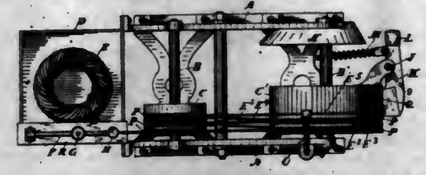
407,565. AUTOMATICALLY-MOVING FIGURE. ALFRED P. BALL, Jersey City, N. J. Filed Feb. 18, 1889. Serial No. 300,255. (No model.)



Claim.—1. The combination of a figure having the body immovably mounted on a post and having movable legs each consisting of two sections pivoted together, a stop on each leg near the pivotal point, an upright shaft having oppositely-extending crank portions having connections with the legs, cross-bars on the shaft, and sails secured to the cross-bars.

2. The combination, with a figure having the body portion immovably mounted on a frame, of legs pivoted to said body portion and comprising, respectively, two sections pivoted together, a shaft having a crank portion, connecting-rods extending from the crank portions to the upper sections of the legs, and sails simultaneously operating the legs by means of the cranked shaft and the connecting-rods, substantially as specified.

3. The combination of an upright standard supporting a horizontally-extending body, an upright shaft having horizontally-extending cranks, legs pivotally connected to the body and connected to the cranks by connecting-rods, a bar carried by the upright shaft above the figure, and sails connected to said bar, substantially as specified.



407,566. BRACELET. WALTER R. BALLOU, North Attleborough, Mass. Filed Feb. 7, 1889. Serial No. 298,945. (No model.)

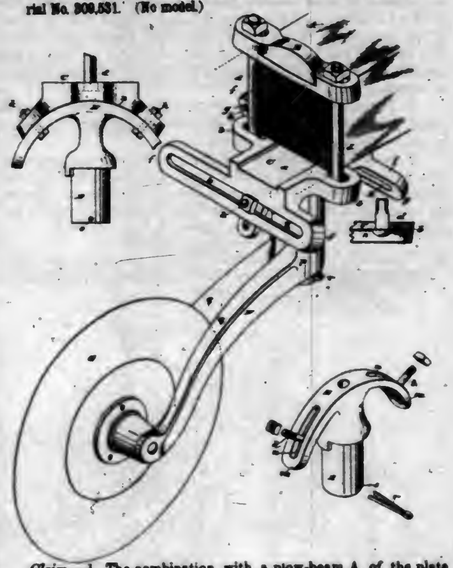
Claim.—1. A bracelet consisting of a number of independent disconnected units strung on an elastic tube, having an endless chain in the tube constructed to limit the expansibility, as described

2. In a bracelet, the combination of the independent disconnected units *a*, the spirally-coiled wire tube *b*, and the chain *c*, forming a continuous flexible ring, as described.

407,567. BAG-STRING CUTTER. ROBERT A. BAUER, Grand Rapids, Mich., assignor of one-half to Henry G. Krekel, same place. Filed Mar. 8, 1889. Serial No. 302,536. (No model.)

Claim.—1. The improved bag-string cutter herein described, consisting of a frame having a grooved pulley mounted upon a shaft journaled in said frame, a second grooved pulley mounted on a shaft journaled in said frame, provided with a pivoted knife adapted to strike upon the face thereof, a spring for operating the knife, a cam adapted to lift said knife from the face of said pulley, and means of regulating the tension of the twine, substantially as described.

2. In a bag-string cutter, in combination with a frame, a grooved pulley journaled in said frame, provided with a knife adapted to strike upon the face thereof, and means for operating said knife and of regulating the tension of the twine, substantially as described.



3. In a bag-string cutter, in combination with a frame and a stationary cam secured to said frame, a pulley provided with grooves upon its face journaled in said frame and with a pivoted knife adapted to strike upon the face of said pulley, and a spring for operating the knife and having a roller adapted to said cam, substantially as described.

4. In a bag-string cutter, in combination with a frame and a stationary cam secured to said frame, a pulley having grooves upon its face for receiving the twine and provided with a pivoted knife actuated by said cam and secured to said pulley, having an operating-spring, a block of wood secured to the face of said pulley for receiving the blow of said knife, and means for adjusting the tension of said twine, substantially as described.

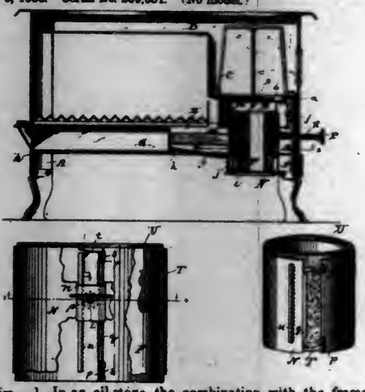
5. In a bag-string cutter, the combination, with a frame having a stationary cam secured thereto, of a pulley having grooves upon its face for receiving the twine and provided with a knife having an actuating-spring attached to said pulley adapted to said cam and a block for receiving the blow of said knife secured to the face of said pulley, a guide-arm for guiding the twine attached to said frame, and a pulley having grooves adapted to receive said twine journaled in said frame to the rear of said first-described pulley, and means for regulating the tension of said twine arranged to the rear of said second-described pulley, substantially as described.

6. In a bag-string cutter, substantially as above described, the combination, with a frame, of a grooved pulley having a wooden block secured to its face and a pivoted knife adapted to strike upon said block, a cam adapted to lift said knife, a supplemental grooved pulley journaled in said frame, a guide-arm arranged between said pulleys, and means for holding a ball of twine and regulating the tension of the twine as it is fed upon said supplemental pulley, substantially as described.

407,568. ROLLING COLTER. THOMAS C. BELDING, Canton, assignor to the Universal Plow Company, Wooster, Ohio. Filed May 3, 1889. Serial No. 309,531. (No model.)

Claim.—1. The combination, with a plow-beam A, of the plate C, having its lower face portion circular in cross-section, arms *f* and *b*, bolts *d*, and yoke B, whereby the plate C is secured to the beam, substantially as described, and for the purpose set forth.

2. The combination, with the beam A, the plate C, having its lower face portion circular in cross-section, an arm D, having a convex head portion E, having perforations *n*, and means for securing said head in desired adjustment with the plate C, substantially as described, and for the purpose set forth.



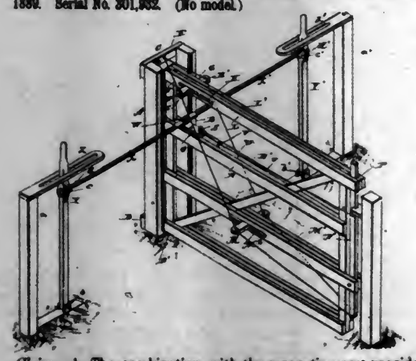
3. In combination with the beam A, the plate C, having side projecting arms *f*, provided with slots *h*, the under surface of said plate being circular in cross-section, a depending arm, as D, having a convex head portion, as E, adapted to rock in the circular face of the plate C.

4. In combination with the beam A, plate C, having a concaved lower face portion, parallel arms *f*, circular in cross-section, slots *h*, arm D, having a convex head E, adapted to rock in said concave in line with the draft and to move laterally, a colter G, arm F, having a sleeve portion, as *p*, loosely secured about an arm, as D, and means

for securing said arm in desired adjustment with the plate C, substantially as described, and for the purpose set forth.

5. In combination, the colter G, colter-arm F, supporting-arm D, having a convex head E, adapted for lateral adjustment, a supporting-plate, as C, having a concaved under portion and parallel arms circular in cross-section, and means for securing said head in desired lateral adjustment on said plate or arms, substantially as described, and for the purpose set forth.

407,569. OIL-STOVE. CHARLES H. BORCK, Milwaukee, Wis. Filed Apr. 6, 1888. Serial No. 269,851. (No model.)



Claim.—1. In an oil-stove, the combination, with the frame, of flanges *h*, projecting inwardly from the sides of the frame, the nest *i* at the front of the stove supported by the said flanges, and a removable reservoir and burner arranged, respectively, on the flanges and nest and secured to and communicating with each other, substantially as described.

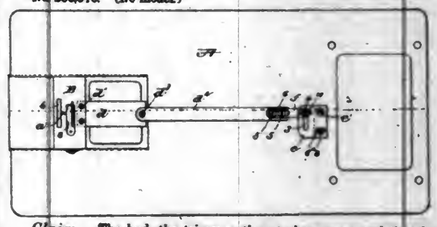
2. The combination, in a burner, of a contiguous inner tube and a split outer tube, and a sectional wick the upper section of which is of practically incombustible material.

3. In an oil-stove, a burner consisting of the cup F, the wick-tube having a perforated inner wall and a split outer wall, with means for uniting the severed edges, the wick between the walls, a rack *u* on the outer wall of the wick-tube, and a pinion meshing therewith operated from the outside of the cup, substantially as described.

407,570. GATE. WILLIAM F. BRADLEY, Old Round Rock, Tex., assignor of one-half to William B. Shiflette, same place. Filed Mar. 5, 1889. Serial No. 301,932. (No model.)

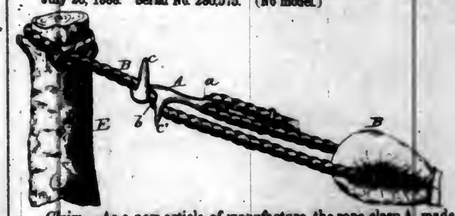
Claim.—1. The combination, with the supporting-post provided with the lower cross-strip and the upper centrally-perforated cross-strip, of the gate-frame having the upper parallel slotted gate-rails and the intermediate parallel slotted gate-rails, the transverse strips seated in the slots of said parallel gate-rails, the hinged lever at the front of the gate-frame, the cords or ropes connected to the upper cross-piece of the supporting-post passed through the ends of the sliding cross-strips and connected to the lower end of the hinged front lever, the shifting-block provided with the front pin connected to the hinged front lever, the shifting-levers fulcrumed at opposite sides of the gate in front of its rear edge, their upper ends working in slotted guides, and the shifting-rods hinged to the shifting-levers and connected to a pivot-pin on the rear end of the hinged block that is connected to the front lever, substantially as specified.

2. In a farm-gate, the combination, with the supporting-post provided with upper and lower cross-pieces, of the gate-frame provided with the transverse perforated slides resting in slots in the upper and intermediate rails of the gate-frame, the vertical lever at the front of the gate-frame, the rope connecting the lower end of the lever with the cross-slides and with the upper cross-piece of the gate-post, the pivoted shifting-block connected to the front lever, and levers fulcrumed on each side of the gate and connected by rods to the shifting-block, substantially as specified.



407,571. KNIFE FOR CUTTING CORN, &c. JOSEPH W. CALEF, North Easton, assignor to William T. Andrews, Boston, Mass. Filed Nov. 2, 1885. Renewed June 1, 1888. Serial No. 275,090. (No model.)

Claim.—1. A handle for corn-knives and other purposes, consisting of a metallic rod bent at its upper end to form an armhole at right angles to the handle and twisted about midway of its length to form a grip or hand-hold projecting laterally from the handle below the armhole, substantially as and for the purpose set forth.

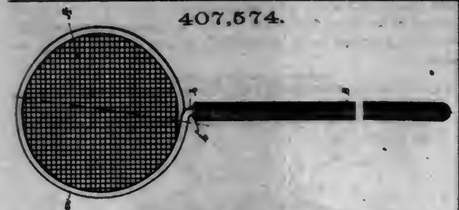


2. A corn-knife consisting of a metal rod bent at its upper end to form an armhole at right angles to the handle and twisted about midway of its length to form a loop projecting laterally from the handle below the armhole, and a blade at the lower end of the rod, substantially as and for the purpose set forth.

407,572. TRIMMING DEVICE FOR SEWING-MACHINES. ANDREW C. CAMPBELL, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed Sept. 26, 1888. Serial No. 286,310. (No model.)

Claim.—The bed, the trimmer throat-plate supported thereby, and its tail-piece or projection, combined with a co-operating cam by which to determine the degree of adjustment of the trimmer throat-plate, substantially as described.

407,573. ROPE-CLASP. MYRON CAMPBELL, South Bend, Ind. Filed July 20, 1888. Serial No. 280,575. (No model.)



Claim.—As a new article of manufacture, the rope-clasp A, made with the eye *a* at one end and at the other end with the straight open notch *b*, with its axis substantially at right angles to the body of the clasp and at the outer edges of the notch *b*, and the spurs *c* and *c'*, projecting substantially at right angles to the plane of the notch *b*, all substantially as shown and described.

407,574. INSECT-DESTROYER. GEORGE B. CHASE, Cambridge, Mass. Filed May 3, 1888. Serial No. 308,967. (No model.)

Claim.—As an improved article of manufacture, an insect-killer comprising a small sheet of wire-gauze, and a metal binding-strip about the edge of said gauze, formed from flat metal bent at the center of its width to lap upon the edge of said sheet of gauze, to which it is secured by pressure, one end of which folded binding-strip is bent outward and secured to a handle, whereby there is no material projection of the strip from the surface of the gauze, and a yielding connection, in one piece with the binding and between the gauze and the handle, is obtained, substantially as described.

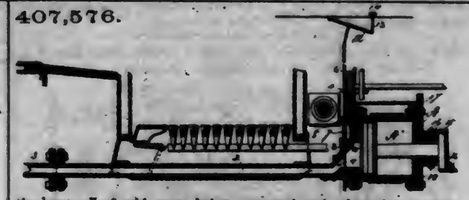
407,574.

407,575. CAR-BRAKE. GEORGE W. CROO, Montvale, N. J. Filed Apr. 2, 1888. Serial No. 269,287. (No model.)

Claim.—1. In an automatic brake, the combination, with the push-bar, of a hollow or box-shaped guide for connecting the portions that pass around the trucks, a lever pivoted to the center portion, having arms connected therewith for operating slides moving in the said guide, levers pivoted to the slides and connecting with the beams carrying the brake-shoes and extending beyond the ends of the car to engage the heads of the push-bars of the cars at its front and rear ends, substantially as described.

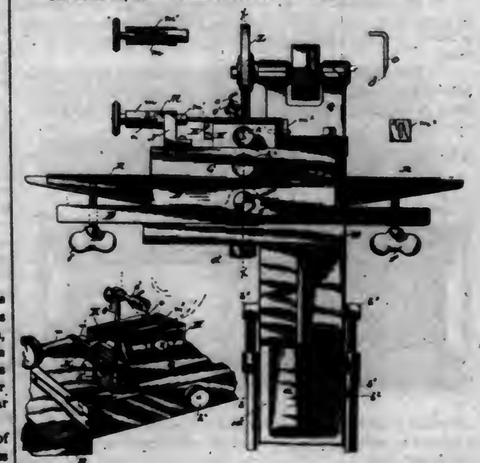
2. In an automatic brake, the combination, with the push-bar, of a hollow or box-shaped guide for connecting the portions that pass around the trucks, a lever pivoted to the center portion and having arms connected therewith for operating slides moving in the said guides, levers pivoted to the slides and connecting with the beams carrying the brake-shoes and extending beyond the ends of the car to engage the heads of the push-bars on the cars at its front and rear ends, and springs connecting with the said lever and with the car-frame and operating in opposite directions, whereby, when the pressure is removed from the push-bar, the springs will cause the lever to resume its normal position and thus apply the brakes to the wheels, substantially as described.

407,576. DEVICE FOR OPERATING BRAKES. GEORGE W. CROO, Montvale, N. J. Filed Aug. 18, 1888. Serial No. 283,072. (No model.)



Claim.—1. In a device for operating brakes, the combination of the casings, the pipe communicating therewith, having controlling-valves, the pipe leading from said pipe, the cylinder in communication with said pipe, the piston working in said cylinder, the cross-bar connected with the piston-rod, the rods connected to the ends of the said cross-bar, the lever fulcrumed to the engine-frame and pivoted to the last-named rods, and the arms carrying the brake-shoes, pivoted to the lever, all of said parts being arranged and adapted to operate substantially in the manner, and for the purpose described.

2. In a device for operating brakes, the combination of the cylinder, the pipe for supplying steam thereto having openings therein, the spring-actuated rod having plugs adapted to close said openings, and the lever or handle for operating said rod, substantially in the manner, and for the purpose described.



3. In a device for operating the brakes on locomotives and cars, the combination of the cylinder, the piston working therein, a plate secured to its outer portion to prevent the piston-head from striking the cylinder-head, an arm secured to the said outer portion to support a bar for operating the brake-rods on the engine, and rods 19, passing from the said bar to a depending lever pivoted on the engine-frame to operate the brakes carrying the shoes, substantially as described.

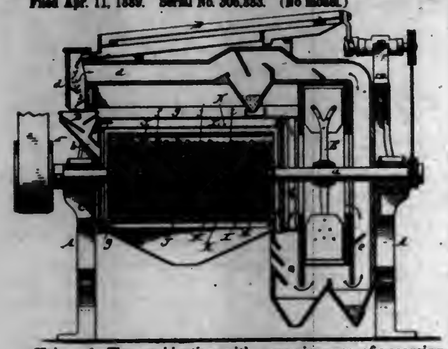
4. In a device for operating brakes, the combination of the steam-supply pipe having openings therein, the spring-actuated rod having plugs for closing said openings, the cylinder communicating with the steam-supply pipe, the piston therein, the cross rod connected to the piston-rod, the rods connected to the cross rod or bar, the lever for operating the brake-shoes, connected to the said rods, the links on the cross-bar, and the arm or projection on the piston-rod connected to said links, all of said parts being arranged as shown, and operating in the manner described.

407,576.

407,577. MACHINE FOR BACK-CLEARING TWIST-DRILLS. JACOB D. COX, Jr., Cleveland, Ohio, assignor to Cox & Prentiss, same place. Filed Jan. 24, 1887. Serial No. 225,254. (No model.)

Claim.—1. In a twist-drill-clearing machine, a sliding holder for the drill, having an open groove in which the drill lies supported and is exposed substantially through its entire length, substantially as set forth.

2. In a twist-drill-clearing machine, a holder having an open groove on its face for supporting the drill, and bearings in the line of the groove in which the holder is advanced, substantially as set forth.



3. In a twist-drill-clearing machine, a sliding holder for supporting the drill, having an open groove in which the drill is exposed above the surface of the holder substantially throughout its entire length, in combination with an emery-wheel to operate on said exposed portion, substantially as set forth.

4. In a twist-drill-clearing machine, a sliding holder for the drill, having a longitudinal groove in which the drill is supported substantially throughout its entire length, in combination with a device, as a finger, fixed to turn the drill, substantially as set forth.

5. In a twist-drill-clearing machine, a metal-removing device rotating in fixed bearings, in combination with a holder having an open groove along one side to support the drill, a base, and guides in the

holder and base, in which the holder is adapted to slide past the metal-removing device, substantially as set forth.

407,578. GRAIN-SCOURER. GILES S. CRAMSON, Silver Creek, N. Y. Filed Apr. 11, 1888. Serial No. 306,863. (No model.)

Claim.—1. The combination, with a scouring-case, of a scouring-drum provided with transverse grooves and recesses or depressions in said grooves, substantially as set forth.

2. The combination, with a scouring-drum provided with grooves and recesses or depressions in said grooves, of a scouring-case provided with grooves and recesses or depressions in said grooves, substantially as set forth.

3. In a grain-scourer, a scouring-plate provided with transverse grooves having inclined advancing sides and abrupt retreating sides, and recesses or depressions in said grooves, substantially as set forth.

4. The combination, with the scouring-case, of a drum having a scouring-plate provided at its entering end with inclined flights and with transverse grooves having recesses or depressions, substantially as set forth.

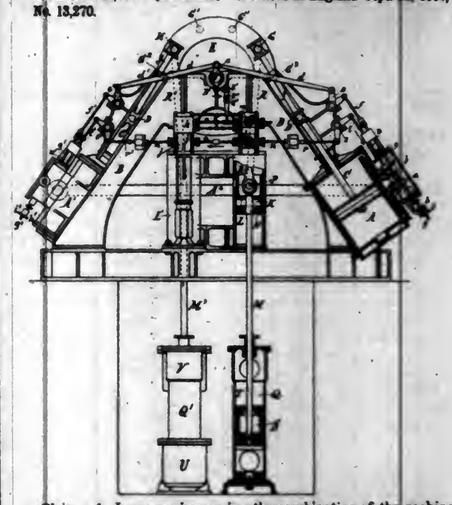
5. The combination, with the scouring-case, of a drum composed of alternating plates having transverse grooves with recesses or depressions, and plates having longitudinal grooves, substantially as set forth.

6. The combination, with a scouring-drum, of a scouring-case provided with a tight bottom plate having transverse grooves and recesses or depressions in said grooves, and with a ventilated top section, substantially as set forth.

407,579. DRUM. EDWIN J. CURLEY, Ravenswood, Ill. Filed Sept. 28, 1888. Serial No. 286,667. (No model.)

Claim.—1. A straining-rod hinged at one end to a bracket that is applied to one of the hoops of a drum, substantially as and for the purpose set forth.

2. The longitudinally-adjustable straining-rod hinged at one end to a bracket that is applied to one of the hoops of a drum, substantially as described.



3. The combination, with the straining-rod made adjustable in length and pivoted to a bracket upon one hoop, of a bracket applied to the opposite hoop and having a recess to receive the free end of said straining-rod, substantially as set forth.

4. The combination, with the straining-rod D, made adjustable in length, of the bracket d^3, to which one end of said rod is pivoted, and the bracket d^4, adapted for engagement with the opposite end of the rod, substantially as and for the purpose set forth.

5. The snare-holder consisting of a pair of jaws connected with a nut by a bent rod or wire, such as set forth, and a screw engaging the nut, for the purpose described.

6. The combination, with the bracket H, secured to one of the hoops, of a swinging snare-holder comprising a nut and a pair of jaws suitably connected together, and a screw engaging the nut and having a shank portion which is extended loosely through an opening in the bracket and provided with a stop or shoulder above the same, said opening in the bracket being enlarged relatively to the shank portion of the screw that passes through it, whereby the snare-holder can have a limited swing, substantially as and for the purpose described.

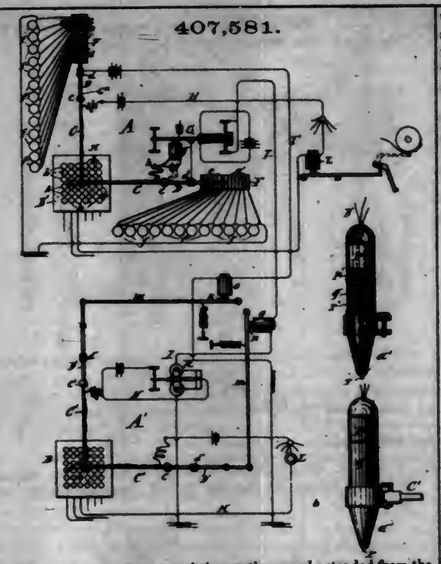
407,580. PUMPING-ENGINE. HENRY DAVEY, Westminster, County of Middlesex, England. Filed Apr. 12, 1888. Renewed June 6, 1889. Serial No. 313,266. (No model.) Patented in England Sept. 20, 1887, No. 13,270.

Claim.—1. In a pumping-engine, the combination of the rocking frame E, having pins G H and a fulcrum F, pumps Q and Q', connecting-rods R I, both pivoted directly to pin G of frame E, and connecting-rods R' and J, both pivoted directly to pin G of frame E, the respective pairs of said connecting-rods forming acute angles at any position of the pins G and H, substantially as and for the purpose described.

2. In a pumping-engine, the combination of the rocking frame E, fulcrumed at F and having pins G and H, and the piston-rods C and C', of steam expansion working-cylinders A A', the adjustable steam expansion-valves *a a'*, valve-gearing comprising arm *c*, rods *d d'*, angular levers *e e'*, connecting valve-rods *f f'*, adjusting valve-rods *g g'*, valves, as *b*, and the pump piston-rods M M', with their pistons S S', substantially as described.

3. The combination of the valves *p q*, the cylinders *j k*, rods *n* and *o*, with their pistons, the cataract-cylinders *l m*, with their pistons, the rods *r r'*, angular levers *s s'*, connecting-rods *t t'*, valve-rods *u u'*, valves, as *b*, and the expansion-valves, as *a a'*, substantially as described.

4. The combination, with the steam pumping-engine working steam expansively and with the pumps, of the cataract-regulator comprising subsidiary steam-cylinders, as *j k*, pistons on rods, as *n* and *o*, cataract-cylinders, as *l m*, and intermediate connections for the valves of the said engine, substantially as and for the purpose described.



407,581. SELECTING-TELEGRAPH. MARK W. DEWEY, Syracuse, N. Y., assignor, by direct and mesne assignments, to the Dewey Corporation, same place. Filed Sept. 22, 1888. Serial No. 286,097. (No model.)

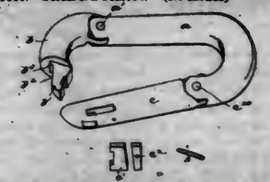
Claim.—1. In an electric telegraph comprising an electric circuit, a table of operative contacts at the receiving-station, a corresponding table of contacts at the transmitting station, a transmitting-instrument adapted to be moved in different directions and to different distances over the latter table, and an instrument adapted to operate the contacts on the table at the receiving-station and electrically moved in unison with the transmitting-instrument, as set forth.

2. In an electric telegraph, a main-line circuit, a table of contacts at the receiving-station, a corresponding table of contacts at the transmitting-station, a manipulative instrument adapted to be moved in different directions and to different distances over the latter table, an instrument adapted to operate the contacts at the receiving-station and moved in unison with the manipulative instrument by a suitable current or currents through the main line, and a circuit maker and breaker in a local circuit at the receiving-station operated by the aforesaid receiving-instrument.

3. In an electric telegraph, the combination of an electric circuit, corresponding tables of contacts respectively at the transmitting-station and receiving-station, a manipulative instrument adapted to operate the contacts at the transmitting-station, a rod extended from the manipulative instrument, a variable resistance in the aforesaid circuit operated by said rod, a magnet in said circuit at the receiving-station controlled by the varying strength of the current, an instrument adapted to operate the contacts at the receiving-station and actuated by the aforesaid magnet, a pole-changer in said circuit operated by a magnet in a local circuit at the transmitting-station, and a circuit maker and breaker in said local circuit operated by the aforesaid manipulative instrument, a polarized relay at the receiving-station in the main line, a local circuit controlled by said relay, and a magnet in said local circuit also actuating the said receiving-instrument, as set forth.

407,581.

4. In an electric telegraph, the combination of electric circuits, corresponding tables of contacts respectively at the transmitting-station and receiving-station, a manipulative instrument adapted to operate the contacts at the transmitting-station, rods disposed at right angles to each other and carrying conjointly at one end the aforesaid manipulative instrument, variable resistances in said circuits operated by said rods, an instrument adapted to operate the contacts at the receiving-station, rods disposed at right angles to each other and carrying conjointly at one end the latter instrument, armature-levers connected with the latter rods, and magnets at the receiving-station controlled by the varying strength of the current or currents in said circuits and operating the aforesaid armature-levers, substantially as described and shown.



5. In an electric telegraph, the combination of an electric circuit, corresponding tables of contacts respectively at the transmitting-station and receiving-station, a manipulative instrument adapted to operate the contacts at the transmitting-station, rods disposed at right angles to each other and carrying conjointly at one end the aforesaid manipulative instrument, variable resistances operated by said rods, an instrument adapted to operate the contacts at the receiving-station, rods disposed at right angles to each other and carrying conjointly at one end the latter instrument, armature-levers connected with the latter rods, magnets at the receiving-station controlled by the varying current in said circuit and operating the aforesaid armature levers, a pole-changer in the main circuit at the transmitting-station operated by a magnet in a local circuit, a maker and breaker in said local circuit carried and operated by the manipulative instrument, a local circuit at the receiving-station, a magnet carried by the instrument which operates the contacts at the receiving-station, and a relay in the main line at the receiving station moved by the change of polarity in the line to make and break the local circuit including said magnet, for the purpose set forth.

6. A transmitting-instrument consisting of a sleeve of non-conducting material, a metallic plunger sliding longitudinally in said sleeve and having its two ends insulated from each other, a metallic cap on one end of the sleeve forming one terminal of an electric circuit and the upper end of the plunger forming the other terminal of said circuit, and a terminal of another circuit connected with the lower section of the plunger, substantially as described and shown.

7. A receiving-instrument consisting of a solenoid, a sleeve extending from the solenoid and surrounding the core thereof, a spring supporting the core, an electrode extending from the core and terminals of an electric circuit connected with the solenoid, and another terminal of an electric circuit connected with the core, substantially as described and shown.

8. A manipulative transmitting-instrument consisting of a holder, a plunger sliding longitudinally within said holder, electric contact-points on said parts, a pole-changer in an electric circuit, and a magnet in a local circuit operating said pole-changer and connected with the aforesaid contact-points, substantially as set forth.

407,582. SHACKLE. WILLIAM D. DURGIN, Boston, Mass. Filed Mar. 9, 1888. Serial No. 302,637. (No model.)

Claim.—1. The shackle herein described, consisting of three parts, two of which are hinged to the one, one of the hinged parts having a tenon provided with a shoulder and with an inclined side and forming one end of the shackle and the other part having a mortise to receive said tenon, the hinged end being free when unlocked to turn and leave the end of the link open and unobstructed, and a locking device for said tenon, substantially as described.

2. The shackle herein described, consisting of the hinged parts *a b c*, the part *b* having a tenon shaped as shown and described and the part *c* having a mortise to receive said tenon, and the notched block or bar *c'* and the wedge-shaped bar c^2, substantially as described.

3. The shackle herein described, consisting of the hinged parts *a b c*, the part *b* having a tenon shaped as shown and described, the part *c* having a mortise to receive said tenon, and the notched block or bar *c'*, the wedge-shaped bar c^2, and the pin 2, substantially as described.

407,583. ROOFING-PAPER ROLL. MICHAEL BERRY, Jr., Philadelphia, Pa. Filed Mar. 3, 1888. Serial No. 266,069. (No model.)

Claim.—1. A core for a roll of roofing-paper having a chamber at one or both ends and caps therefor larger in diameter than the core, substantially as and for the purpose set forth.

2. A core for a roll of roofing-paper having a chamber at one or both ends and a screw-cap closing said chamber, and having a flange of larger diameter than the core, substantially as and for the purpose described.

3. The combination of a core for a roll of roofing-paper with caps of larger diameter than said core and secured thereto, substantially as and for the purpose set forth.

407,584. LAP-RING. ANDREW T. FOSTER, Belle Union, Ind., assignor of one-half to Albert Cox, same place. Filed Jan. 19, 1889. Serial No. 296,894. (No model.)

Claim.—In a lap-ring, the combination of the hooked part A, having the sleeve thereon, provided with a T-shaped slot, and a hooked part C, movably inserted into the said sleeve and having projections adapted to engaged the said T-shaped slot to lock the two

parts together, the parts A and C having overlapping ends *a b*, substantially as described.

407,585. FOUNTAIN-PEN. JOSEPH FRIEDMANN, Seymour, Conn.
Filed Jan. 21, 1889. Serial No. 296,976. (No model.)

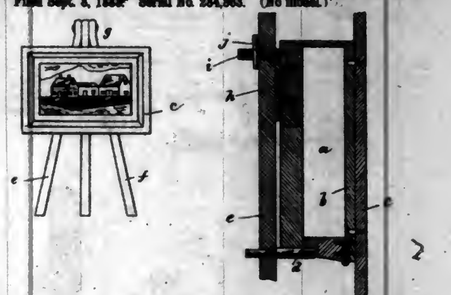
Claim.—1. In a fountain-pen, the pen-holding portion of the socket, constructed in two parts C D, divided longitudinally, the division being in a transverse curve corresponding to the transverse curve of the pen, and so as to form a recess between the two parts to receive the pen, the upper ends of the two parts coming together and externally screw-threaded, so as to be set together and screwed into a correspondingly-threaded socket, the part C constructed with a tongue E, projecting therefrom onto the back of the pen, and the part D constructed with a longitudinal passage G, leading from the fount to the inside of the pen, and an elastic feed-spindle H through said passage onto the inside of the pen, substantially as described.

2. The combination of the tubular fount A, closed at its upper end, the tubular socket B, detachably connected to the lower or pen end of the fount, the pen-holding portion of the socket made in two parts C D, the division between the two parts being longitudinal and transversely curved corresponding to the curve of the pen, and so as to form a recess between the two parts to receive the pen, the upper ends of the two parts together screw-threaded correspondingly to an internal screw-thread formed upon the interior of the socket B, the part C constructed with a tongue projecting from its lower end onto the back of the pen, and the part D constructed with a longitudinal passage from the fount down to the inside of the pen, and a feed-spindle arranged in said passage and extending onto the inside of the pen, substantially as described.

407,586. FOUNTAIN-PEN. JOSEPH FRIEDMANN, Seymour, Conn.
Filed Jan. 21, 1889. Serial No. 296,977. (No model.)

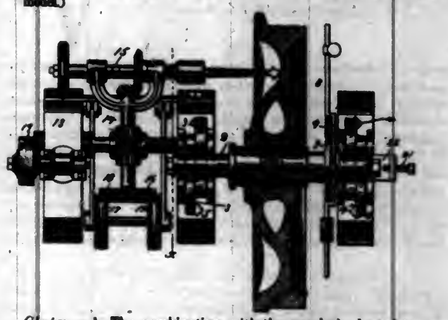
Claim.—The combination of the tubular fount A, the socket made in two parts B E, the one part B detachably connected to the lower or open end of the fount and extending downward in the form of a contracted tube C, the tube open upon one side to form a passage D from the fount downward, the inside of the pen and the tubular part E detachably connected to the part B, the said part E constructed with a tongue F, projecting from its lower end, so as to form an open recess between the tongue and the open side of the tube C, substantially as described.

407,587. PHOTOGRAPHIC CAMERA. WILLARD H. FULLER, Passaic, N. J., assignor to The Scovill Manufacturing Company, New York, N. Y. Filed Dec. 24, 1888. Serial No. 294,453. (No model.)



Claim.—1. The combination, with a camera-back or back-frame and a ground-glass frame, of links having pivotal connection with said frames, springs bearing on each of said links, and a detent adapted to hold the ground-glass frame in a rearward position against the actions of the springs, whereby a plate-holder may be inserted or removed, substantially as specified.

2. The combination, with a camera-back or back-frame, of a ground-glass frame adjustably connected thereto, a pin moving with the ground-glass frame, a detent consisting of a lever having a longitudinal slot terminating in a transverse extension and receiving said pin, and a spring carried by the lever, substantially as specified.



3. The combination, with a camera-back or back-frame and a ground-glass frame, of links, and screws extending vertically through the links and into the top and bottom surfaces of the said back or back-frame and ground-glass frame, and a swinging detent securing the ground-glass frame in its rearward position, substantially as specified.

407,588. WRITING-DESK. ANNIE L. GORHAM, St. Johnsbury, Vt.
Filed Sept. 5, 1888. Serial No. 284,863. (No model.)

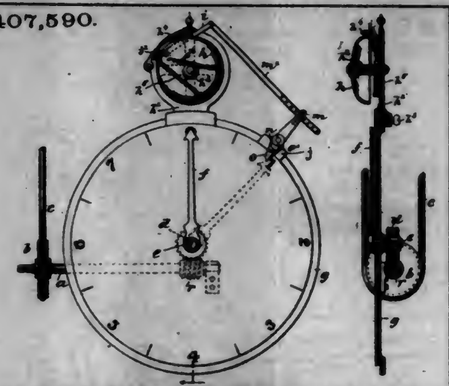
Claim.—The combination, with an easel frame or support having projecting pegs, of a desk resting on said pegs and having a right-angular plate projected through an aperture of said frame or support, and a pin passed through said plate, substantially as set forth, the outer portion or face of the lid of said desk being constructed as a picture-frame containing a picture, as stated.

407,589. BALANCING APPARATUS FOR WHEELS, &c. THOMAS A. GRIFFIN, Chicago, Ill. Filed Apr. 26, 1888. Serial No. 308,726. (No model.)

Claim.—1. The combination, with the mandrel adapted to receive the wheel or pulley to be balanced, and supports for said mandrel on which it may revolve, of a lever adapted to revolve said mandrel and provided with a device for weighing the force applied in revolving the mandrel, substantially as described.

2. The combination, in a balancing apparatus, of a mandrel adapted to receive the wheel or pulley to be balanced, supports for said mandrel on which it may revolve, a vibratable lever, a clutch connecting said lever to said mandrel and adapted to move it in one direction only, and a device attached to said lever for weighing the force applied to revolve the mandrel, substantially as described.

3. The combination, in a balancing apparatus, of a mandrel adapted to receive the wheel or pulley to be balanced, supports for said mandrel in which it may revolve, a vibratable lever hung upon said mandrel and connected by a clutch thereto, and a weighing device adjustable on said lever to correspond with the intended position of the counter-weight, substantially as described.

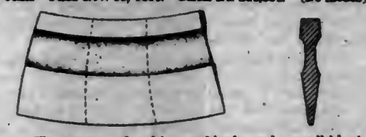


4. The combination, in a balancing apparatus, of a mandrel adapted to receive the pulley or wheel to be balanced, supports for said mandrel on which it may revolve, a lever having a weighing device attached and adapted to revolve the mandrel, and a drill adjustably mounted in the frame carrying the supports for the mandrel, whereby the entire operation of balancing a wheel or pulley may be completed prior to its removal from the apparatus.

407,590. INDICATOR AND SIGNAL FOR ELEVATORS. WILLIAM R. HALL, Butte City, Mont. Filed Apr. 4, 1889. Serial No. 305,994. (No model.)

Claim.—1. The combination, with the dial-plate, the pointer which travels over the same, and its operative mechanism, of the gong and the trip device, substantially as described, mounted adjustably on said dial-plate and coupled to the operating mechanism of the gong, the toe of said trip device being arranged in the path of said pointer, as set forth.

2. The combination, with the dial-plate, the pointer which travels over the same, and its operative mechanism, of the gong mounted adjustably and movably on said plate, and the trip device described,



407,590.

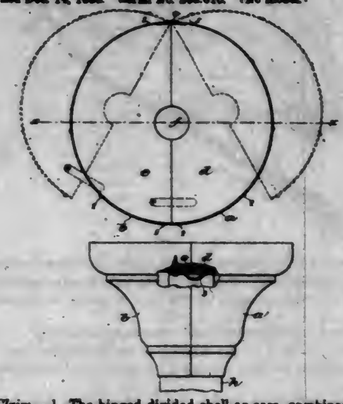
also mounted adjustably on said plate and connected adjustably to the operating mechanism of the gong, as set forth.

3. The combination, with the dial-plate, the pointer and its operative mechanism, of the gong mounted on the dial-plate and the trip device mounted on and clamped to the dial-plate, said device consisting of the supporting-bracket, the rock-shaft in said bracket, the arm *m* on said shaft coupled to the operating mechanism of the gong, the arm *n* on said shaft, the toe *o*, pivotally mounted in the arm *n*, and the spring *o'*, said toe being arranged in the path of the pointer, as set forth.

407,591. MANUFACTURE OF AXES. HENRY HAMMOND, New Haven, Conn. Filed Nov. 15, 1888. Serial No. 290,861. (No model.)

Claim.—1. The process of making ax-blanks and ax-poll blanks, which consists in forming a curved bar of metal, and then in cutting that bar into pieces on lines the ends of which are substantially coincident with the radius of the curve of the bar, all substantially as described.

2. The process of making ax-blanks and ax-poll blanks, which consists in forming a curved bar the two edges of which are segments of concentric circles, and the two sides of which are provided with curved longitudinal concavities concentric with those circles, and then in cutting that bar into pieces on lines the ends of which are substantially coincident with the radius of those circles, all substantially as described.



3. The process of making axes, which consists in forming a curved bar of metal, the cross-section of which is nearly identical with the longitudinal section of the axes to be made, except at the sides of the bar opposite to where the eyes of the axes are to be located, where longitudinal concavities are formed, each of which is about equal in cross-section to half the cross-section of the eyes of the axes, and then cutting the bar into pieces on lines the ends of which are substantially coincident with the radius of the curved edges of the bar, and afterward forming an eye in each of those pieces with a chisel or punch, which, as it penetrates the metal between those concavities, forces the sides of the blank apart, and thus expands the blank at the eye portion to the ultimate shape desired, all substantially as described.

407,592. CURTAIN SUPPORTER AND ADJUSTER. LEVERT B. HARKNESS, Boston, Mass. Filed July 30, 1888. Serial No. 281,423. (No model.)

Claim.—As an improved article of manufacture, the herein-described curtain-cord holder, comprising the casing having the front and back plates and connecting side pieces, the pulley located in the upper portion of said casing, the lever fulcrumed in said casing below said pulley and having a toothed or corrugated dog at one end for clamping the curtain-cord against one of said side pieces of the casing, and also having a free arm provided with a notch through which the free end of the curtain-cord is passed, substantially as set forth, said curtain-cord being guided by the front and back plates and side pieces of the casing, as stated.

407,593. ELECTRIC FIXTURE. JOHN C. HOLLIDAY, Boston, Mass. Filed Dec. 14, 1888. Serial No. 293,610. (No model.)

Claim.—1. The hinged divided shell or case, combined with the divided clamping-collar connected to said shell and provided with a central opening, and a locking or retaining device to hold the parts together, substantially as described.

2. The combination, with pipe *g*, of a two-part hinged shell or case and a clamping-collar of insulating material secured thereto, and means, substantially as set forth, to lock or retain the parts upon the said pipe, substantially as described.

3. The divided shell or case hinged, as at *c*, combined with the two-part clamping-collar *d e*, having a central opening *f*, and a locking or retaining device, as 3, to hold the parts together, substantially as described.

4. The combination, with a fixture and its inclosed coupling, of a hinged sectional shell or case having an inclosed clamping-collar of insulating material rigidly secured thereto and adapted to embrace the pipe and inclose the coupling, substantially as described.

407,594. ADJUSTABLE COVER-HOLDING HINGE FOR BUCKETS, &c. WILLIAM T. HOMRA, Magnolia, Ala. Filed Mar. 5, 1889. Serial No. 301,986. (No model.)

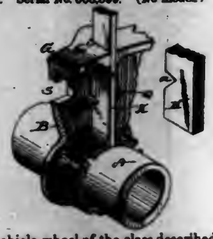
Claim.—1. The hinge consisting of the pivotally-connected wings provided with arms, substantially as and for the purpose herein shown and described.

2. The herein-described hinge, consisting of the pivotally-connected wings provided with arms, the metallic strips fitting between the arms, and thumb-screws working in holes provided therein and impinging against said strips, as and for the purpose set forth.

3. The herein-described hinge for raising and lowering the covers of barrels, buckets, and the like, consisting of the pivotally-connected wings provided with arms, the upper wing thereof having the hollow cylindrical outward-extending portion forming the dipper-holder, and the lower wing being provided with flanges, as and for the purpose set forth.

4. The combination, in a hinge for raising and lowering covers for buckets and the like, of the bifurcated wings A B, metallic strips *a b*, thumb-screws *c d*, flanges *h h*, and the hollow cylindrical dipper-holder D, substantially as and for the purpose herein shown and described.

407,595. BOB-SLED. JOHN A. JOHNSON, Madison, Wis. Filed Apr. 10, 1889. Serial No. 306,653. (No model.)



Claim.—1. The combination, with a shoe, of a runner consisting of two parts secured to said shoe and having their forward ends flanged outwardly to form a support for the rave of a sled, substantially as set forth.

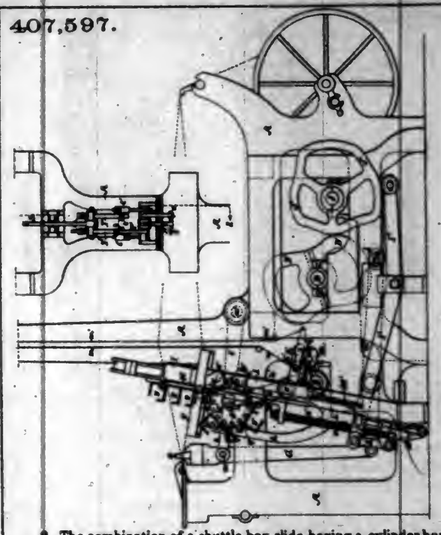
2. The combination, with the cross-beam of a sled, of a runner and a knee consisting of two angular pieces having the upper bearing or supporting portions secured to the cross-beam, substantially as set forth.

3. The combination, with a cross-beam of a sled, of a runner, a knee consisting of two angular pieces having upper bearing or supporting portions, said portions being provided with central ridges, and a keeper or bail passing beneath the upper portions of the shoes and fitting in the ridges thereof, the upturned ends of the said keeper or bail passing into the cross-beam of the sled, substantially as set forth.

4. In a sled, the combination of a runner, shoes secured thereto, a bail or keeper, a cross-beam, and standards secured to the knees and provided with supporting-flanges for the rave, substantially as set forth.

407,596. METALLIC WHEEL. JOHN A. JOHNSON, Madison, Wis. Filed Apr. 24, 1889. Serial No. 308,399. (No model.)

Claim.—1. In a vehicle-wheel of the class described, the combination, with the axle-sleeve having the integral cast malleable head provided with an integral peripheral flange having flanged openings for the reception of the metal spoke, of the integral radial bearings on the axle-sleeve, the metallic spokes secured in the felly and tire, and the removable head or cap and the securing bolts and nuts, substantially as specified.



2. The combination, with the axle-sleeve having the integral radial bearings with seats between them, of the integral head provided with the recessed peripheral flange having the inwardly-projecting bearings along the longer sides of the recesses of said peripheral flange, the felly and tire connected by metal spokes having notches near their inner ends, the removable cap, and the securing bolts and nuts for locking the spokes within the hub, substantially as specified.

3. The combination, with the axle-sleeve and the metallic head having the peripheral flange provided with recesses having inwardly-projecting side flanges bent inwardly against the spokes, of the removable cap and the bolts and nuts for securing the parts together, substantially as specified.

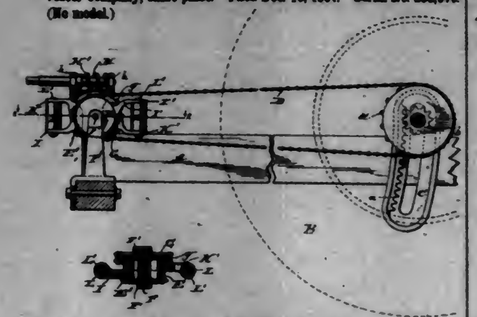
407,597. LOOM. CHARLES H. KNOWLTON and BENJAMIN F. MEYER, Camden, N. J., assignors to the M. A. Furbish & Son Machine Company, same place. Filed Dec. 2, 1886. Serial No. 220,467. (No model.)

Claim.—1. The combination, in a loom, of a fixed shuttle-race and an independent beating-up comb and devices for operating the latter, a shuttle-box slide guided on the fixed frame of the loom and having boxes carried partly by said slide and partly by a cylinder hung thereto, mechanism for raising and lowering the shuttle-box slide on the fixed frame, a notched fork for engaging with the cylinder and turning the same as it is raised or lowered, and means for operating said fork, substantially as specified.

407,597.

2. The combination of a shuttle-box slide having a cylinder hung thereto, means for operating said slide, a notched lever engaging with the box-cylinder to turn the same, a dictating-lever connected to said operating-lever, Jacquard levers having operating-tails, levers intermediate of the Jacquard levers and the dictating-lever, cords connecting said intermediate levers to the dictating-lever, a movable carrier for the Jacquard levers or intermediate levers, and means for operating said carrier, all substantially as specified.

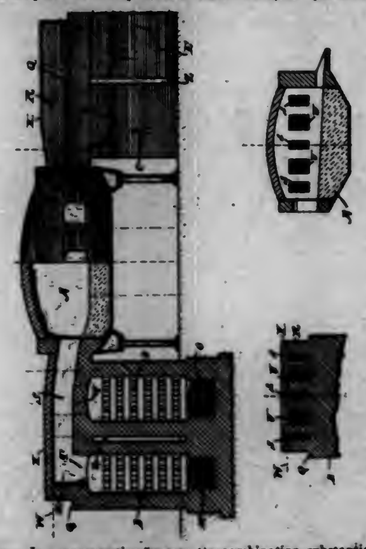
3. The combination of the levers P P' and their supporting-arm, operating-tails connected to said arm and levers, the lever K, intermediate levers T T', connected by cords to the lever K and constructed for engagement with the levers P P', a lever S, carrying one set of said levers, and means for operating said lever S, so as to carry its set of levers from and toward the other set, all substantially as specified.



407,598. DUST-COLLECTOR. OSWALD KUTTNER, Chicago, Ill., assignor to the Chicago Exhaust and Blow Pipe Company, of Illinois. Original application filed Oct. 11, 1886, Serial No. 215,947. Divided and this application filed June 18, 1889. Serial No. 314,728. (No model.)

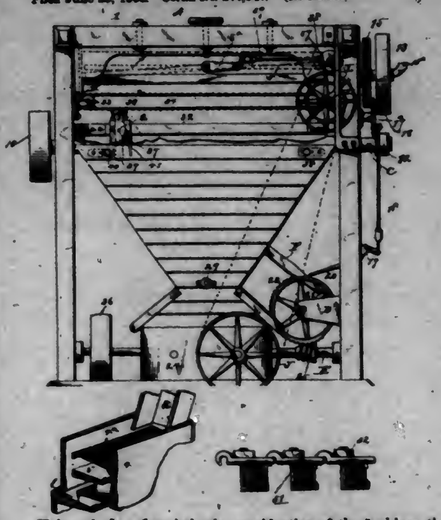
Claim.—1. A dust-collector having a separating-chamber constructed with an imperforate peripheral wall and provided with a discharge-opening for the separated dust toward the bottom of said chamber, and with a discharge-opening for the purified air toward the top of the chamber, and an inlet for the dust-laden air entering the separating-chamber tangentially and with a downward inclination, substantially as described.

2. A dust-collector having a cylindrical separating-chamber constructed with an imperforate peripheral wall, and provided with a discharge-opening in its top for the purified air and with a discharge-opening in its bottom for the separated dust, and with an inlet-pipe for the dust-laden air entering the separating-chamber tangentially near its top and inclined toward the longitudinal axis thereof, substantially as and for the purpose described.



407,599. RAISING AND LOWERING DEVICE FOR HARVESTERS. JOHN W. LATHER, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Dec. 16, 1887. Serial No. 258,076. (No model.)

Claim.—1. In a harvester, the combination of the bull-wheel, its axle and pinions, the racks suspended from the harvester-frame in which the pinions engage, two sleeves loosely carried by a suitably-supported shaft, each of said sleeves having a pair of arms, the arms of each pair extending in opposite directions from each other, and an arm of each sleeve overhanging an arm of the other sleeve, a spring interposed between the opposing arms of the two sleeves, gearing for revolving one of the sleeves, and means, substantially as described, for connecting the other sleeve with the bull-wheel axle, whereby the latter will be supported by the sleeves and be revolved or prevented from revolving by them.



2. In a harvester, the combination of the axle and its pinions, the racks suspended from the harvester-frame, a sprocket-wheel keyed to the axle, a shaft mounted in standards projecting up from the harvester-frame, a pair of sleeves loose on said shaft, each having a pair of arms projecting out from it in opposite directions, with an arm of each sleeve overhanging the arm of its neighbor, a spring interposed between the opposing arms of the two sleeves, an operating-shaft, and gearing connecting the operating-shaft with one sleeve, and sprocket-gear connecting, by means of a sprocket-chain, the other sleeve with the sprocket-wheel on the bull-wheel axle, substantially as described.

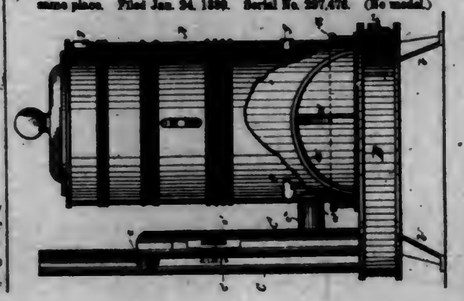
407,600. STEEL-FURNACE. LOUIS G. LAUREAU and FRED. W. GORDON, Philadelphia, Pa., assignors to Gordon, Strobel & Laureau, (Limited,) same place. Filed July 13, 1888. Serial No. 279,873. (No model.)

Claim.—In a regenerative furnace, the combination, substantially as set forth, of a heating or melting chamber, regenerators alongside thereof and near thereto and provided with decks having ports, vertically-parallel walls on said decks extending from said chamber to said ports and forming direct open-top ducts from chamber to ports, the longer ducts thus formed extending across the nearer regenerators, and cover-work disposed on said walls from chamber to ports and closing the tops of the ducts.

407,601. FLOUR-BOLT. WILLIAM M. LUCAS, Uhrichsville, Ohio. Filed June 28, 1888. Serial No. 277,947. (No model.)

Claim.—1. In a flour bolt, the combination of the feed-box, the inclined wire-cloth therein, the centrally-pivoted adjustable dividing-board, and the inclined spreading-boards, substantially as described.

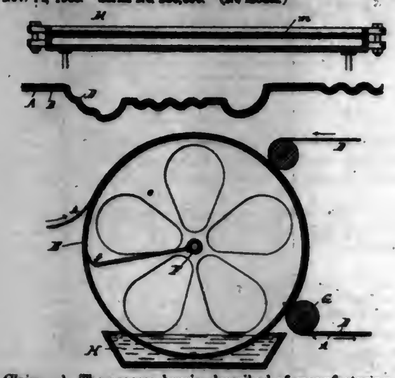
2. The combination of the carrier-bolt, links having a shoulder extending parallel thereto, a cross-strip beneath the shoulder, and an L-shaped bolt extending through the shoulder and cross-strip to clamp the same in place, substantially as described.



3. The combination of the counter-shaft, the cone-shaped worm thereon, an intermittent gear meshing with the worm, a brush-carrier head operated by the intermittent gear, a sieve in contact with the brush-carrier head, a pawl, and mechanism connecting with the pawl to operate the intermittent gear, substantially as and for the purpose specified.

4. The combination of the supporting-frame, a star-wheel journaled thereon, a jointed rod pivoted to the star-wheel, a crank connecting with the rod, a pawl on the crank, an intermittent gear-wheel operated by the pawl, a brush-carrier head operated by the intermittent gear, and a gear-wheel carrying a pin to operate the star-wheel, substantially as described.

5. The combination of the intermittent wheel, an arm pivoted thereto, a shaft carrying at one end a crank connecting with the arm and at its other end a rod, a hollow arm fitting on the rod, and a brush-carrier head connecting with the hollow arm, substantially as described.

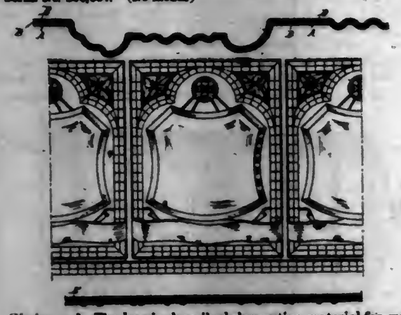


6. The combination, with the frame of the device, of the carrier-head moving thereon, an arm on the carrier-head, a brush-shaft mounted in the arm, the sieve above the brush-shaft, a pawl on the arm, pins on the frame for engaging the pawl, and mechanism, substantially as described, for operating the carrier-head to throw it into and out of engagement with the sieve, substantially as described.

407,602. STRAW-BURNING STOVE. IGNATIUS J. MILLER and HOBART A. DRAKE, De Smet, Dak., said Drake assignor to I. L. Nelson, same place. Filed Jan. 24, 1889. Serial No. 297,476. (No model.)

Claim.—In a straw-burner, the combination, with the magazine A, provided with the removable bottom a, and the semicircular strips a', secured to said bottom, of the drum B, supporting said magazine and provided at its rear end with openings b^2, the vertical longitudinal partition D, dividing said drum into two communicating compartments d d', the pipes C C', secured over the openings b^2 and communicating with each other above the drum, the connecting-pipes c^3 c^4 between said pipes C C', the pipe c^4 having the semicircular strips f over its mouth, and suitable dampers or valves arranged in the pipes C and C', substantially as specified.

407,603. PROCESS OF MAKING DECORATIVE EMBOSSED WORK. WILLIAM S. MORTON, Edinburgh, County of Mid-Lothian, Scotland. Filed Nov. 14, 1888. Serial No. 290,636. (No model.)



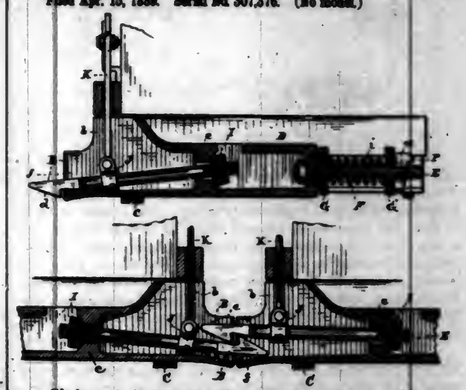
Claim.—1. The process herein described of manufacturing embossed decorative work, said process consisting in sizing canvas, working it into an intaglio mold, applying heat thereto, and then pasting and working a backing of paper into the back cavities of the embossed canvas.

2. The process herein described of manufacturing embossed decorative work, said process consisting in sizing canvas, working it into an intaglio mold, applying heat thereto, putting a coating of stiffening composition on the back of the molded canvas, and then working a layer of paper into the back cavities of the coated and embossed canvas.

3. The mode herein described of manufacturing embossed decorative work, said mode consisting in sizing canvas, working it into an intaglio mold, applying heat thereto, coating the back of the embossed canvas with a stiffening composition while the canvas is still on the mold under heat, and finally working a layer of paper into the back of the embossed canvas, substantially as specified.

4. The mode herein described of manufacturing embossed decorative work, said mode consisting in sizing canvas, working it into an intaglio mold, applying heat to the latter, coating the back of the embossed canvas with a stiffening composition, and pasting a layer of paper onto the back of the canvas and working it into the cavities in the latter while the canvas remains on the mold under heat, substantially as set forth.

407,604. WALL-DECORATING MATERIAL. WILLIAM S. MORTON, Edinburgh, County of Mid-Lothian, Scotland. Filed Nov. 14, 1888. Serial No. 290,637. (No model.)

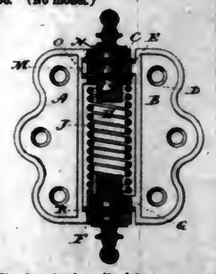


Claim.—1. The herein-described decorative material for walls, ceilings, and other surfaces, said material consisting of a face of embossed canvas, a backing of paper worked into the cavities of the embossed canvas, and an intermediate stiffening composition.

2. The herein-described decorative material for walls, ceilings, and other surfaces, said material consisting of a face of embossed canvas, a backing-paper worked into the cavities of the embossed canvas, and an intermediate stiffening composition containing plaster or similar substance.

3. The herein-described decorative material for walls, ceilings, and other surfaces, said material comprising a surface of embossed canvas with a lining of paper worked into the cavities of the canvas, and with intermediate stiffening composition, and a backing of wood of two or more layers, with the grains running in different directions, substantially as set forth.

407,605. CAR-COUPLING. JOHN L. ORDNER, Thompson, Ohio. Filed Apr. 15, 1889. Serial No. 307,376. (No model.)



Claim.—1. In an automatic car-coupling with reversible draw-bars, the combination of the head A, bar B, bolt E, spring F, and plates G G', the said head having an extension f, adapted to guide and to allow of turning of said bar, and the bolt E, extending through the rear of said head, carrying said spring and plates in the manner and by the means substantially as shown.

2. In an automatic car-coupling, the combination of the draw-head A, the draw-bar B, the sleeve J, attached to said bar, and the rods and lever for operating said bar, constructed and arranged in the manner as described, and for the purpose specified.

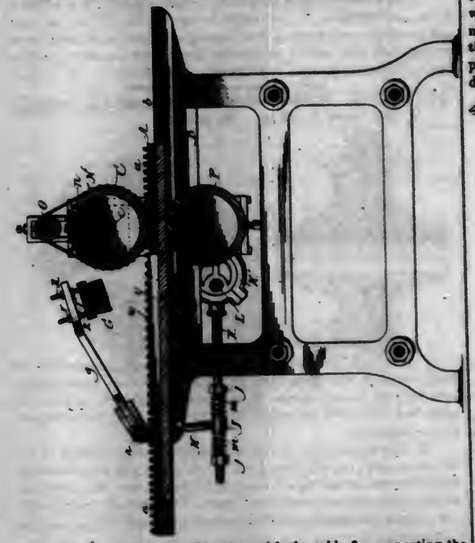
3. An automatic car-coupling consisting of the draw-head A, draw-bar B, sleeve J, rod K, and lever L, in combination with the fulcrum M, rod O, the said draw-bar having a hook d at its front end in projecting relation with the draw-head, and a threaded nut I on the rear end of said bar bearing upon a partition within said draw-head, constructed and arranged substantially as set forth, and for the purpose described.

407,606. SPRING-HINGE. ALBERT A. PAGE, New Haven, Conn., assignor to Sargent & Company, same place. Filed May 3, 1889. Serial No. 309,433. (No model.)

Claim.—1. The herein-described improvement in hinges, consisting of a pintle constructed with annular collars, the two parts of the hinge having their knuckles cast around the said pintle and upon the respective collars, but without contact between the knuckles of the two parts, whereby the said pintle inseparably joins the two parts together in the process of casting said parts, substantially as described.

2. A hinge composed of two leaves A B, the one leaf A constructed with two knuckles C D near one end and with a single knuckle F at the opposite end, the knuckle D constructed with an axial projection H, the other leaf B constructed with a knuckle E corresponding to but less in thickness than the space between the knuckles C D, with a knuckle G corresponding to the knuckle F of the other part, the said knuckle G constructed with an axial projection I corresponding to the projection H of the knuckle D, pintles between the knuckles of the respective parts and constructed with annular collars between the adjacent faces of the knuckles of the two parts, the said pintles being inclosed and held within the knuckles of the respective parts, substantially as described.

407,607. ERASER-HOLDER. KATE PARKE, Chicago, Ill. Filed Apr. 13, 1889. Serial No. 307,136. (No model.)



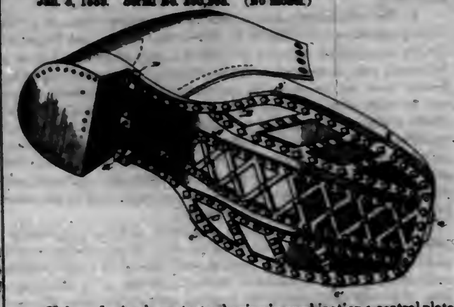
Claim.—1. An eraser-holder having a sheet-metal body cut and bent to form a brush-socket in one end, and having a set of movable jaws at its opposite end, and having a division-plate at the base of said brush-socket, substantially as set forth.

2. In eraser-holders, the combination, with the metal body cut and bent, substantially as shown, to form a brush-socket at one end and extended at the opposite to constitute a clamp-jaw, of the companion jaw pivoted thereto and the reaction-spring bearing against said jaw, substantially as set forth.

3. In eraser-holders, the combination, with the base-plates cut and bent, substantially as shown, to form upturned flanges, with an overlapping top and inturned end to constitute a brush-socket, of the loose jaw having turned ears or lugs joined pivotally to said flanges of the base-plate and the coil-spring reacting to force the clamping-jaws normally together, substantially as described.

407,608. MATRIX-MAKING MACHINE. CHARLES S. PARTRIDGE, Chicago, Ill., assignor to The A. N. Kellogg Newspaper Company, same place. Filed Sept. 22, 1888. Serial No. 286,106. (No model.)

Claim.—1. The combination, with the table for supporting the form to be stereotyped, of an elastically-operated beating-brush located over the table and adapted to beat the matrix material into the type, substantially as specified.



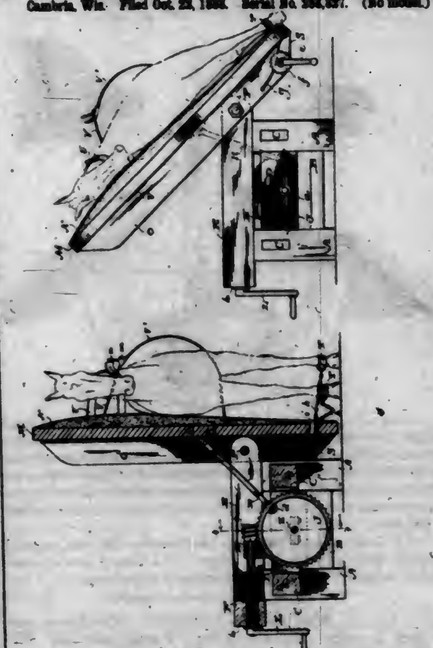
2. In a machine for impressing the matrix upon the type, a vibrating brush and its carrying-levers, in combination with the eccentric-rods and the springs by which the actuating-power transmitted to the brush is rendered elastic, substantially as specified.

3. In a machine for impressing the matrix upon the type, a vibrating brush and its carrying-levers, in combination with the eccentric-rods and the springs interposed between said levers, and the stops at both sides of the levers, substantially as specified.

4. In a machine for impressing the matrix upon the type, the combination of a vibrating brush for beating the matrix and a pressure-roller for pressing it, with a traveling table for carrying the form under said brush and roller, substantially as specified.

5. The combination of the vibrating brush, the pressure-roller, the blanket, roller O, and the moving table, substantially as specified.

407,609. SOLE-PROTECTOR. JAMES F. PRATT, Chicago, Ill. Filed Jan. 3, 1889. Serial No. 295,982. (No model.)

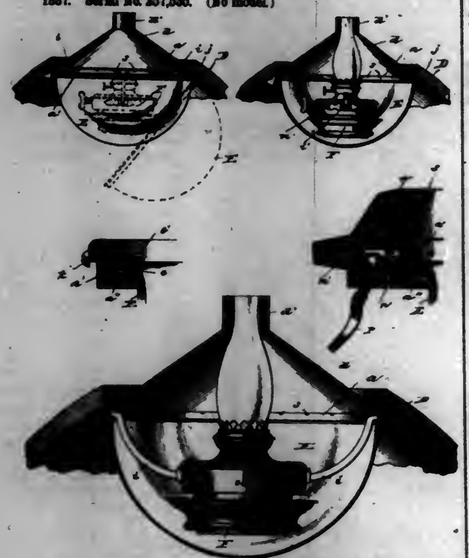


Claim.—1. A sole-protector having in combination a central plate and side plates pivoted thereto at the toe and provided with clamps to engage the sole-edge, each of said plates having toward the heel lugs having bolt-holes and a bolt whereby to draw the side plates together to secure the protector to the shoe, substantially as described.

2. A sole-protector having in combination a central plate and side plates of substantially the length of the sole from toe to inner edge of heel, said plates having corrugations to protect the shank of the sole, the side plates connected pivotally to the center plate at the toe and provided with clamps, and each of said plates being provided toward the heel with projecting lugs having bolt-holes, and a bolt whereby to draw the side plates toward each other to clamp the protector to the shoe.

3. The combination, with the shoe having metallic plates inserted in its sole-edge to provide a wearing-surface, of a protector having a central plate and side plates pivoted thereto at the toe, and provided with clamps to engage the sole-edge and adapted to bear upon the metallic plates in the sole-edge, each of said plates having toward the heel lugs having bolt-holes and a bolt whereby to draw the side plates together to secure the protector to the shoe, substantially as described.

407,610. VETERINARY OPERATING-TABLE. DAVID R. PRICE, Cambria, Wis. Filed Oct. 22, 1888. Serial No. 288,227. (No model.)



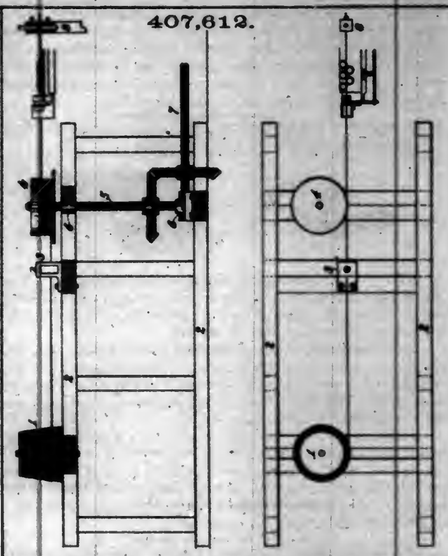
Claim.—1. The combination, with a veterinary operating-table, of a rod journaled in suitable bearings in the lower part thereof, chains or cords of practically equal length connected to said rod, hoppler connected to the free ends of said chains or cords, and means for re-

volving said rod and holding it in any desired adjustment, substantially as set forth.

2. The combination, with a suitable supporting-frame, of a veterinary operating-table hinged to a horizontal rod on said frame below the longitudinal center of said table, a gear-wheel mounted on a horizontal axle in said frame and carrying a transversely-projecting journal near the periphery of said wheel, a journal secured to the rear or under side of the operating-table above the plane of said gear-wheel, a pair of inflexible links pivoted to the last-named journal and straddling the gear-wheel and pivoted to the transverse projecting journal thereon, a horizontal rod mounted in the frame above the gear-wheel and carrying at the inner end a worm-gear rigid with said rod and in mesh with said gear-wheel, and a crank fixed to the other end of said rod, substantially as set forth.

3. The combination, with an adjustable veterinary operating-table provided with a pad or cushion covering its entire outer surface and having holes arranged in pairs at each side of its upper portion and a series of holes arranged in pairs at each side of its lower portion, of a neck-strap passing through one of the upper pairs of holes, body-straps arranged in upper and lower series secured to the table and passing through slits or openings in the cushion, and the straps of one series having clamping-plates and cam-rollers at their free ends, chains or cords of practically equal length passing through the holes in the lower portion of the table and carrying hopples at their outer ends, a transverse revolving rod located adjacent to said lower holes and journaled in cleats or bearings on said table and connected to the inner ends of said chains or cords, a ratchet on said rod, and a spring-pawl on said table adapted to engage with said ratchet, substantially as set forth.

407,611. CAR-VESTIBULE LAMP. AUGUST RAPP, Pullman, assignor to the Pullman's Palace Car Company, Chicago, Ill. Filed Dec. 10, 1887. Serial No. 257,536. (No model.)

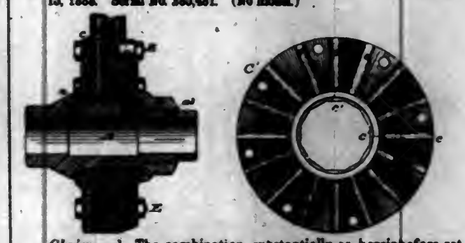


Claim.—1. In a car-vestibule lamp, the combination, with a dome located at or near the roof of the vestibule-extension, a metallic rim attached to said dome centrally and provided with apertures for the admission of air to support combustion, and a supplementary rim beneath and hinged thereto, of a transparent globe supported by the supplementary rim and a cap mounted on the upper rim, substantially as described.

2. In a car-vestibule lamp, the combination, with rims *a* and *a'*, the latter being provided with a flange *a''*, of a globe E, provided with flange *e*, stripe *d'*, and screws *k*, substantially as presented.

407,612. WIRE-WORKING APPARATUS. DAVID RAWSON, Pittsburg, Pa., assignor of one-half to Arthur J. Wilkinson, same place. Filed Feb. 1, 1889. Serial No. 298,340. (No model.)

Claim.—1. In a wire-working apparatus, the combination of a delivery-drum, mechanism for operating on the wire, a mechanism for exerting a pull on the wire, and a continuously-rotating drum having a surface speed equal to or greater than the speed of the pulling mech-

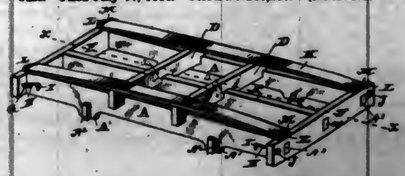


407,612.

anism and having one or more coils or turns of the wire thereon, substantially as set forth.

2. In a wire-drawing apparatus, the combination of a delivery-drum, a drawing-die, a mechanism for exerting a pull on the wire, and a continuously-rotating drum having a surface speed equal to or greater than the pulling mechanism, having one or more coils or turns of the wire thereon, substantially as set forth.

407,613. WHEEL. SEBASTIAN RITTY, Dayton, Ohio. Filed Sept. 15, 1888. Serial No. 285,491. (No model.)

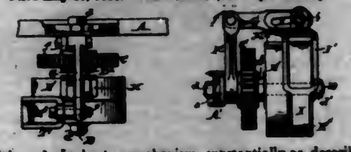


Claim.—1. The combination, substantially as hereinbefore set forth, of the tire, the spokes, the shouldered center box having polygonal seat, the inner hub-rim having waved flange with sockets, the outer hub-rim having correspondingly-waved flange and sockets, and the confining-nut.

2. The combination, substantially as hereinbefore set forth, of the tire, the spokes, the shouldered center box having polygonal seats, the inner hub-rim having waved flange with sockets and re-entrant and salient angles, the outer hub-rim having correspondingly-waved flange and sockets, the fastening-bolts passing through said flanges, and the confining-nut.

3. The combination, substantially as hereinbefore set forth, of the tire, the spokes, the shouldered center box having polygonal seats, the inner hub-rim having waved flange with sockets at re-entrant and salient angles, and shoulders at the inner ends of said sockets, the outer hub-rim having corresponding waved flange, sockets, and shoulders, the fastening-bolts passing through said flanges, and the confining-nut.

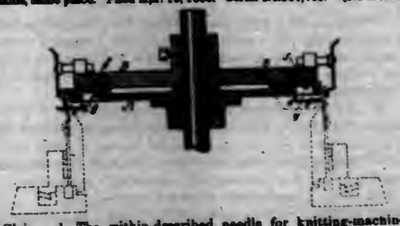
407,614. HAY-RACK. ADAM RUTHERFORD and JESSE RAMUS, Beall, Ohio. Filed July 17, 1888. Serial No. 280,216. (No model.)



Claim.—1. In a hay-rack, the combination of the side pieces formed with open-ended slots in their upper edges and with reduced ends, the cross-pieces formed with open-ended slots in their lower edge to receive the slots in the side pieces, the end pieces formed with openings to receive the reduced ends of the side pieces and removably secured to the ends of the said side pieces, longitudinal top pieces, and keepers secured to the upper edge of the said end pieces to receive the ends of the longitudinal top pieces, substantially as described.

2. In a hay-rack, the combination of the side pieces formed with open-ended slots in their upper edges and with reduced ends, the cross-pieces formed with open-ended slots in their lower edge to receive the slots in the side pieces, the end pieces formed with openings to receive the reduced ends of the side pieces, longitudinal top pieces, keepers secured to the upper edge of the said end pieces to receive the ends of the longitudinal top pieces, and a longitudinal brace provided with open-ended slots to receive the cross-pieces and with reduced ends to engage openings in the end pieces, substantially as and for the purpose specified.

3. In a hay-rack, the combination of the end pieces, the side pieces provided with slots and having their ends connected to said end pieces, the cross-pieces fitting in the slots of the side pieces, and the longitudinal top pieces having their ends secured to the said end pieces and serving to retain the cross-pieces in place, substantially as described.



407,615. BRAKE MECHANISM. OTTO W. SCHAUB, Philadelphia, Pa. Filed May 13, 1889. Serial No. 310,553. (No model.)

Claim.—1. In brake mechanism, substantially as described, the combination of a movable stud-shaft adapted to support a fast and loose pulley, and a driving-pinion, with a brake-supporting standard connected directly with said stud-shaft, all substantially as and for the purpose specified.

2. In brake mechanism, substantially as described, the combination of a movable stud-shaft adapted to support a fast and loose pulley, and a driving-pinion with a brake-supporting standard formed integral with said stud-shaft, all substantially as and for the purpose specified.

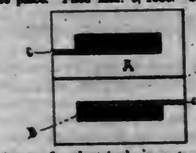
407,616. KNITTING-MACHINE AND NEEDLE THEREFOR. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, same place. Filed Apr. 19, 1889. Serial No. 307,765. (No model.)

Claim.—1. The within-described needle for knitting-machines, said needle consisting of a wire bent to form a guide-shank with projecting bit, and a depending arm terminating in a stitch-forming shank in a different plane from the guide-shank of the needle, substantially as specified.

2. The combination of the radially grooved and slotted dial and a cam-plate, with needles having stems guided in the radial grooves in said dial, bits for engagement with the cams of the plate, and depending arms passing through the radial slots of the dial and terminating in stitch-forming shanks below said dial and free from contact with any radial guiding devices, substantially as specified.

407,617. CENTERING DEVICE. FREDERIC A. SEAVER, Hartford, Conn. Filed Apr. 9, 1889. Serial No. 306,613. (No model.)

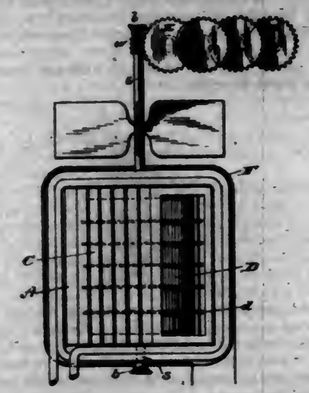
Claim.—1. In combination with a retaining-spring, the angular arms having the adjacent clamping-jaws with the flaring working-faces, all substantially as described.



2. In combination with angular arms having clamping-faces and the angularly-disposed working-faces, the cross-bar uniting the two arms, and the spring operating to normally hold the clamping-faces of the arms in contact, all substantially as described.

407,617.

3. In combination, the angular arms having the clamping-faces and the angularly-disposed working-faces, the cross-bars fast to one of the arms and projecting beyond the opposite arm, and the retaining-spring, all substantially as described.



407,618. CORE FOR CONVERTERS. MARMADUKE M. M. SLATTERY, Fort Wayne, Ind., assignor to the Fort Wayne Electric Light Company, same place. Filed Mar. 6, 1889. Serial No. 302,516. (No model.)

Claim.—1. A core for electrical converters or transformers, consisting of two sets of superposed iron plates laid side by side, each plate of a rectangular form divided at the side opposite to the divided side in the corresponding plate of the pair, substantially as shown and described.

2. A compound plate for a converter-core, consisting of two thin flexible laminæ of iron, each with a central opening to embrace the wire coils, and each slitted at one end to permit its being opened and placed upon the coils, the two laminæ to be laid one above the other with no insulation between them and with the slitted ends opposite each other.

407,619. ELECTRIC METER. MARMADUKE M. M. SLATTERY, Fort Wayne, Ind., assignor to the Fort Wayne Electric Light Company, same place. Filed Mar. 14, 1889. Serial No. 303,216. (No model.)

Claim.—1. An electric meter consisting of a fixed coil traversed by alternating currents, a second coil the circuit of which is closed upon itself, fixed in inductive relation with said first coil and with its plane intersecting the plane of the first coil, a moving part consisting of a closed electrical conductor free to rotate placed in inductive relation with the two fixed coils aforesaid, a shunt-coil in a circuit derived from points in the circuit of the first-named coil having a difference of potential between them less than that operating in the circuit of the first-named coil and superadded to said first-named coil, and a retarding and regulating device and registering mechanism.

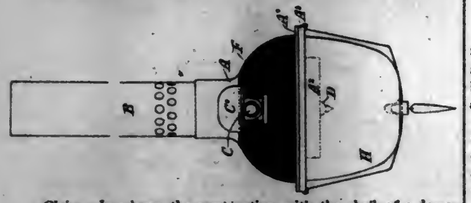
2. In an electric meter for alternating currents, the combination of a coil connected with a source of alternating current, a fixed closed coil or conductor whose plane is disposed angularly toward the plane of said first coil and in inductive relation therewith, a moving part free to rotate placed in inductive relation with both said coils, and consisting of a cylinder of diamagnetic conducting material whose axis is the axis of rotation, with disks of magnetic material

attached thereto whose planes are in the plane of rotation, and a derived or shunt circuit of a lower potential than that between the terminals of the working-circuit, so disposed as to re-enforce the inductive action of the first and second coils upon the moving part, together with a retarding and regulating device and registering mechanism.

3. In an electric meter for measuring alternating currents containing a primary inducing-coil, a secondary inducing-coil, and a moving part actuated by induction from said coils, a shunt-coil in a circuit of lower potential than that between the terminals of the working-circuit, so disposed as to assist the primary coil for initial action.

407,620. HEDDLE FOR JACQUARD LOOMS. GEORGE W. STAFFORD, Providence, R. I., assignor to the Geo. W. Stafford Manufacturing Company, same place. Filed May 14, 1888. Serial No. 310,735. (No model.)

Brief.—The objects of the invention are to prevent the cramping of the warp-thread as it passes through the eye of the heddle, which is due to the twisting of the heddle, and to diminish the wear upon adjacent warp-threads.

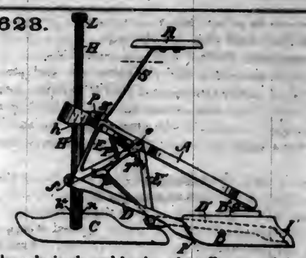


Claim.—As a new article of manufacture, a heddle and linge for Jacquard looms made of a single piece, substantially as shown and described, having its upper end prepared to receive the harness-cord and having an eye for the warp-thread made in it without flattening the body of the heddle, so that the diameter in all directions at the eye shall be about the same as the rest of the heddle.

407,621. PIN FOR PATTERN-CHAINS FOR LOOMS. GEORGE W. STAFFORD, Providence, R. I., assignor to the Geo. W. Stafford Manufacturing Company, same place. Filed May 27, 1889. Serial No. 312,211. (No model.)

Claim.—As a new article of manufacture, a pin for pattern-chains for looms, constructed substantially as described—that is, having a portion of the pin for insertion in the bar of a pattern-chain made with one or more longitudinal grooves therein, substantially as shown.

407,622. INVERTED GAS-LAMP. DAVID W. SUGG, Westminster, England. Filed Jan. 23, 1888. Serial No. 260,002. (No model.) Patented in England Feb. 21, 1884, No. 3,707; in France Mar. 28, 1885, No. 167,943; in Belgium Nov. 21, 1885, No. 70,887; in Italy June 30, 1886, XXXIX, 394; in Spain Sept. 18, 1886, No. 9,483, and in Austria-Hungary Oct. 1, 1886, No. 20,909.

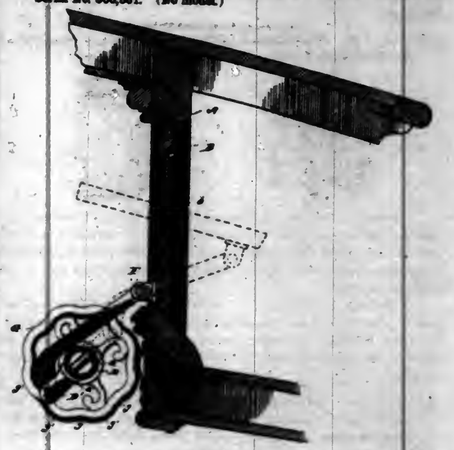


Claim.—In a lamp, the combination, with the shell, of a downwardly-extending gas-tip, a cylindrical apron having a closed upper end and an open lower end surrounding said gas-tip at such distance therefrom as to leave an annular air-space between said apron and the gas-tip, air-tubes opening upon the outside of said shell and communicating with the interior of said apron, perforations in said gas-tip below the lower end of said apron and extending obliquely to the axis of the gas-tip, a deflector at the lower end of said apron, a petticoat having open upper and lower ends and surrounding said apron at a distance therefrom, a perforated air-distributer between said petticoat and the outside of the lamp, and a cup-shaped globe secured upon the lamp into which the gas-tip extends and which receives the air from said air-distributer to be passed to the under side of the flame, substantially as specified.

407,623. VELOCIPEDE-SLED. SYLVANUS J. TALBOT, Milford, N. H., assignor of one-half to John McLane, same place. Filed Dec. 17, 1888. Serial No. 293,311. (No model.)

Claim.—1. A velocipede-sled consisting of a backbone hinged at the rear to a sled-bob, in combination with propelling-bars and a steering-rod provided with a rudder at the lower end thereof, all arranged and operated substantially as and for the purposes described.

2. In a velocipede-sled, a triangular-shaped one-piece spring-actuated bell-crank lever pivoted near one corner to the inclined back-



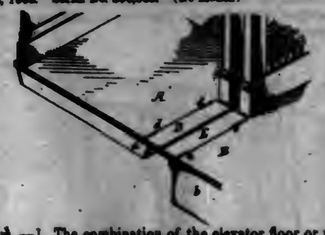
407,628.

bone of the velocipede and having pivotally secured thereto, near its other two corners, a pedal and a rearwardly-projecting propelling-bar provided with a claw, substantially as and for the purposes described.

3. In a velocipede-sled, a steering-rod, in combination with a rudder secured thereto at a point in advance of the center, substantially as and for the purposes described.

407,624. TRANSOM-LIFTER. AARON TWYMAN, Pullman, assignor to the Pullman's Palace Car Company, Chicago, Ill. Filed Feb. 23, 1889. Serial No. 300,881. (No model.)

Claim.—1. In a transom-operating device, the combination, with an operating-rod and a transom-arm pivotally connected thereto, of a hand-wheel for the operating-rod, and a locking-spring secured to bear yieldingly on the periphery thereof, whereby to lock the operating-wheel, substantially as described.

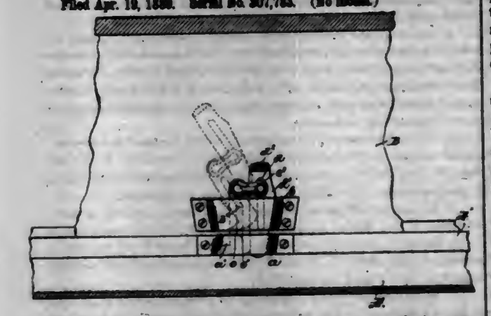


2. In a transom-operating device, the combination, with an operating-rod and one or more transom-arms pivotally connected thereto, of a hand-wheel for the operating-rod having a fluted rim, and a curved locking-spring secured to bear yieldingly upon the said rim, whereby to lock the operating-rod, substantially as described.

407,625. LIFE-PRESERVING BUOYANT BAG. SALVADOR M. Y VALDIVIELSO, Paris, France. Filed Apr. 11, 1889. Serial No. 306,776. (No model.) Patented in England Nov. 17, 1887, No. 15,796.

Claim.—The herein-described buoyant bag, composed of the canvas lining or inner bag A, the outer canvas jacket B, the inflatable air-pocket C D, located between and cemented to said lining and jacket, the inner fabric E, extended from the upper end of said air-pocket to near the top of the outer jacket, thereby forming a covering for the mouth of the inner bag A, the blow-pipe F, for inflating the air pocket, and a locking-handle G H, for the mouth of the outer jacket, substantially as specified.

407,626. ELEVATOR. ROBERT J. WALKER, Philadelphia, Pa. Filed Feb. 4, 1889. Serial No. 298,582. (No model.)



Claim.—1. The combination of the elevator floor or platform, the building-floor, a section pivoted to the elevator-floor and a section pivoted to the building-floor, said pivoted sections filling the space between the floor of the elevator and the floor of the building, and acting substantially in the manner and for the purpose described.

2. The combination of an elevator, the pivoted floor-sections thereon, and pivoted levers projecting into the elevator-well at the different floors of the building and adapted to come in contact with the pivoted floor-section of the elevator on the descent of the elevator, so that the said pivoted section will act as a bridge-piece for the removal of freight from or onto the elevator, substantially as described.

3. The combination, in an elevator, of the floors of the building and pivoted floor-sections thereon, with levers on the elevator which come in contact with and raise said pivoted floor-sections on the ascent of the elevator, so as to form bridge-pieces over which trucks can be moved, substantially as described.

4. The combination of the elevator with the floors of a building, a pivoted floor-section on said elevator and a pivoted floor-section on the different floors of the building, with lugs on the floor-sections of the building and levers on the elevator acting on said lugs, and with lugs on the floor-section of the elevator and levers at or near the different floors of the building which project into the elevator-well and come in contact with the lugs on the pivoted elevator-section, substantially as and for the purpose described.

407,627. WAGON-SEAT LOCK. DANIEL D. WHITNEY, Cornwall, N. Y., assignor to the Whitney Coupling Company, Whitinsville, Mass. Filed Apr. 19, 1889. Serial No. 307,783. (No model.)

Claim.—1. A wagon-body having a latch-engaging device, combined with a wagon-seat having attached thereto a holder *b*, provided with a pin *b'*, a slotted latch pivoted thereon and movable longitudinally in said holder, and a key or wedge for and loosely connected to said latch, also longitudinally movable in the holder, such movement of the key disengaging the latch, substantially as described.

2. A wagon-body having a latch-engaging device, combined with a wagon-seat having a latch pivoted thereto, movable longitudinally, and also adapted to turn on its pivot to withdraw it from the engaging device, and a key or wedge loosely connected with and employed to lock the latch, withdrawal of said key effecting the disengagement of the latch, substantially as described.

3. A wagon-body having a latch-engaging device, combined with a wagon-seat having a latch *c*, slotted to receive the pin *b'*, the arm c^3, having a pin or stud thereon, and the slotted key or wedge *d'*, and holder for the latch, substantially as described.

407,628. CULTIVATOR. HARRY WIARD and JAMES L. JUDD, Syracuse, N. Y. Filed Dec. 3, 1888. Serial No. 292,490. (No model.)

Claim.—1. The combination, with a cultivator-frame formed with a central longitudinal bar, of convex cheek-pieces rigidly secured to opposite sides of said central bar, handles secured at their front ends to the convex sides of the said cheek-pieces and adapted to slide thereon, and two standards formed in one piece mounted adjustably

407,628.

on the rear end of the frame and supporting the handles, substantially as set forth.

2. The combination of a cultivator-frame formed with a central longitudinal bar, convex cheek-pieces secured to opposite sides of said bar and provided with a transverse bolt-hole flared from the bar outward, handles resting with their front ends against the convex sides of said cheek-pieces, a bolt passing through the handles and the aforesaid flaring hole of the cheek-pieces and through the longitudinal bar, and props mounted laterally adjustably on the frame and supporting the handles, substantially as described and shown.

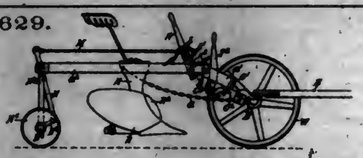
3. The combination of the cultivator-frame formed with integral spreader-arms at the rear end, handles adjustably connected at their front ends to the said frame, and a U-shaped frame or brace connected to the handles and mounted laterally adjustably on the aforesaid spreader-arms and clamped thereon in their adjusted position, substantially as set forth.

4. The combination of a cultivator-frame formed with a central longitudinal bar and side bars hinged at their front ends to the central bar and terminating with overlapping inward-extending spreader-arms at their rear ends lying across the central bar, the handles connected adjustably at their front ends to the aforesaid central bar, props united at their bases by a horizontal cross-bar formed integral therewith and seated thereby on the overlapping ends of the aforesaid spreader-arms and connected at their upper ends to the handles, and a clip embracing the rear end portion of the central bar and the overlapping spreader-arms and base of the props and adjustably clamping said parts together, substantially as described and shown.

5. In combination with the cultivator-frame formed with a central longitudinal bar and side bars hinged at their front ends to the said central bar and terminating with overlapping inward-extending spreader-arms at their rear ends, a cylindrical block straddling vertically the central bar, the handles resting with their front ends against opposite sides of said block, a tie-bolt passing transversely through said ends of the handle and through the intervening block and bar, props formed in one piece with a horizontal bar at the base and seated thereby upon the aforesaid spreader-arms, and a clip embracing the rear end portion of the central bar, segmental arms, and base of the props, and adjustably clamping said parts together, substantially as described and shown.

6. The combination of the frame provided with the horizontal slot *a*, the standard *b*, pivotally connected to said frame and formed with the extension *b'*, provided with the bolt-hole *c'* and with bolt-holes *c'' c''* at a greater distance from the pivotal connection of the standard and at different elevations than the bolt-hole *c'*, and a bolt passing through one of said holes and through the slot *a*, substantially as described and shown.

7. The combination of the cultivator-frame having the side bar D, formed with the segmental curved portion *d*, disposed in a horizontal plane, and a standard or tooth-shank formed with a correspondingly horizontally-curved attaching end terminating with a concave bearing and clamped adjustably and directly on the aforesaid curved portion of the side bar, substantially as described and shown.



8. The combination of the cultivator-frame having the side bar D, formed with the segmental curved portion *d*, disposed in a horizontal plane and provided with horizontal slots *e e*, the standard *f*, formed with a correspondingly horizontally-curved attaching end terminating with a concave bearing and provided with holes, and attaching-bolts passing through said holes and slots *e e* and adjustably clamping the said standard on the side bar, substantially as described and shown.

9. The combination of the cultivator-frame having the side bar D, formed with the segmental outwardly-deflected portion *d*, disposed in a horizontal plane, and provided with the horizontal slots *e e*, the standard *f*, formed with the forward extension *f'*, terminating with the vertically-enlarged portion *f''*, concaved on its inner side and provided with the bolt-hole *c* and bolt-holes *c' c' c'* at different elevations, and attaching-bolts passing, respectively, through the hole *c* and one of the holes *c' c' c'* and through the slots *e e*, substantially as described and shown.

407,629. PLOW. MALCOLM WILSON, London, Ontario, Canada, assignor to David Smith, same place. Filed Feb. 16, 1889. Serial No. 300,186. (No model.)

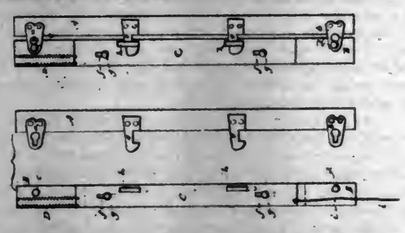
Claim.—1. The bearing plate or block C^3, having socket C^4, formed therein, in combination with the frame A and axle C, and means for securing them together, substantially as shown and described, and for the purpose specified.

407,629.

2. The combination of the jointed frame A, the bearing plate or block C^3, pivotally secured thereto, the chains G G, the lever K, the anti-friction roller K', rod M, pivotal bar N, link N^3, arm N^4, and caster-wheel N^3, substantially as shown and described, and for the purpose set forth.

3. The combination, with the frame A, of the lever K, anti-friction roller K', rod M, pivotal bar N, link N^3, arm N^4, and caster-wheel N^3, revolving on bearings secured to or in the arm N^4, substantially as shown and described, and for the purpose specified.

4. The combination of the bearing plate or block C^3, jointed to frame A, lever K, and anti-friction roller K', in combination with the rod M, pivotal bar N, link N^3, arm N^4, and caster-wheel N^3, substantially as shown and described, and for the purpose specified.



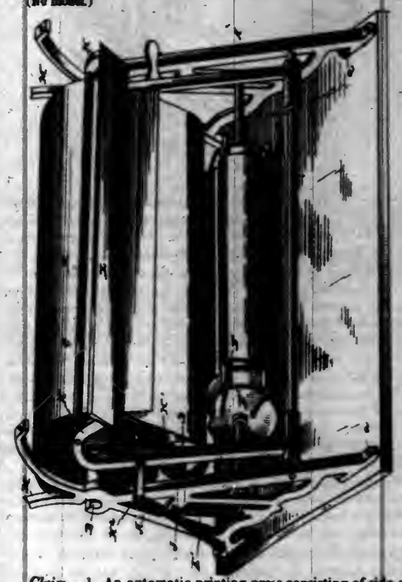
5. The combination of the jointed frame A, having recesses a^3 therein, lever K, anti-friction roller K', dogs K^3, trip L, and connection L', substantially as shown and described, and for the purpose specified.

6. The combination of the jointed frame A, the bearing plate or block C^3, the chains G G, the standards H, plows R, cutters R^3, the lever K, the anti-friction roller K', rod M, pivotal bar N, link N^3, arm N^4, and caster-wheel N^3, substantially as and for the purpose set forth.

7. The combination of the jointed frame A, bearing plate or block C^3, axle C, secured in socket C^3 in the bearing C^3, and a portion T of the axle C formed round in cross-section, the tube T', lever T^2, spring-actuated dog T^3, arm P, and segment C^3, having perforations C^3 formed therein, and the wheels W W', substantially as shown and described, and for the purpose set forth.

8. The combination of the jointed frame A, bearing plate or block C^3, axle C, chains G G, standards H, plows R, cutter R^3, bracket S^2, casting S', bracing-roller S, lever K, anti-friction roller K', rod M, pivotal bar N, link N^3, arm N^4, and caster-wheel N^3, substantially as shown and described, and for the purpose specified.

407,630. CORSET-CLASP. LOUIS WILKIN, New Haven, Conn., assignor of one-half to Max Adler, same place. Filed Apr. 22, 1889. Serial No. 308,120. (No model.)



Claim.—1. The combination of the two busks A B, the one provided with an eye at each end and the other with corresponding studs, and one busk provided with one or more stationary hooks projecting from the meeting edge of the busk, a vertically-sliding plate C on the other busk, the said sliding plate constructed with loops corresponding to the said hooks, and a spring between the said sliding plate and its busk, the tendency of which is to yieldingly hold the said plate in the position to interlock with the hooks, substantially as described.

2. The combination of the two busks A B, constructed to engage each other when in the closed position to prevent longitudinal movement of one independent of the other, one of said busks constructed with hooks projecting from its meeting edge, a vertical sliding plate C on the other busk, the said plate constructed with loops corresponding to said hooks, and a spring between the said sliding plate and its busk, the tendency of which is to yieldingly hold said plate in position to interlock with the hooks, substantially as described.

3. The combination of the two busks A B, constructed to interlock the one with the other to prevent vertical movement, with a vertically-sliding plate on one busk, the said sliding plate and the other busk provided the one with loops and the other with corresponding hooks, and a spring between the said sliding plate and its busk, the tendency of which is to yieldingly hold the said plate in position to interlock said loops and hooks, substantially as described.

407,631. AUTOMATIC PRINTING DEVICE. HORSBURY B. BARRADALL, Dallas, and ANDREW J. BRADLEY, Fort Worth, Tex.; said Barradall assignor to said Bradley. Filed July 11, 1888. Serial No. 279,601. (No model.)

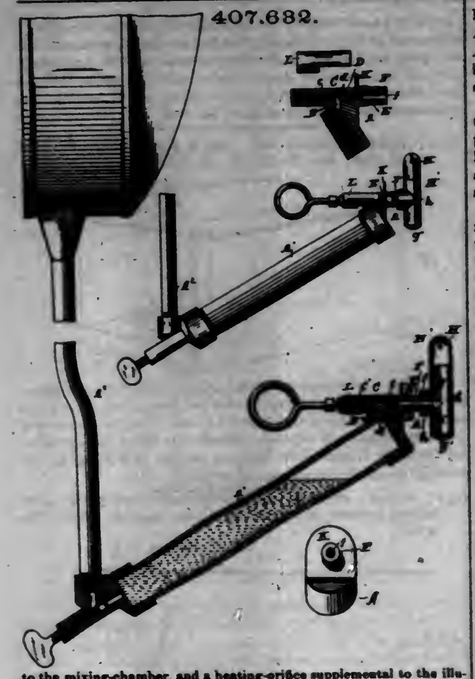
Claim.—1. An automatic printing-press consisting of side pieces, the shaft B for the paper roll, the impression-roller D, the type-roller E, said shaft, impression, and type rollers having bearings in said side pieces, and the type-roller journal having springs attached thereto and to the side pieces, an inking device, and a swinging frame carrying a cutter and roller, the said roller and cutter being parallel to said shaft B, said parts being combined substantially as described.

2. An automatic printing-press having a shaft for the paper roll suitably mounted in the frame thereof, an impression-roller below said shaft and parallel therewith, a type-roller rotated by the movement of said shaft and impression-roller, and a swinging arm having a roller parallel to said shaft and provided with a cutter, said parts being combined substantially as described.

3. The side pieces A A, in combination with the shaft B, journaled in said end pieces, the impression-roller D, the type-roller E, the end plates F, the rollers F, having bearings in said plates, and the absorbent G, passing around the rollers F, substantially as described.

4. In an automatic printing-press, the impression-roller D, suitably journaled in end pieces A A, in combination with the type-cylinder E, the springs E', secured to the axle of said cylinder E and to the side pieces A A, the plates F' on said cylinder-axle, and rollers F and absorbent G, substantially as described.

5. In an automatic printing-press, the swinging frame H, pivoted to the end pieces A A, the springs J, connected to said frame and end pieces, the roller K, journaled in said swinging frame, and the knife L, secured at its ends to said frame H, said parts being combined substantially as and for the purpose set forth.



407,632. VAPOR-BURNER. HENRY S. BELDEN, Canton, Ohio. Filed May 23, 1887. Serial No. 239,093. (No model.)

Claim.—1. In a vapor-burner, the combination of the downpipe, the burner and unpacked retort-chamber enlarged relatively to the downpipe and inclined substantially as set forth, whereby the top surface of oil in the retort-chamber can be enlarged and a body of oil can be utilized to prevent recoil, a vertical vapor-passage, as at B, extending up from the retort, a horizontally-arranged needle-valve above the retort, a valve-chamber therefor on top of the retort, and an air-mixing chamber between the needle-orifice and the burner, substantially as set forth.

2. In a vapor-burner, the combination, with the retort, of a horizontally-arranged needle-valve above the retort, the valve-chamber therefor, the horizontal mixing-chamber communicating with the valve-chamber, the vertical gas holder or chamber transverse to the mixing-chamber, the burner-tip above the gas-holder, and the jet-orifice in the wall of the gas-holder, substantially as set forth.

3. A vapor-burner having a burner-tip with an orifice for an illuminating-flame, a mixing-chamber with an orifice for admitting air

407,632.

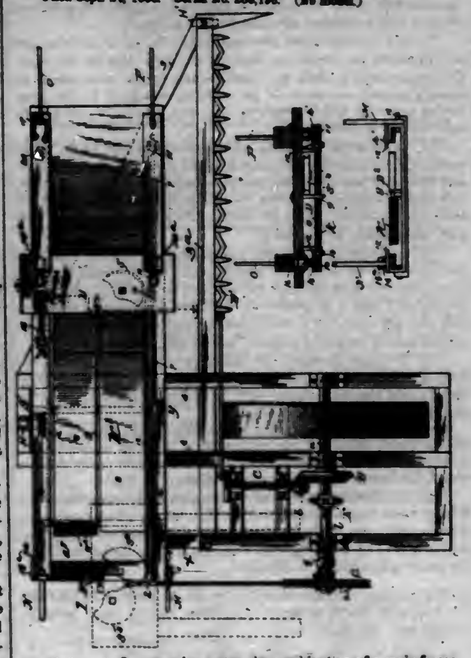
to the mixing-chamber, and a heating-orifice supplemental to the illuminating-jet orifice and formed on a line converging with the line of the said air-orifice, whereby it is adapted to direct a jet of vapor against the metal surrounding said air-orifice, substantially as set forth.

4. A vapor-burner having a burner-tip with an orifice for an illuminating-flame, a gas-chamber directly below said tip, a horizontally-arranged mixing-chamber communicating with the gas-chamber, an orifice for the admission of air to the mixing-chamber, whereby the air and vapor are mingled prior to entering the vertical gas-chamber, and a heating-jet orifice or duct leading from the gas-chamber and directed toward the metal around the air-orifice, substantially as set forth.

5. A vapor-burner having a burner-tip with an orifice for an illuminating-flame, a gas-chamber directly below the burner-tip, an orifice for the admission of air to the gas-chamber, and a heating-orifice supplemental to the illuminating-orifice and situated below the air-orifice, whereby the flame from the heating-orifice rises and bears against the metal around the air-orifice, substantially as set forth.

6. A vapor-burner having a burner-tip with an illuminating-jet orifice, a mixing-chamber, a vapor-orifice communicating with the duct in said mixing-chamber, an air-orifice for admitting air to said duct, a gas-chamber having a duct for the mingled vapor and air situated at an angle to the duct in the mixing-chamber, and having a heating-jet orifice supplemental to the illuminating-jet orifice, and directed to throw the heating-flame into immediate proximity to both the aforesaid vapor-orifice and air-orifice entering the mixing-chamber, substantially as described.

7. In a vapor-burner, the combination of the supply and retort tube A, the vertically-arranged duct B, the burner G H upon one side of said duct, the air-orifices E between the burner G H and the wall of the said duct B, the valve-chamber extending from the said duct B in the direction opposite to that of the burner, and the sleeve L, extending from the said air-orifice along the outside of the valve-chamber to a point on the opposite side of the duct B, and adapted to slide loosely on said valve-chamber, substantially as described.



8. The combination, with the downpipe, of the unpacked pipe A', of larger diameter than the downpipe, whereby an enlarged surface of oil is presented and recoil is prevented, the air mixing chamber on the top of said pipe A' and arranged horizontally, and a vertically-arranged gas-holder with its wall situated transverse to the said mixing-chamber and having a heating-jet orifice, and a burner-tip at the upper end of said gas-holder having an illuminating-jet orifice supplemental to the heating-jet orifice, substantially as set forth.

9. The combination of the downpipe, the unpacked pipe A', inclined to the horizon and enlarged relatively to the downpipe, the horizontal mixing-chamber, the duct B, extending upward from pipe A', the needle-valve arranged on a line diverging from the axis of pipe A', the vertical gas-chamber communicating with the horizontal mixing-chamber, and the burner-tip at the top thereof, substantially as set forth.

10. The combination, with the inclined unpacked pipe A', adapted to hold a body of oil in its lower end and a body of vapor in the upper end, of the cap-piece for said pipe, formed with a mixing-chamber having air-orifices and the valve-chamber, the walls of the said valve and mixing chambers being cast integrally with the said cap and situated above and inclined to it, substantially as set forth.

11. In a vapor-burner, the combination, with a horizontally-arranged mixing-chamber, a horizontally-arranged needle-valve and valve-orifice, and a vertically-arranged vapor-holder with a vertically-arranged burner-tip at the upper end, a closed lower end, and a heating-jet orifice supplemental to the illuminating-orifice, said parts being arranged substantially as set forth, whereby the vapor is forced from the valve-orifice on one line through the mixing-chamber and on another line through the vapor-holder to the burner-tip, substantially as set forth.

407,633. CORN-HARVESTER. TAYLOR BOOM, Delaware, Ohio. Filed Sept. 24, 1888. Serial No. 286,196. (No model.)

Claim.—1. In a corn-harvester, the combination of a main frame, a driving-wheel, a sickle, a movable table on the frame, and automatically-operating devices for first moving the table laterally and then pivotally, substantially as described.

2. In a corn-harvester, the combination of a main supporting-frame, a main driving-wheel, a sickle, a laterally-movable table supported on the frame arranged to receive the shock of corn, and driving-connections between the movable table and the main driving-wheel, whereby said table may be moved to deliver the shock upon the ground, substantially as described.

3. In a corn-harvester, the combination of a main supporting-frame, a main driving-wheel, a sickle, a movable table in rear of the sickle for receiving the shock of corn, driving-connections between the movable table and the main driving-wheel, and an automatic clutch in said connection, substantially as described.

4. In a corn-harvester, the combination of a main frame, the driving-wheel and axle, the movable table in rear of the sickle for receiving the shock of corn and supported on the frame, a wheel loose on the axle of the main wheel and having clutch projections, a clutch splined on the axle, and a rope attached to the wheel and the movable table, substantially as described.

5. In a corn-harvester, the combination of the main frame and driving-wheel, the movable table, driving-connections therefrom to

the main driving-wheel, and the stop projections D D², which stop the table and on which the table is caused to have pivotal movement by the driving-connections, substantially as described.

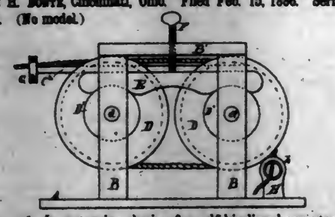
6. In a corn-harvester, the combination of the main driving-wheel and frame, the sickle, the laterally-movable table supported on the frame, driving-connections from said table to the main driving-wheel, a clutch in said connection, and means for automatically operating said clutch, substantially as described.

7. In a corn-harvester, the combination of the main supporting frame and driving-wheel, a sickle, a laterally-movable table on the frame, driving-connections from the table to the main driving-wheel, the segment on the table forming a part of said connections, the stops D D², adapted in connection with the segment and driving-connections to cause pivotal movement of the table, and a track on the frame adapted to control the movement of the table and prevent its pivotal movement until the stops D D² engage with each other, substantially as described.

8. In a corn-harvester, the combination of the main frame and driving-wheel, the sickle, a laterally-movable table, driving-connections between said table and the main driving-wheel for moving the table laterally, means for causing pivotal movement of the table, and a track extending laterally of the frame and arranged to prevent displacement or pivotal movement of the table until it reaches the end of its lateral movement, substantially as described.

9. In a corn-harvester, the combination of the main frame and driving-wheel, the sickle, the laterally-movable table on the frame, driving-connections from the driving-wheel to the table, means for causing pivotal movement of the table, the tracks K K', the latter having a groove, and the roller on the table moving in said groove, substantially as described.

10. In a corn-harvester, the combination of the main frame, wheel, and sickle, the movable table arranged to receive the shock of corn, said table carrying a movable arm for engaging and holding the corn, means for automatically moving the arm during the movement of the table, and automatic means for holding the arm in its adjusted position, substantially as described.



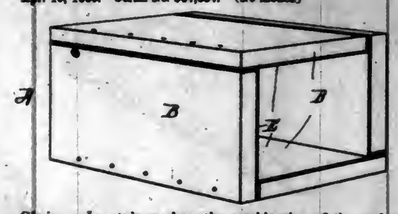
11. In a corn-harvester, the combination of the main frame and driving-wheel, the sickle, and movable table for receiving the corn-shock, the said table having a movable arm for engaging and holding the shock, a cam or projection on the frame for engaging said movable arm and operating it, and a holding-catch on the table for retaining the arm in its moved position, substantially as described.

12. In a corn-harvester, the combination of the main frame and driving-wheel, the sickle, the movable table, the movable arm carried thereby, and the catch on the table for holding said arm in its moved position, substantially as described.

13. In a corn-harvester, the combination of the main frame and driving-wheel, the sickle, the movable table, the arms carried by said table for engaging the shock, and the removable arms at the delivery end of the frame, substantially as described.

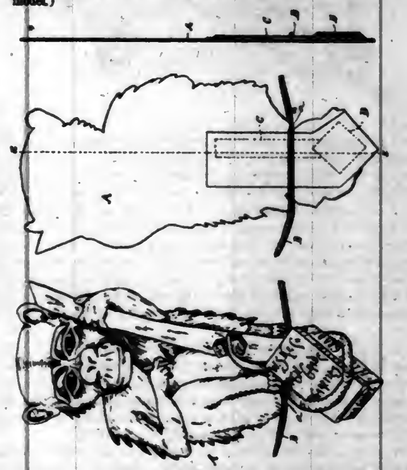
14. In a corn-harvester, the combination of the main frame and driving-wheel, the sickle, the movable table, the movable arm thereon, the removable arm at the delivery end of the frame, and a catch on the table adapted to engage and hold said arm to confine the top of the shock, substantially as described.

407,684. ROLLER-TENSION FOR SELF-BINDING HARVESTERS. George H. Dowr, Cincinnati, Ohio. Filed Feb. 15, 1886. Serial No. 191,945. (No model.)



Claim.—1. In a tension device for self-binding harvesters, the grooved rollers, each having a hub or drum D', the independent brake-piece E, resting upon the said hubs, and at the point where it so rests being hollowed to receive the hub, and the set-screw F, engaging a stationary support and pressing against the brake-piece E at a point between the hubs, substantially as and for the purposes specified.

2. In a tension device for self-binding harvesters, the grooved rollers and hubs or drums D', and independent brake-piece resting against the said hubs, and at the point where it so rests being hollowed to receive the hub, and the set-screw F, engaging a stationary support and pressing against the brake-piece E at a point between the hubs, and delivery-guide G, having the funneled-shaped eye, whose larger end is next to the rollers, substantially as and for the purposes specified.



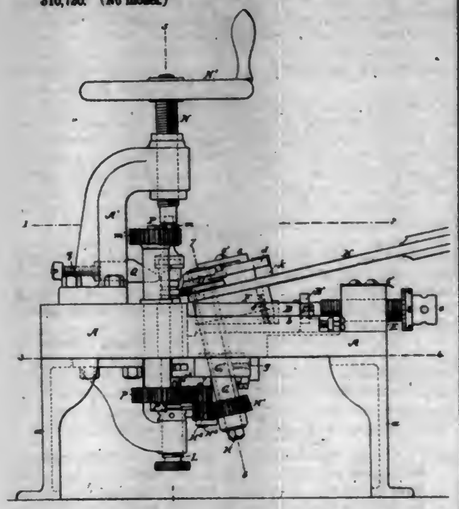
3. In a tension device for self-binding harvesters, the grooved rollers and hubs or drums D', and brake-piece E, in contact with said hubs, and hollowed to receive the latter, and the set-screw F, provided with stationary support, and between said rollers resting on the brake-piece E, and inlet and outlet guides, having funneled eyes, substantially as and for the purposes specified.

407,685. TOBACCO-BOX. John M. Brosius, Atlanta, Ga. Filed Apr. 19, 1889. Serial No. 307,857. (No model.)

Claim.—In a tobacco-box, the combination of the end pieces with the side pieces B, having thereon the lining-pieces E, covering one face and one edge placed adjacent to each other, the tinned nails G, driven through said adjacent sections of the lining, forming burrs, and the solder F, poured into the space between said linings E, substantially as and for the purpose set forth.

407,686. ORNAMENT AND ADVERTISING DEVICE. George W. Brower, Rochester, N. Y. Filed Apr. 4, 1889. Serial No. 305,931. (No model.)

Claim.—1. The combination, with the thin flat body portion having upon it the representation of an animate figure, of a sustaining cord or wire attached to the back of said body and extending transversely thereof, and a counter-weight secured to the back of the body below the cord, substantially as described.



2. In an advertising device, the combination, with the body portion formed of sheet material, of a sustaining cord or wire attached to said body, the counter-weight, and the pocket for the latter formed by the textile covering secured to the back of the body below the sustaining-cord, substantially as described.

3. In an advertising device, the combination, with the body portion formed of sheet material, of the sustaining cord or wire attached to said body, the counter-weight, and the recess in the side of the body at about the level of the cord, into which the latter projects to steady the body, substantially as described.

4. In an advertising device, the combination, with the body portion formed of sheet material, of a sustaining cord or wire, the stiffening-strip and counter-weight, and the pocket for the latter formed by the textile covering secured to the back of the body below the sustaining-cord, substantially as described.

5. In an advertising device, the combination, with a figure formed of sheet material—such as pasteboard—having on one side the pictorial representation of an object or body, of a counter-weight secured to the lower portion of the figure, and a suspension device, as a cord, secured to said figure above the center of gravity, substantially as described.

407,687. THIMBLE-EMBOSSING MACHINE. Joseph Brownell, Philadelphia, Pa., assignor to John F. Simons, Frederick M. Simons, and Edwin S. Simons, all of same place. Filed May 14, 1889. Serial No. 310,720. (No model.)

Claim.—1. The combination, in an embossing-machine, of the thimble-carrying spindle, the embossing-wheel having a concentric ring on which the figure is cut, and two eccentric rings, one inside the other, by which the position of the embossing-ring is varied, substantially as described.

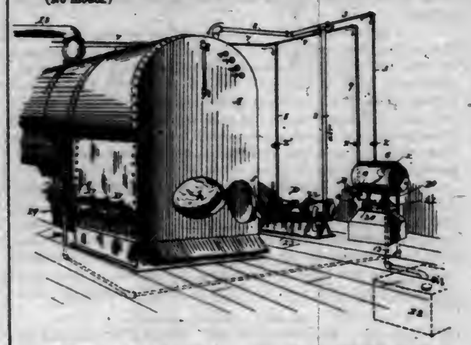
2. The combination, in an embossing-machine, of the vertical shaft, in which is mounted the thimble-carrying spindle, with a shaft carrying an embossing-wheel, and a handle therefor, said shaft being geared to the thimble-shaft, substantially as and for the purpose described.

3. The combination, in an embossing-machine, of the plate A, bearings therein, a thimble-shaft mounted in said bed-plate, with a slide B, carrying the embossing-tool, and a set-screw E for adjusting the slide B toward or from the thimble, with an arm B', carried by the slide and adapted to pass between the end of the set-screw and the slide, substantially as described.

4. The combination of the bed-plate A, the vertical thimble-carrying shaft C, with a slide B, adapted to ways on said frame, and a block in said slide carrying the embossing-tool, with mechanism for raising and lowering said block, by which the angle of the tool is varied, substantially as described.

5. The combination, in an embossing-machine, of the embossing-tool, a vertical thimble-carrying shaft having a pinion at its lower end, with a second shaft having a gear-wheel meshing with said pinion, and having at its upper end a second wheel meshing with a pinion on a spindle carrying the clamp for the head of the thimble, with mechanism for turning the shaft, so that when the shaft C turns the clamp for the head of the thimble will likewise be turned, substantially as specified.

6. The combination, in a thimble-embossing machine, of the thimble-carrying shaft and a clamp for the upper portion of the thimble, with the embossing-tool and a block Q, adapted to take the strain of the embossing-tool, substantially as described.

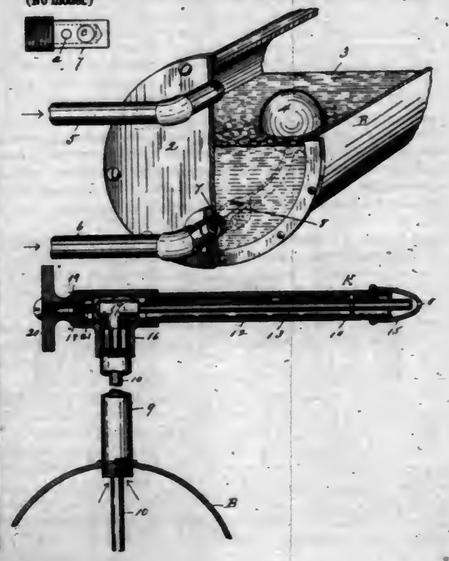


7. The combination, in an embossing-machine, of the bed-plate A, the slide B, a sleeve G, carried by said slide, with a shaft H, adapted to said sleeve and carrying at its upper end the embossing-tool and handle, and having at its lower end a bevel-wheel meshing with a bevel-pinion, which is geared to the thimble-carrying shaft, substantially as described.

8. The combination of the embossing-ring d', having an arm d, with the rings d^3 and d^5, a clamp e, and a set-screw d', by which the rings d^3 and d^5 are clamped to the ring d', substantially as described.

9. The combination, in an embossing-machine, of the embossing-wheel, its shaft and gear-wheel, with a thimble-carrying shaft, its pinion, an intermediate pinion, and intermediate wheel, said wheel being carried by a lever pivoted to the thimble-carrying shaft, but connected to the intermediate pinion, so that on the movement of the embossing-wheel toward or from the thimble the lever J will be moved, substantially as described.

10. The combination, in a thimble-embossing machine, of the hollow shaft C and spindle c therein, carrying the thimble to be embossed, with a clamp M, detachable from the spindle M', so that the thimble and clamp can be detached from the spindles, substantially as described.

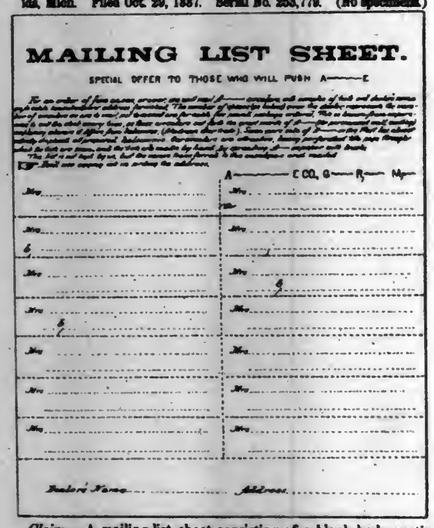


407,688. APPARATUS FOR BURNING HYDROCARBONS AS FUEL. James H. Bullard, Springfield, Mass., assignor to the Aerated Fuel Company, same place. Filed Feb. 6, 1888. Serial No. 263,128. (No model.)

Claim.—1. An apparatus for securing the combustion of hydrocarbons for fuel, consisting of a burner-tank and one or more burners connected therewith and a pipe leading to said tank from an air-compressor, a steam oil-pump having a pipe for conveying steam thereto and having therein a regulating-valve, an oil-tank connected by a pipe with said burner-tank and located at such a height relative to that of said burner-tank that a common oil-level may be maintained in each by the hydrostatic pressure of the oil, and a ball-cock in said oil-tank having a connection, as described, with said steam-pipe regulating-valve, substantially as described.

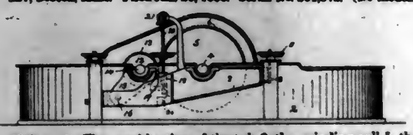
2. Apparatus for burning hydrocarbons for fuel, consisting of one or more burner-tanks, one or more burners attached to each of said tanks, combined with an oil-pump actuated by steam, having an oil-tank connected therewith supplied by said pump and connected with said burner-tanks by an oil-pipe, a steam-pipe conveying steam to said pump, a regulating-valve in said steam-pipe, and a ball-float in said oil-tank having a connection, as described, with said regulating-valve, and an air-pump having air-pipe connections with said burner-tanks and with said oil-tank, substantially as set forth

407,689. BURNER AND BURNER-TANK FOR HYDROCARBON FUEL. James H. Bullard, Springfield, Mass., assignor to the Aerated Fuel Company, same place. Filed Dec. 1, 1887. Serial No. 256,586. (No model.)



Claim.—1. A hydrocarbon-burner consisting of an air and oil reservoir, an oil-pipe communicating therewith, a nozzle connected to one end of said pipe, an air-pipe communicating with the air-space in the reservoir and with the nozzle, said oil and air pipes being adjustable in the nozzle with reference to each other, and a pipe by which compressed air may be conveyed to the reservoir, whereby the air-pressure in the reservoir serves to force the oil as well as an air-jet to the nozzle, and whereby by the adjustment of the nozzle the relative force of the air and oil jets may be regulated, substantially as described.

2. A hydrocarbon-burner consisting of an air-pipe in two sections, as described, united by a T-connection 16, having a hub screwed thereto, said pipe having a nozzle thereon in which is a discharge-aperture, a hydrocarbon-conducting tube within said air-pipe, consisting likewise of two sections united by a T-connection 17, having a screw-stud thereon, one end of said tube terminating within said nozzle, a sleeve 19, having a screw-connection with said stud, and a hand-wheel connected with said sleeve, combined and operating substantially as set forth.



3. The combination of a reservoir, an oil-pipe leading thereto, and a float-valve controlling said pipe, an air-supply pipe leading to said reservoir, an oil-escape and an air-escape pipe leading from the reservoir to a nozzle, and a screw-thread for adjusting one of these pipes with reference to the nozzle, whereby the air-pressure is made to control the flow of air and of oil from the reservoir, and the nozzle is made to control the final mixing of the same, substantially as described.

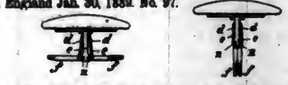
407,640. MAILING-SHEET LIST. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Oct. 29, 1887. Serial No. 253,779. (No specimens.)

Claim.—A mailing-list sheet consisting of a blank body portion having perforations dividing said portion into slips, printed lines on each slip for the names and addresses, a printed explanatory heading at the top of said sheet, and a blank for the dealer's name and address at the bottom of the sheet, substantially as described.

407,641. BEATING-ENGINE FOR PAPER-PULP. EDWARD CONLEY, Boston, Mass. Filed Jan. 20, 1888. Serial No. 261,372. (No model.)

Claim.—1. The combination of the tub 2, the grinding-roll 5, the lighter-beams 8 8, slotted at 17, a revolving bed-roll 12, and swinging arms 15 15, disposed in said slots, as and for purposes set forth.

2. In beating-engines for paper-pulp, a vertically-adjustable grinding-roll 5, lighter-beams 8 8, and the tub 2, having a mid-feather 3 and back-fall 10, combined with a revolving bed-roll 12, pivotal arms 15 15, and the movable sleeve-nuts 18 18, with their operating mechanism by which the bed-plate is adjusted toward or away from the grinding-roll, substantially as specified.



407,642. STEM WINDING AND SETTING WATCH. CONSTANT DIMCHERT, Montilier, near Morat, Freyburg, Switzerland. Filed Apr. 11, 1888. Serial No. 306,814. (No model.)

Claim.—1. The combination, with the crown and the lever actuated by the crown and its stem, of a yoke actuated by the lever for bringing the setting and winding wheels into action and a detent M for locking the lever both in the winding and in the setting position of the mechanism, substantially as described.

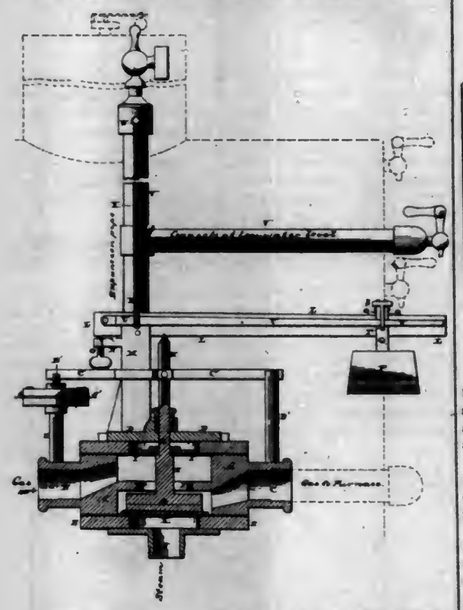
2. The combination, with the crown and the lever actuated by the crown and its stem, of a yoke actuated by the lever for bringing the setting and winding wheels into action and a detent M for locking the lever both in the winding and in the setting position of the mechanism, said lever being provided with a locking-shoulder L for holding the yoke in the setting position, substantially as described.

407,643. HINGED BUTTON. ROBERT W. A. DITTMANN, Hamburg, Germany, assignor to Aug. F. Richter, same place. Filed Apr. 3, 1889. Serial No. 305,818. (No model.) Patented in Germany May 27, 1888, No. 45,825; in Austria-Hungary Oct. 5, 1888, No. 32,716 and No. 39,112, and in England Jan. 30, 1889. No. 97.

Claim.—The herein-described improved button, consisting of the button having a hollow shank, the wings pivoted to said shank at their inner ends and having opposite notches and eccentric heads, and the U-shaped spring sliding in said shank and having lateral projections and bent ends inserted in said notches, substantially as set forth.

407,644. LOCKING RAIL-JOINT. PRESTON C. DOCKSTADER, Colorado Springs, Colo. Filed Mar. 19, 1888. Serial No. 267,779. (No model.)

Claim.—1. The combination, with the track-rails, of a chair provided with two arms embracing the rails and resting against the under surface of the heads of the rails, said arms being provided with longitudinally-inclined bearing-surfaces opposite the rail-flanges, wedges driven between the rail-flanges and the chair-arms and bearing laterally against the rail-web, said wedges being provided with a series of holes, and split keys driven into the said holes of the wedges against the rail, substantially as described.



2. The combination, with the track-rails provided with notches *c c* in their flanges, of a chair provided with two arms embracing the rails engaging the under surface of the head thereof, said arms being provided with longitudinally-inclined bearing-surfaces opposite the rail-flanges, and with lugs *a a* formed upon the base of the chair adjacent to the chair-arms and adapted to engage the said notches *c c* of the rails, and wedges inserted between the said inclined bearing-surfaces of the chair-arms and the rail-flanges, substantially as described.

3. The combination, with the track-rails, of a chair provided with two arms embracing the rails, and having a recess or channel extending lengthwise of the upper surface of the base of the chair and forming bearing-surfaces or ledges upon which the flanges of the rails rest, substantially as described.

4. The combination, with the track-rails, of a chair provided with two arms embracing the rails and engaging the under surface of the head thereof, said arms being provided at their lower parts with longitudinally-inclined bearing-surfaces opposite the rail-flanges, and wedges driven between the said inclined bearing-surfaces and the flanges and bearing laterally against the rail-web, said wedges being provided with funnel-shaped holes, substantially as described.

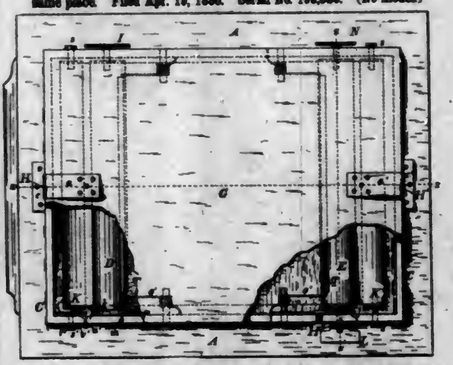
5. The combination, with the track-rails, of a chair provided with upwardly-extending converging arms on opposite sides of the rail constructed to engage the under surface of the rail-head, said arms being provided with longitudinally and transversely inclined surfaces opposite the rail-flanges, and having edges or corners at the inner margins of said inclined surfaces, and locking-wedges provided with ribs *i i*, constructed to engage the said edges or corners of the chair-arms, substantially as described.

407,645. GAS GOVERNOR OR REGULATOR. WILLIAM H. DOWNING, Goodell, Pa. Filed Mar. 15, 1889. Serial No. 303,424. (No model.)

Claim.—1. The combination of the regulator A, the valve G, the stem H, the weighted lever L, which bears upon the stem for regulating the flow of gas, and the diaphragm I, connected to the stem, the diaphragm K, and the pipe J, connected to a boiler or water-supply for shutting off the flow of gas when the limit of the steam-pressure is reached, substantially as set forth.

2. The combination of the pivoted lever L, the weight P, placed upon it and provided with a latch, a removable cap S, provided with a slotted guide R, a rod or lever U, pivoted to the lever S, the expansion-pipe, and a rod connected to the pipe and to the rod U, substantially as specified.

3. The combination of the regulator, a valve placed therein, a weighted lever for bearing upon the stem of the valve, and an expansion-pipe, a rod connected to the pipe, a rod or lever pivoted to the weighted lever, and the weight adapted to drop from its lever and which is operated by the rod U, substantially as shown.



4. In a gas-regulator, the combination of a valve, a weighted lever, expansion-pipe which is connected to the boiler, a rod connected to the expansion-pipe, a lever which is operated by the rod connected to the expansion-pipe, a detachable weight which is connected both to the lever and the rod which is pivoted thereto, and a diaphragm which is placed in the regulator for closing the valve when the weight is detached from the levers, substantially as described.

407,646. ANIMAL-TRAP. EPHRAIM L. DUNLAP, Kingfield, Me. Filed May 3, 1889. Serial No. 309,498. (Model.)

Claim.—The combination of the angular jaw A, provided with stop C and the sharp points B upon its lower end, the jaw D, provided with sharp points at one end and a crank or bend at its opposite end and pivoted upon the jaw A and having a projection I upon its inner edge, the spring H, connected at one end to the jaw A, the connecting-link G, which unites the ends of the spring and the jaw D together, the trigger J, pivoted to the jaw A and adapted to catch over the projection I upon the jaw D, and the notched hook L, pivoted to the jaw A and adapted to engage with the trigger, substantially as shown and described.

407,647. PHOTOGRAPHIC ROLL-HOLDER. GEORGE EASTMAN, Rochester, N. Y., assignor to the Eastman Dry Plate and Film Company, same place. Filed Apr. 19, 1886. Serial No. 199,339. (No model.)

Claim.—1. The combination, in a roll-holder, of the detachable front A, provided with the exposing-slide B, the detachable case C, sustaining the film-support F and inclosing the operating mechanism and the back G, and suitable means for attaching the front, casing, and back to each other, substantially as described.

2. The combination, in a roll-holder, of the front A, provided with the exposing-slide B, the casing C, sustaining the paper-support of the operating mechanism, the back G, and the spring-catches H H', substantially as described.

3. In a photographic roll-holder, the combination, with the detachable front A, provided with guards *g g'*, of the casing C, carrying the paper-support F and inclosing the operating mechanism, and the back G, substantially as described.

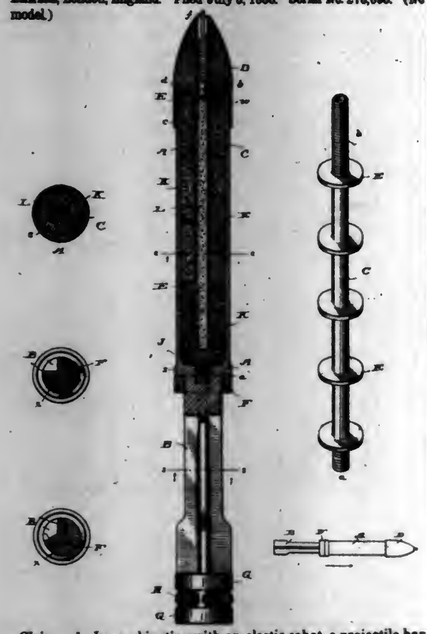
4. In a photographic roll-holder, the combination, with the reel E, of the clamp-bar R, provided with slotted arms *d d'*, substantially as described.

5. The combination, with the photographic roll-holder, of the guide-roll K, pinion *c'*, gear *t'*, stud *d'*, and indicator *r'*.

6. In a photographic roll-holder, an audible and visible indicator consisting of the revolving pin *r'* and spring *u'*, attached to the exterior of the case, substantially as described.

7. In a photographic roll-holder and in combination with the measuring-roll thereof, an audible and visible indicator, with intermediate gearing connecting them with the measuring-roll, substantially as described.

8. In a photographic roll-holder, the combination, with a detachable film-spool, of a friction-wheel mounted on the casing, a segmental clamp mounted upon said wheel and held in frictional engagement therewith by the spring of the material of which it is constructed, and a spring attached at one end to the casing and at the opposite end to the segmental clamp, substantially as described.



9. In a photographic roll-holder, a tension or film-straining device comprising a friction-clamp embracing a surface rotating in unison with the film-spool, and a spring engaging said friction-clamp to limit its motion, substantially as described.

10. In a photographic roll-holder, the combination, with the film-spool and a cylindrical friction-surface connected to rotate in unison with said spool, of a friction-clamp applied to and embracing said friction-surface, and a spring for restraining the movement of the friction-clamp, substantially as described.

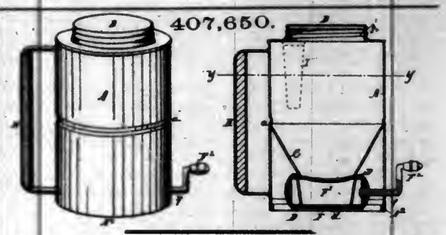
11. In a photographic roll-holder and in combination with the film-spool and grooved friction-wheel or surface, a friction-clamp occupying the groove in the friction-wheel and engaging the latter, and a device engaging said friction-clamp to restrain its motion in one direction only, substantially as described.

12. In a photographic roll-holder, the combination, with the circumferentially-grooved friction-wheel adapted to be connected to and rotated in unison with the film-spool, of a segmental friction-clamp sprung upon the friction-wheel, and a spring connected to said clamp, substantially as described.

407,648. PROJECTILE FOR SMOOTH-BORE GUNS. STEPHEN H. EMMENS, London, England. Filed July 3, 1888. Serial No. 278,893. (No model.)

Claim.—1. In combination with an elastic sabot, a projectile having a hollow cylindrical body constructed with a base portion which fits the bore of the gun behind the charge-chamber, a charge-chamber portion of reduced diameter and an open front end, a head having a rearwardly-projecting lip which fits the bore of the gun, and a charge-holder screwed down upon a suitable packing within the charge-chamber, substantially as hereinbefore specified.

2. A combined strut and charge-holder having axial screw ends and circular webs, in combination with a thin-walled body having an open front end, and a head screwed upon the front end of said strut and charge-holder and having a deep rearwardly-projecting lip, which overlaps said front end, substantially as hereinbefore specified.



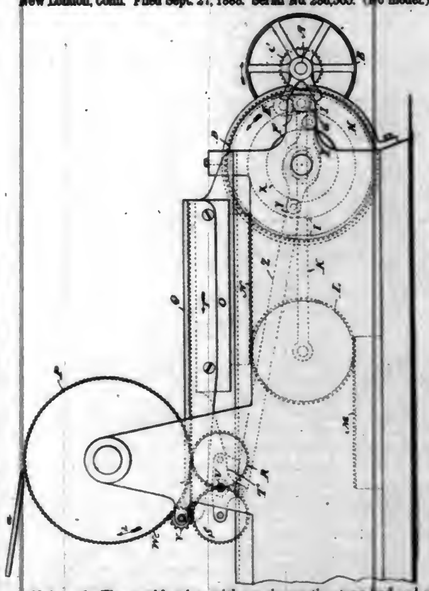
407,649. MANUFACTURE OF WRITING-SURFACES. KARL ENGLER, Horne, Kans. Filed Mar. 23, 1889. Serial No. 304,552. (Specimens.)

Claim.—A compound to be applied to painted objects for producing a writing-surface that can be written upon with an ordinary stick, consisting of linseed-oil, gritty matter, and spirits of turpentine, in about the proportions specified.

407,650. MEASURING CAN OR CANISTER. SYLVESTER B. BRITAINBROOK, Leicester, and JOHN P. ASHEY, Worcester, Mass. Filed Apr. 15, 1889. Serial No. 307,357. (No model.)

Claim.—The within-described canister, consisting of the body A, formed of sheet metal, with a cover B and downwardly-projecting rim A^2, and having the funnel-shaped bottom C, the cylindrical chamber D, connected with and opening to said bottom, and with an exit-opening *d*, the rotating measuring-gate fitted within said cylindrical chamber, and the operating crank or handle F^3, all arranged substantially as shown and described.

407,650.

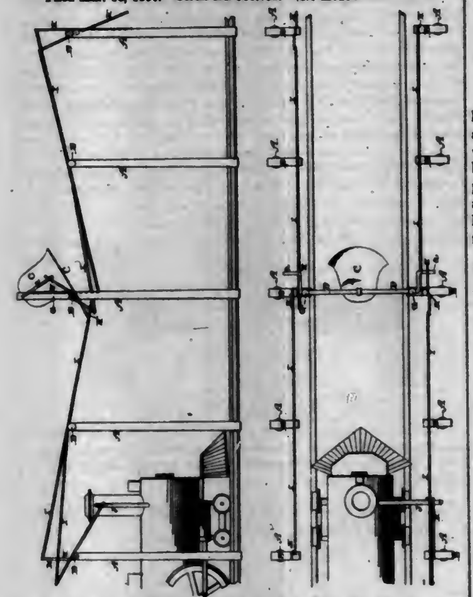


407,651. SHARPENING DEVICE. CHARLES EVERDING, Branford, Conn. Filed Mar. 18, 1889. Serial No. 303,728. (No model.)

Claim.—1. A sharpening device consisting of a casting bent at a suitable angle and provided with ears or flanges, in combination with a file, a holding-pin which catches against the inner side of the file, and set-screws for adjusting the file, substantially as shown.

2. The combination of a casting bent at a suitable angle and having one end made concave and the other end provided with ears or flanges, and a holding-pin which extends across between the ears, with a file and the set-screws for holding the file, substantially as described.

407,652. CYLINDER PRINTING-MACHINE. GEORGE P. PERNER, New London, Conn. Filed Sept. 27, 1888. Serial No. 286,505. (No model.)

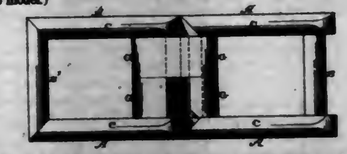


Claim.—1. The combination, with a reciprocating type-bed and an impression-cylinder, of an actuating crank or wheel E, link K, gears L M, connecting the crank or wheel and type-bed, and a guide-cam H, guiding said link and constructed to allow the type-bed to remain temporarily at rest at the end of each reciprocation, substantially as described.

2. The combination, with a reciprocating type-bed and an impression-cylinder, of shifting-gears R S, for conveying motion between the cylinder and type-bed, and a cam for shifting said gears, substantially as described.

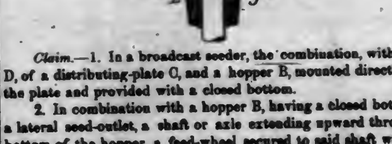
3. The combination, with an impression-cylinder and a reciprocating type-bed, of a mechanism for reciprocating said bed, said mechanism consisting of a crank or crank-pin E, a link F, and a stationary cam H, engaged by said link, substantially as described.

407,653. RAILROAD-SIGNAL. CHARLES A. FISLEY, Holton, Kans. Filed Mar. 18, 1889. Serial No. 303,733. (No model.)



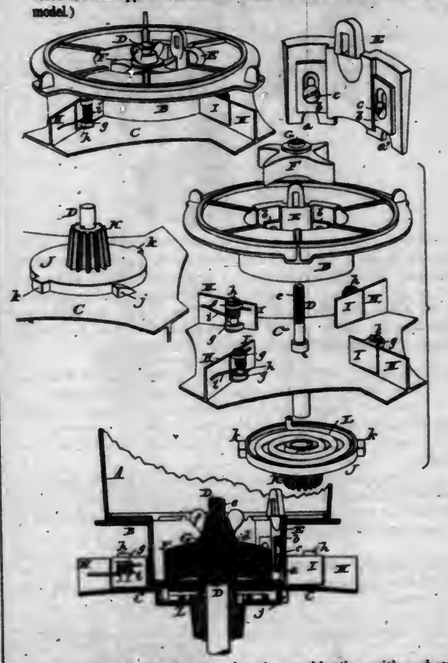
Claim.—In a railroad-signal, the combination of bells supported above the track, horizontal rods connected thereto which extend across the track, cranks upon each end at opposite sides of the track, levers journaled to supports below the cranks at each side of the track and having their upper ends engaged thereby, and intermediate levers on each side of the track which are operated by devices upon the locomotive, with supporting-poles placed upon opposite sides of the track, two lines of wires—one on each side of the track—which connect the said levers, and a device upon the locomotive for operating the levers, substantially as shown and described.

407,654. BURGLAR-ALARM. GEORGE C. GRUBER and THOMAS D. WOGAN, Marita, Ohio. Filed Mar. 29, 1889. Serial No. 305,295. (No model.)



Claim.—In a burglar-alarm, the combination, with a bell-frame, spring-actuated tapper-operating mechanism, and bell connected with said frame, of the outwardly and upwardly bent tapper-arm, spring locking rod *f*, its upper free end being adapted to be made to engage with said tapper, as described, key *h*, having leg *h'*, door-knob-stem clamp *l*, and cord or wire *k*, connecting said clamp and spring-rod *f*, substantially as and for the purpose specified.

407,655. DRIVE-CHAIN. THEODORE P. HALL, Marietta, Ohio; assignor to John Short, same place. Filed Mar. 18, 1889. Serial No. 303,722. (No model.)



Claim.—In combination with the links of a driving-chain, a pair of coupling-clasps transversely slotted and of approximately C shape and arranged upon the links side by side with the slots in opposite sides of the clasps, substantially as described.

407,656. REGULATING GAS-BURNER. JOHN G. HAWKES and JOHN BARTON, Peterborough, County of Northampton, England. Filed Feb. 27, 1889. Serial No. 301,382. (No model.) Patented in England Nov. 1, 1887, No. 14,806, and Feb. 13, 1888, No. 2,162.

Claim.—In a gas-regulating burner, the combination of a casing having a lower contracted portion, a diaphragm located in said casing at the junction of its expanded and contracted portions and provided with a central opening and a tubular downwardly-projecting portion having lateral openings or slits, a valve located in the downwardly-projecting tubular portion of said lower diaphragm and provided with an upwardly-projecting valve-spindle, a disk on said spindle above the lower diaphragm, and an upper diaphragm having a central opening for passage of the valve-spindle, substantially as described.

407,657. BROADCAST SEEDER. FREDERICK J. HEINRICHSEN, Racine, Wis., assignor to the Henrichsen Manufacturing Company, same place. Original application filed Dec. 22, 1888, Serial No. 294,305. Divided and this application filed June 24, 1889. Serial No. 315,377. (No model.)

Claim.—1. In a broadcast seeder, the combination, with a shaft D, of a distributing-plate C, and a hopper B, mounted directly above the plate and provided with a closed bottom.

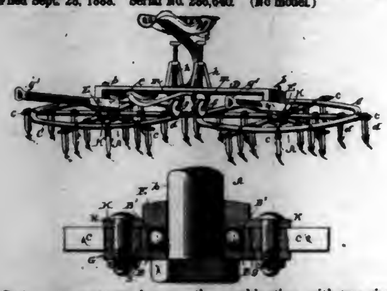
2. In combination with a hopper B, having a closed bottom and a lateral seed-outlet, a shaft or axle extending upward through the bottom of the hopper, a feed-wheel secured to said shaft within the hopper, and a distributing-plate also secured to the shaft and placed directly beneath the hopper.

3. In a broadcast seeder, the combination, with the hopper and the shaft journaled therein, of the plate C, provided with yielding ribs.

4. In a broadcast seeder, the combination, with the hopper and the shaft journaled therein, of the plate C, provided with wings or ribs having yielding ends or gates.

5. In a broadcast seeder, the combination, with the hopper and the shaft journaled therein, of the plate C, provided with wings H, gate I, provided with lugs *g*, bolt *h*, passing through the lugs, and spring *i*, bearing at opposite ends against the wing and gate.

6. The combination, in a broadcast seeder, of the grooved shaft D, of the elastic feed-wheel, the metallic bushing, spline, or feather *d*, and means for securing the wheel in position.



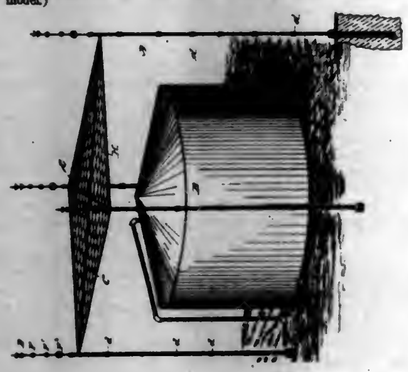
7. In a broadcast seeder, the combination, with threaded shaft D, provided with groove *c*, of elastic wheel F, metallic bushing G, provided with spline *d*, and a thumb nut *f*, applied to the shaft.

8. In a broadcast seeder, the combination, with a shaft, of a distributing-plate C, secured rigidly thereto, a gear-wheel K, provided with a lug *k* to engage a lug *j* on the plate, and a spring L, secured at opposite ends to the wheel and case.

9. In a broadcast seeder, the combination, with a shaft and a distributing-plate secured thereto, of a gear-wheel adapted to engage the plate, and a spring secured to the plate and the gear-wheel, whereby the spring is adapted to take up initial movement of the wheel.

10. In a broadcast seeder, the combination, with a hopper B, and a shaft D, extending upward therethrough, of a feed-wheel mounted upon the shaft within the hopper, a distributing-plate also mounted upon the shaft and provided with wings or blades, a gear-wheel mounted loosely upon the shaft and provided with lugs adapted to engage the plate, and a spring secured to the wheel and plate whereby the initial movement of the gearing may be taken up by the spring.

407,658. ROTARY HARROW. JAMES R. HICKS, Kansas City, Mo. Filed Sept. 28, 1888. Serial No. 286,640. (No model.)

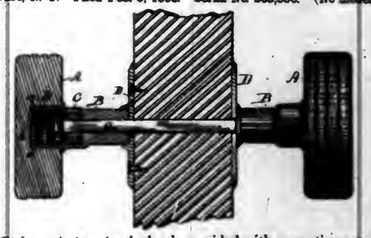


Claim.—In a rotary harrow, the combination, with two similar harrow-frames A A, that are circular and each composed of a central hub-plate G, having upright flange *g*, cap-plate E, bolts *k*, and spaced arms *c*, of king-bolts *b*, located in central perforations of said plates G and E, and two sets of anti-friction rolling devices that are loosely held between and in contact with the king-bolts and the upright flanges of said hub-plates, substantially as set forth.

407,659. WELDING COMPOUND. HIRAM G. HICKS, Worcester, Mass. Filed Dec. 6, 1888. Serial No. 292,810. (No specimens.)

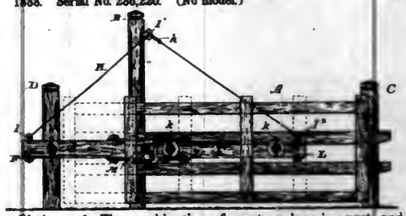
Claim.—1. A compound for the purposes of welding, toughening, and refining steel, consisting of borax, sal-ammoniac, carbonate of iron and plaster-of-paris, in combination, substantially as hereinbefore set forth.

2. A compound for use in welding, refining, or treating steel, composed of borax, sal-ammoniac, carbonate of iron, and plaster-of-paris, combined in the proportions substantially as specified, and prepared in the manner substantially as described.



407,660. SYSTEM OF PROTECTION FROM LIGHTNING. CHAS. F. HILL, Hazleton, Pa. Filed Nov. 16, 1888. Serial No. 291,024. (No model.)

Claim.—1. A system for protecting receivers of inflammable or explosive substances from lightning, consisting of a cordon of poles located some distance from the structure and having their upper ends extended above said structure, a metallic net suspended horizontally above the structure by the poles, and conductors connected to said net and embedded at their lower extremities in the earth, substantially as and for the purpose described.



2. A system for protecting receivers of inflammable or explosive substances from lightning, consisting of a cordon of tubular metallic poles located some distance from the structure, a series of conductors arranged horizontally some distance above the tank and passing longitudinally through the poles from end to end thereof and having their lower ends coiled exteriorly around the lower embedded ends of said poles, and a metallic net connected to and supported by the horizontal portions of the conductors, said net being located some distance above and entirely isolated from the structure to be protected, substantially as described.

407,661. KNOB ATTACHMENT. FRANK A. HOLLENBECK, Syracuse, N. Y. Filed Feb. 9, 1888. Serial No. 263,550. (No model.)

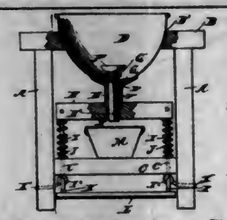
Claim.—A door-knob shank provided with a mortise *c*, a nut inserted into the shank and accessible through the mortise, and a spring within the shank bearing against the nut, in combination with a threaded spindle, substantially as described.

407,662. GATE. FLOYD HOPKINS, Belvidere, Ill. Filed Sept. 24, 1888. Serial No. 286,220. (No model.)

Claim.—1. The combination of a gate, a hanging-post, and an anchor-post, with a jointed hanging-bar provided with a pivotal fastening securing it to the hanging-post, and having means of adjustment with the anchor or anchor-post, substantially as and for the purpose hereinbefore set forth.

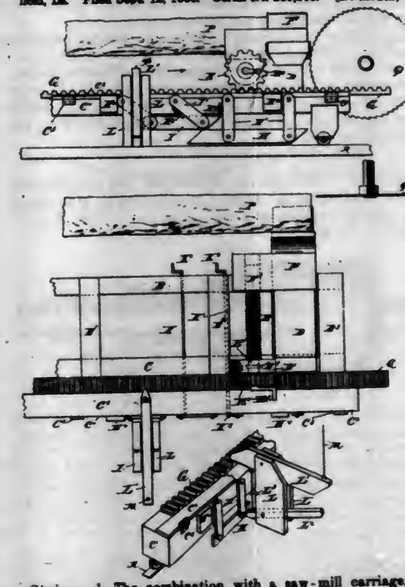
2. The combination of a hanging-post, a jointed hanging-bar pivoted to the hanging-post and provided with wheels or bearings, a gate, a supporting wire, rod, or chain, and an anchor or anchor-post, substantially as and for the purpose hereinbefore set forth.

3. A gate supported on a jointed bar, extending horizontally, and pivoted at one side of the joint by a bolt to a hanging-post, and provided with means of adjustment, and having bearings whereon the gate may have endwise movement, substantially as and for the purpose described.



4. A hanging-post, an anchor or anchor-post, and a jointed hanger or bar pivoted to the hanging-post, in combination with a gate and a suspender supported at one point by the hanging-post and connected with the front part of the hanger, substantially as and for the purpose hereinbefore described.

407,663. WASH-BASIN. GEORGE W. HUCKABAY, Garfield, La. Filed Sept. 12, 1888. Serial No. 285,201. (No model.)

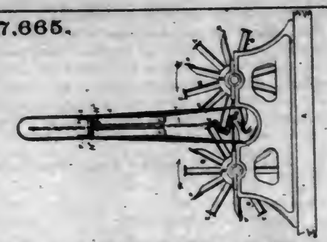


Claim.—1. The combination, with the frame A, its top B, with opening B', and the wash-basin D, having an extension E, the lower end thereof seated in a cross-bar H, provided with an opening H', of the valve-stem F', secured in the opening of the cross-bar at one end, its upper end passing through the extension and into the bowl, and having on its upper end a bowl-shaped valve F, and the said extension and stem having a space between them to form a waste-passage, substantially as specified.

2. The combination, with the frame, its top B and opening B', and the wash-basin seated in said opening and having a downward extension E, of the valve F, mounted on the valve-stem F', located in said extension, said extension and stem having a space between them to form a waste-pipe, the valve-seat G, the spring G', interposed between the valve-seat and valve, the cross-bar H, having an opening communicating with the space between the extension and stem, said extension located in a seat in the bar, and the valve-stem secured by a pin to said bar, the bar C, with openings C', the rods I, with their upper ends secured to bar H and passing through said openings of bar C and having loops I', the springs J J, interposed between the bars H C, the levers K K, connected to said loops and fulcrumed to the frame, and the foot-piece L, secured to said levers, all arranged to operate as set forth.

407,668.

407,664. SAW-MILL SET-WORKS. GEORGE W. HUCKABAY, Garfield, La. Filed Sept. 12, 1888. Serial No. 285,202. (No model.)

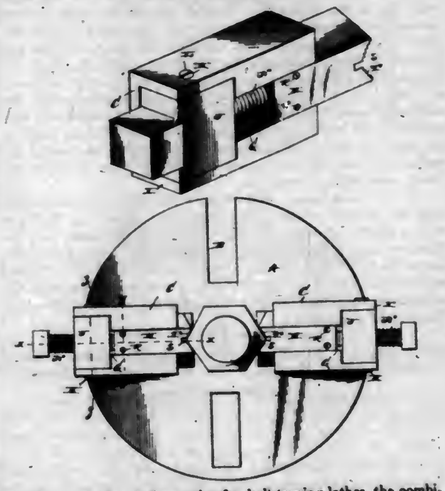


Claim.—1. The combination, with a saw-mill carriage, of a toothed bar seated thereon, an arm for intermittently locking the said bar, so as to permit the carriage to move independently of the same, the gear-wheel engaging said bar, the screw to which said gear-wheel is attached, and the movable head-block operated by said screw, and the bar or lever whereby the movement of the toothed bar is arrested and the parts operated to move the head-block, substantially as specified.

2. The combination, with a saw-mill carriage, of a toothed bar seated thereon, a beveled bar or bars suspended therefrom by hanger-arms L', the rods K K', having arms K^2 and cranks K^3, whereby the bar or bars may be elevated, the blocks for engaging the hanger-arms, the gear, screws, and head-block, the blocks L, and connected arms L' L^2, all arranged to operate substantially in the manner specified.

3. A saw-mill carriage provided with a toothed bar seated thereon and also provided with one or more bars suspended by hanger-arms, and a gear, screw, and head-block, in combination with the connected arms L' L^2, substantially as specified.

407,665. ROTARY BRAKE. WILLIAM S. JOHNSTON, Newtownards, County of Down, Ireland. Filed Nov. 2, 1887. Serial No. 254,057. (No model.) Patented in England May 14, 1887, No. 7,060, and in Germany Oct. 25, 1887, No. 43,490.



407,665.

Claim.—1. In a machine for breaking, scutching, or cleaning flax, &c., two beaters whose circles of rotation intersect, each provided with alternating radial and tangential blades, in combination with ways and traveling clamps to guide and bring the fiber within the range of such beaters, substantially as described.

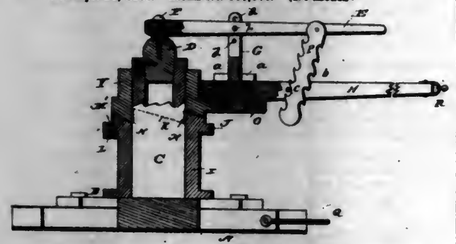
2. In a machine for breaking, scutching, and cleaning flax, &c., a pair of beaters whose circles of rotation intersect, provided with alternating radial and tangential blades, the latter having wavy or fluted edges, substantially as described.

407,666. LATHE-CARRIER. JOHN M. KLEIN, Altoona, Pa. Filed Mar. 20, 1889. Serial No. 303,976. (No model.)

Claim.—1. In a lathe-carrier for bolt-turning lathes, the combination, with a block or box mounted adjustably and detachably upon the face-plate of a lathe, of a longitudinally-movable dovetailed slide, the projecting end of which has a toothed angular recess, and in the opposite end of which is swiveled the end of an operating-bolt, substantially as set forth.

2. In a lathe-carrier, the combination, with the block or casing mounted adjustably and detachably upon the face-plate of a lathe, of a longitudinally-movable dovetailed slide, a block or nut secured between the sides of the casing, and a bolt working in the said nut and having its inner end swiveled in a recess in the rear end of the sliding block, substantially as set forth.

3. In a lathe-carrier, the combination of a block or casing, a longitudinally-movable dovetailed slide having an angular toothed recess at its projecting end, a block or nut mounted in the said casing and having a limited oscillating or rocking motion, and a bolt extending through said nut and having its inner end swiveled in a recess in the dovetailed slide, substantially as set forth.

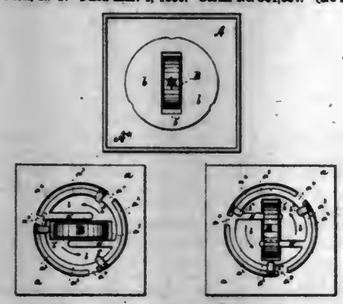


4. In a lathe-carrier, the combination of a block or casing, a dovetailed slide movable longitudinally therein, a nut arranged between the walls of the casing and mounted upon screw-threaded studs or trunnions, and a bolt working in said nut and having its inner end swiveled in the said slide, substantially as set forth.

5. In a lathe-carrier, the combination, with the block or casing having on its rear side a rectangular stud provided with a screw-threaded recess, of one or more washers or liners and the bolt to secure it to the face-plate of a lathe, substantially as herein described, and for the purpose set forth.

6. As an improvement in lathe-carriers, the combination of a

block or casing having on its rear side the rectangular stud provided with a screw-threaded recess, a dovetailed slide movable longitudinally in the said casing and having an angular toothed recess at its projecting end, and a bolt working in a nut which has a limited rocking or oscillating motion between the walls of the casing, the inner end of said bolt being swiveled to the longitudinally-movable slide, substantially as and for the purpose herein set forth.

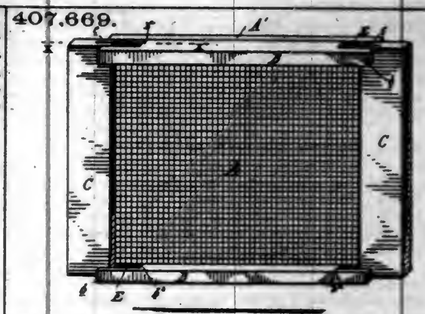


407,667. STUMP-PULLER. OSCAR A. KLEYE, Sigourney, Iowa. Filed Apr. 26, 1888. Serial No. 308,676. (No model.)

Claim.—1. In a stump-puller, the combination, with the cruciform base, of the hollow post arranged thereon, the toothed drum arranged on said post and adapted to receive a winding-rope, the cylinder Y, having an arm for the attachment of the hitch-beam and provided on its under side with a toothed face, the bearing-block arranged in the upper end of the hollow post and beveled, as shown, the hitch-beam secured to the arm of the upper drum-section, the standards secured to said beam, the adjusting-lever journaled in said standards and having one end connected with the bearing-block in the post, and the depending arm pivoted to the lever and having oppositely-directed teeth, and adapted to engage a pin on the hitch-beam, substantially as specified.

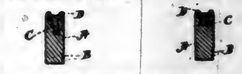
2. In a stump-puller, substantially as described, the combination, with the cylinder, of the hitch-beam secured thereto and having a stud or pin, the adjusting-lever fulcrumed in standards rising from the hitch-beam and having one end journaled on a block arranged in the top of the hollow post, and the depending arm pivoted to the adjusting-lever and having its opposite sides provided with oppositely-directed teeth and adapted to engage the stud or pin in the hitch-beam, substantially as specified.

407,668. HOLDER FOR FINGER-RINGS. CHARLES A. KROH, New York, N. Y. Filed Mar. 1, 1889. Serial No. 301,657. (No model.)



Claim.—1. The combination of plate a, having an opening that is traversed by a horn projecting partially across the opening, with a slotted plate b, adapted to be revolved above plate a, substantially as specified.

2. The combination of fixed plate a, having a central opening traversed by a horn, and a surrounding slot a^2, traversed by radial arms, with a superposed movable plate b, having a central slot, and prongs b^2, that engage the slot a^2 of plate a, substantially as specified.

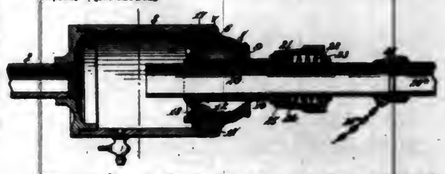


407,669. WINDOW-SCREEN. FRANK LEDUC and AMBROSE LEDUC, Detroit, Mich. Filed Oct. 30, 1888. Serial No. 289,558. (No model.)

Claim.—In a window-screen, the combination of the main frame A with the supplemental rails B, provided with the arm b, shoulder b^2, and groove b', the wing C, having the slot c to hold the rod D, the guide-rod D, reciprocating in the groove b' and provided with the arm d', to be inserted in the wing C, and arm d, to engage with the stop F in the groove b', the coiled spring sleeved on the guide-rod D, and the stop F, as and for the purposes set forth.

407,669.

407,670. ELASTIC-FACED TYPE. EDWIN A. LELAND, New York, assignor to Leonard Richardson, Brooklyn, N. Y. Filed Aug. 8, 1888. Serial No. 282,206. (No model.)

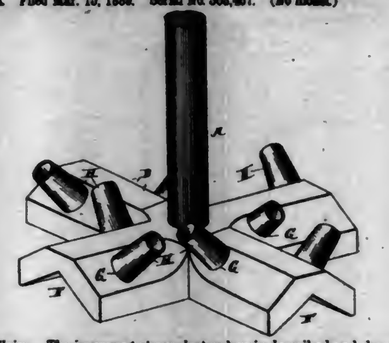


Claim.—1. As a new article of manufacture, a printing-type the body of which is composed of vulcanized fiber having a printing-face, substantially as described.

2. A printing-type the body of which is composed of vulcanized fiber having a yielding printing-face, substantially as described.

3. As a new article of manufacture, an elastic-faced printing-type consisting of a body of vulcanized fiber having at one end an undercut groove and a separate elastic printing-face having a flexible tongue cemented into said groove of the vulcanized-fiber body, substantially as described.

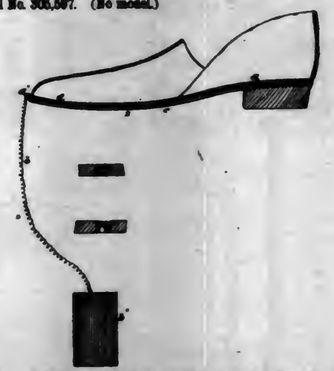
407,671. COUPLING FOR STEAM-PIPES FOR RAILWAY-CAR HEATING APPARATUS. EDWIN A. LELAND, Brooklyn, N. Y., assignor to Leonard Richardson, same place. Filed Apr. 16, 1889. Serial No. 307,430. (No model.)



Claim.—1. In a coupling for the steam and other pipes of railway-cars, the combination, with the train-pipe having a cylindrical shell forming an expansion-chamber and provided with a zonoidal section, of a spherical section fitting the latter and containing an internal sleeve having at its outer end an attached conical packing-box, a packing-ring in said conical packing-box, a spring acting upon the packing-ring, and a coupling-pipe section telescoping in the said sleeve and conical packing-box, substantially as described.

2. In a pipe-coupling for the steam-pipes of railway-cars, the combination, with the train-pipe, of a cylindrical casing forming an expansion-chamber, a short cylindrical section threaded into one end of said casing and having a zonoidal section, a cylindrical section having a spheroidal bearing fitting the zonoidal section, an annular packing located between the spheroid and the inner face of the short cylindrical section, and spring-actuated plungers acting on the annular packing, substantially as described.

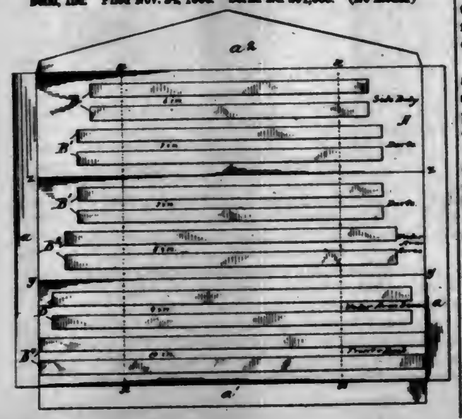
3. In a coupling for the steam and other pipes of railway-cars, the combination, with the train-pipe having a cylindrical shell forming an expansion-chamber and provided with a zonoidal section, of a spherical section fitting the latter and containing an internal sleeve having at its outer end an attached packing-box, a coupling-pipe section telescoping in the said sleeve and packing-box and provided at its outer end with a collar, and a chain secured to said collar for limiting the outward sliding movement of the telescoping pipe-section, substantially as described.



4. In a coupling for the steam-pipes of railway-cars, the combination, with the coupling-pipe section having both angular and telescopic adjustment, of a spring-buckle supporting the same and consisting of an eye or loop surrounding the pipe, a rod on said eye passing through a screw-cap turned upon a cylindrical shell or casing which contains a spiral spring supporting said rod, and a screw-cap turned upon the upper end of the shell and connected to the platform-bottom, substantially as described.

407,672. CHURN-DASHER. LANDAN M. LITTLEFIELD, Valdosta Ga. Filed Mar. 15, 1889. Serial No. 303,467. (No model.)

Claim.—The improved churn-dasher herein described and shown, consisting of the intersecting cross-bars secured rigidly together and provided in their under sides with longitudinal concave channels, and having inclined openings extending in opposite directions through the opposite walls of said channels, and the straight tubes secured in said openings and projecting upward above the cross-bars, as set forth.

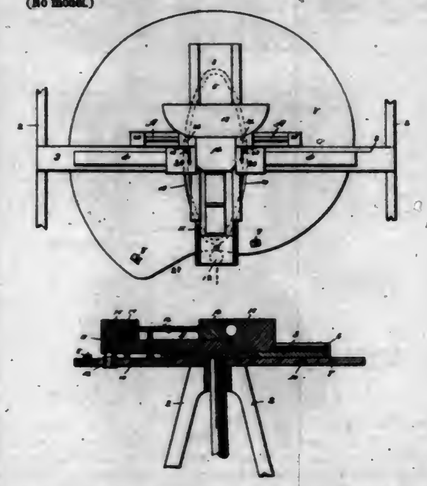


407,673. GALVANIC SHOE. JOHN S. MELLON, St. Louis, Mo., assignor of six-tenths to G. W. Lewis, same place. Filed Apr. 1, 1889. Serial No. 305,567. (No model.)

Claim.—1. The combination consisting of the shoe, the metallic inner sole, and the metallic rivets inserted through and in combination with the shoe-sole, as and for the purposes mentioned.

2. The combination consisting of the shoe, the metallic inner sole, the metallic rivets inserted through and in combination with the shoe-sole, and the metallic ground-connection a', b, and b', as stated herein.

407,674. PACKAGE FOR DRESS-STAYS. CHARLES MOSHER, South Bend, Ind. Filed Nov. 24, 1888. Serial No. 291,805. (No model.)



407,674.

Claim.—A dress-stay package consisting of the rectangular sheet A, having the set or complement of dress-stays B, B', B^2, B^3, and B^4, secured on its inner face by lines of stitching x x, and having printed thereon characters designating the nature and length of said stays, said sheet being provided with marginal flaps a and a' at the sides and bottom to fold inward and protect the contents, and a flap a^2 at the top to fold over the body of the envelope when folded, the whole sheet being adapted to fold upon the transverse lines y y and z z to form a flat package or envelope to inclose and protect the stays, substantially as and for the purposes specified.

407,675. TUBE-BENDING MACHINE. JOHN F. McHUTT and HIRAM F. GRIMMEST, Warren, Ohio. Filed Mar. 19, 1889. Serial No. 303,931. (No model.)

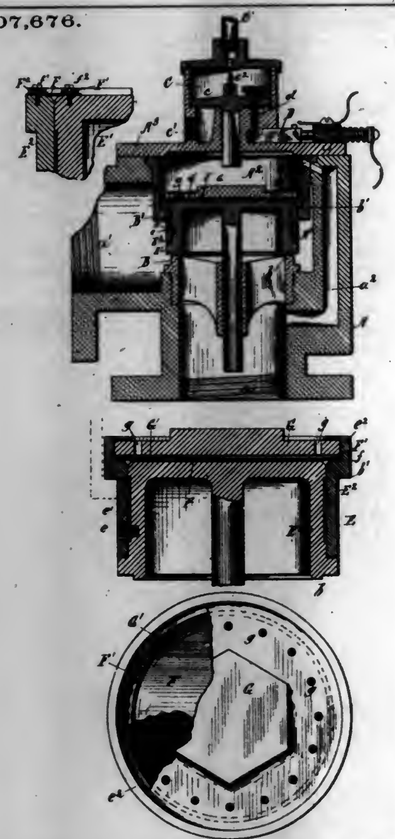
Claim.—1. The combination, with a support and bed-plate, of a sliding bar provided with a former and oppositely-movable mandrels upon opposite sides of the former, substantially as herein described.

2. The combination, with a support and bed-plate, of a sliding bar provided with a clamp and former, a cam for operating this sliding bar, and oppositely-movable mandrels arranged upon opposite sides of the said former, substantially as described.

3. The combination, with a support and bed-plate provided with ways and a groove at right angles to the said ways, of a former and a bar moving in said groove, slides mounted on the ways, and pivoted mandrels mounted on the said slides, substantially as described.

4. The combination, with a bed-plate, of a former supported by the said bed-plate, a tube-clamp, slides upon opposite sides of the former and adapted to move in opposite directions, and pivoted mandrels upon the said slides, substantially as described.

5. The combination, with a support and bed-plate, of a former and clamp therefor, oppositely-moving slides located upon opposite sides of the former, pivoted mandrels upon these slides, and a cam provided with a groove for moving the said slides, substantially as described.



6. The combination, with a former, a sliding clamping-block, and a toggle-lever provided with an extension and connected to the said clamping-block, of vertically-moving pins adapted to operate the said lever, and means for operating the pins, substantially as described.

7. The combination, with a former and clamp, of oppositely-moving slides upon opposite sides of the former, and mandrels pivoted upon these slides, these mandrels being provided with inwardly-projecting rods and ring-dies, as and for the purpose described.

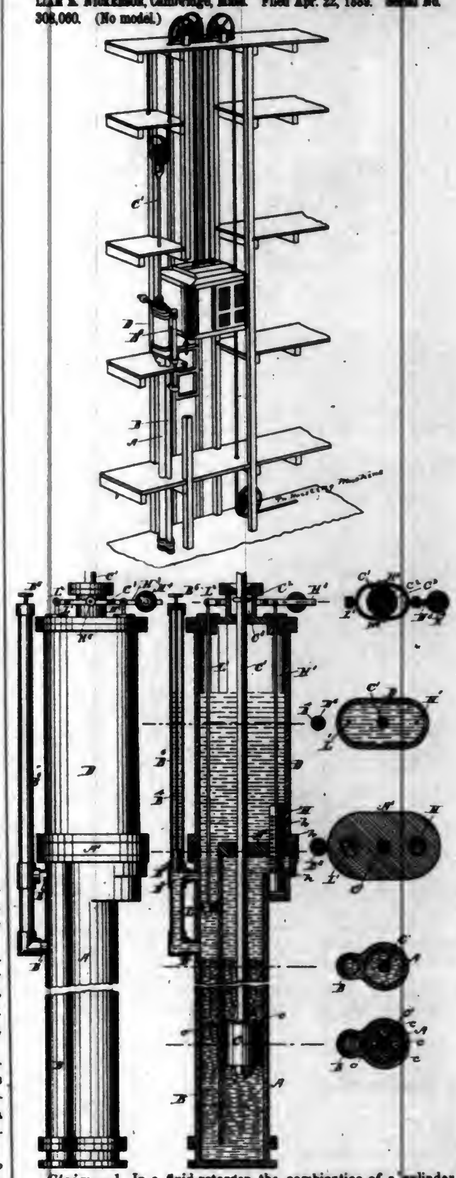
407,676. DOUBLE-SEATED VALVE. AUGUSTUS F. NAGLE, Chicago, Ill. Filed May 3, 1888. Serial No. 309,494. (No model.)

Claim.—1. The combination, with the valve-casing provided with two stationary seats, of the valve composed of two sections movable relatively to each other, and each provided with a seating-surface to fit the corresponding seat of the valve-casing, said sections being held

407,676.

to their seats under pressure independently of each other, substantially as and for the purposes specified.

2. The combination, with the valve-casing provided with two stationary valve-seats, of the valve composed of two independently-movable sections, each provided with a seating-surface to fit the corresponding valve-seat, and consisting of an inner section closed at one end and an outer hollow cylindrical section surrounding said inner section, substantially as and for the purposes specified.



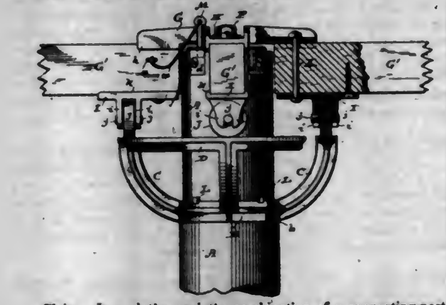
3. The combination, with the valve-casing provided with two stationary valve-seats, of the valve composed of an inner and an outer section movable the one upon the other, and each provided with a seating-surface to fit the corresponding valve-seat, and a flexible disk covering the joint formed by the meeting surfaces of the two sections, substantially as and for the purposes specified.

4. The combination, with the valve-casing provided with two stationary valve-seats, of a differential valve composed of two sections movable relatively to each other, and each provided with a seating-surface to fit the corresponding valve-seat, the effective external area of one section being greater than the similar area of the other, substantially as and for the purposes specified.

5. The combination, with the valve-casing provided with two stationary seats, of the valve composed of an inner and an outer section movable the one upon the other, and each provided with a seating-surface to fit the corresponding valve-seat, and a flexible disk closing the head of the outer section and adapted to bear upon the head of the inner section, substantially as and for the purposes specified.

6. The combination, with the valve-casing A, having seats B and B', of the valve E, composed of the inner section E', having seating-surface b, and the outer section E^2, fitting over and movable upon the section E', and provided with seating-surface b' and upwardly-extending threaded flange e^3, the flexible disk F, resting on a suitable seat at the base of said flange, and the nut G, threaded to fit said flange and having apertures g, substantially as and for the purposes specified.

407,677. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM R. NICKERSON, Cambridge, Mass. Filed Apr. 22, 1889. Serial No. 308,060. (No model.)

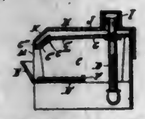


Claim.—1. In a fluid-retarder, the combination of a cylinder and piston with a balanced valve, a disk movable by the flow of the fluid, and connections between the disk and the valve whereby the undue velocity of the flow of the fluid operates the valve and restricts the movement of the piston, all substantially as described.

2. In a fluid speed-regulator, the cylinder A, piston C, piston-rod C', balanced valve H, pipe B, having a disk L, and mechanism for connecting the disk L and balanced valve H, substantially as and for the purpose set forth.

3. In a fluid speed-regulator, the cylinder A, provided with a short passage, piston C, piston-rod C', balanced valve H, pipe B, disk L, and connecting mechanism between the disk L and valve H, and regulating-plunger B^3, substantially as and for the purpose set forth.

407,678. CLOTHES-DRIER. ANDREW J. PEIRCE, Madison, Wis., assignor of one-half to Nicholas Konrad, Jr., same place. Filed May 7, 1888. Serial No. 273,101. (No model.)

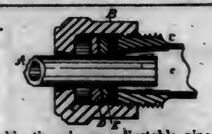


Claim.—In a clothes-reel, the combination of a supporting-post, a reel-head having its bearing on the post, beams arranged beneath the arms of the reel-head, plates secured to the under side of the beams and bolted to the latter and said arms of the reel-head, forked ears depending from the plates, wheels journaled in the ears, and a circular track for the wheels, substantially as set forth.

407,679. CAR-COUPLING. JAMES A. PERDUE, Belfield, Va. Filed Mar. 20, 1889. Serial No. 304,044. (No model.)

Claim.—In a car-coupling, a buffer A, having an annular chamber therein, brackets g g on the top of said buffer, a coupling-pin mounted in said brackets and made of a simple bar bent to form a long arm h, a short arm i, and a pivoting-loop j, a groove f in said buffer for the reception of the lower end of said short arm, a block l, secured to said buffer for the support of the long arm, a rod m, pivoted to said buffer and provided with a crank at its end, and a lug n on said rod and adapted to engage with the long arm of the coupling-pin, for the purpose set forth, substantially as described.

407,680. HYDROCARBON-BURNER. CHARLES H. PHELPS, Cleveland, and EVAN A. EDWARDS, Toledo, Ohio. Filed Mar. 29, 1889. Serial No. 305,244. (No model.)



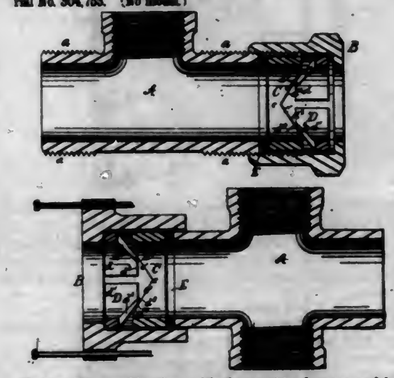
Claim.—1. In a hydrocarbon-burner, a burner-plate formed with a downwardly-extending portion provided with a ledge, an upper plate sustained at some distance from the lower plate and formed with a corresponding downwardly-extending portion, and having a hood forming a chamber, in combination with an oil-supply pipe extending through the lower plate and into the hood formed in the upper plate as and for the purpose set forth.

2. A hydrocarbon-burner comprising a base portion, a base-plate formed with an upwardly-inclined outer edge and an upturned inner edge, in combination with two parallel burner-plates having downwardly-inclined end portions and an oil-supply pipe in communication with the space between the burner-plates, as and for the purpose set forth.

407,681. DETACHABLE PIPE-JOINT. ISAAC B. POTTS, Columbus, Ohio. Filed Mar. 25, 1889. Serial No. 304,752. (No model.)

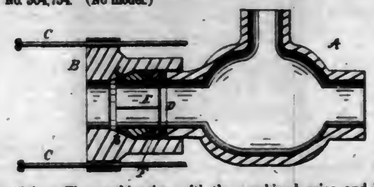
Claim.—1. In an adjustable pipe-joint, in combination with the heads or coupling-nuts and interposed union of the rings D and E tapering in the direction of the length of the pipe, one edge of each ring being straight and their abutting edges tapered or thicker upon one side than the other and the ring D split, substantially as described

407,681.



2. The combination, in an adjustable pipe-coupling, with the union or connected pipe end and coupling nut or head having a seat whose edge is curved, of the rings D and E, tapered in the direction of the length of the pipe, the ring D split and with rounded edge.

3. The combination, in an adjustable pipe-coupling, with the coupling nut or head, and rings D and E, tapered in the direction of the length of the pipe, of the union C, having recess c.



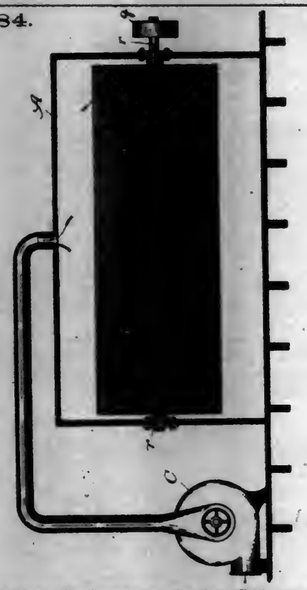
4. The combination, in an adjustable pipe-coupling, with the coupling nuts or heads and interposed union with recess in its interior, of the rings D and E, tapered in the direction of the length of the pipe, and packing interposed at the end of the union, substantially as described.

407,682. COMBINED DETACHABLE PIPE COUPLING AND BRANCH. ISAAC B. POTTS, Columbus, Ohio. Filed Mar. 25, 1889. Serial No. 304,753. (No model.)

Claim.—The combination, with the combined union and branch into which the ends of the pipe to be coupled are inserted, of the follower-ring C, formed with recess c upon each side, having inclined surfaces c', split clamp D, having inclined projections d^3 upon opposite sides, packing-ring E, adjacent the end of the union, and suitable means for applying power to said clamp, for the purposes specified.

407,683. COMBINED DETACHABLE PIPE COUPLING AND BRANCH. ISAAC B. POTTS, Columbus, Ohio. Filed Mar. 25, 1889. Serial No. 304,754. (No model.)

Claim.—The combination, with the combined union and branch A, of coupling-head B, formed with a tapered seat b, collar E in sections and with cylindrical interior and tapered exteriorly from center to each end and fitting against the seat b of the head B, ring F, having tapered interior and fitting upon the inner end of collar E, and packing D, interposed between the union and ring F, all constructed and arranged to operate as described.



407,684. PROCESS OF TREATING NUTS. ALBERT H. PRATT, Chicago, Ill. Filed Mar. 21, 1889. Serial No. 304,169. (No specimens.)

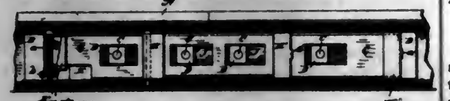
Claim.—1. The process of treating nuts, which consists in tumbling them with dry pulverized coloring material, substantially as described.

2. The process of treating nuts, which consists in tumbling them to cleanse them of dirt on their surfaces, and then coloring them by tumbling them with a dry pulverized coloring material, substantially as described.

3. The process of treating nuts, which consists in tumbling them with a dry pulverized coloring material, thereby imparting color to

407,684.

them, and with powdered soapstone, thereby polishing them, substantially as described.

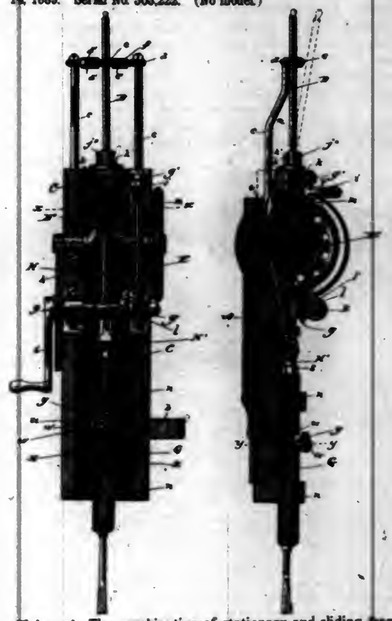


4. The process of treating nuts, which consists in tumbling them with a dry powdered Italian sienna, thereby imparting color to them, and with powdered soapstone, thereby polishing them, substantially as described.

407,685. REFRIGERATOR. WILLIAM A. PRESTON, Fort Branch, Ind. Filed Feb. 9, 1889. Serial No. 299,251. (No model.)

Claim.—In a refrigerator, the combination of the body thereof provided with an opening H in one of its sides, an ice-chamber so suspended in the refrigerator as to form, with the walls thereof, side passages C and D, this ice-chamber being constructed of non-conducting walls and having an open side B leading into the passage C, a non-conducting bridge-wall G over the top of the passage C, the inclined non-conducting partition I, depending from the bottom of the ice-chamber and extending to near the bottom of the refrigerator, forming passages C' and *c*, and a fresh-air-inlet pipe J, provided with an extension J' extending to the lower end of the said passage C', as and for the purposes herein set forth.

407,686. NUT-LOCK. WILLIAM A. PRESTON, Fort Branch, Ind. Filed Feb. 28, 1889. Serial No. 301,477. (No model.)



Claim.—The combination of the rails, the fish-plates, the connecting-bolts provided with nuts D, a bar E, clamped to the face of one of the fish-plates and provided with loops F F', the latter loop carrying a stop *a'* and the former a removable pin *a*, a main locking-bar G, held removably against the face of the said bar E by means of the loops F F', and provided with loops H H' and longitudinal slots for the reception of the nuts D, the said loops H H' being provided, respectively, with a removable pin and a stop, a plate J, placed against the face of the bar G between the loops H H', nuts D', for clamping this plate against the face of bar G, a supplemental bar I, held removably against the plate J by the loops H H' and provided with slots for the reception of the nuts D', as and for the purpose set forth.

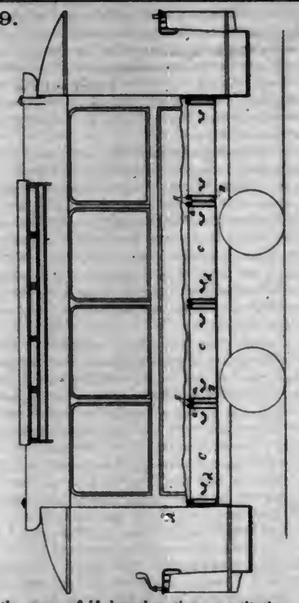
407,687. LIVER AND KIDNEY REMEDY. ALFRED H. RAMEY, Aurora, Ill. Filed Apr. 8, 1889. Serial No. 306,434. (No specimens.)

Claim.—The herein-described composition of matter to be used for diseases of the kidneys, liver, and urinary organs, consisting of fluid extract of buchu, spirits of niter, acetate of potassium, fluid extract of couch-grass, fluid extract of juniper-berries, and granulated sugar, in substantially the proportions specified.

407,688. DRILL. AUGUSTUS RENETZKY, Lincoln, Ill. Filed Mar. 14, 1889. Serial No. 303,222. (No model.)

Claim.—1. The combination of stationary and sliding frames, a divided box upon the former, a short shaft journaled in the sliding frame and provided with a ratchet-wheel, a screw pivotally attached to the said short shaft and clamped between the said divided box, and a rock-shaft and pawl for operating the said ratchet-wheel, as described.

2. The combination of the drill-holder G, recessed at its upper end, a headed connecting-rod H', inserted in the said recess, a bushing *c*, tapped into the said recess, a cushion interposed between the headed end of the rod H' and the bottom of the said recess, and a metallic washer inserted between the cushion and headed end of rod H', as and for the purpose set forth.



3. The combination of a cylindrical drill-holder and mechanism for reciprocating it, a ratchet-wheel secured to the said holder, a divided collar upon the said holder, a spring-actuated pawl engaging the said ratchet-wheel, and reversely-inclined ways for rotating the said collar, substantially as described.

407,689. CHARGING SYSTEM FOR SECONDARY BATTERIES. ANDREW L. RIKER, New York, N. Y. Filed May 9, 1889. Serial No. 310,200. (No model.)

Claim.—1. A car or other vehicle having compartments all open at the side for the admission of batteries and transverse rails near the top of each compartment, in combination with a series of battery-vessels having rollers adapted to run on said rails, substantially as described.

2. The combination, with secondary batteries having rollers for

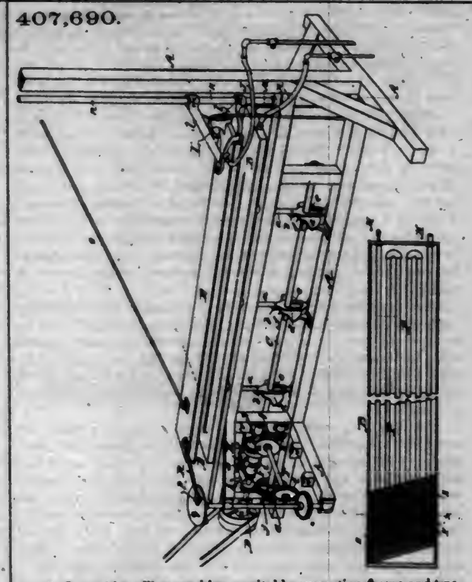
407,689.

suspending the same, of U-shaped castings constituting supporting-rails, each casting forming two rails, substantially as described.

3. A charging system for electric railways employing secondary batteries, in which the batteries are supported by grooved rollers running on rails transverse to the vehicle, said system comprising a transfer-truck having transverse rails corresponding in position and number to those on the vehicles, and a supporting frame-work having similar rails and adapted to receive the batteries from said truck and support them while being charged, substantially as described.

4. In a charging system for secondary batteries, the combination, with a transfer-truck having rails for supporting a series of batteries, of a frame-work having corresponding rails arranged in tiers one above the other and an elevator for raising said truck to the level of any of said tiers, substantially as described.

5. The combination, with a series of secondary batteries provided with rollers, two of which, on opposite sides of the vessel, are connected with the battery elements to act as terminals, of a series of supporting-rails for said rollers, the rails at the extreme ends being connected with the terminal wires of a circuit, and the adjacent intermediate rails being electrically connected, so that the said circuit is completed when the batteries are put in place upon their respective rails, substantially as described.



6. In a charging system for secondary batteries, a frame-work adapted to receive said batteries for charging, said frame-work comprising uprights and two or more series of supporting-rails arranged in tiers one above the other, in combination with a transfer-truck having rails corresponding with those on the frame-work, substantially as described.

7. The frame-work for holding secondary batteries while being charged, said frame-work being provided with several series of rails arranged in horizontal tiers, in combination with a charging-dynamo, a main circuit, parallel branch circuits leading therefrom to the end rails of each horizontal tier, respectively, the intermediate adjacent rails being electrically connected, and a series of battery-vessels provided with rollers for running on said rails, said rollers constituting the terminals of the batteries, substantially as described.

407,690. WHIP-ROLLING MACHINE. ELKANAH RISE, Westfield, Mass., assignor to James Noble, Jr., same place. Filed Dec. 17, 1888. Serial No. 293,837. (No model.)

Claim.—1. In a whip-rolling machine, a suitable supporting-frame, and two whip-rolling tables sustained thereon, one thereof being by its inner end pivotally supported on a part of said frame, whereby it is adapted to be reciprocatingly swung across the working-face of the other table, and a stay-rod connected to said frame and to the outer end of said table, holding said outer end more separated from the opposing table than is its inner end, whereby a slight angle between the working-faces of said table is secured, substantially as described.

407,690.

2. In a whip-rolling machine, a suitable supporting-frame and two whip-rolling tables, movable supports mounted on said frame, on and by which one of said tables is carried and presented toward and away from the opposing table, and the other of said tables pivotally supported by its inner end on a part of said frame, whereby it is adapted to be reciprocatingly swung across the working-face of the adjacent table, and a stay-rod connected to said frame and to the outer end of said table, holding the said outer end more separated from the opposing table than is the inner end, whereby a slight angle between the working-faces of said tables is secured, substantially as described.

3. In a whip-rolling machine, a suitable supporting-frame and two whip-rolling tables, movable supports mounted on said frame, on and by which one thereof is carried and presented toward and away from the opposing table, and the other of said tables pivotally supported by its inner end on a part of said frame, whereby it is adapted to be reciprocatingly swung across the working-face of the adjacent table, and a stay-rod connected to said frame and to the outer end of said table, holding the said outer end more separated from the opposing table than is the inner end, whereby a slight angle between the working-faces of said tables is secured, combined with a crank-pin and means for securing its revolution, and a pitman-rod secured to said crank-pin and to said pivotally-mounted table, substantially as described.

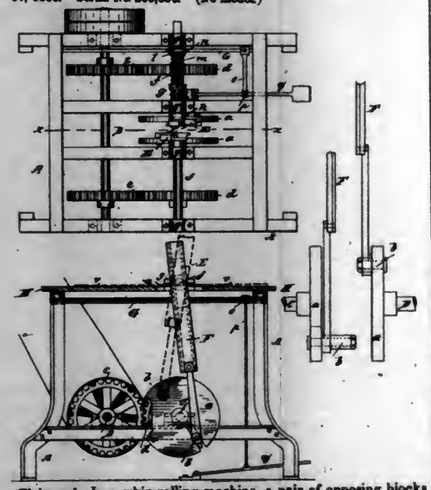
4. In a whip-rolling machine, the lower table B, the vertically-movable supporting-posts *a* therefor, lateral abutments *b* on one or more of said posts, and a horizontal shaft C, having one or more cams *d*, on which the said post-abutments bear, combined with the upper table E, supported for a lateral vibration, and means for so vibrating said table, substantially as and for the purpose described.

5. In a whip-rolling machine, in combination, two whip-rolling tables, one of which is adapted to have a reciprocatory movement relative to the other, and one of said tables having its working-surface constituted by a series of laterally-extending strips of spring metal, substantially as and for the purpose described.

6. In a whip-rolling machine, in combination, two whip-rolling tables, one of which is adapted to have a vibratory motion relative to the other, and one of said tables having its working-surface constituted by a series of laterally-extending strips of spring metal of arch form secured by their ends to the edge portions of the table, substantially as and for the purpose described.

7. In a whip-rolling machine, in combination, two whip-rolling tables, one of which is adapted to have a vibratory motion relative to the other, and one of said tables being of box form, having its working-surface constituted by a series of laterally-extending strips of spring metal secured by their ends to the side walls of the table, and steam-pipe coils disposed within the chamber of said table, substantially as described.

8. A whip-rolling machine comprising upper and lower whip-rolling tables, the former supported with its face at a slight angle to the other and pivotally hung at its least separated end for a horizontal



lateral swing therefrom, and the latter having an intermittent vertical vibratory movement, an intermittently-rotating shaft having a crank-pin, and a pitman-rod connected thereto and to said upper table, for the purpose described.

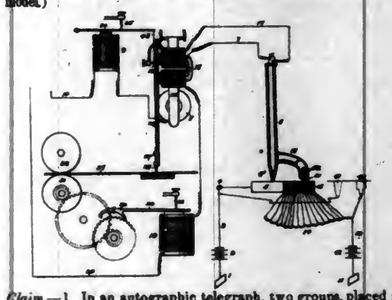
9. In a whip-rolling machine, the combination, with the lower table B, vertically-movable supporting-posts therefor, and the upper vibratory table E, of a shaft C, having the cams thereon for engagement with the said posts and having a gear *y* thereon, a driving-shaft D, having a gear *v* thereon and a clutch therefor, a counter-shaft *i*, geared to receive rotation from the said driving-shaft and to impart rotation to said cam-shaft C, a counter-shaft F, having a gear engaging with said clutching-gear *v*, a shaft G, geared to said counter-shaft F, having a crank-pin, the pitman-rod R, connected to said crank-pin and said upper table, a slide-rod H, having an engagement with said gear-clutch, and cam-inclines carried by a rotary part of the machine for moving said slide-rod, substantially as and for the purpose described.

10. In a whip-rolling machine, the combination, with the driving-shaft D and the gear *v* and clutch therefor, of the cam-shaft C, having thereon the gear *y*, provided with the cam-inclines on its opposite sides, and the slide-rod H, provided with the legs *x x*, located in the path of said cam-inclines to be actuated thereby to move said rod H, and also having an arm *w*, for operating the gear-clutch, substantially as described.

11. In a whip-rolling machine, a suitable supporting-frame and two whip-rolling tables interiorly provided with steam-chambers, movable supports mounted on said frame, on and by which one of said tables is carried and presented near and away from the opposing table, and the other of said tables pivotally supported by its inner end on a part of said frame, whereby it is adapted to be reciprocatingly swung across the working-face of the adjacent table, and a stay-rod connected to said frame and to the outer end of said table, holding the said outer end more separated from the opposing table than is said inner end, whereby a slight angle between the working-faces of said table is secured, combined with flexible steam supply and exhaust conduits leading to and from said chambered tables, substantially as described.

407,691. WHIP-ROLLING MACHINE. ELKANAH RING, Westfield, Mass., assignor of one-half to James Noble, Jr., same place. Filed Dec. 17, 1888. Serial No. 293,838. (No model.)

Claim.—1. In a whip-rolling machine, a pair of opposing blocks E E, having longitudinal slideways therein and pivotally mounted for swiveling movements, combined with whip-rolling boards longitudinally movable in said ways, and means for imparting thereto relatively-reversed longitudinal motions and relatively-reversed lateral vibratory motions with their faces in substantially parallel planes, substantially as and for the purpose described.



2. In a whip-rolling machine, a pair of opposing blocks E E, having longitudinal slideways therein and pivotally mounted for a swiveling movement, combined with a pair of whip-rolling boards longitudinally movable in said ways, and a pair of revolving eccentric-pins, one set to rotate in advance of the other, to which the lower extensions of said boards are connected, substantially as and for the purposes described.

3. In a whip-rolling machine, a pair of opposing blocks E E, having longitudinal slideways therein, and journaled arbors on which said blocks are mounted for oscillating movements, one of which arbors is movable endwise with or against a spring-pressure, and means for longitudinally moving said arbor, combined with a pair of whip-rolling boards longitudinally movable in said ways, and a pair of revolving eccentric-pins, diametrically opposite each other, to which the lower extensions of said boards are connected, substantially as and for the purpose described.

4. In a whip-rolling machine, a pair of opposing blocks E E, having longitudinal slideways therein, and journaled arbors on which said blocks are mounted for oscillating movements, one of which arbors is movable endwise with or against a spring-pressure, combined with a pair of whip-rolling boards longitudinally movable in said ways, and a pair of revolving eccentric-pins diametrically opposite each other, to which the lower extensions of said boards are connected, the rock-shaft G, having the radial arms *o* and *n*, the latter being in engagement with said longitudinally-movable arbor, a treadle-lever, and the rod connected thereto and to said radial arm *o*, substantially as and for the purpose described.

5. In a whip-rolling machine, in combination, a driving-shaft having the gears *e e* and a supporting-frame therefor, the journals *g g* on said frame, arbors supported for oscillation in said journals, one of which is movable endwise with or against a spring-pressure, the opposing blocks carried by said arbors having ways therein, the counter-shafts C D, provided with the opposing face-plates having the eccentric-pins diametrically opposite each other, the whip-rolling boards adapted to play in the ways of said blocks and by their lower extensions connected with said eccentric-pins, the rock-shaft G, having radial arms *o n*, the former engaging said longitudinally-movable arbor, a treadle-lever *q*, and a rod connected thereto and to said radial arm *o*, all substantially as shown and described.

407,692. AUTOGRAPHIC TELEGRAPH. JAMES H. ROBERTSON, Rutherford, N. J., assignor to the Writing Telegraph Company, of New York. Original application filed Feb. 3, 1885, Serial No. 154,796. Divided and this application filed May 21, 1889. Serial No. 311,516. (No model.)

Claim.—1. In an autographic telegraph, two groups, placed side by side, of insulated conducting-strips connected to resistances, in combination with a contact-maker or circuit-closer in the form of a stylus the contact-points of which constitute the tracing-points, substantially as described.

2. In an autographic telegraph, the combination, with the receiving stylus or pen, of two electro-magnets and two armatures pivoted to move at right angles to each other, one of said armatures pivoted to the other and the said two armatures arranged to operate said stylus, whereby the latter is moved in a straight line by either of said magnets, substantially as described.

3. In an autographic telegraph, the combination, with the receiving stylus or pen, of two electro-magnets and two armatures pivoted to move at right angles to each other, one of said armatures pivoted to the other and carrying the said stylus, and the said two armatures arranged to operate said stylus, substantially as described.

4. In an autographic telegraph, the combination, with the receiving stylus or pen, of two electro-magnets and two armatures pivoted to move at right angles to each other, one of said armatures pivoted to the other and having its electro-magnet fastened to the latter, and the said two armatures arranged to operate said stylus, substantially as described.

5. In an autographic telegraph, the combination, with the receiving-stylus laterally movable in any direction, of the sending-stylus provided with two contact-points, an electro-magnet in circuit with one of the contact-points of the sending-stylus, and an armature therefor connected to the said receiving-stylus for lifting the latter from the paper, substantially as described.

6. The combination, with the receiving stylus or pen laterally movable in any direction, of the sending-stylus provided with two contact-points, an electro-magnet in circuit with one of the contact-points of the sending-stylus, an armature for said magnet, and a cord connecting the stylus with said armature for the purpose of lifting the said styles when the circuit is broken and the spring has retracted said armature, substantially as described.

7. The combination, with the receiving-stylus and a pair of pressure-rollers between which the paper is held, of the sending-stylus provided with two contact-points, an electro-magnet in circuit with one of the contact-points of the sending-stylus, an armature therefor operating an escapement, and a spring and system of gears connected with said pressure-rollers for imparting an intermittent movement to the latter, substantially as described.

8. The combination, with the receiving-styles and the pressure rollers, of two electro-magnets and their armatures, one of said magnets arranged in circuit with one of the contact-points of the sending-stylus and the other magnet in circuit with the other contact-point of said stylus, a connection from one of said armatures to the stylus for lifting the same, and an escapement of a clock-work mechanism geared with the pressure-rollers operated by the other armature for feeding the paper, substantially as described.

9. A combined sending stylus or tracer and contact-maker provided with two contact-points serving as tracers insulated from each other and constructed of a size and form to be held and operated by the hand, substantially as described.

10. A combined sending stylus or tracer and contact-maker constructed to be held and operated by hand, and provided with two contact-points, one of which is spring-seated, substantially as and for the purpose set forth.

11. A combined sending stylus or tracer and contact-maker constructed to be held and operated by hand, and provided with two contact-points insulated from each other, one of which consists of a pin suitably guided and pressed forward by a spring connected to said pin at one end and to the casing at the other, substantially as described.

12. A sending-stylus or contact-maker provided with two contact-points, one of which is formed on the handle constructed to be held in the hand and the other on an insulated arm extending from the same near the lower end thereof, substantially as described.

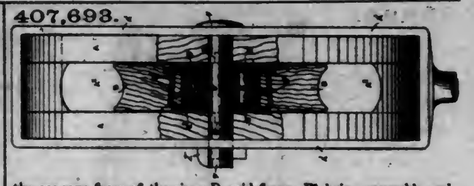
13. In an autographic telegraph, the combination of two magnets and two vertically-arranged armatures therefor pivoted so as to swing at right angles to each other, with a stylus or marking pen or pencil directly connected to the lower end of one of said armatures, substantially as described.

14. In an autographic telegraph, the combination, with a vertically-arranged armature provided with a guide attached to its lower end, of a marking-instrument loosely fitted in said guide, so as to freely move or slide therein, whereby the contact of the marking-instrument with the paper is insured during all the movements of the armature, substantially as described.

15. In an autographic telegraph, the combination, with a receiving pen or stylus laterally movable in any direction and a set of electro-magnets and armatures for moving said receiving-pen, of paper-feeding mechanism and an electro-magnet for controlling the latter for feeding the paper at intervals, substantially as described.

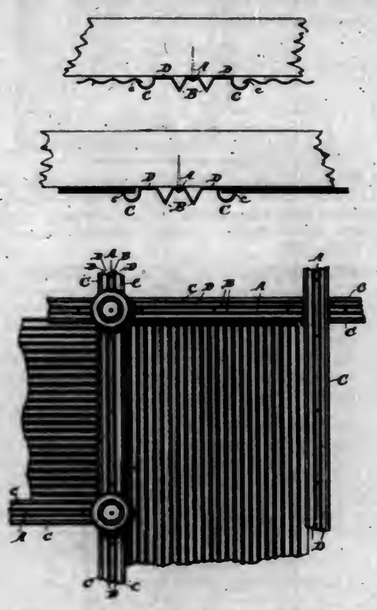
16. In an autographic telegraph, the combination, with a receiving pen or stylus laterally movable in any direction, a set of electro-magnets and armatures for moving said receiving-pen, and a pen-lifting mechanism, of paper-feeding mechanism and an electro-magnet for controlling the latter for feeding the paper at intervals, substantially as described.

17. In an autographic telegraph, the combination, with the receiving-pen laterally movable in any direction and a set of electro-magnets and armatures for moving said receiving-pen, of a stationary recording-surface, such as paper, over which the pen moves to reproduce the message, a feeding mechanism for moving the paper at times when the writing is suspended, an electro-magnet for controlling said feeding mechanism, and electrical connections including said magnet, and a circuit making and breaking means at the transmitter, whereby the operator at the transmitter can control the shifting of the paper in the receiver, substantially as described.



18. In an autographic telegraph, the combination, with the receiving stylus or pen, of two electro-magnets and two armatures pivoted to move at right angles to each other and connected at their operative ends, one of said armatures carrying the other one, together with the latter's adjusting means, substantially as described.

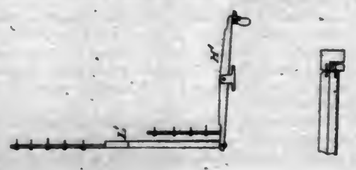
407,698. ROLLER-BEARING FOR PULLEY-BLOCKS. HENRY A. ROOKE, Liverpool, County of Lancaster, England. Filed Sept. 18, 1888. Serial No. 285,004. (No model.) Patented in England Dec. 6, 1887, No. 16,803.



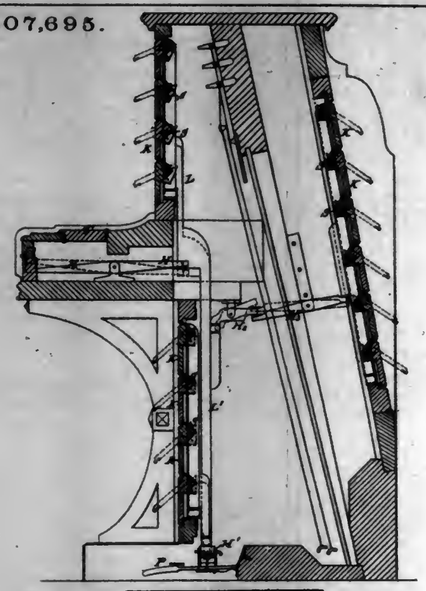
Claim.—1. In roller-bearings for pulley-blocks, the combination of the rollers C, the retaining-rings D, having equidistant roller-bearing pins D' on their inner faces and having their outer faces annularly concaved, and the sleeve E, having flanges E' E² bearing against the concave faces of the rings D, said flange E² being separable and adjustable, whereby the rollers or rings as they become worn may be readily adjusted or removed, substantially as described.

2. In a pulley-block, the combination, with the cheeks A and central pin F, of a roller-bearing casing E E' E², supported between the cheeks upon said pin, and having lugs G, engaged by grooves formed in the inner faces of the cheeks and extended outward to the edge thereof, whereby the casing is prevented from turning within the block, but can readily be detached therefrom without injury to any part, substantially as described.

407,693.

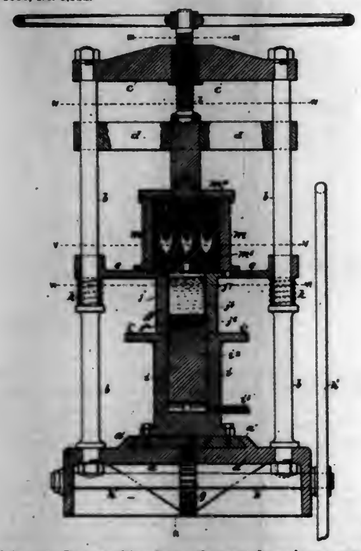


407,694. METALLIC MOLDING-STRIP. LOOSLEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Charles H. Harder, Piedmont, W. Va. Filed Apr. 1, 1889. Serial No. 305,587. (No model.)



Claim.—A metallic molding-strip having the longitudinal V-shaped corrugations B, extending downward at each side of the nailing portion A, the outer edges of said molding having the circular corrugations C, the top of the upturned portions *c* being below the plane of the central nailing portion A, as and for the purposes set forth.

407,695. PIANO. FERDINAND SCHAAF, Frankfort-on-the-Main, Germany. Filed June 1, 1888. Serial No. 275,193. (No model.)



Claim.—An upright piano with inclined back provided with long horizontal flaps K on its front and back sides, in combination with the vertical rods L L', and the levers H H' H² H³, which are opened by the weight of the rods and automatically closed by the shutting of the key-lid T and a pressure upon the pedal P.

407,695.

407,696. APPARATUS FOR CASTING METALS UNDER PRESSURE. JOHN J. C. SMITH and CHARLES GRASSER, Passaic, N. J., assignors to the Smith Brothers Manufacturing Company, same place. Filed Feb. 16, 1888. Serial No. 264,189. (No model.) Patented in England June 30, 1887, No. 9,322.

Claim.—1. In a machine for casting metals under pressure, the combination of the hydraulic ram *i*, a metal receptacle *j*, both arranged on a sliding platform, and an elevated mold, substantially as and for the purpose set forth.

2. The combination of the elevated mold-receptacle *m*, table *e*, cylinder *j*, piston i^3, asbestus lining j^3, asbestus disk j^3, covering the head of the ram-piston i^3, and the asbestus partition j^7, provided with a contracted gate and interposed between the mold in the receptacle *m* and the metal in the receptacle *j*, all substantially as and for the purposes herein set forth.

3. The combination of the mold-receptacle *m*, formed in two parts, hinged together and resting on a vertically-movable table *e*, and a metal receptacle *j* and a hydraulic ram *i*, both mounted on a horizontally-sliding platform, substantially as and for the purpose set forth.

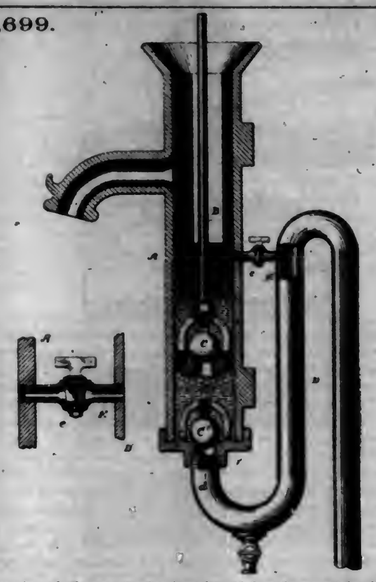
4. The combination of the movable table *e* and mold-receptacle *m*, both movable vertically by means of spring and screw, and a movable cover for receptacle *m*, adapted to be raised therefrom by said screw, substantially as and for the purposes set forth.

407,697. SWING-FIGURE MUSICAL TOY. FELIX A. SOMMER, Hammersmith, County of Middlesex, England. Filed Apr. 13, 1889. Serial No. 307,080. (No model.) Patented in England Sept. 11, 1888, No. 13,138.

Claim.—A musical toy consisting of a pin-barrel, sound-producing tongues, a crown-wheel geared to and rotating the pin-barrel, and a pendulum operated by a cord attached thereto and having an escapement-anchor which intermittently rotates the crown-wheel, substantially as described.

407,698. CLAMPING-FRAME. THEODOR STEINERT, Chicago, Ill. Filed Feb. 19, 1889. Serial No. 300,501. (No model.)

Claim.—The frame for the purpose described, consisting of timbers E and F, connected by bar G and stringer H, and having block I, with clamp-screw *i*, and posts *j j'*, engaging bar J, said timber F having projecting plate *f*, and timber E having strip *e*, all substantially as set forth.

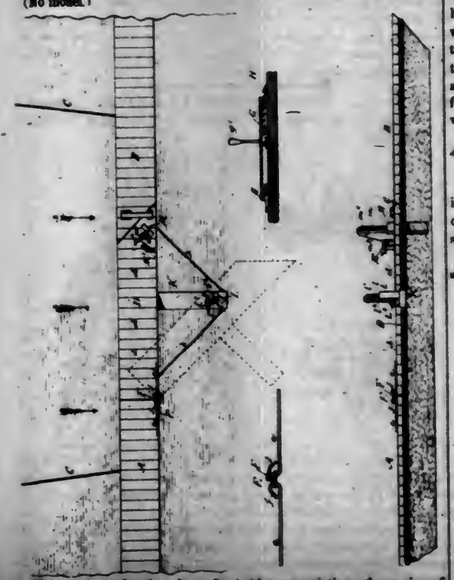


407,699. PUMP. JOHN STEVENS, Neenah, Wis. Original application filed Feb. 1, 1888, Serial No. 83,719. Divided and this application filed Apr. 20, 1888. Serial No. 162,783. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the pump-barrel, the supply-pipe having the siphon-bend and the rebend at its end and screw-threaded into a seat at the bottom of the barrel, and the contracted connecting-pipe or air-tube between the upper bend of the siphon and the pump-barrel.

2. The combination, substantially as hereinbefore set forth, of the pump-barrel, the supply-pipe bent into siphon form and rebent at the end of its shorter leg to screw into a seat at the bottom of the barrel, the contracted connecting-pipe or air-tube between the upper bend of the siphon and the pump-barrel, and the stop-cock in said pipe.

3. The combination, substantially as hereinbefore set forth, of



407,699.

the pump-barrel, the supply-pipe bent into siphon form and having a rebend at the end of the shorter leg of the siphon to screw into a seat at the bottom of the barrel, the contracted connecting-pipe or air-tube between the upper bend of the siphon and the barrel, and the diminishing aperture opening from the end of said connecting-pipe into the barrel-chamber.

4. The combination, substantially as hereinbefore set forth, of the pump-barrel, the supply-pipe bent into siphon form alongside the barrel and rebent at the foot of its shorter leg to screw into the seat at the bottom of said barrel, the contracted connecting-pipe or air-tube between the upper bend of the siphon and the pump-barrel, the diminishing aperture from the end of said connecting-pipe into the chamber of the barrel, and the stop-cock in said connecting-pipe.

407,700. FLOATING DRAW FOR BRIDGES. SYLVESTER H. STEWART, Philadelphia, Pa. Filed Mar. 26, 1889. Serial No. 304,835. (No model.)

Claim.—1. A floating draw for bridges, consisting of a series of decked scows having parallel and vertical sides, said scows being attached together with their sides in close contact, instead of being placed at intervals, as usual, and the decks of the same forming the road-bed of the draw, substantially as described.

2. In a floating draw for bridges, movable motor-boards M and L, adapted to be projected into the water, substantially as and for the purpose described.

3. In a floating draw for bridges, the combination, with the draw structure and a movable motor-board M, adapted to be held in the water at an angle to the direction of the current, of the raft K and the movable motor-board L, adapted to be projected into the water below the level of the bottom of the raft and at an angle to the direction of the current, substantially as described.

4. In a floating draw for bridges, the combination, with the causeway A, having a rectangular end, and the causeway B, having a triangular end, of the draw D, having one end corresponding in shape to the causeway A, where it is hinged, and its opposite end corresponding in shape to the end of causeway B, substantially as described.

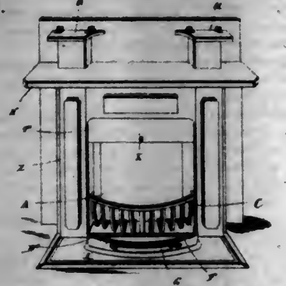
5. In a floating draw for bridges, the combination, with causeway A and metallic strap *e* secured thereon and formed with an eye *f*, of the draw D, having a similar strap and eye, and the rope or other flexible and separable connection F, all constructed and arranged substantially as described.

6. In a floating draw for bridges, the combination, with the swinging draw D, having the pivoted hook G, of the causeway B, having the rack H, with which said hook is adapted to engage and lock the draw, substantially as described.

407,701. AUTOMATIC FIRE-EXTINGUISHER. DANIEL C. STILLSON, Somerville, Mass. Filed Feb. 21, 1889. Serial No. 300,681. (No model.)

Claim.—1. An automatic fire-extinguisher comprising the sprinkler-shell *a*, having the valve-seat *a'*, perforated head *c*, the valve *b*, having a stem *b'*, the levers *d*, and the fusible joint *e* for holding the valve on the seat, said sprinkler-shell having a neck a^2 extending back from the valve-seat in line with the valve and valve-stem and having a lateral tube *g*, located between the valve-seat and the water-supply pipe and closed at its outer extremity against the external atmosphere by an external fusible plug *h*, which, on being fused, permits the escape of air from said neck directly behind the valve, substantially as described.

2. An automatic fire-extinguisher consisting of a sprinkler-head having a lateral water-outlet orifice, a valve-seat at its inner end, a valve held on the valve-seat by a fusible joint, and a tubular neck extending longitudinally from the valve-seat and provided with a lateral tube located in rear of the valve and closed at its outer extremity against the external atmosphere by a fusible plug, which, on being fused, permits the escape of air from the neck directly behind the valve, substantially as described.



407,702. FIRE-PLACE. THOMAS J. SUGGS, Lafayette, Ala. Filed Oct. 26, 1888. Serial No. 289,210. (No model.)

Claim.—1. In a fire-place, the herein-described hollow base having the rear end of its upper side inclined downwardly, having a draft-opening on its inner or rear side, and provided with a door on its front side, substantially as set forth.

2. The hollow base-plate having a transverse groove in its upper side, in combination with the sides of the mantel having vertical

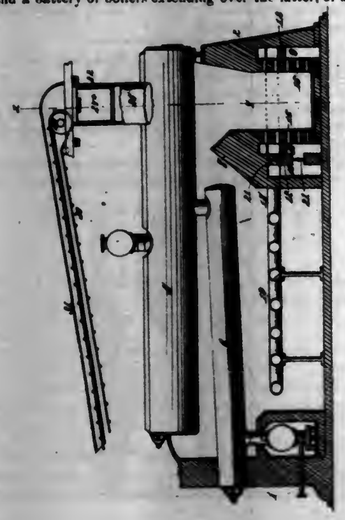
407,702.

grooves on their inner sides, and the vertically-sliding blower, substantially as set forth.

3. In a fire-place, the hollow base-plate having inclined rear end, a draft-opening in its rear side, a hinged front top section, and a hinged front door, substantially as and for the purpose set forth.

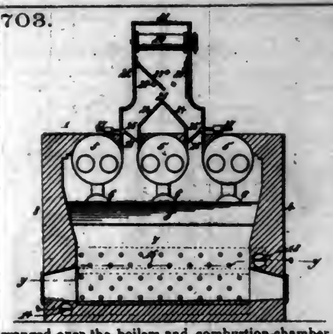
4. The combination, with the hollow base-plate having inclined rear end, a draft opening in its rear side, a hinged front top section, a hinged front door, and provided with a transverse groove in its upper side, of the vertically-adjustable blower sliding in grooves in the sides of the mantel, and adapted to have its lower edge fitted in the transverse groove of the base plate, substantially as set forth.

5. The mantel having hollow or recessed sides or legs provided with vertical grooves in their inner sides extending upwardly through the mantel-shelf, and having open upper ends provided with hinged or removable covers, in combination with the vertically-adjustable blower and screen sliding in the grooves in the inner sides of the legs, the counter-weights arranged in the hollow legs, and suitable connecting cords and pulleys, substantially as set forth.



6. The combination, with the mantel and the chimney, of a transverse flue connecting the space in rear of the breast of the mantel with the chimney-flue, substantially as set forth.

7. The combination, with the mantel and the chimney, of a transverse flue connecting the space in rear of the breast of the mantel with the chimney-flue, and the vertically-sliding blower, adapted, when not in use, to occupy said space in rear of the breast of the mantel, substantially as set forth.

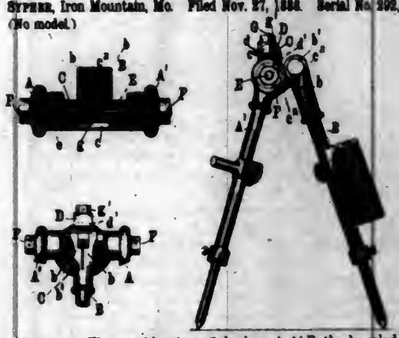


407,703. BAGASSE-FURNACE. WILLIAM W. SUTCLIFFE, New Orleans, La. Filed Mar. 14, 1889. Serial No. 303,287. (No model.)

Claim.—1. The combination, with a bagasse-furnace having a combustion-chamber, of a feed-casing above the furnace having a central dividing feed-guide forming side passages, which extend through the top portion of the furnace above the combustion-chamber, valve-chutes pivotally mounted on the sides of the feed-casing and a pivoted and weighted automatically-closing hopper-valve in each side passage, substantially as described.

2. The combination, with a bagasse-furnace having a combustion-chamber and a battery of boilers extending over the latter, of a feed-

407,703.

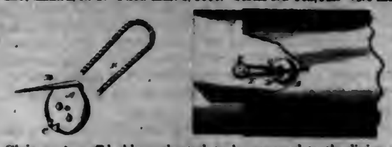


casing arranged over the boilers and combustion-chamber, a central feed-guide having inclined surfaces forming separate passages, respectively extending down between the boilers and provided with hopper-valves, and valve-chutes pivotally mounted above the feed-guide to divert the feed down between the boilers, substantially as described.

3. In a bagasse-furnace, the combination, with a combustion-chamber inclosed by the front, side, and bridge walls, the front wall and bridge-wall having air-chambers divided into upper and lower sections communicating with the furnace by tuyeres, said upper chambers connected by a lateral passage in one side wall and the lower by a lateral side passage in the other side wall, of a hot-blast manifold arranged in the fire-space and communicating with a common air-chamber in the bridge-wall, said chamber connected with the upper and lower air-chambers in the bridge-wall by passages having valves, substantially as described.

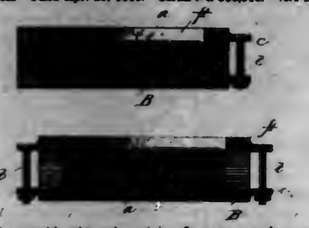
4. In a bagasse-furnace, a combustion-chamber having an upper and lower air-chamber in its front wall and bridge-wall, respectively, the two upper chambers communicating by a lateral passage in the side wall above the furnace-door and the two lower by a lateral passage in the other side wall below the furnace-door, said chambers having tuyeres communicating with the furnace, substantially as described.

5. In a bagasse-furnace, the combination, with a battery of boilers, of a feed-casing arranged over the boilers and above the combustion-chamber, a central guide having inclining surfaces meeting at a central angle and forming passages between the boilers which are provided with hoppers, valve-chutes pivotally mounted above the feed-guide to divert the feed from one passage to the other, and suitable feeding devices carrying the fuel to the casing, the combustion-chamber being supplied with upper and lower chambers in the front wall and bridge-wall, the former communicating by a passage in the side wall above the door, and the latter by a passage in the opposite wall below the door, a hot-blast manifold supplying said chambers, and means for cutting off the blast in either the upper or lower chambers in both walls, substantially as described.



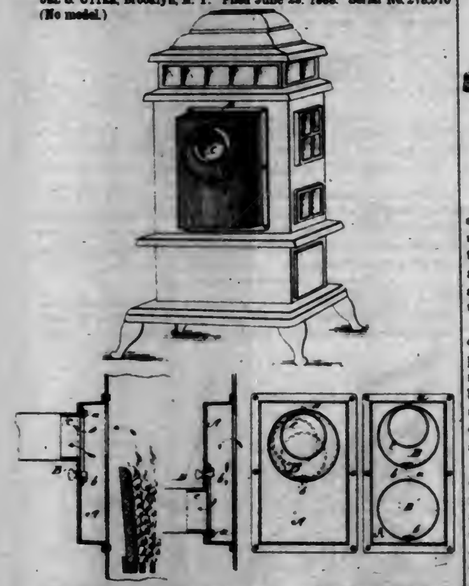
407,704. TRIPOD-SUPPORT FOR ROCK-DRILLS. ABRAHAM J. SYPHER, Iron Mountain, Mo. Filed Nov. 27, 1888. Serial No. 292,022. (No model.)

Claim.—1. The combination of the legs A A' B, the beveled saddle perforated and having the socket and upper edge, as described, the tie-bolt E, the eyebolt G, and the beveled clamp D, said legs being attached to said saddle, as described.



2. The combination of the beveled saddle C, having socket *c*, the tie-bolt E, horizontally passing through the saddle, the legs A and A', secured at the respective ends thereof, the beveled clamp D, the strengthening-lug c^3 on the saddle, the split leg B, and bolt and nut *b'*, substantially as and for the purposes set forth.

407,705. CUFF-HOLDER. WILLIAM R. TERRY and EDWIN K. HANLEY, Elmira, N. Y. Filed Mar. 8, 1888. Serial No. 302,443. (No model.)



Claim.—A cuff-holder adapted to be secured to the lining of a sleeve, consisting of a plate having an arm or pin projecting forward parallel with its surface, with teeth opposite the arm extending at right angles to the surface of the plate to prevent the holder working up the sleeve, the plate having apertures and a cord having its ends passed through the apertures and secured therein so as to form a loop, for the purpose substantially as shown and described.

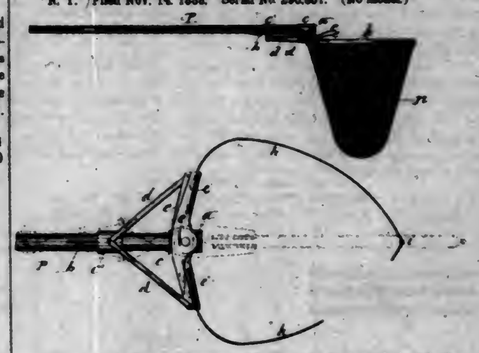
407,706. CLAMP FOR STICKY FLY-PAPER. OTTO TRUE, Grand Rapids, Mich. Filed Apr. 25, 1889. Serial No. 308,513. (No model.)

Claim.—In combination, the sticky fly-paper having uncoated edges and central portions covered by the sticky material, the clamping-frames upon each of its sides, one of said frames having bearings pressing upon the paper about its uncoated edges only, whereby the said edges will be compressed and the sticky material confined to the central portions not subjected to pressure, substantially as described.

407,707. ADJUSTABLE PIPE-OPENING IN STOVES, &c. SAMUEL S. UTTER, Brooklyn, N. Y. Filed June 29, 1888. Serial No. 278,570. (No model.)

Claim.—1. A stove provided with an auxiliary back A, of configuration adapted to form an air-chamber on the back of the stove and provided with suitable smoke-discharging opening, in combination with a plate B, adapted to rotate in such opening and having a pipe-collar C and an opening therein disposed on such plate eccentrically, such plate being further provided with a lug *a* and button *b*, substantially as described and shown.

2. As a new article of manufacture, a hollow auxiliary stove-back A, adapted to be attached to the back of a stove and to form an air-chamber thereon, such back provided with a suitable smoke-discharging opening, in combination with the pipe-adjusting device described, consisting of a plate B, adapted to rotate in such opening and having a pipe-collar C and opening therein disposed on such plate eccentrically, such plate being further provided with a lug *a* and button *b*, substantially as described and shown.



3. The hollow auxiliary stove-back A, adapted to be attached to the back of a stove and to form an air-chamber thereon, such back having two openings of equal size formed therein, in combination with interchangeable plates B B', adapted to rotate in such openings, such plates having suitable holding parts, as the lugs *a* and buttons *b*, and one of such plates B having a pipe-opening and collar C disposed therein eccentrically, substantially as described and shown.

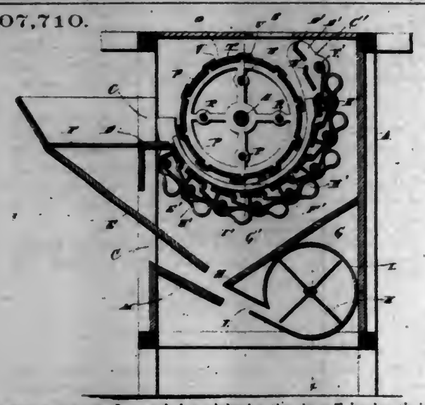
407,708. METHOD OF FASTENING STRIPS. VINTON A. WEAVER, Moundsville, W. Va. Filed Sept. 4, 1888. Serial No. 284,583. (No model.)

Claim.—The method herein described of joining articles, which consists in first making a spirally-coiled ring and inserting the parts to be joined therein and overlapping their ends, and then further coiling the ring in a spiral direction around the strips to be joined and making it of smaller diameter in every direction, whereby the parts to be joined are reduced where they are pressed by the ring, and the latter is caused to coil more than once around the joined parts and hold the overlapping parts in a spiral clasp, substantially as and for the purpose specified.

407,709. FISH-LANDING NET. CHARLES E. WHITE, Syracuse, N. Y. Filed Nov. 14, 1888. Serial No. 290,867. (No model.)

Claim.—1. In combination with the pole P, provided with the stop *a* and catch *b*, and the ferrules *c c'*, mounted movably longitudinally on the pole, the braces *e e*, pivoted at the central portions of their respective lengths to the outer ferrule *c*, the hoop-sections *h h*, attached at their extremities to one end of the said respective braces, and the toggles *d d*, connected to the opposite end of said braces and to the inner ferrule *c'*, substantially as described and shown.

2. In combination with the pole P, provided with stop *a* and catch *b* and the ferrules *c c'*, mounted movably longitudinally on said pole, the braces *e e*, pivoted in common at the central portion of their respective lengths to one and the same side of the outer ferrule *c*, the hoop-sections *h h*, attached at their extremities to one end of the respective braces, and the toggles *d d*, connected to the opposite end of said braces and to the inner ferrule *c'*, substantially as described and shown.



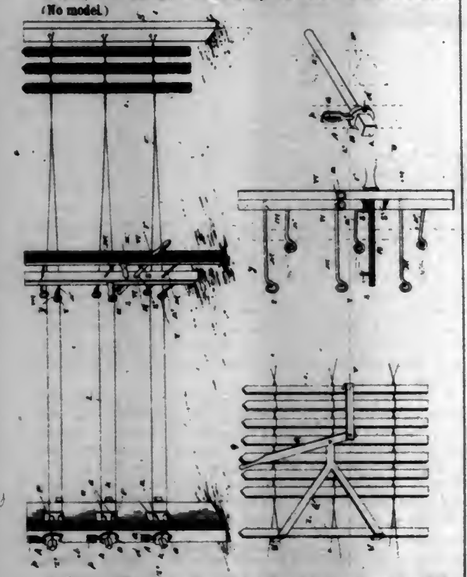
3. In combination with the pole P, provided with the stop *a* and catch *b*, and the ferrules *c c'*, mounted movably longitudinally on said pole, the braces *e e*, lying one upon the other and pivoted in common at the central portion of their respective lengths to one and the same side of the outer ferrule *c*, the hoop-sections *h h*, attached at their extremities to one end of the respective braces, and the toggles connected to the opposite end of said braces and pivoted in common to one and the same side of the inner ferrule *c'*, substantially as described and shown.

407,710. CORN HUSKER AND SHELLER. LOUIS R. WHITING, Dallas, Tex. Filed July 10, 1888. Serial No. 279,604. (No model.)

Claim.—1. The cylinder having the plates T, provided with the overlapping flanges U, the latter having their front sides sharpened to form cutting-edges V and being provided with transverse grooves or recesses W, substantially as described.

2. The combination of the cylinder-heads P, having the annular

407,710.

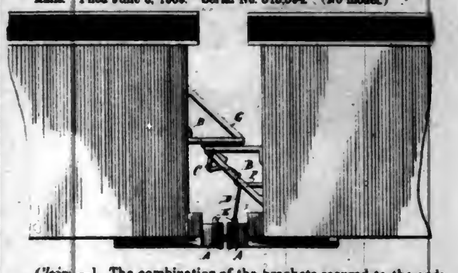


recesses or grooves S near their peripheries, the plates T, having their ends arranged in said grooves or recesses, said plates being provided with the overlapping flanges U, and the clamping-bolts securing the heads of the cylinder on the ends of the plates, substantially as described.

3. The combination of the rib-frame comprising the end walls C', having the flanges F', and the connecting-rods E', with the ribs G', obtuse-angled in cross-section and arranged at a slight distance apart between the end walls C', the arms H', secured to the ribs and pivoted on the rods E', and the springs I', bearing against the outer sides of the ribs and pressing the latter normally against the flanges F, substantially as described.

4. In a corn-shelling machine, the rotating cylinder having the peripheral teeth, in combination with the end walls C', having the flanges F', concentric with the cylinder, the rods E', connecting said end walls, the arms H', pivoted on said rods, the ribs secured to the free ends of said arms and obtuse-angled in cross-section, and the springs bearing against the ribs and keeping the latter normally in contact with the flanges F', substantially as described.

407,711. MACHINE FOR MAKING PICKET FENCES. GILES W. WICKES, New Market, Va. Filed Apr. 23, 1889. Serial No. 308,256. (No model.)



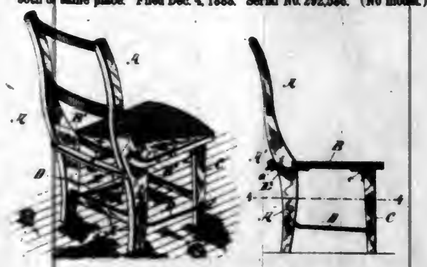
Claim.—1. The weaver herein described, the same comprising the front and rear bars W W, long wires M on the front of said bars passing loosely through holes in the rear bar, and wires N on the rear bar exteeding rearwardly therefrom, all of said wires having eyes Y on their rear ends, the whole adapted for use, substantially as described.

2. The weaving-bars W W and the wires M N, carried thereby, in combination with the rod R, journaled loosely in said bars and having heads *r* on its front end and studs *s s* on its body, said studs being adapted to pass through a slot *s'* in the edge of the bearing in the rear bar, the forward stud being placed a distance from said head equal to the combined thickness of the two bars, and the rearmost stud being placed a distance from said forward stud equal to the distance between the inner faces of said bars when in their utmost distended position, as and for the purpose set forth.

3. The picket-placer herein described, the same comprising the hook V, the lever Q, pivoted at one end to the free end of said hook, and the grapple G, forked in its body and having feet *g* at its front ends adapted to engage the picket being applied, said grapple being pivoted at its rear end to the lever Q, intermediately between its ends, substantially as and for the purpose set forth.

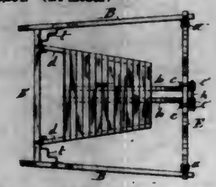
407,712. CAR-COUPLING. FRANK E. WILLIAMSON, Smith Centre, Kans. Filed June 3, 1889. Serial No. 313,594. (No model.)

Claim.—1. The combination of the brackets secured to the ends of the cars, and the lever connected with the coupling-pin and supported by the bracket on the end of one car, and adapted to be acted upon by the bracket on the other car, as set forth.



2. The combination of the brackets B, the arm F, the lever supported by the brackets B, and the cable secured to the lever passing through the arm F and secured to the coupling-pin, as set forth.

407,713. GAME APPARATUS. VINCENT W. WILSON, Pawtucket, R. I., assignor to the R. Bliss Manufacturing Company, same place. Filed May 28, 1888. Serial No. 275,389. (No model.)

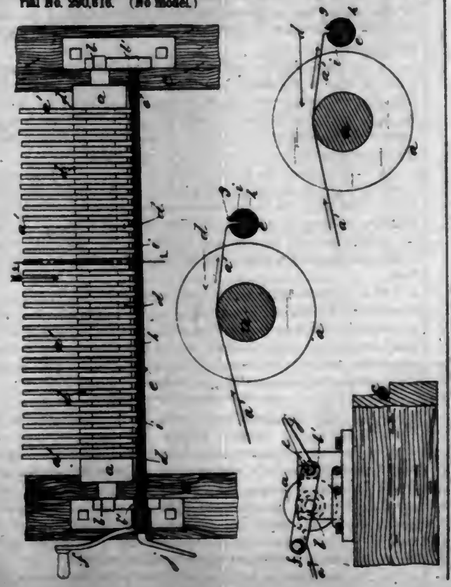


Claim.—In a game apparatus, the combination, with the game board or table, of a ball and a downwardly-inclined conduit formed of a spiral wire coil having its convolutions so separated from each other as to operate to retard the motion of the ball, substantially as and for the purpose specified.

407,714. FOLDING CHAIR. AARON R. ALBERT, Indianapolis, Ind., assignor of two-thirds to Augustus S. Knapp and Charles Stevenson, both of same place. Filed Dec. 4, 1888. Serial No. 292,586. (No model.)

Claim.—The combination of the back A, having the cross-bar A', the engaging-pin *a*, depending from said cross-bar, the seat B, hinged to the side pieces of the back A by the curved hinge-bars B', the front leg C, hinged to the seat by the hinge *c*, the connecting or brace rods D, secured to the front legs on the pivot-pins *c'* and to the rear legs on the pivot-pins *a'*, as shown, said pins *a'* being located in advance of the pins *b* of the hinge-bars B' and also in advance of the center of gravity when the seat is folded up, and the spring-catch E secured to the rear edge of the seat B, and arranged to engage with the catch-pin *a* in the cross-bar A' when the seat is turned down, all substantially as described, and for the purposes specified.

407,715. TWO-WHEELED VEHICLE. GEORGE BEEBE, Penn Yan, N. Y., assignor to William M. Beebe, same place. Filed Apr. 8, 1889. Serial No. 306,251. (No model.)

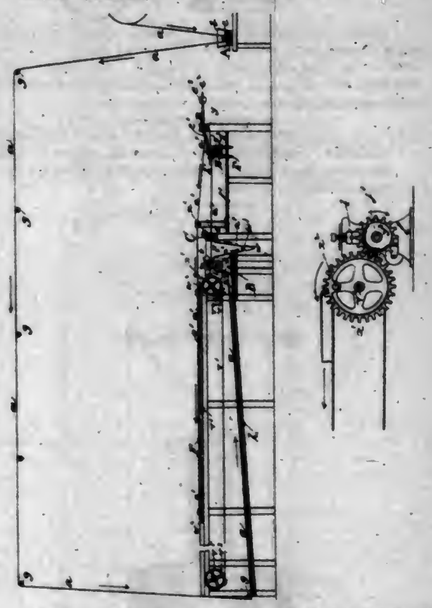


Claim.—1. In a two-wheeled vehicle, the foot-board provided at one end with shackle-eyes and at the opposite end with supporting-arms, in combination with shackle-eyes on the vehicle coinciding with those of the foot-board, a single bolt inserted removably through the aforesaid shackle-eyes and supporting one end of the foot-board, and loops attached to the vehicle and receiving through them the aforesaid supporting-arms of the foot-board, all constructed and combined to allow the foot-board to be removed by the withdrawal of the aforesaid single bolt, substantially as set forth.

2. The combination of the shafts and seat-supporting cross-spring, clip-ties on said spring formed with shackle-eyes, which latter are axially in line with each other, loops on the cross-bar of the shafts, the foot-board provided with forwardly-extending arms passing through the aforesaid loops, and rearwardly-extended arms terminating with shackle-eyes close to the sides of and axially in range with the shackle-eyes of the aforesaid clip-ties, and a single bolt inserted in said shackle-eyes and removably connecting the foot-board to the vehicle, substantially as described and shown.

3. The combination of the shafts and seat-supporting cross-spring, clip-ties on said spring formed with shackle-eyes, which latter are axially in line with each other, and one of said latter eyes screw-threaded internally, loops on the cross-bar of the shafts, the foot-board provided with rearwardly-extended arms terminating with shackle-eyes close to the inner sides of and in range with the shackle-eyes of the aforesaid clip-ties, a single bolt, screw-threaded at one end, passing through the aforesaid shackle-eyes and engaging the screw-threaded eye, and arms extending forward from the foot-board and through the aforesaid loops and removable therefrom, substantially as described and shown.

407,716. APPARATUS FOR WINDING FLEXIBLE LIGHTING-MATCHES. FREDERICK BONNABIUS, New Orleans, La., assignor to the Carroll Flexible Match Company, of Missouri. Filed Nov. 12, 1888. Serial No. 290,616. (No model.)



Claim.—The combination of a tubular spindle *e*, mounted removably in bearings and having slot *g* and handle *f*, with rod or spindle *h*, having groove or channel *i* and handle *j*, substantially as shown, and for the purpose described.

407,717. PREPARING FLEXIBLE MATCHES. FREDERICK BONNABIUS, New Orleans, La., assignor to the Carroll Flexible Match Company, of Missouri. Filed Nov. 12, 1888. Serial No. 290,617. (No specimens.)

Claim.—1. The method herein described of manufacturing matches, which consists in first passing a web or band of flexible material through a bath of inflammable composition whereby the web is rendered inflammable; second, drying the web so that the web may be cut without tearing; third, slitting the web longitudinally into a series of strands, and, fourth, depositing an igniting composition on the separated strands at intervals, substantially as and for the purposes specified.

2. The method herein described for making flexible matches, which consists in the following successive steps, viz: first, immersing a web or band of flexible material, such as paper, in a bath of inflammable material, such as a solution of shellac and rosin in fusel-oil; second, exposing said web to the atmosphere to evaporate the solvent and dry the web so that it can be cut; third, slitting said dried web longitudinally into a series of narrow strips or strands, and, finally, depositing an igniting composition at intervals on each of the separate strands of the series, substantially as and for the purposes specified.

407,718. MATCH-MACHINE. FREDERICK BONNABIUS, New Orleans, La., and GRAY STAUNTON, St. Louis, Mo., assignors to the Carroll Flexible Match Company, of Missouri. Filed Nov. 22, 1888. Serial No. 291,705. (No model.)

Claim.—1. In machinery for making flexible lighting-matches, the combination of two series of circular plates or disks fixed vertically on parallel spindles having adjustable bearings, the disks of one series entering the space, respectively, between the disks of the other series, with two slotted bars or combs inserted horizontally and parallel to each other within the respective spaces of the disks for guiding and separating fanwise the strands or strips, and means for rotating one of said spindles, substantially as shown, and for the purpose described.

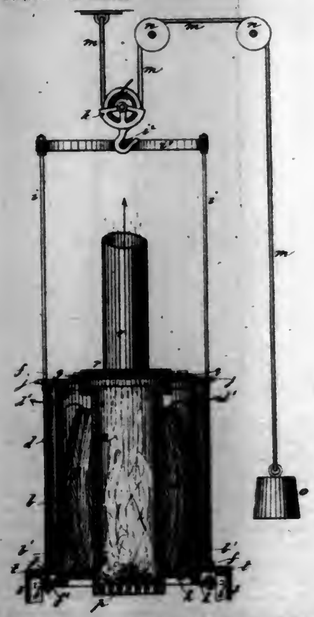
2. In machinery for making flexible lighting-matches, the combination of circular plates or disks *i i'* and washers *m m'*, fixed vertically on parallel spindles *j j'*, having adjustable bearings *k k'*, combs *q*, inserted horizontally and parallel to each other within the respective spaces of the disks *i i*, for guiding and separating fanwise the strands or strips, roller *p*, and spur-pinion y^3, rotating spindle *j'*, substantially as described.

3. The combination of a front guide-roller having cams on its circumference and pivoted horizontally between end bearings at the sides of the machine, a yoke or lever frame pivoted in advance of

the front guide-roller and having rollers adjacent to the cams and having at its rear end a transverse dipper-bar with a tank or vessel, substantially as shown, and for the purpose described.

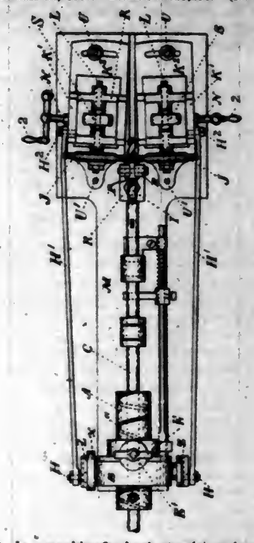
4. The combination of a front guide-roller *y*, having grooves *y'* and cams *y²*, and pivoted at the ends in brackets *z*, having forwardly-projecting arms *z'*, carrying pins *b'*, a yoke or lever frame *c'*, fulcrumed on the pins *b'* and provided with rollers *c'* adjacent to the cams *y²*, rods *f'*, depending from the rear end of frame *c'* and connected by dipper-bar *f³* with tank or vessel *g'*, carrying top roller *k'*, substantially as shown, and for the purpose described.

5. In machinery for making flexible lighting-matches, the combination of frame-work *l'*, casing *g³*, containing tank *g'* and supported on table *l²*, roller *k'*, rods *l³*, projecting from the under side of the table *l²* and passing through holes in the lower frame-work *l'*, with spiral springs *m³*, substantially as described.



6. The combination of a rectangular frame *o'*, mounted in guides on the table of the machine and having clamping devices, all constructed substantially as described, with endless belt *v'*, having cleats *w²* and pulleys *v²* *v³* on spindles *v⁴* *v⁵*, rotated by handle *x²* on spur-wheel *x'*, substantially as shown, and for the purpose described.

407,719. THREAD-CUTTER FOR THIMBLES. ORRIN CADY, Cincinnati, Ohio, assignor of one-half to Willard B. Pritchard, Waterbury, Conn. Filed Apr. 2, 1889. Serial No. 305,658. (No model.)



Claim.—In combination with a thimble, a thread-cutter consisting of an open elastic spring-metal band having one of its ends broadened, turned outwardly, and provided with a centrally-located cutting-edge, and with guards projecting above said cutting-edge at each side thereof, substantially as shown and described.

407,720. APPARATUS FOR HEATING AND DRYING BARRELS OR CASKS. JAMES M. CHAMBERS, St. Louis, Mo., assignor to the Chambers Patent Barrel Heater Company, same place. Filed Oct. 27, 1888. Serial No. 289,307. (No model.)

Claim.—In apparatus for heating and drying barrels, the combination of the heater *a*, cylinder or drum *b*, having openings *b'* near its lower end and forming annular space *c*, outer drum or casing *d*, having openings *d'* near its upper end and forming annular space *e*, said drums being carried by framing *f*, with platform *h* for carrying the barrel *g*, and means for raising and lowering said platform, substantially as shown, and for the purpose described.

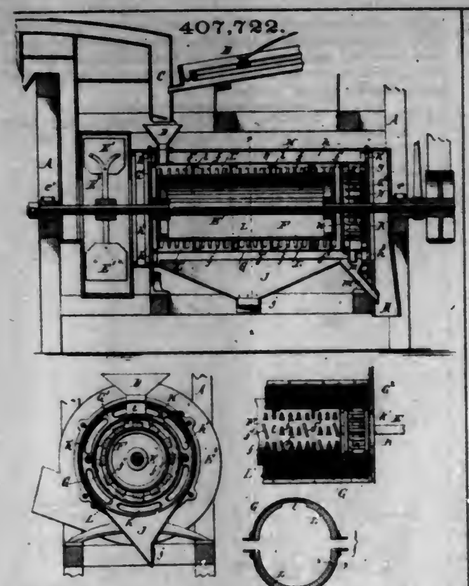
407,721. MECHANISM FOR BACK-CLEARING TWIST-DRILLS. JAMES D. COX, Jr., Cleveland, Ohio, assignor to Cox & Prentiss, same place. Filed Jan. 24, 1887. Serial No. 225,255. (No model.)

Claim.—1. In a machine for back-clearing twist-drills, a supporting-bed, a pair of frames, each carrying a metal-removing device, and converging guides between the bed and frames, in which the frames are adapted to reciprocate, in combination with the driving-shaft and connections with the pair of frames to reciprocate the said frames, substantially as set forth.

2. In a machine for back-clearing twist-drills, a pair of frames provided with metal-removing devices and supported on the bed in converging guides, with a spindle which carries the drill, said spindle located on the bed with the line of its axis extending between the metal-removing devices, in combination with the driving-shaft, and connections between said shaft and the frames aforesaid to reciprocally operate said frames, substantially as set forth.

3. In a machine for back-clearing twist-drills, a supporting-bed, a spindle for holding the drill, a pair of frames, each provided with a metal-removing device, and guides in which said frames are adapted to slide on the bed, in combination with rods connecting said frames with the driving-shaft, whereby said frames are reciprocated, substantially as set forth.

4. In a machine for back-clearing twist-drills, a supporting-bed, a pair of frames supported in converging guides thereon and latterally adjustable with respect to each other, in combination with revolving metal-removing devices on said frames, a drive-shaft, and parts connecting the shaft and the frames to reciprocate the frames and the metal-removing devices, substantially as set forth.



5. In a machine for back-clearing twist-drills, a supporting-bed, a pair of revolving metal-removing devices, and a spindle for holding the drill set with the line of its axis projecting between said metal-removing devices, in combination with separate frames which carry the metal-removing devices, and guides on the supporting-bed in which said frames are adapted to be reciprocated, substantially as set forth.

6. In a twist-drill-clearing machine, a supporting-bed, a pair of metal-removing devices supported upon separate sliding pieces adapted to be reciprocated, in combination with a drill-advancing shaft provided with a gear-wheel, a shaft having a worm meshing with said gear-wheel, and rods connecting the said sliding pieces with the ends of the worm-shaft, substantially as set forth.

407,722. GRAIN-SCOURER. GILBERT S. CRANDON, Silver Creek, N. Y. Filed Apr. 9, 1888. Serial No. 270,084. (No model.)

Claim.—1. The combination, with the horizontal scouring-case provided at opposite ends with an inlet and an outlet for the grain, of a scouring-drum arranged within said case, and a series of retarding-rings secured to the inner side of the scouring-case in the annular space between the drum and the scouring-case and provided with openings in their upper portions through which the grain passes from one compartment to the next, substantially as set forth.

2. The combination, with the horizontal perforated scouring-case

provided at opposite ends with an inlet and an outlet for the grain, of a scouring-drum arranged within said case and provided with scouring-teeth and inclined flights, and a series of retarding-rings secured to the inner side of the scouring-case in the annular space between the drum and the scouring-case and having openings in their upper portions through which the grain passes from one compartment to the other, substantially as set forth.

3. In a grain-scourer, the combination, with the perforated scouring-case G, divided longitudinally, and the feed-hopper D and receiving-hopper J, of the inclosing-casing H, divided lengthwise and obliquely, one of the sections of the casing carrying the feed-hopper D and the other section the receiving-hopper J, substantially as set forth.

407,723. ORNAMENTAL CHAIN. JOSEPH E. CROOK, Providence, R. I., assignor of one-half to A. T. Wall & Co., same place. Filed Dec. 26, 1888. Serial No. 294,633. (No model.)

Claim.—1. An ornamental chain composed of links consisting of an outer grooved ring and an inner ring secured in the groove of the outer ring, as described.

2. A link for an ornamental chain, consisting of an outer ring having a grooved cross-section and an inner ring, the joints of the two rings being placed in opposite points, as described.

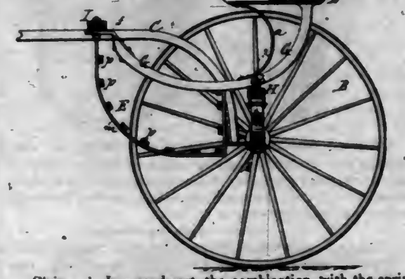
3. A link for an ornamental chain, consisting of a grooved outer ring and an inner ring partly embedded in the groove of the outer ring, the inner portion of the inner ring being exposed to view, as and for the purpose set forth.

4. A chain made up of links each composed of an outer grooved ring and an inner ring partly or wholly embedded in the groove of the outer ring, as described.

407,724. GRAIN-CONVEYER FOR HARVESTERS. JOHN S. DAVIS, Cleveland, Ohio. Filed Oct. 19, 1887. Serial No. 252,794. (No model.)

Claim.—1. The combination of a grain-carrier composed of a series of endless belts and their rollers, a revolving shaft located between the rollers and the upper and lower surfaces of the belts, fingers on the shaft, which revolve through the spaces between the belts and into the stream of grain thereon in the same direction, but at a speed different from the speed of the belts, substantially as hereinbefore set forth.

2. The combination of the series of endless belts and their rollers, a revolving shaft located between the rollers and the upper and lower surfaces of the belts and provided with hooked fingers, as shown, which revolve through the spaces between the belts and into the stream of grain thereon in the same direction, but at a speed different from the speed of the belts, substantially as hereinbefore set forth.



3. The combination of a grain-carrier composed of a series of

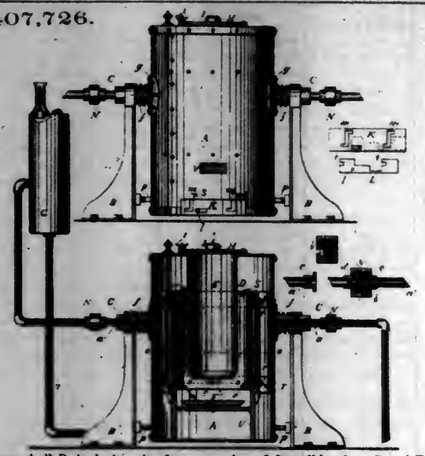
407,724.

endless belts with a revolving shaft provided with fingers which project between the belts and penetrate the stream of grain thereon, acting upon it in the same direction, but at a speed different from the speed of the belts, substantially as hereinbefore set forth.

407,725. ROAD-CART. JOSEPH A. DIBLEY, East Kendall, N. Y. Filed Apr. 26, 1889. Serial No. 308,750. (No model.)

Claim.—1. In a road-cart, the combination, with the spring-bar H and cross-bar I, of the hangers G G, pivoted to the spring-bar so as to rock vertically, and provided with slotted plates *f f*, that slide forward and back on bolts *h h*, attached to the cross-bar, as shown and described, and for the purpose specified.

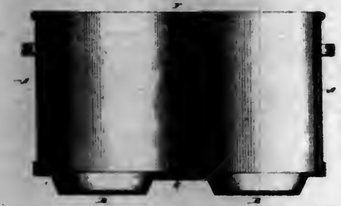
2. In a road-cart, the combination of the spring-bar H, the rockers G G, the eyebolts *b c*, connecting said parts, the thill-bar I, the slotted straps *f f*, attached to the rockers, and bolts *h h*, attached to the thill-bar, said parts being connected as shown and described, and operating in the manner and for the purpose specified.



407,726. SAFETY-HEATER FOR RAILWAY-CARS. ELIJAH H. EDSON, Rochester, N. Y. Filed Mar. 21, 1887. Serial No. 231,704. (No model.)

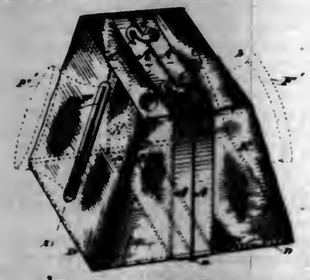
Claim.—1. A heater for railway-cars, inserted in a hot-water-circulation system and suspended above the floor of the car from points above the center of gravity of the heater by hollow trunnions C C, connecting with the water-space, said trunnions resting in bearings in brackets B B, substantially as and for the purposes described.

2. In a heater for railroad-cars, having an outer shell and an inner shell separating the water and fire spaces, pairs of frangible rings connecting the two shells and inclosing therewith the water-space, each pair of rings meeting substantially in V form and each ring being thinned toward the line of meeting with the other ring, so that in the event of fracture of such rings the contents of the water-space will discharge into the fire-space, substantially as and for the purposes set forth and described.



3. In a heater for railway-cars, the outer containing-shell A, the

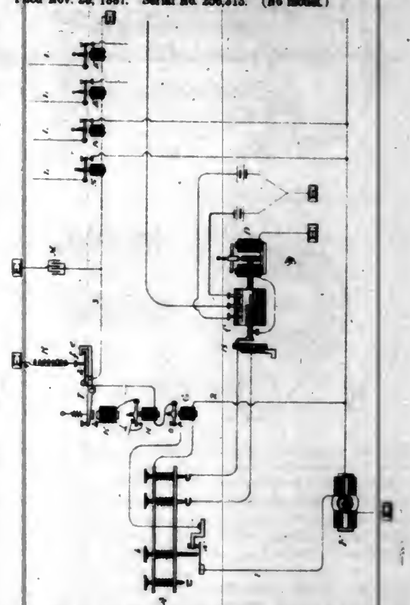
407,726.



inner shell D, inclosing the fire-pot, pairs of frangible rings S and T, connecting said two shells and inclosing therewith the water-space, fire-tubes *k k*, passing through said water-space and the rings S and T, smoke-flue I, grate F, hollow trunnions C C, fastened to said shell A, connecting with the water-space and resting in bearings in brackets B B, a system of pipes *a a*, and expansion water-tank G, substantially as and for the purposes set forth and described.

407,727. WASH-BOILER. HELEN FARRWELL, Detroit, Mich. Filed Nov. 14, 1888. Serial No. 290,785. (No model.)

Claim.—A wash-boiler consisting of two sections each complete in itself, a plate extending along the adjacent bottom edges of the sections, and a cap extending along the adjacent top edges of the sections, the plate and the cap firmly uniting the two sections into a complete whole, substantially as set forth.



407,728. PHOTOGRAPHER'S PORTABLE COMPARTMENT FOR TRANSFERRING PLATES. SIDNEY GREEN, Brooklyn, N. Y. Filed Jan. 30, 1889. Serial No. 298,036. (No model.)

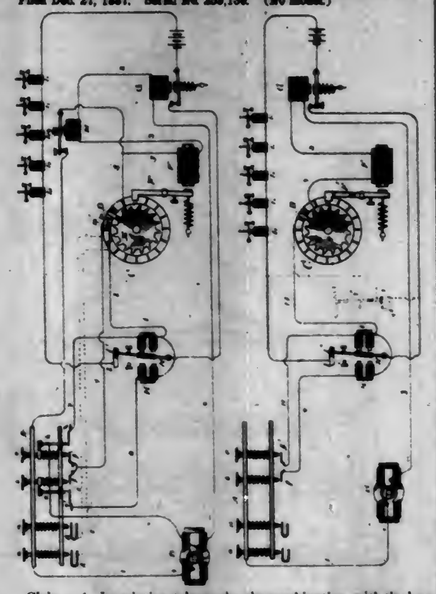
Claim.—1. The herein-described photographer's transferring-case, consisting of adjacent rectangular standard-frames hinged at one side to open and close toward or from one another, extension-leaves hinged thereon at opposite sides of the respective frames to open or fold upon the exterior of the frames, and opaque flexible hoods attached to the outer margins of said leaves, and said frames having slits or sleeves located at opposite sides of the case, for the purposes described.

2. The combination, in a photographer's transferring-case, of adjacent rectangular standard-frames hinged at one side to open and close toward one another, extension-leaves hinged thereon at opposite sides of the respective frames to open and fold upon the exterior of the frames, opaque flexible hoods attached to the outer margins of said leaves, and said frames having slits or sleeves, as described, and the observation-openings located in suitable parts of the said stand-frames, for the purpose specified.

407,729. PRINTING-TELEGRAPH. CLARENCE L. HEALY, Brooklyn, assignor to the Commercial Telegram Company, New York, N. Y. Filed Nov. 28, 1887. Serial No. 256,313. (No model.)

Claim.—1. In printing-telegraphs, the combination, with the repeat-key circuit, of a number of printing-circuit relays located in a branch circuit, an artificial resistance located in another branch circuit, and a circuit-controller shifting the repeat-key circuit from the relay branch to the resistance branch, substantially as set forth.

2. In printing-telegraphs, the combination, with the repeat-key circuit, of a number of printing-circuit relays located in a branch circuit, an artificial resistance located in another branch circuit, and a continuity-preserving lever operated by a magnet and acting to shift the repeat-key circuit from the relay branch to the resistance branch, substantially as set forth.



3. In printing-telegraphs, the combination, with the repeat-key circuit, of a number of printing-circuit relays located in a branch circuit, an artificial resistance located in another branch circuit, a circuit-controller shifting the repeat-key circuit from the relay branch to the resistance branch, and a condenser connected with the relay branch to absorb the spark, substantially as set forth.

4. In printing-telegraphs, the combination, with the repeat-key circuit, of a number of printing-circuit relays located in a branch circuit, an artificial resistance located in another branch circuit, a circuit-controller shifting the repeat-key circuit from the relay branch to the resistance branch, a magnet controlled by the repeat-key circuit working this shifting circuit-controller, and a transmitter-circuit controller controlling the repeat-key circuit, substantially as set forth.

5. In printing-telegraphs, the combination, with the repeat-key circuit, of a number of printing-circuit relays located in a branch circuit, an artificial resistance located in another branch circuit, a circuit-controller shifting the repeat-key circuit from the relay branch to the resistance branch, a magnet controlled by another magnet located in the repeat-key circuit working this shifting circuit-controller and a transmitter-circuit controller controlling the repeat-key circuit, substantially as set forth.

6. In printing-telegraphs, the combination, with the repeat-key circuit, of a number of printing-circuit relays located in a branch circuit, an artificial resistance located in another branch circuit, a circuit-controller shifting the repeat-key circuit from the relay branch to the resistance branch, a magnet controlled by another magnet located in the repeat-key circuit working this shifting circuit-controller, and a magnet in the key-board circuit controlling the repeat-key circuit, substantially as set forth.

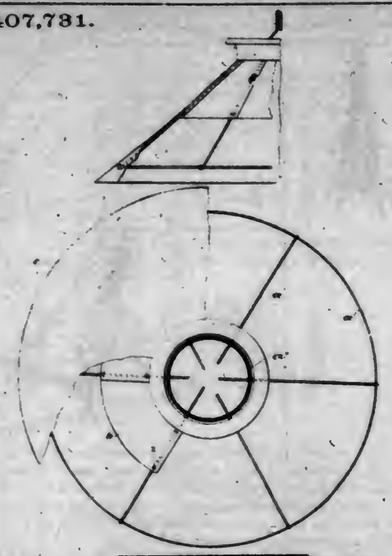
407,730. PRINTING-TELEGRAPH. CLARENCE L. HEALY, Brooklyn, assignor to the Commercial Telegram Company, New York, N. Y. Filed Dec. 27, 1887. Serial No. 259,130. (No model.)

Claim.—1. In printing-telegraphs, the combination, with the key-board, the sunflower, the trailing arm, and the clutch, of a shifting-circuit, a switch controlling said shifting-circuit, and two magnets moving said switch in opposite directions, the circuits to such magnets being controlled both at the key-board and at the sunflower, substantially as set forth.

2. In printing-telegraphs, the combination, with the key-board, the sunflower, the trailing arm, and the clutch, of a shifting-circuit, a switch controlling said shifting-circuit, two magnets moving said switch in opposite directions, the circuits to such magnets being controlled both at the key-board and at the sunflower, and an electro-magnet in the sunflower circuit acting to close a break in said shifting-circuit at each stoppage of the trailing arm, substantially as set forth.

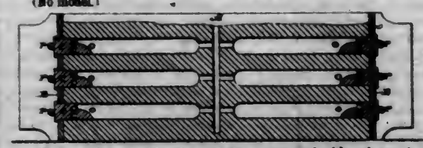
3. In printing-telegraphs, the combination, with the key-board, the sunflower, the trailing arm, and the clutch, of a shifting-circuit controlled both at the key-board and at the sunflower, substantially as set forth.

4. In printing-telegraphs, the combination, with the sunflower having a divided segment, the parts of which are bridged by the trailing arm, of a circuit broken at the sections of such segment and closed by the trailing arm, substantially as set forth.



5. In printing-telegraphs, the combination, with the sunflower having a divided segment, the parts of which are bridged by the trailing arm, of a circuit broken at the sections of such segment, and closed by the trailing arm, the key-board having contacts also controlling said circuit, an electro-magnetic circuit-controller in said circuit, and the shifting-circuit controlled by said circuit-controller, substantially as set forth.

6. In printing-telegraphs, the combination, with the unison-keys and the separate insulated contact-rods and contacts at the key-board, and the sunflower having a divided segment, of a circuit-controller composed of two magnets acting oppositely on a circuit-controlling armature-lever, connections through the sections of the divided sunflower-segment to the windings of both magnets, and separate connections from the magnets to the contacts of the insulated rods of the key-board, substantially as set forth.



407,731. SHADE FOR ILLUMINATING-BURNERS. JOHN C. HOLLINS, Boston, Mass., assignor to R. Hollings & Co., same place. Filed Nov. 24, 1888. Serial No. 291,773. (No model.)

Claim.—The shade for illuminating-burners, composed of the wire frame, substantially as shown and described, the shield *b*, of material that is a non-conductor of heat, fitted to said frame and secured thereon by loops 2, of thread or wire, and the outer covering resting upon and supported by the frame and shield, as set forth.

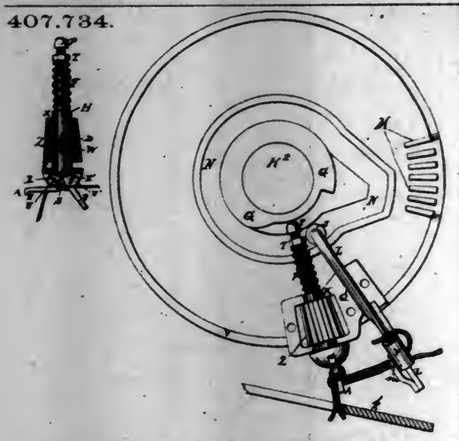
407,731.

407,732. MOLD FOR CASTING SASH-WEIGHTS. RICHARD JOWITT, South Pittsburg, Tenn. Filed May 29, 1888. Serial No. 312,492. (No model.)

Claim.—The combination of the apertured side pieces A, the metallic perforated end pieces B, the chills which are passed through the end pieces, and the rods passing through the apertures in the side pieces to hold the chills in position, substantially as described.

407,733. MACHINE FOR BUNCHING CIGARS. FREDERICK R. KELSEY, New York, and GEORGE D. WOODWORTH, Brooklyn, N. Y. Filed Apr. 16, 1889. Serial No. 307,268. (No model.)

Claim.—1. In a machine for bunching cigars, the combination, with a mold having separable parts and which is adapted to receive the binder of the bunch and to give the fillers the requisite bunch form, of a holder for retaining the side of the binder while the fillers are being packed in the mold.



2. In a machine for bunching cigars, the combination, with a mold adapted to receive the binder and to give forth to the bunch of fillers, of a holder for retaining the ends of the binder while the mold is being filled with fillers, the mold having separable parts by which it is opened or the bunch removed therefrom.

3. In combination, the base A, the mold B, having the movable side D E, the binder-holder H, and the link F, adjustably securing the movable part of the mold to the base.

4. In combination, the base A, the mold B, the slide E, carrying the mold-piece D, the binder-holder H, link F and its pivot-rod J, and the cam K and spring L.

407,734. KNOTTING DEVICE FOR GRAIN-BINDERS. KENTON C. KUNKLE and ALLEN A. KUNKLE, Lebanon, Ohio; said Allen A. Kunkle assignor to said Kenton C. Kunkle. Filed Aug. 18, 1888. Serial No. 283,159. (No model.)

407,734.

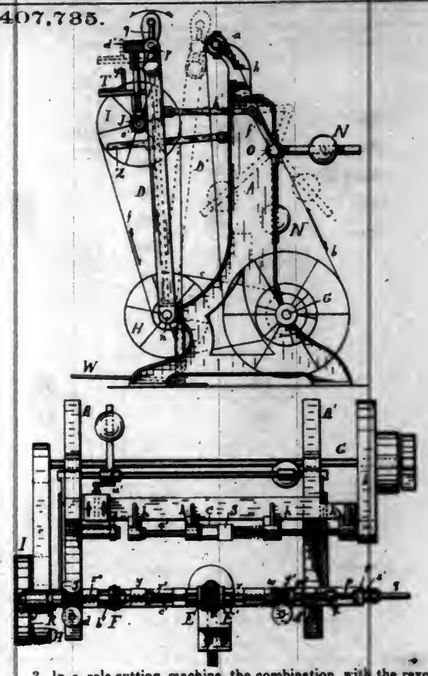
Claim.—1. In a knotting device, a twine-knotter having two movable knotter-jaws A and B, having the slots U and U', respectively, a knotter-head having pins X X' passed through the slots U U', respectively, and the longitudinally-movable spindle mounted in the knotter-head having the pin S in its lower end, upon which the jaws are pivoted, as and for the purpose specified.

2. In a twine-knotter, the knotter-head and two knotter-jaws A and B, located in an opening between opposing portions of said head and moving toward and away from one another, the jaw A having pivotal slot U, and jaw B having pivotal slot U', each jaw being pivoted to said knotter-head by a pivot passing through its respective slot aforementioned, the jaws being free, when actuated by the spindle H, to reciprocate within the limit of their slots, and reciprocating spindle H, pivotally attached to the rear portion of said jaws between slots, the said slots, when the jaws are closed, lying obliquely to the length of the jaws and parallel to one another, thereby causing the jaws, when apart, to stand at different angles to the axis of the knotter-spindle, substantially as and for the purposes specified.

3. In a twine-knotter, a rotating knotter-head having a longitudinally-movable knotter-spindle mounted therein and connected thereto to rotate upon the same axis by a pin D passing through a slot U in said spindle, knotter-jaws located in a slot in the lower end of the spindle and in the knotter-head and pivotally connected to said spindle and knotter-head, respectively, a tension-spring surrounding the spindle and interposed between the upper end of the knotter-head and an adjusting-nut on the upper portion of said spindle, a cap-piece P, mounted upon the extreme upper end of the spindle to be engaged by a cam-surface on the knotter-operating wheel to reciprocate the spindle in the knotter-head and to open and close the knotter-jaws, and means for rotating said knotter-head, substantially as described.

4. The combination, in a twine-holding device, of the movable jaw L, having the notches *q* and *b* and provided with an anti-friction roller J, the holder-shoe Y, having the notches *d* and *d'* and pivoted to a stationary frame, and spring *a*, bearing against the holder-shoe, and the knotter-operating wheel having cam-groove N N, within which the roller J travels, substantially as and for the purpose specified.

5. The combination of a wheel provided with cam-groove N N, the spring *a*, shoe Y, movable jaw L, having the notches *q* and *b*, and having the anti-friction roller J, traveling in the cam-groove N N, with the knife *m*, secured to and carried by said movable jaw, as and for the purpose specified.



6. The combination, in a twine-holding device for knotting mechanism, of a movable jaw having the notches *q* and *b*, the knife carried thereby and secured thereto, and the holder-shoe Y, having the notches *d* and *d'*, as and for the purpose specified.

407,735. SOLE-CUTTING MACHINE. HENRY LOEWER and BARTON L. BLAIR, Rochester, N. Y., assignors of one-fourth to Anson S. Moon, same place. Filed Mar. 11, 1889. Serial No. 302,801. (No model.)

Claim.—1. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, of the revolving sole-clamps E E', their supporting-shafts, the movable carriage, and a revolving form operating to vary the relative positions of the cutter and the sole-clamps, substantially as described.

2. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, of the revolving and traveling recessed sole-clamps E E', form F, suitable supporting-shafts, and guide *s*, substantially as described.

407,735.

3. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, of the revolving sole-clamps E E', supported on shafts on a suitable traveling carriage, and clamp-screw *p*, substantially as described.

4. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, and guide *s*, of the revolving sole-clamps E E', clamp-plates *z z'*, removable form F, and suitable supporting-shafts, substantially as described.

5. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, and guide *s*, of the revolving and traveling sole-clamps E E', form F, suitable supporting-shafts, and movable blank-guide T, substantially as described.

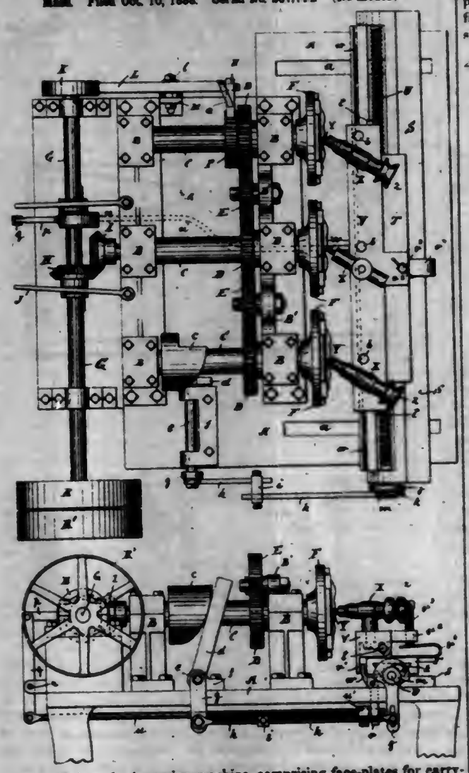
6. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, and guide *s*, of the revolving and traveling sole-clamps E E', suitable supporting-shafts, and movable blank-guide T, provided with adjustable plate *y'*, substantially as described.

7. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, and guide *s*, of the revolving and traveling sole-clamps E E', divided shaft *r r'*, screw *p*, removable form F, and suitable supporting-shafts, substantially as described.

8. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, and guide *s*, of the revolving and traveling sole-clamps E E', shafts *r r' r''*, screws *p*, clamp-plates *z z'*, removable former F, and suitable supporting-shafts, substantially as described.

9. In a sole-cutting machine, the combination, with the main frame A A', supporting the revolving cutter C and its shaft, and the guide *s*, of the movable frame D, carrying the revolving sole-clamps E E' and form F, and mechanism adapted to secure the simultaneous revolution of the sole-clamps and the form, substantially as described.

10. In a sole-cutting machine, the combination, with the cutter C and its shaft, and the guide *s*, of the movable carriage D, supporting the sole-clamps E E' and form F, divided shafts *r r' r''*, worms *d d'*, and worm-gears *g g'*, substantially as described.



11. In a sole-cutting machine, the combination, with the cutter C and its shaft, and guide *s*, of the movable carriage D, supporting sole-clamps E E', clamp-screw *p*, divided shafts *r r' r''*, worms *d d'*, and worm-gears *g g'*, substantially as described.

12. In a sole-cutting machine, the combination, with the cutter C and its shaft, and guide *s*, of the movable carriage D, supporting the revolving sole-clamps E E', divided shafts *r r' r''*, worms *d d'*, and worm-gears *g g'*, shaft J, bevel-gears *c c'*, clutch *j' k'*, lever R, and cam *l*, substantially as described.

13. In a sole-cutting machine, the combination, with the main frame A A', supporting the revolving cutter C and its shaft, and the guide *s* and driving-shaft G, of the swinging frame D, pivoted to the main frame and carrying the revolving sole-clamps E E', divided shafts *r r' r''*, worms and worm-gears *d d' g g'*, bevel-gears *c c'*, shaft J, and pulleys I H L, substantially as described.

14. In a sole-cutting machine, the combination, with the revolving cutter C and its shaft, provided with the spring-guard S, of the guide *s*, and the revolving sole-clamps E E', form F, and suitable supporting-shafts, substantially as described.

407,736. CARVING-MACHINE. WILLIAM A. N. LOUD, Boston, Mass. Filed Oct. 10, 1888. Serial No. 287,714. (No model.)

Claim.—1. A carving-machine comprising face-plates for carrying the pattern and material to be operated upon, means for intermittently rotating same, substantially as described, a tracer and rotating tools mounted in tool-carriers and arranged to stand horizontally but on an angle to the face of the material to be operated upon and means for periodically raising the tools and tracer from the face of the material, substantially as shown and described.

2. The shafts C, mounted in suitable bearings and to which rotary motion is imparted, the gears D E, and face-plates F, in combination with the slide-bed S, slide T, pivoted tool-carrier plate V, having a lip r^2, the spring r^4, screw r^3, tool-carriers X, tools Y, and tracer W, substantially as and for the purposes set forth.

3. The combination of the shaft G, the cam K, mounted thereon, the lever L, fulcrumed on the frame and having its outer end in contact with the cam K, and a pawl N, mounted upon its inner end, the shafts C, and face-plates F, gears D, mounted upon said shafts, and ratchet-wheel P, mounted upon one of the shafts C, and the intermediate gears E, for imparting an intermittent rotary motion in the same direction to said shafts C and face-plates F, substantially as shown and described.

4. The cam *c*, mounted upon shaft C, in combination with shaft *e*, having a lever *d* mounted on one end, and a lever *g* on its other end, the slide-bed S, slide T, and screw U, passing along the slide-bed and under the slide, ratchet-wheel *m*, and lever *j*, mounted upon one end of the screw, pawl *k* on lever *j*, the rods *h h*, connecting the levers *g* and *j*, and adjustable block *i*, for connecting the rods *h h* together, substantially as and for the purposes set forth.

5. The shaft G, eccentric *n*, mounted thereon, lever *q*, fulcrumed to the frame, arm *p*, connecting lever *q* with eccentric *n*, and rod *u*, having an adjustable block *u'*, in combination with the kick-out lever *m*, fulcrumed on the slide-bed S, and tool-carrier plate V, pivoted at each end to the slide T, and having a lip r^1, substantially as and for the purposes set forth.

6. The spring r^4 and screw r^3, in combination with the slide T and tool-carrier plate V, pivoted at each end to the slide T, for throwing the plate V back after it has been raised, substantially as set forth.

7. In a carving-machine, a series of rotating face-plates for supporting the material to be operated upon and the pattern to be reproduced, and a tracer and cutting-tools, the axes of which are on a plane parallel to the axes of the face-plates, but on an angle to the face of the plates, so that the cut is made by the side of the tool, substantially as set forth.

407,737. LAST. FRANK F. MARTIN, Gloucester, Mass., assignor of one-fourth to Robert T. Mountain, same place. Filed Nov. 24, 1888. Serial No. 291,758. (No model.)

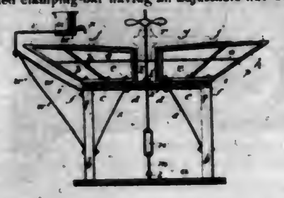
Claim.—1. In a last, the combination, with the parts A and B, having corresponding openings, as *a* and *b*, of the perforated plate C, fitted in one of the said openings, and the pin adjustably supporting the said plate in the other opening, substantially as described.

2. The combination, with the parts A and B of the last, having the openings *a* and *b*, of the plate C, having two sets of openings, as *n* and *n'*, the openings of one set coming opposite the spaces between the openings of the other set, and securing-pins, substantially as described.

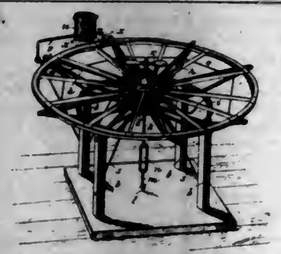
3. The combination, with the parts A and B, having openings *a* and *b*, of the plate C, having two sets of openings and tapering in thickness, and the pins *d* and *d'*, substantially as described.

4. The hereinbefore shown and described last, composed of the parts A and B, having openings *a* and *b*, the part A having channel F and the part B the recess E, the plate C, tapering in thickness and having the two sets of openings *n* and *n'*, and the pins *d* and *d'*, substantially as and for the purpose described.

407,738. LOCK. WASHINGTON A. MARTIN, Chicago, Ill., assignor of one-fourth to Henry Reuter, same place. Filed Mar. 6, 1889. Serial No. 302,161. (No model.)



Claim.—1. The combination, substantially as set forth, of the bolt provided with a lug, as 10, the swinging pin or dog to engage said lug and to hold the bolt back, and the trigger provided with an oblique slot, as 16, to throw the dog and release the bolt.



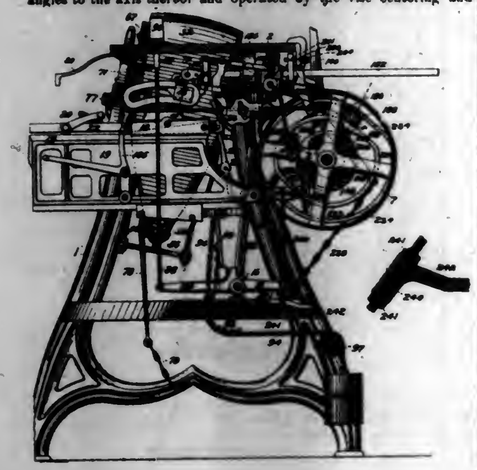
2. The combination, substantially as set forth, of the bolt, the dog, the trigger, the cam to retract the bolt, the cam-arbor having a forked end, and a key-operated lock, as 28, in engagement with said cam-arbor, all arranged and operating substantially as shown and described.

407,739. TIRE-SETTING MACHINE. DAVID R. MILLER, Logansport, Ind. Filed Aug. 20, 1888. Serial No. 284,064. (No model.)

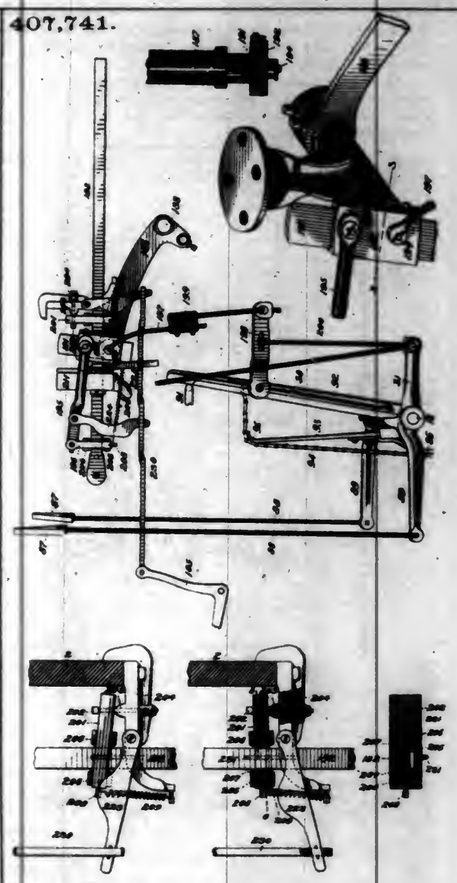
Claim.—In a tire-setting machine, a stationary stand provided with bearing-rings and a rotary table, in combination with a central screw-threaded clamping-bar having an adjustable nut bearing upon

407,739.

the wheel-table, the clamping-bar being secured to the base of said stand by a swivel connection, in the manner and for the purpose set forth.



407,740. **WRENCH.** HORATIO B. MORRISON, Britt, assignor of three-fourths to Francis M. Rogers, Charles H. Hughes, and William H. Cottrell, Mason City, Iowa. Filed Aug. 10, 1888. Serial No. 282,456. (No model.)



Claim.—The herein-described wrench, comprising the handle composed of the parallel similar side plates B B, secured together at their ends by the transverse screws or bolts C C, the adjustable jaws D D, fitting between the ends of the said plates, mounted on the screws or bolts C C, and provided at their inner ends with the segmental ratchets E, in a common plane with the jaws, the screws or bolts G G, also arranged in registering apertures in the side plates near the inner ends of the said jaws, the pawls H, engaging with the segments, provided with inwardly-extending enlargements *h*, mounted on the screws or bolts G, and having their adjacent ends projecting slightly beyond the edges of the side plates, the pins K K, arranged adjacent to each other near the centers of the side plates, and the springs L L, each bent around one of said pins and around and beyond the other and bearing at their free ends against the adjacent ends of the pawls to hold the latter in engagement with the segments' ratchets, substantially as specified.

407,741. **BROOM-SEWING MACHINE.** GEORGE F. MCCOMBS, Allegheny, assignor to the Hand Stitch Broom Sewing Machine Company, Pittsburg, Pa. Filed Apr. 20, 1889. Serial No. 307,969. (No model.)

Claim.—1. In a broom-sewing machine, the combination of a carriage fitted to slide upon ways or guides, a broom vise or clamp pivoted to said carriage, a rock-shaft 16, operated by the carriage in its inward traverse, mechanism, substantially as described, for centering and clamping the broom-vise in operative position, a rock-shaft 187, a sliding head fitted to have a traverse on the rock-shaft at right angles to the axis thereof and operated by the vise centering and

407,741.

clamping mechanism, and a feed-rod connected to the broom vise or clamp and operated by the sliding head, substantially as set forth.

2. In a broom-sewing machine, the combination of a pivotally-mounted broom vise or clamp, mechanism for centering and clamping the broom-vise in operative position, a rock-shaft 16, operating such centering and clamping mechanism and controlled thereby, a rock-shaft 187, a sliding head fitted to have a traverse on said rock-shaft at right angles to the axis thereof, an adjustable connection between the sliding head and an arm on rock-shaft 16, and a feed-rod connected to the broom vise or clamp and operated by the sliding head, substantially as set forth.

3. In a broom-sewing machine, the combination of a pivotally-mounted broom vise or clamp, a plate 183, connected to said vise or clamp and having a circular rim formed thereon, a feed-bar having a groove formed therein for the reception of the circular rim, thereby forming a hinge-joint between the plate and feed-bar, and mechanism, substantially as described, for moving the feed-bar, substantially as set forth.

4. In a broom-sewing machine, the combination of a pivotally mounted broom vise or clamp, a feed-bar connected to the vise or clamp, a reciprocating automatically-operating grip, and an automatically-operating detent, said grip and detent engaging the feed-bar, substantially as set forth.

5. In a broom-sewing machine, the combination of a pivotally-mounted broom vise or clamp, a movable feed-bar connected thereto, and a brake or holdback engaging the feed-bar and controlling the movements of the vise, substantially as set forth.

6. In a broom-sewing machine, the combination of a pivotally-mounted broom vise or clamp, a feed-bar connected thereto, a reciprocating automatically-operating grip, an automatically-operating detent, and a brake or holdback for controlling the movements of the vise or clamp, said grip, detent, and holdback engaging the feed-bar, substantially as set forth.

7. In a broom-sewing machine, the combination of a swinging block having an opening therethrough, jaws arranged in said opening, automatically-adjustable shoes mounted in the adjacent faces of said jaws, and a feed-bar having parallel edges passing between said shoes, substantially as set forth.

8. In a broom-sewing machine, the combination of a swinging block having an opening therethrough, jaws arranged in said opening, one of said jaws being adjustable, automatically-adjustable shoes mounted in the adjacent faces of said jaws, and a feed-bar having parallel edges passing between said shoes, substantially as set forth.

9. In a broom-sewing machine, the combination of a swinging block having an opening therethrough, jaws arranged in said opening, automatically-adjustable shoes mounted in the adjacent faces of said jaws, said shoes lying in different vertical planes, and a feed-bar having parallel edges passing between said shoes, substantially as set forth.

10. In a broom-sewing machine, the combination of a block having an opening therethrough, a feed-bar having a wedge-like portion on one side thereof and passing through said opening, and a stationary and a movable shoe arranged on opposite sides of the feed-bar, the movable shoe having a yielding pressure upon the feed-bar, substantially as set forth.

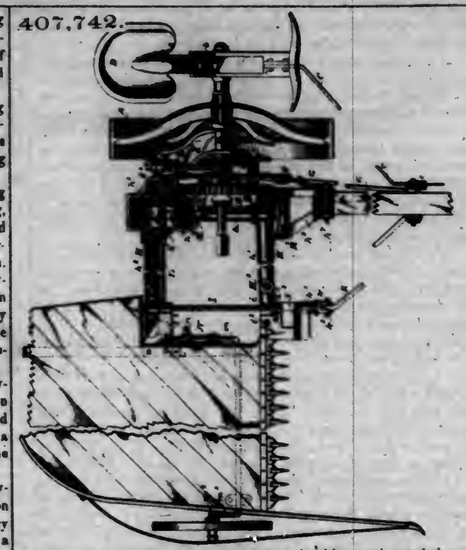
11. In a broom-sewing machine, the combination of a block having an opening therethrough, a feed-bar having a wedge-like portion on one side thereof and passing through said opening, a stationary and a movable shoe arranged on opposite sides of the feed-bar, and a spring-actuated plunger for forcing the movable shoes against the feed-bar, substantially as set forth.

12. In a broom-sewing machine, the combination of a block having an opening therethrough, a feed-bar having a wedge-like portion on one side thereof and passing through said opening, a stationary and a movable shoe arranged on opposite sides of said feed-bar, a plunger bearing at one end against the movable shoe, a tension-plate adjustably mounted on a stud on said block, and a spring surrounding the plunger and interposed between said plate and a shoulder on the plunger, substantially as set forth.

13. In a broom-sewing machine, the combination of a block having an opening therethrough, a feed-bar having a wedge-like portion on one side thereof and passing through said opening, a stationary and a movable shoe arranged on opposite sides of said bar, a spring-actuated plunger operative on the movable shoe, lever connected to the plunger, a pin bearing against the free end of said lever, and a movable wedge for moving the pin, substantially as set forth.

14. In a broom-sewing machine, the combination of a block having an opening therethrough, a feed-bar having a wedge-like portion and passing through said opening, a spring-actuated plunger for controlling the movements of the feed-bar, and a wedge for forcing the plunger away from the feed-bar, substantially as set forth.

15. In a broom-sewing machine, the combination of a carriage fitted to slide upon ways or guides, a broom vise or clamp pivoted to said carriage, a feed-bar connected to the vise or clamp, a reciprocating automatically-operating grip and an automatically-operating detent, the grip and detent engaging the feed-bar, and tripping-arms for releasing the feed-bar from engagement with the grip and detent, substantially as set forth.



16. In a broom-sewing machine, the combination of a carriage fitted to slide upon ways or guides, a broom vise or clamp pivoted to said carriage, a feed-bar connected to the vise or clamp, a reciprocating automatically-operating grip, an automatically-operating detent, a brake or holdback, the grip, detent, and brake, and simultaneously-operating tripping-levers for releasing the feed-bar from engagement with the grip, detent, and brake or holdback, substantially as set forth.

17. In a broom-sewing machine, the combination of a pivotally-mounted broom vise or clamp, a feed-bar connected thereto, a grip engaging the feed-bar, a rock-shaft connected to said grip, an arm secured to the rock-shaft and provided with rollers, one of which is adjustable, and a wheel having a cam-ring 233, said ring being provided with shoulders 235 on its inner face in line, or approximately so, with the front ends of the active portions of the cam-ring, substantially as set forth.

407,742. **HARVESTER.** HENRY R. PRIDMORE, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Aug. 12, 1886. Renewed Oct. 8, 1887. Serial No. 251,823. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the main wheel, the platform, the rectangular gear-frame suspended from the main axle inside the main wheel at practically the level of the platform, the rake-standard located upon and near the outer end of the front lateral arm of said frame, the hinge-joints connecting the platform-frame both to the front and to the rear lateral arms of said gear-frame, and the extension of the front arm beyond the hinge, lapping the inner shoe fixed to said platform-frame,

407,742.

and adapted to receive a bolt passing through said extension and shoe to clamp the platform rigidly to the gear-frame.

2. The combination, substantially as hereinbefore set forth, of the main wheel, the platform, the intermediate or gear frame hinged to said platform and adapted to receive a bolt which holds the frame and platform rigidly together, the bracket-casting and its radius-arm connecting the main axle with the rear inner corner of the gear-frame, the hinged tongue, the frame-bar pivoted to the tongue and entering a keeper at the rear of the gear-frame, and the lifting and tilting levers, respectively, supporting the frame-bar from the bracket and the front of the gear-frame from the frame-bar.

3. The combination, substantially as hereinbefore set forth, of the main wheel, the platform, the intermediate or gear frame suspended from the main wheel and adapted to receive a fastening which holds said frame and platform rigidly together, the hinge-connection between the platform and gear-frame, the divided crank-shaft supporting the grain-wheel at its outer end and link-connected to the main axle at its inner, and means for transmitting motion from one section to the other.

4. The combination, substantially as hereinbefore set forth, of the main wheel, the platform, the intermediate or gear frame suspended from the main wheel and having an extension of its front frame-bar adapted to receive a fastening to secure it rigidly to the platform, the hinge-connection between the platform and intermediate frame, the divided crank-shaft supporting the grain-wheel at its outer end, and the link connecting the cranks at the adjacent ends of the sections of said shaft.

5. The combination, substantially as hereinbefore set forth, with a platform and a frame intermediate between it and the main wheel, to which frame it is hinged, of a divided crank-shaft running beneath the platform, having the ends of each section cranked, and the outer crank of each section adapted, the one and the other, to receive a grain-wheel, a link connecting the adjacent cranks of the two sections, and a grain-wheel fitted to be applied to either of the two outer cranks of the sections.

6. The combination, substantially as hereinbefore set forth, of the main wheel, the platform, the gear-frame intermediate between the main wheel and the platform, the hinge-joint between the platform and outer end of said frame, the draft-tongue, and a bound connecting the inner shoe with the tongue and swivel-jointed to said inner shoe on the same axis as the hinge between the platform and frame.

7. The combination, substantially as hereinbefore set forth, of a main wheel, a platform, an intermediate frame, a draft-tongue hinged to said intermediate frame, a hinge between the platform and the intermediate frame parallel with the main wheel, and a bound connecting the inner shoe with the draft-tongue and universally jointed to said inner shoe in line with the axes of the hinges between the platform and frame and tongue and frame.

8. The combination, substantially as hereinbefore set forth, of a main wheel, a platform, an intermediate frame, a draft-tongue hinged to said intermediate frame, a hinge between the platform and intermediate frame parallel with the main wheel, a bound connecting the

inner shoe with the draft-tongue, a swivel-bolt between the hound and inner shoe in line with the platform-hinge, and a pin-joint between said hound and bolt in line with the tongue-hinge.

9. The combination, substantially as hereinbefore set forth, of the main wheel, the main axle, the platform, the intermediate frame suspended from the main axle, the hinge between the platform and the intermediate frame, the extension of the front arm, said frame adapted to receive a fastening to hold the platform rigid, the divided crank-shaft running beneath the frame and platform, the radius-bar connecting the crank at the stubble end of the inner section of said shaft with the main axle, the link connecting the crank at the outer end of said section with a crank on the inner end of the second or outer section, and the grain-wheel mounted on the crank at the divider end of said outer section.

10. The combination, substantially as hereinbefore set forth, with the main wheel, the platform, and the intermediate frame, of the divided crank-shaft running underneath the platform and adjacent frame, the link connecting the adjacent cranks of the two shaft-sections and the spring-pin to said link, whereby it may be readily applied to or detached from the crank on the inner section to permit the grain-wheel to be transferred thereto when the platform is folded.

11. The combination, substantially as hereinbefore set forth, with the main wheel, of the platform and gear-frame suspended from the main axle, and the hinged tongue, the frame-bar pivoted to said tongue and entering a keeper at the rear of the gear-frame and having the reverse curves or arches described, and the lifting and tilting levers arranged to apply their strains at or near the apexes of said curves.

12. The combination, substantially as hereinbefore set forth, of the bracket-casting on the main axle, the lever pivoted thereto, the frame-bar pivoted to the draft-tongue and extending to a keeper at the rear of the inner platform or gear-frame and having an inverted arch, and the link depending from said lever and connected at or near the apex of said arch.

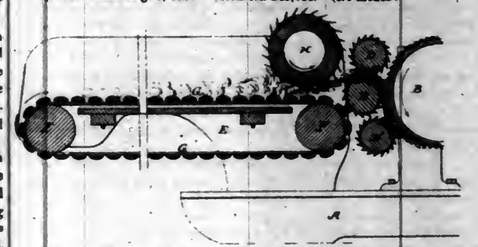
13. The combination, substantially as hereinbefore set forth, of the bracket-casting on the main axle supporting the inner end of the platform and gear-frame, the frame-bar pivoted to the draft-tongue and extending to a keeper at the rear of the gear-frame and formed with an upright curve or arch, the segment and tilting-lever mounted at the apex of said arch, and the link extending from said lever to a hinge-connection at the front of the gear-frame.

14. The combination, substantially as hereinbefore set forth, of the bracket-casting on the main axle supporting the inner platform or gear-frame, the lever pivoted thereto, the link depending from said lever, the frame-bar pivoted to the draft-tongue and extending to a keeper at the rear of the gear-frame and formed with reverse curves, the link depending from the tilting-lever to the apex of the inverted curve of said bar, the tilting-lever and its segment mounted at the apex of the upright curve, and the link depending from said lever to a connection with the front of the frame.

15. The frame-casting composed of the longitudinal sleeve for the reception of the crank-shaft and the transverse hollow arm integral therewith to form the front bar of the frame.

16. The frame-casting composed of the longitudinal sleeve for the reception of the crank-shaft, the box integral therewith at the rear end for the prime pinion and bevel-gearing which drive said shaft, and the hollow transverse arm at the front of said sleeve and integral therewith for the support of the finger-bar.

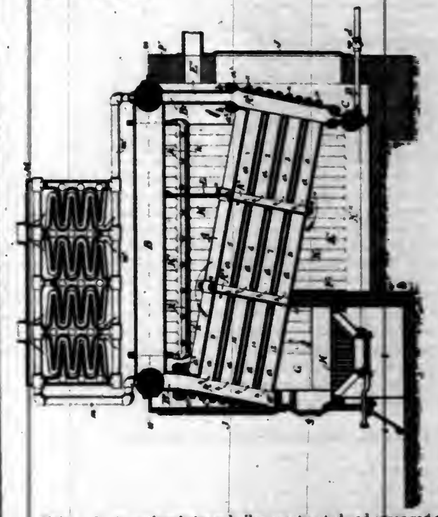
17. The frame-casting composed of the longitudinal sleeve for the reception of the crank-shaft, with the forward-extending bracket, to which the draft-tongue is hinged, and the transverse hollow arm for the support of the finger-bar.



18. The frame-casting composed of the longitudinal sleeve for the reception of the crank-shaft, and the transverse hollow arm supporting the finger-bar and having the rake-standard rising therefrom and integral therewith.

19. The combination, substantially as hereinbefore set forth, of the hollow sleeve for the crank-shaft, the front transverse arm cast integral therewith and formed hollow, the integral rake-standard rising from said arm, the bracket for the draft-tongue hinge, also integral with said casting, and the wrought-metal bar riveted to an ear from the rear end of said casting and extending parallel with the front or hollow arm.

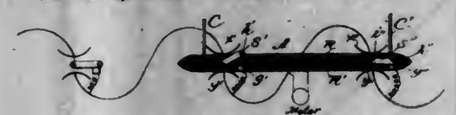
20. The combination, substantially as hereinbefore set forth, of the hollow sleeve for the crank-shaft, the box for the prime pinion and bevel-gearing, the front transverse arm formed hollow and with the rake-standard thereon, and the bracket for the draft-tongue, all cast in one piece, and the wrought-metal bar riveted to an ear from said casting adjacent to the box and extending parallel with the front arm.



21. The combination, substantially as hereinbefore set forth, of the main wheel, the main axle, the supporting-bracket mounted on said axle, the prime-pinion shaft entering a radius-arm from said bracket, the hinged draft-tongue, the frame-bar, the platform, the levers on the bracket and frame-bar to lift and to tilt the platform, the metal intermediate frame formed as described and having its front arm or bar adapted to receive a stiffening-bolt, whereby it is connected to the finger-bar, the pivot-rod extending between the two arms of said frame and forming the hinge for the platform, the divided crank-shaft running underneath said frame and platform, the radius-bar connecting the axle and crank on the stubble end of the inner section of said shaft, the grain-wheel supported on the crank at the divider end of the outer section, and the link connecting the cranks at the adjacent ends of said sections.

407,743. CARDING-MACHINE. JOSIAH K. PROCTOR, Philadelphia, Pa., assignor to the Philadelphia Textile Machinery Company, same place. Filed Aug. 1, 1887. Serial No. 245,781. (No model.)

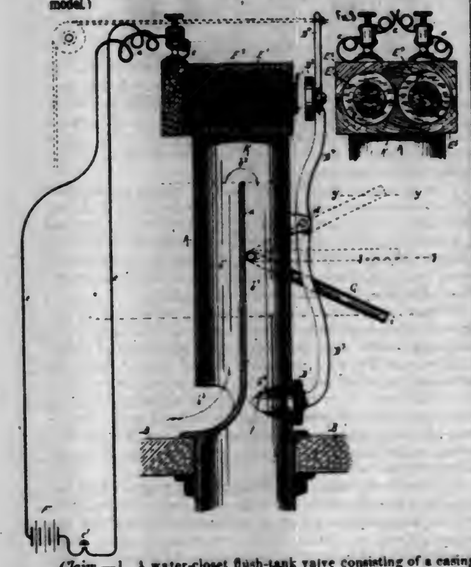
Claim.—The combination of the feed-rolls with the feed-apron or equivalent device, and a retainer-roll located above the apron and having teeth, whereby as the fiber is fed between the retainer-roll and apron to the feed-rolls snarls or bunches will be caught and held by the teeth of the roll without preventing the passage of the clear fibers, all substantially as specified.



407,744. SECTIONAL STEAM-BOILER. JOHN ROWBOTHAM and WILLIAM ROWBOTHAM, Merchantville, N. J.; said William Rowbotham assignor to said John Rowbotham. Filed Mar. 14, 1888. Serial No. 308,230. (No model.)

Claim.—1. A sectional steam-boiler constructed and arranged as described, each section being a single casting and consisting of a series of tubes formed with and opening into a header or stand-pipe at its ends, and formed with one or more hollow diaphragms intermediate of its length, with which the series of tubes are in open communication, whereby the steam generated in the section to the immediate rear of each hollow diaphragm is caused to flow therein, as set forth.

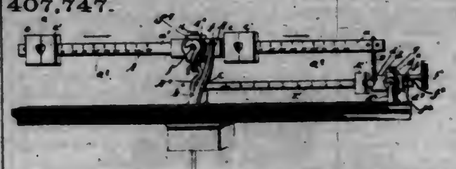
2. In combination with a steam-boiler, a furnace the vertical walls of which are formed in whole or part of one or more castings, each casting consisting of a series of vertical tubes in such juxtaposition that the thickness of metal of two contiguous tubes at the line of contact is equal only to the thickness of the metal of one tube as to its portion out of contact, said tubes at one end cast integral and in open communication with a laterally-extending base-tube and at its opposite end formed with a flange adapted to be suitably united to a corresponding flanged end of a similarly-cast section of a series of tubes, the latter cast integral, in open communication and preferably at an incline with a steam-drum and together forming the furnace-top, the flanged ends of said sections so formed as, when joined together, to form a laterally-extending tube, and when two or more such co-joint sections are employed in a single furnace the ends of the respective laterally-extending tubes and the steam-drum section formed with a flange as a means of coupling the sections together, all of said tubes adapted to contain water and form radiating-surface for generating steam in connection with a boiler, as set forth.



407,745. ELECTRICAL RAILWAY. SIDNEY H. SHORT, Denver, Colo. Filed Apr. 15, 1887. Serial No. 234,994. (No model.)

Claim.—1. In an electric railway, the combination of an insulated underground wire or cable cut in sections, with throw-switches connecting the ends of the sections, and contact-plates at the ends of the sections with a space between them, and a current-collector adapted to operate the switches and collect the current through the contact-plates, substantially as described.

2. An electric railway having a single conductor composed of sections of insulated wire, the ends of the sections being connected together by switches, a switch-shifter for operating said switches, contact-plates on the ends of the sections with a space between them, and a suitable current-collector, substantially as described.



407,746. WATER-CLOSET FLUSHING-VALVE. JOHN W. STEVENS, St. Paul, Minn. Filed Sept. 7, 1888. Serial No. 284,779. (No model.)

Claim.—1. A water-closet flush-tank valve consisting of a casing A, having division *a* and inlet-ports b^3 b^4, an electro-magnet attached to said casing, and a valve-lever D^2, having valve D', adapted to close said port b^4, and an armature D^3, adapted to be actuated by said electro-magnet when the circuit therein is broken or closed to correspondingly open and close said valve, substantially as and for the purpose set forth.

2. A water-closet flush-tank valve consisting of a casing A, having division *a* and inlet-ports b^3 b^4, a valve D', adapted to open and close said port b^4, and an adjustable tube G, connected into said casing, whereby the height of water in the tank may be regulated, substantially as and for the purpose set forth.

407,747. WEIGHING-SCALES. WILLIAM H. STEWART, Kansas City, Kans., assignor of one-half to William S. Whittaker, same place. Filed Nov. 15, 1888. Serial No. 290,971. (No model.)

Claim.—1. A scale-beam fulcrumed at an intermediate point and provided on each side of its fulcrum with a series of graduations which increase, respectively, toward and from the fulcrum, and also provided at each end of each series with a space devoid of graduations to receive the poises, in combination with two sets of poises arranged, respectively, on opposite sides of the fulcrum and adapted to occupy said ungraduated spaces, each set of poises consisting of two independent members, substantially as and for the purpose specified.

2. A longitudinally-adjustable scale-beam fulcrumed at an intermediate point, provided on each side of its fulcrum with a series of graduations which increase in the same direction, respectively, toward and from the fulcrum, and also provided with a central space and end spaces which are devoid of graduations, substantially as specified.

3. In weighing-scales, the centrally-poised main beam, both arms of which are graduated and carry weighing-poises, in combination with an auxiliary beam the longer arm of which is connected near the fulcrum to the outer or free end of one of the arms of the main beam, substantially as specified.

4. In weighing-scales, the centrally-poised main beam, each arm of which is provided with a series of graduations which increase, respectively, toward and from the fulcrum, the load being suspended from the inner end of that arm on which the graduations increase toward the fulcrum, and the weighing-poises arranged, respectively, on the arms of the beam and adapted to be normally located at the initial points of the series of graduations, in combination with an auxiliary scale-beam carrying a poise on its longer graduated arm, said arm being connected near its fulcrum to the extremity of that arm of the main beam on which the graduations increase outward or from the fulcrum, substantially as specified.

5. In weighing-scales, the combination of the main centrally-poised beam having a movable pivot, and having both arms graduated, respectively, toward and from the said pivot, the movable weighing-poises arranged, respectively, on opposite sides of the pivot, and the auxiliary beam provided with a movable pivot and a weighing-poise, and having its longer arm connected to the extremity of one of the arms of the main beam, substantially as specified.

6. A scale-beam provided with a blank or ungraduated space and an auxiliary weighing-poise, in combination with the usual weighing-poise upon the same beam and adapted to register with the same series of graduations and the longitudinally-adjustable auxiliary beam, substantially as set forth.

7. In a weighing-scale, the combination of the scale-beam having two series of graduations and having a blank or ungraduated space at each end of each series of graduations, and the two sets of poises of two poises to each set, one set being adapted to register with each series of graduations, substantially as specified.
